   string  symbol      // symbol
   )
```

Parameters

symbol

[in] New value for "Symbol" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Period (Get Method)

Gets the value of "Period" property.

```
int  Period() const
```

Return Value

Value of "Period" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

Period (Set Method)

Sets new value for "Period" property.

```
bool  Period(
   int  period      // period
   )
```

Parameters

period

[in] New value for "Period" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Scale (Get Method)

Gets the value of "Scale" property.

```
double  Scale() const
```

Return Value

Value of "Scale" property of the object assigned to the class instance. If there is no object assigned, it returns EMPTY_VALUE.

Scale (Set Method)

Sets new value for "Scale" property.

```
bool  Scale(
   double  scale      // property value
   )
```

Parameters

scale

[in] New value for "Scale" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

DateScale (Get Method)

Gets the value of "DateScale" flag.

```
bool  DateScale() const
```

Return Value

Value of "DateScale" flag of the object assigned to the class instance. If there is no object assigned, it returns false.

DateScale (Set Method)

Sets new value for "DateScale" property.

```
bool  DateScale(
   bool  scale      // flag value
   )
```

Parameters

scale

[in] New value for "DateScale" flag.

Return Value

true - successful, false - cannot change the flag.

© 2000-2025, MetaQuotes Ltd.

PriceScale (Get Method)

Gets the value of "PriceScale" flag.

```
bool  PriceScale() const
```

Return Value

Value of "PriceScale" flag of the object assigned to the class instance. If there is no object assigned, it returns false.

PriceScale (Set Method)

Sets new value for "PriceScale" flag.

```
bool  PriceScale(
   bool  scale      // flag value
   )
```

Parameters

scale

[in] New value for "PriceScale" flag.

Return Value

true - successful, false - cannot change the flag.

© 2000-2025, MetaQuotes Ltd.

Time

Prohibits changes of the time coordinate.

```
bool  Time(
   datetime  time      // any value
   )
```

Parameters

time

[in]

Return Value

always false.

© 2000-2025, MetaQuotes Ltd.

Price

Prohibits changes of the price coordinate.

```
bool  Price(
   double  price      // any value
   )
```

Parameters

price

[in]

Return Value

always false.

© 2000-2025, MetaQuotes Ltd.

Save

Saves object parameters to file.

```
virtual bool  Save(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Load

Loads object parameters from file.

```
virtual bool  Load(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Type

Returns graphical object type identifier.

```
virtual int  Type() const
```

Return Value

Object type identifier (OBJ_CHART for CChartObjectSubChart).

© 2000-2025, MetaQuotes Ltd.

CChartObjectBitmap

CChartObjectBitmap is a class for simplified access to "Bitmap" graphical object properties.

Description

CChartObjectBitmap class provides access to "Bitmap" object properties.

Declaration

```
class CChartObjectBitmap : public CChartObject
```

Title

```
#include <ChartObjects\ChartObjectsBmpControls.mqh>
```

Inheritance hierarchy

CObject
  CChartObject
    CChartObjectBitmap

Class Methods by Groups

Create	
Create	Creates "Bitmap" graphical object
Properties	
BmpFile	Gets/sets "BMP Filename" property
X_Offset	Gets/sets "X_Offset" property
Y_Offset	Gets/sets "Y_Offset" property
Input/output	
virtual Save	Virtual method for writing to file
virtual Load	Virtual method for reading from file
virtual Type	Virtual method of identification

Object types, Object properties, Graphic objects

© 2000-2025, MetaQuotes Ltd.

Create

Creates "Bitmap" graphical object.

```
bool  Create(
   long      chart_id,      // chart identifier
   string    name,          // object name
   int       window,        // chart window
   datetime  time,          // time coordinate
   double    price          // price coordinate
   )
```

Parameters

chart_id

[in] Chart identifier (0 - current chart).

name

[in] A unique name of the object to create.

window

[in] Chart window number (0 - main window).

time

[in] Time coordinate of the anchor point.

price

[in] Price coordinate of the anchor point.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

BmpFile (Get Method)

Gets the value of "BmpFile" property.

```
string  BmpFile() const
```

Return Value

Value of "BmpFile" property of the object assigned to the class instance. If there is no object assigned, it returns false.

BmpFile (Set Method)

Sets new value for "BmpFile" property.

```
bool  BmpFile(
   string  name      // property value
   )
```

Parameters

name

[in] New value for "BmpFile" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

X_Offset (Get Method)

Gets the value of "X_Offset" property (the upper left corner) of the CChartObjectBitmap graphical object.

```
int  X_Offset() const
```

Return Value

Value of "X_Offset" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

X_Offset (Set Method)

Sets new value for "X_Offset" property (the upper left corner) of the CChartObjectBitmap graphical object. The value is set in pixels relative to the upper left corner of the original image.

```
bool  X_Offset(
   int  X      // property value
   )
```

Parameters

X

[in] New value for "X_Offset" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Y_Offset (Get Method)

Gets the value of "Y_Offset" property (the upper left corner) of the CChartObjectBitmap graphical object.

```
int  Y_Offset() const
```

Return Value

Value of "Y_Offset" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

Y_Offset (Set Method)

Sets new value for "Y_Offset" property (the upper left corner) of the CChartObjectBitmap graphical object. The value is set in pixels relative to the upper left corner of the original image.

```
bool  Y_Offset(
   int  Y      // property value
   )
```

Parameters

Y

[in] New value for "Y_Offset" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Save

Saves object parameters to file.

```
virtual bool  Save(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Load

Loads object parameters from file.

```
virtual bool  Load(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Type

Returns graphical object type identifier.

```
virtual int  Type() const
```

Return Value

Object type identifier (OBJ_BITMAP for CChartObjectBitmap).

© 2000-2025, MetaQuotes Ltd.

CChartObjectBmpLabel

CChartObjectBmpLabel is a class for simplified access to "Bitmap Label" graphical object properties.

Description

CChartObjectBmpLabel class provides access to "Bitmap Label" object properties.

Declaration

```
class CChartObjectBmpLabel : public CChartObject
```

Title

```
#include <ChartObjects\ChartObjectsBmpControls.mqh>
```

Inheritance hierarchy

CObject
  CChartObject
    CChartObjectBmpLabel

Class Methods by Groups

Create	
Create	Creates "BmpLabel" graphical object
Properties	
X_Distance	Gets/sets "X_Distance" property

Create

Creates "BmpLabel" graphical object.

```
bool  Create(
   long    chart_id,      // chart identifier
   string  name,          // object name
   int     window,        // chart window
   int     X,             // X coordinate
   int     Y              // Y coordinate
   )
```

Parameters

chart_id

[in] Chart identifier (0 - current chart).

name

[in] A unique name of the object to create.

window

[in] Chart window number (0 - main window).

X

[in] X coordinate.

Y

[in] Y coordinate.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

X_Distance (Get Method)

Gets the value of "X_Distance" property.

```
int  X_Distance() const
```

Return Value

Value of "X_Distance" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

X_Distance (Set Method)

Sets new value for "X_Distance" property.

```
bool  X_Distance(
   int  X      // property value
   )
```

Parameters

X

[in] New value for "X_Distance" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Y_Distance (Get Method)

Gets the value of "Y_Distance" property.

```
int  Y_Distance() const
```

Return Value

Value of "Y_Distance" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

Y_Distance (Set Method)

Sets new value for "Y_Distance" property.

```
bool  Y_Distance(
   int  Y      // property value
   )
```

Parameters

Y

[in] New value for "Y_Distance" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

X_Offset (Get Method)

Gets the value of "X_Offset" property (the upper left corner) of the CCartObjectBmpLabel graphical object.

```
int  X_Offset() const
```

Return Value

Value of "X_Offset" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

X_Offset (Set Method)

Sets new value for "X_Offset" property (the upper left corner) of the CChartObjectBitmap graphical object. The value is set in pixels relative to the upper left corner of the original image.

```
bool  X_Offset(
   int  X      // property value
   )
```

Parameters

X

[in] New value for "X_Offset" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Y_Offset (Get Method)

Gets the value of "Y_Offset" property (the upper left corner) of the CCartObjectBmpLabel graphical object.

```
int  Y_Offset() const
```

Return Value

Value of "Y_Offset" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

Y_Offset (Set Method)

Sets new value for "Y_Offset" property (the upper left corner) of the CCartObjectBmpLabel graphical object. The value is set in pixels relative to the upper left corner of the original image.

```
bool  Y_Offset(
   int  Y      // property value
   )
```

Parameters

Y

[in] New value for "Y_Offset" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Corner (Get Method)

Gets the value of "Corner" property.

```
ENUM_BASE_CORNER Corner() const
```

Return Value

Value of "Corner" property of the object assigned to the class instance. If there is no object assigned, it returns WRONG_VALUE.

Corner (Set Method)

Sets new value for "Corner" property.

```
bool  Corner(
   ENUM_BASE_CORNER  corner      // property value
   )
```

Parameters

corner

[in] New value for "Corner" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

X_Size

Gets the value of "X_Size" property.

```
int  X_Size() const
```

Return Value

Value of "X_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

Y_Size

Gets the value of "Y_Size" property.

```
int  Y_Size() const
```

Return Value

Value of "Y_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

BmpFileOn (Get Method)

Gets the value of "BmpFileOn" property.

```
string  BmpFileOn() const
```

Return Value

Value of "BmpFileOn" property of the object assigned to the class instance. If there is no object assigned, it returns "".

BmpFileOn (Set Method)

Sets new value for "BmpFileOn" property.

```
bool  BmpFileOn(
   string  name      // file name
   )
```

Parameters

name

[in] New value for "BmpFileOn" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

BmpFileOff (Get Method)

Gets the value of "BmpFileOff" property.

```
string  BmpFileOff() const
```

Return Value

Value of "BmpFileOff" property of the object assigned to the class instance. If there is no object assigned, it returns "".

BmpFileOff (Set Method)

Sets new value for "BmpFileOff" property.

```
bool  BmpFileOff(
   string  name      // file name
   )
```

Parameters

name

[in] New value for "BmpFileOff" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

State (Get Method)

Gets the value of "State" property.

```
bool  State() const
```

Return Value

Value of "State" property of the object assigned to the class instance. If there is no object assigned, it returns false.

State (Set Method)

Sets new value for "State" property.

```
bool  State(
   bool  state      // property value
   )
```

Parameters

state

[in] New value for "State" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Time

Prohibits changes of the time coordinate.

```
bool  Time(
   datetime  time      // any value
   )
```

Parameters

time

[in] Any value of datetime type.

Return Value

always false.

© 2000-2025, MetaQuotes Ltd.

Price

Prohibits changes of the price coordinate.

```
bool  Price(
   double  price      // any value
   )
```

Parameters

price

[in] Any value of double type.

Return Value

always false.

© 2000-2025, MetaQuotes Ltd.

Save

Saves object parameters to file.

```
virtual bool  Save(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Load

Loads object parameters from file.

```
virtual bool  Load(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Type

Returns graphical object type identifier.

```
virtual int  Type() const
```

Return Value

Object type identifier (OBJ_BITMAP_LABEL for CChartObjectBmpLabel).

© 2000-2025, MetaQuotes Ltd.

CChartObjectRectLabel

CChartObjectRectLabel is a class for simplified access to "Rectangle Label" graphical object properties.

Description

CChartObjectRectLabel class provides access to "Rectangle Label" object properties.

Declaration

```
class CChartObjectRectLabel : public CChartObjectLabel
```

Title

```
#include <ChartObjects\ChartObjectsTxtControls.mqh>
```

Inheritance hierarchy

CObject
  CChartObject
    CChartObjectText
      CChartObjectLabel
        CChartObjectRectLabel

Class Methods by Groups

Create	
Create	Creates "RectLabel" graphical object

Create

Creates the "CChartObjectRectLabel" graphic object.

```
bool  Create(
   long     chart_id,      // chart ID
   string   name,          // object name
   int      window,        // chart window
   int      X,             // X coordinate
   int      Y,             // Y coordinate
   int      sizeX,         // horizontal size
   int      sizeY          // vertical size
   )
```

Parameters

chart_id

[in] Chart identifier (0 - current chart).

name

[in] A unique name of the object to create.

window

[in] Chart window number (0 - main window).

X

[in] X coordinate.

Y

[in] Y coordinate.

sizeX

[in] Horizontal size.

sizeY

[in] Vertical size.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

X_Size

Sets the value of "X_Size" property.

```
bool  X_Size(
   int  size      // property value
   )
```

Parameters

size

[in] New horizontal size property value.

Return Value

true - successful, false - cannot change the property.

Note

To get the values of "X_Size" and "Y_Size" properties, use the X_Size and Y_Size methods of the parent CChartObjectLabel class.

© 2000-2025, MetaQuotes Ltd.

Y_Size

Sets the value of "Y_Size" property.

```
bool  Y_Size(
   int  size      // property value
   )
```

Parameters

size

[in] New vertical size property value.

Return Value

true - successful, false - cannot change the property.

Note

To get the values of "X_Size" and "Y_Size" properties, use the X_Size and Y_Size methods of the parent CChartObjectLabel class.

© 2000-2025, MetaQuotes Ltd.

BackColor

Gets the background color property value.

```
color  BackColor() const
```

Return Value

Background color property value of the object assigned to the class instance. If there is no object assigned, it returns 0.

BackColor

Sets the background color property value.

```
bool  BackColor(
   color  new_color      // property value
   )
```

Parameters

new_color

[in] New background color property value.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Angle

Prohibits changing the slope angle property.

```
bool  Angle(
   double  angle      // any value
   )
```

Parameters

angle

[in] Any value of double type.

Return Value

Always false.

© 2000-2025, MetaQuotes Ltd.

BorderType

Gets border type property value.

```
int  BorderType() const
```

Return Value

Border type property value of the object assigned to the class instance. If there is no object assigned, it returns 0.

BorderType

Sets border type property value.

```
bool  BorderType(
   int  type      // property value
   )
```

Parameters

type

[in] New border type property value.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Save

Saves object parameters to file.

```
virtual bool  Save(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Load

Loads object parameters from file.

```
virtual bool  Load(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Type

Returns graphical object type identifier.

```
virtual int  Type() const
```

Return Value

Object type identifier (OBJ_RECTANGLE_LABEL for CChartObjectRectangleLabel).

© 2000-2025, MetaQuotes Ltd.

Custom graphics

This section provides tools for working with custom graphics.

Their use greatly facilitates plotting custom charts, drawings and visualization of data.

There are individual classes for creating graphical objects and primitives, for drawing various types of pie charts and curves. Various options for displaying objects are implemented: changing the style and color of lines, filling, working with series of data on the chart, etc.

Class	Description
CCanvas	Class for simplified creation of custom images
CChartCanvas	Base class for implementing classes intended for drawing charts and their elements
CHistogramChart	Class for plotting histograms
CLineChart	Class for plotting curves
CPieChart	Class for plotting pie charts

© 2000-2025, MetaQuotes Ltd.

CCanvas

CCanvas is a class for simplified creation of custom images.

Description

CCanvas provides creation of a graphical resource (with or without binding to a chart object) and drawing graphic primitives.

Declaration

```
class CCanvas
```

Title

```
#include <Canvas\Canvas.mqh>
```

Inheritance hierarchy

CCanvas

Direct descendants

CChartCanvas, CFlameCanvas

Class methods by groups

Creating	
Attach	Attaches the OBJ_BITMAP_LABEL object to an instance of the CCanvas class
Create	Creates a graphical resource without binding to a chart object
CreateBitmap	Create a graphical resource bound to a chart object
CreateBitmapLabel	Create a graphical resource bound to a chart object
Destroy	Destroys a graphical resource
Properties	
ChartObjectName	Gets the name of a bound chart object
ResourceName	Gets the name of a graphical resource
Width	Gets the width of a graphical resource
Height	Gets the height of a graphical resource
LineStyleSet	Sets the line style
Updates an object on the screen	
Update	Displays changes on the screen

Creating	
Resize	Resizes a graphical resource
Erasing/Filling with color	
Erase	Erases or fills with the specified color
Data access	
PixelGet	Gets a color of the dot with the specified coordinates
PixelSet	Sets color of the dot with the specified coordinates
Draws primitives	
LineVertical	Draws a vertical line
LineHorizontal	Draws a horizontal line
Line	Draws a freehand line
Polyline	Draws a polyline
Polygon	Draws a polygon
Rectangle	Draws a rectangle
Circle	Draws a circle
Triangle	Draws a triangle
Ellipse	Draws an ellipse
Arc	Draws an ellipse arc
Pie	Draws an ellipse sector
Draws filled primitives	
FillRectangle	Draws a filled rectangle
FillCircle	Draws a filled circle
FillTriangle	Draws a filled triangle
FillPolygon	Draws a filled polygon
FillEllipse	Draws a filled ellipse
Fill	Fills an area
Draws primitives with antialiasing	
PixelSetAA	Draws a pixel
LineAA	Draws a line
PolylineAA	Draws a polyline
PolygonAA	Draws a polygon

Creating	
TriangleAA	Draws a triangle
CircleAA	Draws a circle
EllipseAA	Draws an ellipse
LineWu	Draws a line
PolylineWu	Draws a polyline
PolygonWu	Draws a polygon
TriangleWu	Draws a triangle
CircleWu	Draws a circle
EllipseWu	Draws an ellipse
LineThick	Draws a segment of a freehand line having a specified width using antialiasing algorithm.
LineThickVertical	Draws a vertical segment of a freehand line having a specified width using antialiasing algorithm.
LineThickHorizontal	Draws a horizontal segment of a freehand line having a specified width using antialiasing algorithm.
PolygonSmooth	Draws a polygon with a specified width using two antialiasing algorithms
PolygonThick	Draws a polygon with a specified width using antialiasing algorithm
PolylineSmooth	Draws a polyline with a specified width using two antialiasing algorithms
PolylineThick	Draws a polyline with a specified width using antialiasing algorithm
Text	
FontSet	Sets font parameters
FontNameSet	Sets font name
FontSizeSet	Sets font size
FontFlagsSet	Sets font flags
FontAngleSet	Sets font slope angle
FontGet	Gets font parameters
FontNameGet	Gets font name
FontSizeGet	Gets font size
FontFlagsGet	Gets font flags
FontAngleGet	Gets font slope angle

© 2000-2025, MetaQuotes Ltd.

Creating	
TextOut	Displays text
TextWidth	Gets the text width
TextHeight	Gets the text height
TextSize	Gets the text size
Transparency	
TransparentLevelSet	Sets transparency level
Input/output	
LoadFromFile	Reads an image from a BMP file

Attach

Gets the graphical resource from an OBJ_BITMAP_LABEL object and attaches it to an instance of the CCanvas class.

```
bool  Attach(
   const long          chart_id,                          // chart identifier
   const string        objname,                           // object name
   ENUM_COLOR_FORMAT   clrfmt=COLOR_FORMAT_XRGB_NOALPHA   // color processing metho
   )
```

Creates a graphical resource for an OBJ_BITMAP_LABEL object and attaches it to an instance of the CCanvas class.

```
bool  Attach(
   const long          chart_id,                          // chart identifier
   const string        objname,                           // object name
   const int           width,                             // image width in pixels
   const int           height,                            // image height in pixels
   ENUM_COLOR_FORMAT   clrfmt=COLOR_FORMAT_XRGB_NOALPHA   // color processing metho
   )
```

Parameters

chart_id

[out] Chart identifier.

objname

[in] Name of the graphical object.

width

[in] Image width in the resource.

height

[in] Image height in the resource.

clrfmt=COLOR_FORMAT_XRGB_NOALPHA

[in] Alpha channel processing method. The alpha channel is ignored by default.

Return Value

true - if successful, false - if failed to attach the object.

© 2000-2025, MetaQuotes Ltd.

Arc

Draws an arc of an ellipse inscribed in a rectangle with corners at (x1,y1) and (x2,y2). The arc boundaries are clipped by lines from the center of the ellipse, which extend to two points with coordinates (x3,y3) and (x4,y4).

```
void  Arc(
   int          x1,      // X coordinate of the upper left corner of the rectangle
   int          y1,      // Y coordinate of the upper left corner of the rectangle
   int          x2,      // X coordinate of the bottom right corner of the rectangle
   int          y2,      // Y coordinate of the bottom right corner of the rectangle
   int          x3,      // X coordinate of the first point to find the arc boundaries
   int          y3,      // Y coordinate of the first point to find the arc boundaries
   int          x4,      // X coordinate of the second point to find the arc boundaries
   int          y4,      // Y coordinate of the second point to find the arc boundaries
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the top left corner forming the rectangle.

y1

[in] Y coordinate of the top left corner forming the rectangle.

x2

[in] X coordinate of the bottom right corner forming the rectangle.

y2

[in] Y coordinate of the bottom right corner forming the rectangle.

x3

[in] X coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

y3

[in] Y coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

x4

[in] X coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

y4

[in] Y coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

clr

[in] Color in ARGB format. Use the ColorToARGB() function to convert a color into the ARGB format.

© 2000-2025, MetaQuotes Ltd.

Draws an arc of an ellipse with center at point (x,y), inscribed in rectangle, with radii rx and ry. The arc boundaries are cropped from the ellipse center using rays formed by angles fi3 and fi4.

```
void  Arc(
   int          x,       // X coordinate of the ellipse center
   int          y,       // Y coordinate of the ellipse center
   int          rx,      // ellipse radius on the X axis
   int          ry,      // ellipse radius on the Y axis
   int          fi3,     // angle of ray from ellipse center, which defines the first b
   int          fi4,     // angle of ray from ellipse center, which defines the second
   const uint   clr      // color
   );
```

Draws an arc of an ellipse with center at point (x,y), inscribed in rectangle, with radii rx and ry, and also returns the coordinates of the arc boundaries. The arc boundaries are cropped from the ellipse center using rays formed by angles fi3 and fi4.

```
void  Arc(
   int          x,       // X coordinate of the ellipse center
   int          y,       // Y coordinate of the ellipse center
   int          rx,      // ellipse radius on the X axis
   int          ry,      // ellipse radius on the Y axis
   int          fi3,     // angle of ray from ellipse center, which defines the first b
   int          fi4,     // angle of ray from ellipse center, which defines the second
   int&         x3,      // X coordinate of the first arc boundary
   int&         y3,      // Y coordinate of the first arc boundary
   int&         x4,      // X coordinate of the second arc boundary
   int&         y4,      // Y coordinate of the second arc boundary
   const uint   clr      // color
   );
```

Parameters

x

[in] X coordinate of the ellipse center.

y

[in] Y coordinate of the ellipse center.

rx

[in] Ellipse radius on the X axis, in pixels.

ry

[in] Ellipse radius on the Y axis, in pixels.

fi3

[in] Angle in radians, which defines the first boundary of the arc.

fi4

© 2000-2025, MetaQuotes Ltd.

[in] Angle in radians, which defines the second boundary of the arc.

x3

[out] Variable to get the X coordinate of the first arc boundary.

y3

[out] Variable to get the Y coordinate of the first arc boundary.

x4

[out] Variable to get the X coordinate of the second arc boundary.

y4

[out] Variable to get the Y coordinate of the second arc boundary.

clr

[in] Color in ARGB format. Use the ColorToARGB() function to convert a color into the ARGB format.

Examples of calling the class methods:

```
#include <Canvas\Canvas.mqh>
CCanvas canvas;
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
  {
   int      Width=600;
   int      Height=400;
//--- create canvas
   if(!canvas.CreateBitmapLabel(0,0,"CirclesCanvas",30,30,Width,Height))
     {
      Print("Error creating canvas: ",GetLastError());
     }
//--- clear canvas
   canvas.Erase(clrWhite);
//--- draw rectangle
   canvas.Rectangle(215-190,215-120,215+190,215+120,clrGray);
//--- draw first arc
   canvas.Arc(215,215, 190,120,M_PI_4,2*M_PI-M_PI_4,ColorToARGB(clrRed));
   int x1,y1,x2,y2;
//--- draw second arc
   canvas.Arc(215,215, 190,120,2*M_PI-M_PI_4,2*M_PI+M_PI_4,x1,y1,x2,y2,ColorToARGB(cl
//--- print coordinates of arc
   PrintFormat("First point of arc at (%G,%G), second point of arc at (%G,%G)",x1,y1,x
   canvas.CircleAA(x1,y1,3, ColorToARGB(clrRed));
   canvas.CircleAA(x2,y2,3, ColorToARGB(clrBlue));
//--- show updated canvas
   canvas.Update();
  }
```

© 2000-2025, MetaQuotes Ltd.

© 2000-2025, MetaQuotes Ltd.

Pie

Draws a filled sector of an ellipse inscribed in a rectangle with corners at (x1,y1) and (x2,y2). The sector boundaries are clipped by lines from the center of the ellipse, which extend to two points with coordinates (x3,y3) and (x4,y4).

```
void  Pie(
   int          x1,      // X coordinate of the upper left corner of the rectangle
   int          y1,      // Y coordinate of the upper left corner of the rectangle
   int          x2,      // X coordinate of the bottom right corner of the rectangle
   int          y2,      // Y coordinate of the bottom right corner of the rectangle
   int          x3,      // X coordinate of the first point to find the arc boundaries
   int          y3,      // Y coordinate of the first point to find the arc boundaries
   int          x4,      // X coordinate of the second point to find the arc boundaries
   int          y4,      // Y coordinate of the second point to find the arc boundaries
   const uint   clr,     // line color
   const uint   fill_clr // fill color
   );
```

Parameters

x1

[in] X coordinate of the top left corner forming the rectangle.

y1

[in] Y coordinate of the top left corner forming the rectangle.

x2

[in] X coordinate of the bottom right corner forming the rectangle.

y2

[in] Y coordinate of the bottom right corner forming the rectangle.

x3

[in] X coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

y3

[in] Y coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

x4

[in] X coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

y4

[in] Y coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

clr

[in] Border color of the sector in the ARGB format.

fill_clr

© 2000-2025, MetaQuotes Ltd.

[in] Fill color of the sector in the ARGB format. Use the ColorToARGB() function to convert a color into the ARGB format.

Draws a filled sector of an ellipse with center at point (x,y), inscribed in rectangle, with radii rx and ry. The sector boundaries are cropped from the ellipse center by rays formed by angles fi3 and fi4.

```
void  Pie(
   int          x,       // X coordinate of the ellipse center
   int          y,       // Y coordinate of the ellipse center
   int          rx,      // ellipse radius on the X axis
   int          ry,      // ellipse radius on the Y axis
   int          fi3,     // angle of ray from ellipse center, which defines the first b
   int          fi4,     // angle of ray from ellipse center, which defines the second
   const uint   clr,     // line color
   const uint   fill_clr // fill color
   );
```

Draws a filled sector of an ellipse with center at point (x,y), inscribed in rectangle, with radii rx and ry, and also returns the coordinates of the arc boundaries. The sector boundaries are cropped from the ellipse center by rays formed by angles fi3 and fi4.

```
void  Pie(
   int          x,       // X coordinate of the ellipse center
   int          y,       // Y coordinate of the ellipse center
   int          rx,      // ellipse radius on the X axis
   int          ry,      // ellipse radius on the Y axis
   int          fi3,     // angle of ray from ellipse center, which defines the first b
   int          fi4,     // angle of ray from ellipse center, which defines the second
   int&         x3,      // X coordinate of the first arc boundary
   int&         y3,      // Y coordinate of the first arc boundary
   int&         x4,      // X coordinate of the second arc boundary
   int&         y4,      // Y coordinate of the second arc boundary
   const uint   clr,     // line color
   const uint   fill_clr // fill color
   );
```

Parameters

x

[in] X coordinate of the ellipse center.

y

[in] Y coordinate of the ellipse center.

rx

[in] Ellipse radius on the X axis, in pixels.

ry

[in] Ellipse radius on the X axis, in pixels.

© 2000-2025, MetaQuotes Ltd.

fi3

[in] Angle in radians, which defines the first boundary of the arc.

fi4

[in] Angle in radians, which defines the second boundary of the arc.

x3

[out] Variable to get the X coordinate of the first arc boundary.

y3

[out] Variable to get the Y coordinate of the first arc boundary.

x4

[out] Variable to get the X coordinate of the second arc boundary.

y4

[out] Variable to get the Y coordinate of the second arc boundary.

clr

[in] Border color of the sector in the ARGB format.

fill_clr

[in] Fill color of the sector in the ARGB format. Use the ColorToARGB() function to convert a color into the ARGB format.

Examples of calling the class methods:

```
#include <Canvas\Canvas.mqh>
CCanvas canvas;
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
  {
   int      Width=600;
   int      Height=400;
//--- create canvas
   if(!canvas.CreateBitmapLabel(0,0,"CirclesCanvas",30,30,Width,Height))
     {
      Print("Error creating canvas: ",GetLastError());
     }
//--- clear canvas
   canvas.Erase(clrWhite);
//--- draw rectangle
   canvas.Rectangle(215-190,215-120,215+190,215+120,clrGray);
//--- draw first pie
   canvas.Pie(215,215, 190,120,M_PI_4,2*M_PI-M_PI_4,ColorToARGB(clrBlue),ColorToARGB(c
//--- draw second pie
   canvas.Pie(215,215, 190,120,2*M_PI-M_PI_4,2*M_PI+M_PI_4,ColorToARGB(clrGreen),Colo
//--- show updated canvas
   canvas.Update();
```

© 2000-2025, MetaQuotes Ltd.

```
   DebugBreak();
  }
```

© 2000-2025, MetaQuotes Ltd.

FillPolygon

Draws a filled polygon.

```
void  FillPolygon(
   int&          x,      // array with the X coordinates of polygon points
   int&          y,      // array with the Y coordinates of polygon points
   const uint    clr     // color
   );
```

Parameters

x

[in] Array of the X coordinates of the polygon points.

y

[in] Array of the Y coordinates of the polygon points.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

FillEllipse

Draws a filled ellipse inscribed in a rectangle with the specified coordinates.

```
void  FillPolygon(
   int          x1,      // X coordinate of the upper left corner of the rectangle
   int          y1,      // Y coordinate of the upper left corner of the rectangle
   int          x2,      // X coordinate of the bottom right corner of the rectangle
   int          y2,      // Y coordinate of the bottom right corner of the rectangle
   const uint   clr       // ellipse color
   );
```

Parameters

x1

[in] X coordinate of the top left corner forming the rectangle.

y1

[in] Y coordinate of the top left corner forming the rectangle.

x2

[in] X coordinate of the bottom right corner forming the rectangle.

y2

[in] Y coordinate of the bottom right corner forming the rectangle.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

GetDefaultColor

Returns a predefined color by its index.

```
static uint  GetDefaultColor(
   const uint  i      // index
   );
```

Parameters

i

[in] Index to get the color.

Return Value

Color.

© 2000-2025, MetaQuotes Ltd.

ChartObjectName

Receives the name of a bound chart object.

```
string  ChartObjectName();
```

Return Value

the name of a bound chart object

© 2000-2025, MetaQuotes Ltd.

Circle

Draws a circle

```
void  Circle(
   int          x,        // X coordinate
   int          y,        // Y coordinate
   int          r,        // radius
   const uint   clr       // color
   );
```

Parameters

x

[in] X coordinate of the center of the circle.

y

[in] Y coordinate of the center of the circle.

r

[in] Circle radius.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

CircleAA

Draws a circle using antialiasing algorithm

```
void  CircleAA(
   const int      x,        // X coordinate
   const int      y,        // Y coordinate
   const double   r,        // radius
   const uint     clr       // color
   );
```

Parameters

x

[in] X coordinate of the center of the circle.

y

[in] Y coordinate of the center of the circle.

r

[in] Circle radius.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

CircleWu

Draws a circle using Wu's anti-aliasing algorithm

```
void  CircleWu(
   const int      x,        // X coordinate
   const int      y,        // Y coordinate
   const double   r,        // radius
   const uint     clr       // color
   );
```

Parameters

x

[in] X coordinate of the center of the circle.

y

[in] Y coordinate of the center of the circle.

r

[in] Circle radius.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

Create

Creates a graphical resource without binding to a chart object.

```
virtual bool  Create(
   const string       name,                                  // name
   const int          width,                                 // width
   const int          height,                                // height
   ENUM_COLOR_FORMAT  clrfmt=COLOR_FORMAT_XRGB_NOALPHA       // format
   );
```

Parameters

name

[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

width

[in] Width (size along X axis) in pixels.

height

[in] Height (size along Y axis) in pixels.

clrfmt=COLOR_FORMAT_XRGB_NOALPHA

[in] Color processing method. See ResourceCreate() function description to learn more about color processing methods.

Return Value

true - successful, otherwise - false

© 2000-2025, MetaQuotes Ltd.

CreateBitmap

Creates a graphical resource bound to a chart object.

1. Creates a graphical resource in the main window of the current chart.

```
bool  CreateBitmap(
   const string       name,                                  // name
   const datetime     time,                                  // time
   const double       price,                                 // price
   const int          width,                                 // width
   const int          height,                                // height
   ENUM_COLOR_FORMAT  clrfmt=COLOR_FORMAT_XRGB_NOALPHA       // format
   );
```

2. Creates a graphical resource using a chart ID and a subwindow number.

```
bool  CreateBitmap(
   const long         chart_id,                              // chart ID
   const int          subwin,                                // subwindow number
   const string       name,                                  // name
   const datetime     time,                                  // time
   const double       price,                                 // price
   const int          width,                                 // width
   const int          height,                                // height
   ENUM_COLOR_FORMAT  clrfmt=COLOR_FORMAT_XRGB_NOALPHA       // format
   );
```

Parameters

chart_id

[in] Chart ID for creating an object.

subwin

[in] Chart subwindow number for creating an object.

name

[in] Chart object name and a basis for a graphical resource name.

time

[in] Chart object anchor point time coordinate.

price

[in] Chart object anchor point price coordinate.

width

[in] Graphical resource width (size along X axis) in pixels.

height

[in] Graphical resource height (size along Y axis) in pixels.

clrfmt=COLOR_FORMAT_XRGB_NOALPHA

© 2000-2025, MetaQuotes Ltd.

[in] Color processing method. See ResourceCreate() function description to learn more about color processing methods.

Return Value

true - successful, otherwise - false

Note

If the first function version is used, the object is created in the main window of the current chart.

Object size coincides with the size of a graphical resource.

© 2000-2025, MetaQuotes Ltd.

CreateBitmapLabel

Creates a graphical resource bound to a chart object.

1. Creates a graphical resource in the main window of the current chart.

```
bool  CreateBitmapLabel(
   const string       name,                              // name
   const int          x,                                 // X coordinate
   const int          y,                                 // Y coordinate
   const int          width,                             // width
   const int          height,                            // height
   ENUM_COLOR_FORMAT  clrfmt=COLOR_FORMAT_XRGB_NOALPHA   // format
   );
```

2. Creates a graphical resource using a chart ID and a subwindow number.

```
bool  CreateBitmapLabel(
   const long         chart_id,                          // chart ID
   const int          subwin,                            // subwindow number
   const string       name,                              // name
   const int          x,                                 // X coordinate
   const int          y,                                 // Y coordinate
   const int          width,                             // width
   const int          height,                            // height
   ENUM_COLOR_FORMAT  clrfmt=COLOR_FORMAT_XRGB_NOALPHA   // format
   );
```

Parameters

chart_id

[in] Chart ID for creating an object.

subwin

[in] Chart subwindow number for creating an object.

name

[in] Chart object name and a basis for a graphical resource name.

x

[in] Chart object anchor point X coordinate.

y

[in] Chart object anchor point Y coordinate.

width

[in] Graphical resource width (size along X axis) in pixels.

height

[in] Graphical resource height (size along Y axis) in pixels.

clrfmt=COLOR_FORMAT_XRGB_NOALPHA

© 2000-2025, MetaQuotes Ltd.

[in] Color processing method. See ResourceCreate() function description to learn more about color processing methods.

Return Value

true - successful, otherwise - false

Note

If the first function version is used, the object is created in the main window of the current chart.

Object size coincides with the size of a graphical resource.

© 2000-2025, MetaQuotes Ltd.

Destroy

Destroys a graphical resource.

```
void  Destroy();
```

Note

If a graphical resource has been bound to a chart object, the latter is deleted.

© 2000-2025, MetaQuotes Ltd.

Ellipse

Draws an ellipse using two points.

```
void  Ellipse(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the first point forming an ellipse.

y1

[in] Y coordinate of the first point forming an ellipse.

x2

[in] X coordinate of the second point forming an ellipse.

y2

[in] Y coordinate of the second point forming an ellipse.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

EllipseAA

Draws an ellipse based on two points using anti-aliasing algorithm.

```
void  EllipseAA(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the first point forming an ellipse.

y1

[in] Y coordinate of the first point forming an ellipse.

x2

[in] X coordinate of the second point forming an ellipse.

y2

[in] Y coordinate of the second point forming an ellipse.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

EllipseWu

Draws an ellipse based on two points using Wu's anti-aliasing algorithm.

```
void  EllipseWu(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the first point forming an ellipse.

y1

[in] Y coordinate of the first point forming an ellipse.

x2

[in] X coordinate of the second point forming an ellipse.

y2

[in] Y coordinate of the second point forming an ellipse.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

Erase

Erases or fills with the specified color.

```
void  Erase(
   const uint  clr=0      // color
   );
```

Parameters

clr=0

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

Fill

Fills an area.

```
void  Fill(
   int          x,        // X coordinate
   int          y,        // Y coordinate
   const uint   clr       // color
   );
```

Parameters

x

[in] X coordinate of filling starting point.

y

[in] Y coordinate of filling starting point.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

FillCircle

Draws a filled circle.

```
void  FillCircle(
   int          x,        // X coordinate
   int          y,        // Y coordinate
   int          r,        // radius
   const uint   clr       // color
   );
```

Parameters

x

[in] X coordinate of a filled circle center.

y

[in] Y coordinate of a filled circle center.

r

[in] Filled circle radius.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

FillRectangle

Draws a filled rectangle.

```
void  FillRectangle(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the first point forming a rectangle.

y1

[in] Y coordinate of the first point forming a rectangle.

x2

[in] X coordinate of the second point forming a rectangle.

y2

[in] Y coordinate of the second point forming a rectangle.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

FillTriangle

Draws a filled triangle.

```
void  FillTriangle(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   int          x3,      // X coordinate
   int          y3,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the triangle's first corner.

y1

[in] Y coordinate of the triangle's first corner.

x2

[in] X coordinate of the triangle's second corner.

y2

[in] Y coordinate of the triangle's second corner.

x3

[in] X coordinate of the triangle's third corner.

y3

[in] Y coordinate of the triangle's third corner.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

FontAngleGet

Receives font slope angle.

```
uint  FontAngleGet();
```

Return Value

font slope angle

© 2000-2025, MetaQuotes Ltd.

FontAngleSet

Sets font slope angle.

```
bool  FontAngleSet(
   uint  angle      // angle
   );
```

Parameters

angle

[in] Font slope angle in tenths of a degree.

Return Value

true - successful, otherwise - false

© 2000-2025, MetaQuotes Ltd.

FontFlagsGet

Receives font flags.

```
uint  FontFlagsGet();
```

Return Value

font flags

© 2000-2025, MetaQuotes Ltd.

FontFlagsSet

Sets font flags.

```
bool  FontFlagsSet(
   uint  flags      // flags
   );
```

Parameters

flags

[in] Font creation flags. See TextSetFont() function description to learn more about the flags.

Return Value

true - successful, otherwise - false

© 2000-2025, MetaQuotes Ltd.

FontGet

Receives the current font parameters.

```
void  FontGet(
   string&  name,       // name
   int&     size,       // size
   uint&    flags,      // flags
   uint&    angle       // slope angle
   );
```

Parameters

name

[out] Reference to the variable for returning a font name.

size

[out] Reference to the variable for returning a font size.

flags

[out] Reference to the variable for returning font flags.

angle

[out] Reference to the variable for returning a font slope angle.

© 2000-2025, MetaQuotes Ltd.

FontNameGet

Receives font name.

```
string  FontNameGet();
```

Return Value

font name

© 2000-2025, MetaQuotes Ltd.

FontNameSet

Sets font name.

```
bool  FontNameSet(
   string  name      // name
   );
```

Parameters

name

[in] Font name. For example, "Arial".

Return Value

true - successful, otherwise - false

© 2000-2025, MetaQuotes Ltd.

FontSet

Sets the current font.

```
bool  FontSet(
   const string  name,        // name
   const int     size,        // size
   const uint    flags=0,     // flags
   const uint    angle=0      // angle
   );
```

Parameters

name

[in] Font name. For example, "Arial".

size

[in] Font size. See TextSetFont() function description to learn more about setting a size.

flags=0

[in] Font creation flags. See TextSetFont() function description to learn more about the flags.

angle=0

[in] Font slope angle in tenths of a degree.

Return Value

true - successful, otherwise - false

© 2000-2025, MetaQuotes Ltd.

FontSizeGet

Receives font size.

```
int  FontSizeGet();
```

Return Value

font size

© 2000-2025, MetaQuotes Ltd.

FontSizeSet

Sets font size.

```
bool  FontSizeSet(
   int  size      // size
   );
```

Parameters

size

[in] Font size. See TextSetFont() function description to learn more about setting a size.

Return Value

true - successful, otherwise - false

© 2000-2025, MetaQuotes Ltd.

Height

Receives the height of a graphical resource.

```
int  Height();
```

Return Value

height of a graphical resource

© 2000-2025, MetaQuotes Ltd.

Line

Draws a segment of a freehand line.

```
void  Line(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the segment's first point.

y1

[in] Y coordinate of the segment's first point.

x2

[in] X coordinate of the segment's second point.

y2

[in] Y coordinate of the segment's second point.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

LineAA

Draws a segment of a freehand line using antialiasing algorithm.

```
void  LineAA(
   const int   x1,                  // X coordinate
   const int   y1,                  // Y coordinate
   const int   x2,                  // X coordinate
   const int   y2,                  // Y coordinate
   const uint  clr,                 // color
   const uint  style=UINT_MAX       // line style
   );
```

Parameters

x1

[in] X coordinate of the segment's first point.

y1

[in] Y coordinate of the segment's first point.

x2

[in] X coordinate of the segment's second point.

y2

[in] Y coordinate of the segment's second point.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

LineWu

Draws a segment of a freehand line using Wu's anti-aliasing algorithm.

```
void  LineWu(
   const int   x1,                  // X coordinate
   const int   y1,                  // Y coordinate
   const int   x2,                  // X coordinate
   const int   y2,                  // Y coordinate
   const uint  clr,                 // color
   const uint  style=UINT_MAX       // line style
   );
```

Parameters

x1

[in] X coordinate of the segment's first point.

y1

[in] Y coordinate of the segment's first point.

x2

[in] X coordinate of the segment's second point.

y2

[in] Y coordinate of the segment's second point.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

LineHorizontal

Draws a segment of a horizontal line.

```
void  LineHorizontal(
   int          x1,       // X coordinate
   int          x2,       // X coordinate
   int          y,        // Y coordinate
   const uint   clr       // color
   );
```

Parameters

x1

[in] X coordinate of the segment's first point.

x2

[in] X coordinate of the segment's second point.

y

[in] Segment's Y coordinate.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

LineVertical

Draws a segment of a vertical line.

```
void  LineVertical(
   int          x,        // X coordinate
   int          y1,       // Y coordinate
   int          y2,       // Y coordinate
   const uint   clr       // color
   );
```

Parameters

x

[in] Segment's X coordinate.

y1

[in] Y coordinate of the segment's first point.

y2

[in] Y coordinate of the segment's second point.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

LineStyleSet

Sets the line style.

```
void  LineStyleSet(
   const uint  style      // style
   );
```

Parameters

style

[in] Line style.

Note

The input parameter can have any of ENUM_LINE_STYLE enumeration values. Besides, it is possible to create a custom line drawing style.

© 2000-2025, MetaQuotes Ltd.

LineThick

Draws a segment of a freehand line having a specified width using antialiasing algorithm.

```
void  LineThick(
   const int      x1,            // X coordinate of the segment's first point
   const int      y1,            // Y coordinate of the segment's first point
   const int      x2,            // X coordinate of the segment's second point
   const int      y2,            // Y coordinate of the segment's second point
   const uint     clr,           // color
   const int      size,          // line width
   const uint     style,         // line style
   ENUM_LINE_END  end_style      // line ends style
   )
```

Parameters

x1

[in] X coordinate of the segment's first point.

y1

[in] Y coordinate of the segment's first point.

x2

[in] X coordinate of the segment's second point.

y2

[in] Y coordinate of the segment's second point.

clr

[in] Color in ARGB format.

size

[in] Line width.

style

[in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style

[in] Line style is one of the ENUM_LINE_END enumeration's values

ENUM_LINE_END

ID	Description
LINE_END_ROUND	Line ends are rounded.
LINE_END_BUTT	Line ends are cut.
LINE_END_SQUARE	A line ends in a filled rectangle.

© 2000-2025, MetaQuotes Ltd.

LineThickVertical

Draws a vertical segment of a freehand line having a specified width using antialiasing algorithm.

```
void  LineThickVertical(
   const int      x,              // X coordinate of the segment
   const int      y1,             // Y coordinate of the segment's first point
   const int      y2,             // Y coordinate of the segment's second point
   const uint     clr,            // color
   const int      size,           // line width
   const uint     style,          // line style
   ENUM_LINE_END  end_style       // line ends style
   )
```

Parameters

x

[in] Segment's X coordinate.

y1

[in] Y coordinate of the segment's first point.

y2

[in] Y coordinate of the segment's second point.

clr

[in] Color in ARGB format.

size

[in] Line width.

style

[in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style

[in] Line style is one of the ENUM_LINE_END enumeration's values.

© 2000-2025, MetaQuotes Ltd.

LineThickHorizontal

Draws a horizontal segment of a freehand line having a specified width antialiasing.

```
void  LineThickHorizontal(
   const int      x1,            // X coordinate of the segment's first point
   const int      x2,            // X coordinate of the segment's second point
   const int      y,             // Y coordinate of the segment
   const uint     clr,           // color
   const int      size,          // line width
   const uint     style,         // line style
   ENUM_LINE_END  end_style      // line ends style
   )
```

Parameters

x1

[in] X coordinate of the segment's first point.

x2

[in] X coordinate of the segment's second point.

y

[in] Segment's Y coordinate.

clr

[in] Color in ARGB format.

size

[in] Line width.

style

[in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style

[in] Line style is one of the ENUM_LINE_END enumeration's values.

© 2000-2025, MetaQuotes Ltd.

LoadFromFile

Reads an image from a BMP file.

```
bool  LoadFromFile(
   const string  filename      // file name
   );
```

Parameters

filename

[in] File name (including "BMP" extension).

Return Value

true - successful, otherwise - false

© 2000-2025, MetaQuotes Ltd.

PixelGet

Receives color of the point with the specified coordinates.

```
uint  PixelGet(
   const int  x,      // X coordinate
   const int  y       // Y coordinate
   );
```

Parameters

x

[in] Point's X coordinate.

y

[in] Point's Y coordinate.

Return Value

Point color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

PixelSet

Sets color of the point with the specified coordinates.

```
void  PixelSet(
   const int   x,       // X coordinate
   const int   y,       // Y coordinate
   const uint  clr      // color
   );
```

Parameters

x

[in] Point's X coordinate.

y

[in] Point's Y coordinate.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

PixelSetAA

Draws a point using antialiasing algorithm.

```
void  PixelSetAA(
   const double  x,        // X coordinate
   const double  y,        // Y coordinate
   const uint    clr       // color
   );
```

Parameters

x

[in] Point's X coordinate.

y

[in] Point's Y coordinate.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

Polygon

Draws a polygon.

```
void  Polygon(
   int&         x[],     // array of X coordinates
   int&         y[],     // array of Y coordinates
   const uint   clr      // color
   );
```

Parameters

x[]

[in] Array of X coordinates of a polygon points.

y[]

[in] Array of Y coordinates of a polygon points.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

PolygonAA

Draws a polygon using antialiasing algorithm.

```
void  PolygonAA(
   int&         x[],                // array of X coordinates
   int&         y[],                // array of Y coordinates
   const uint   clr,                // color
   const uint   style=UINT_MAX      // line style
   );
```

Parameters

x[]

[in] Array of X coordinates of a polygon points.

y[]

[in] Array of Y coordinates of a polygon points.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

PolygonWu

Draws a polygon using Wu's anti-aliasing algorithm.

```
void  PolygonWu(
   int&         x[],                // array of X coordinates
   int&         y[],                // array of Y coordinates
   const uint   clr,                // color
   const uint   style=UINT_MAX      // line style
   );
```

Parameters

x[]

[in] Array of X coordinates of a polygon points.

y[]

[in] Array of Y coordinates of a polygon points.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

PolygonThick

Draws a polygon with a specified width using antialiasing algorithm.

```
void  PolygonThick(
   const int&      x[],          // array with the X coordinates of polygon points
   const int&      y[],          // array with the Y coordinates of polygon points
   const uint      clr,          // color
   const int       size,         // line width
   const uint      style,        // line style
   ENUM_LINE_END   end_style     // line ends style
   )
```

Parameters

x[]

[in] Array of X coordinates of polygon points.

y[]

[in] Array of Y coordinates of polygon points.

clr

[in] Color in ARGB format.

size

[in] Line width.

style

[in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style

[in] Line style is one of the ENUM_LINE_END enumeration's values.

© 2000-2025, MetaQuotes Ltd.

PolygonSmooth

Draws a polygon with a specified width consecutively using two antialiasing algorithms First, individual segments are smoothed based on Bezier curves. Then, the raster antialiasing algorithm is applied to the polygon built from these segments to improve the rendering quality.

```
void  PolygonSmooth(
   int&              x[],                        // array with the X coordinates of p
   int&              y[],                        // array with the Y coordinates of p
   const uint        clr,                        // color
   const int         size,                       // line width
   ENUM_LINE_STYLE   style=STYLE_SOLID,          // line style
   ENUM_LINE_END     end_style=LINE_END_ROUND,   // line ends style
   double            tension=0.5,                // antialiasing parameter value
   double            step=10                     // length of approximation lines
   )
```

Parameters

&x[]

[in] Array of X coordinates of polygon points.

&y[]

[in] Array of Y coordinates of polygon points.

clr

[in] Color in ARGB format.

size

[in] Line width.

style=STYLE_SOLID

[in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style=LINE_END_ROUND

[in] Line style is one of the ENUM_LINE_END enumeration's values.

tension=0.5

[in] Smoothing parameter value.

step=10

[in] Length of approximating lines.

© 2000-2025, MetaQuotes Ltd.

Polyline

Draws a polyline.

```
void  Polyline(
   int&         x[],     // array of X coordinates
   int&         y[],     // array of Y coordinates
   const uint   clr      // color
   );
```

Parameters

x[]

[in] Array of X coordinates of a polyline.

y[]

[in] Array of Y coordinates of a polyline.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

PolylineSmooth

Draws a polyline with a specified width consecutively using two antialiasing algorithms. First, individual line segments are smoothed based on Bezier curves. Then, the raster antialiasing algorithm is applied to the polyline built from these segments to improve the rendering quality.

```
void  PolylineSmooth(
   const int&        x[],                        // array with the X coordinates of p
   const int&        y[],                        // array with the Y coordinates of p
   const uint        clr,                        // color
   const int         size,                       // line width
   ENUM_LINE_STYLE   style=STYLE_SOLID,          // line style
   ENUM_LINE_END     end_style=LINE_END_ROUND,   // line ends style
   double            tension=0.5,                // antialiasing parameter value
   double            step=10                     // approximation step
   )
```

Parameters

&x[]

[in] Array of X coordinates of a polyline.

&y[]

[in] Array of Y coordinates of a polyline.

clr

[in] Color in ARGB format.

size

[in] Line width.

style=STYLE_SOLID

[in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style=LINE_END_ROUND

[in] Line style is one of the ENUM_LINE_END enumeration's values.

tension=0.5

[in] Smoothing parameter value.

step=10

[in] Approximation step.

© 2000-2025, MetaQuotes Ltd.

PolylineThick

Draws a polyline with a specified width using antialiasing algorithm.

```
void  PolylineThick(
   const int       &x[],          // array with the X coordinates of polyline points
   const int       &y[],          // array with the Y coordinates of polyline points
   const uint      clr,           // color
   const int       size,          // line width
   const uint      style,         // line style
   ENUM_LINE_END   end_style      // line ends style
   )
```

Parameters

&x[]

[in] Array of X coordinates of a polyline.

&y[]

[in] Array of Y coordinates of a polyline.

clr

[in] Color in ARGB format.

size

[in] Line width.

style

[in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style

[in] Line style is one of the ENUM_LINE_END enumeration's values

© 2000-2025, MetaQuotes Ltd.

PolylineWu

Draws a polyline using Wu's anti-aliasing algorithm.

```
void  PolylineWu(
   int&         x[],                // array of X coordinates
   int&         y[],                // array of Y coordinates
   const uint   clr,                // color
   const uint   style=UINT_MAX      // line style
   );
```

Parameters

x[]

[in] Array of X coordinates of a polyline.

y[]

[in] Array of Y coordinates of a polyline.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

PolylineAA

Draws a polyline using antialiasing algorithm.

```
void  PolylineAA(
   int&         x[],                // array of X coordinates
   int&         y[],                // array of Y coordinates
   const uint   clr,                // color
   const uint   style=UINT_MAX      // line style
   );
```

Parameters

x[]

[in] Array of X coordinates of a polyline.

y[]

[in] Array of Y coordinates of a polyline.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

Rectangle

Draws a rectangle using two points.

```
void  Rectangle(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the first point forming a rectangle.

y1

[in] Y coordinate of the first point forming a rectangle.

x2

[in] X coordinate of the second point forming a rectangle.

y2

[in] Y coordinate of the second point forming a rectangle.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

Resize

Resizes a graphical resource.

```
bool  Resize(
   const int  width,       // width
   const int  height       // height
   );
```

Parameters

width

[in] New width of a graphical resource.

height

[in] New height of a graphical resource.

Return Value

true - successful, otherwise - false

Note

When resizing, the previous image is not saved.

© 2000-2025, MetaQuotes Ltd.

ResourceName

Receives the name of a graphical resource.

```
string  ResourceName();
```

Return Value

name of a graphical resource

© 2000-2025, MetaQuotes Ltd.

TextHeight

Receives the text height.

```
int  TextHeight(
   const string  text      // text
   );
```

Parameters

text

[in] Text for measuring.

Return Value

text height in pixels

Note

The current font is used for measuring the text.

© 2000-2025, MetaQuotes Ltd.

TextOut

Displays text.

```
void  TextOut(
   int          x,               // X coordinate
   int          y,               // Y coordinate
   string       text,            // text
   const uint   clr,             // color
   uint         alignment=0      // alignment
   );
```

Parameters

x

[in] Text anchor's X coordinate.

y

[in] Text anchor's Y coordinate.

text

[in] Text to be displayed.

clr

[in] Color in ARGB format.

alignment=0

[in] Text anchoring method. See TextOut() function description to learn more about anchoring methods.

Note

The current font is used to display the text.

© 2000-2025, MetaQuotes Ltd.

TextSize

Receives the text size.

```
void  TextSize(
   const string  text,        // text
   int&          width,       // width
   int&          height       // height
   );
```

Parameters

text

[in] Text for measuring.

width

[out] Reference to the variable for returning a text width.

height

[out] Reference to the variable for returning a text height.

Note

The current font is used to measure the text.

© 2000-2025, MetaQuotes Ltd.

TextWidth

Receives the text width.

```
int  TextWidth(
   const string  text      // text
   );
```

Parameters

text

[in] Text for measuring.

Return Value

text height in pixels

Note

The current font is used to measure the text.

© 2000-2025, MetaQuotes Ltd.

TransparentLevelSet

Sets transparency level.

```
void  TransparentLevelSet(
   const uchar  value      // value
   );
```

Parameters

value

[in] New value of the transparency level.

Note

0 stands for full transparency, while 255 - for full opacity.

Setting a transparency level affects all that was previously drawn. The specified transparency level does not affect further constructions.

© 2000-2025, MetaQuotes Ltd.

Triangle

Draws a triangle.

```
void  Triangle(
   int          x1,      // X coordinate
   int          y1,      // Y coordinate
   int          x2,      // X coordinate
   int          y2,      // Y coordinate
   int          x3,      // X coordinate
   int          y3,      // Y coordinate
   const uint   clr      // color
   );
```

Parameters

x1

[in] X coordinate of the triangle's first corner.

y1

[in] Y coordinate of the triangle's first corner.

x2

[in] X coordinate of the triangle's second corner.

y2

[in] Y coordinate of the triangle's second corner.

x3

[in] X coordinate of the triangle's third corner.

y3

[in] Y coordinate of the triangle's third corner.

clr

[in] Color in ARGB format.

© 2000-2025, MetaQuotes Ltd.

TriangleAA

Draws a triangle using antialiasing algorithm.

```
void  TriangleAA(
   const int   x1,                  // X coordinate
   const int   y1,                  // Y coordinate
   const int   x2,                  // X coordinate
   const int   y2,                  // Y coordinate
   const int   x3,                  // X coordinate
   const int   y3,                  // Y coordinate
   const uint  clr,                 // color
   const uint  style=UINT_MAX       // line style
   );
```

Parameters

x1

[in] X coordinate of the triangle's first corner.

y1

[in] Y coordinate of the triangle's first corner.

x2

[in] X coordinate of the triangle's second corner.

y2

[in] Y coordinate of the triangle's second corner.

x3

[in] X coordinate of the triangle's third corner.

y3

[in] Y coordinate of the triangle's third corner.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

TriangleWu

Draws a triangle using Wu's anti-aliasing algorithm.

```
void  TriangleWu(
   const int   x1,                  // X coordinate
   const int   y1,                  // Y coordinate
   const int   x2,                  // X coordinate
   const int   y2,                  // Y coordinate
   const int   x3,                  // X coordinate
   const int   y3,                  // Y coordinate
   const uint  clr,                 // color
   const uint  style=UINT_MAX       // line style
   );
```

Parameters

x1

[in] X coordinate of the triangle's first corner.

y1

[in] Y coordinate of the triangle's first corner.

x2

[in] X coordinate of the triangle's second corner.

y2

[in] Y coordinate of the triangle's second corner.

x3

[in] X coordinate of the triangle's third corner.

y3

[in] Y coordinate of the triangle's third corner.

clr

[in] Color in ARGB format.

style=UINT_MAX

[in] Line style is one of ENUM_LINE_STYLE enumeration's values or a custom value.

© 2000-2025, MetaQuotes Ltd.

Update

Displays changes on the screen.

```
void  Update(
   const bool  redraw=true      // flag
   );
```

Parameters

redraw=true

Flag of a chart redrawing necessity.

© 2000-2025, MetaQuotes Ltd.

Width

Receives the width of a graphical resource.

```
int  Width();
```

Return Value

graphical resource width

© 2000-2025, MetaQuotes Ltd.

CChartCanvas

Base class for implementing classes, which are used for drawing charts and their elements.

Description

This class includes methods for working with the basic elements of any chart: coordinate axes and their marks, chart legend, grid, background, etc. Here you can customize the options for displaying elements: visibility, text color, etc.

Declaration

```
class CChartCanvas : public CCanvas
```

Title

```
#include <Canvas\Charts\ChartCanvas.mqh>
```

Inheritance hierarchy

CCanvas

CChartCanvas

Direct descendants

CHistogramChart, CLineChart, CPieChart

Class methods

Method	Action
ColorBackground	Returns and sets the background color.
ColorBorder	Returns and sets the border color.
ColorText	Returns and sets the text color.
ColorGrid	Returns and sets the grid color.
MaxData	Returns and sets the maximum amount of data (series) allowed.
MaxDescrLen	Returns and sets the maximum length of the descriptors.
ShowFlags	Returns and sets the visibility flag of the chart elements.
IsShowLegend	Returns and sets the visibility flag of the legend on the chart.
IsShowScaleLeft	Returns the visibility flag of the scale of values on the left.

© 2000-2025, MetaQuotes Ltd.

Method	Action
IsShowScaleRight	Returns the visibility flag of the scale of values on the right.
IsShowScaleTop	Returns the visibility flag of the scale of values at the top.
IsShowScaleBottom	Returns the visibility flag of the scale of values at the bottom.
IsShowGrid	Returns the visibility flag of the grid on the chart.
IsShowDescriptors	Returns the visibility flag of the descriptors on the chart.
IsShowPercent	Returns the visibility flag of the percentages on the chart.
VScaleMin	Returns and sets the minimum on the vertical scale of values.
VScaleMax	Returns and sets the maximum on the vertical scale of values.
NumGrid	Returns and sets the number of vertical scale divisions when plotting the chart grid.
DataOffset	Returns and sets the data offset value.
DataTotal	Returns the total number of data series on the chart.
DrawDescriptors	Virtual method for drawing descriptors.
DrawData	Virtual method for drawing data series at the specified index.
Create	Virtual method that creates a graphical resource.
AllowedShowFlags	Sets the set of allowed visibility flags for chart elements.
ShowLegend	Sets the visibility flag for the legend.
ShowScaleLeft	Sets the visibility flag for the left scale.
ShowScaleRight	Sets the visibility flag for the right scale.
ShowScaleTop	Sets the visibility flag for the top scale.
ShowScaleBottom	Sets the visibility flag for the bottom scale.
ShowGrid	Sets the visibility flag for the grid.
ShowDescriptors	Sets the visibility flag for the descriptors.

© 2000-2025, MetaQuotes Ltd.

Method	Action
ShowValue	Sets the visibility flag for the values.
ShowPercent	Sets the visibility flag for the percentages.
LegendAlignment	Sets the text alignment for the legend.
Accumulative	Sets the value accumulation flag for the series.
VScaleParams	Sets the parameters for the vertical scale of values.
DescriptorUpdate	Updates the value of the series descriptor (at the specified position).
ColorUpdate	Updates the series colors (at the specified position).
ValuesCheck	Performs internal calculations for plotting the chart.
Redraw	Redraw the chart.
DrawBackground	Draws the background.
DrawLegend	Redraws the legend.
DrawLegendVertical	Draws a vertical legend.
DrawLegendHorizontal	Draws a horizontal legend.
CalcScales	Calculates the coordinates of the scale.
DrawScales	Redraws all scales of values.
DrawScaleLeft	Redraws the left scale of values.
DrawScaleRight	Redraws the right scale of values.
DrawScaleTop	Redraws the top scale of values
DrawScaleBottom	Redraws the bottom value scale.
DrawGrid	Redraw the chart.
DrawChart	Redraw the chart.

Methods inherited from class CCanvas

ColorBackground (Get method)

Returns the background color.

```
uint  ColorBackground()
```

Return Value

Background color.

ColorBackground (Set method)

Sets the background color.

```
void  ColorBackground(
  const uint  value,  // background color
  )
```

Parameters

value

[in] Background color.

© 2000-2025, MetaQuotes Ltd.

ColorBorder (Get method)

Returns the border color.

```
uint  ColorBorder()
```

Return Value

Border color.

ColorBorder (Set method)

Sets the border color.

```
void  ColorBorder(
  const uint  value,  // border color
  )
```

Parameters

value

[in] Border color.

© 2000-2025, MetaQuotes Ltd.

ColorText (Get method)

Returns the text color.

```
uint  ColorText()
```

Return Value

Text color.

ColorText (Set method)

Sets the text color.

```
void  ColorText(
  const uint  value,  // text color
  )
```

Parameters

value

[in] Text color.

© 2000-2025, MetaQuotes Ltd.

ColorGrid (Get method)

Returns the grid color.

```
uint  ColorGrid()
```

Return Value

Grid color.

ColorGrid (Set method)

Sets the grid color.

```
void  ColorGrid(
  const uint  value,  // grid color
  )
```

Parameters

value

[in] Grid color.

© 2000-2025, MetaQuotes Ltd.

MaxData (Get method)

Returns the maximum amount of data (series) allowed.

```
uint  MaxData()
```

Return Value

The maximum amount of data (series).

MaxData (Set method)

Sets the maximum amount of data (series) allowed.

```
void  MaxData(
  const uint  value,  // amount of data
  )
```

Parameters

value

[in] The maximum amount of data (series).

© 2000-2025, MetaQuotes Ltd.

MaxDescrLen (Get method)

Returns the maximum length of the descriptors.

```
uint  MaxDescrLen()
```

Return Value

The value of the maximum length of the descriptors.

MaxDescrLen (Set method)

Sets the maximum length of the descriptors.

```
void  MaxDescrLen(
  const uint  value,  // maximum length
  )
```

Parameters

value

[in] The value of the maximum length of the descriptors.

© 2000-2025, MetaQuotes Ltd.

ShowFlags (Get method)

Returns the visibility flag of the chart elements.

```
bool  ShowFlags()
```

Return Value

Value of the visibility flag of the chart elements.

ShowFlags (Set method)

Sets the visibility flag of the chart elements.

```
void  ShowFlags(
  const uint  flags,  // flag
  )
```

Parameters

flags

[in] Value of the visibility flag of the chart elements.

© 2000-2025, MetaQuotes Ltd.

IsShowLegend

Returns and sets the visibility flag of the legend on the chart.

```
bool  IsShowLegend()
```

Return Value

true if the legend is visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

IsShowScaleLeft

Returns the visibility flag of the scale of values on the left.

```
bool  IsShowScaleLeft()
```

Return Value

true if the scale of values is visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

IsShowScaleRight

Returns the visibility flag of the scale of values on the right.

```
bool  IsShowScaleRight()
```

Return Value

true if the scale of values is visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

IsShowScaleTop

Returns the visibility flag of the scale of values at the top.

```
bool  IsShowScaleTop()
```

Return Value

true if the scale of values is visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

IsShowScaleBottom

Returns the visibility flag of the scale of values at the bottom.

```
bool  IsShowScaleBottom()
```

Return Value

true if the scale of values is visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

IsShowGrid

Returns the visibility flag of the grid on the chart.

```
bool  IsShowGrid()
```

Return Value

true if the grid is visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

IsShowDescriptors

Returns the visibility flag of the descriptors on the chart.

```
bool  IsShowDescriptors()
```

Return Value

true if the descriptors are visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

IsShowPercent

Returns the visibility flag of the percentages on the chart.

```
bool  IsShowPercent()
```

Return Value

true if the percentages are visible, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

VScaleMin (Get method)

Returns the minimum on the vertical scale of values.

```
double  VScaleMin()
```

Return Value

The minimum value on the vertical scale.

VScaleMin (Set method)

Sets the minimum on the vertical scale of values.

```
void  VScaleMin(
  const double  value,    // value on the vertical scale
  )
```

Parameters

value

[in] The minimum value.

© 2000-2025, MetaQuotes Ltd.

VScaleMax

Returns the maximum on the vertical scale of values.

```
double  VScaleMax()
```

Return Value

The maximum value on the vertical scale.

VScaleMax

Sets the maximum on the vertical scale of values.

```
void  VScaleMax(
  const double  value,  //   value on the vertical scale
  )
```

Parameters

value

[in] The maximum value.

© 2000-2025, MetaQuotes Ltd.

NumGrid

Returns the number of vertical scale divisions when plotting the chart grid.

```
uint  NumGrid()
```

Return Value

The number of divisions.

NumGrid

Sets the number of vertical scale divisions when plotting the chart grid.

```
void  NumGrid(
  const uint  value,  // number of divisions
  )
```

Parameters

value

[in] The number of divisions.

© 2000-2025, MetaQuotes Ltd.

DataOffset

Returns the data offset value.

```
int  DataOffset()
```

Return Value

Data offset.

DataOffset

Sets the data offset value.

```
void  DataOffset(
  const int  value,  // offset
  )
```

Parameters

value

[in] Data offset.

© 2000-2025, MetaQuotes Ltd.

DataTotal

Returns the total number of data series on the chart.

```
uint  DataTotal()
```

Return Value

The number of series.

© 2000-2025, MetaQuotes Ltd.

DrawDescriptors

Virtual method for drawing descriptors.

```
virtual void  DrawDescriptors()
```

© 2000-2025, MetaQuotes Ltd.

DrawData

Virtual method for drawing data series at the specified index.

```
virtual void  DrawData(
   const uint  idx=0,  // index
   )
```

Parameters

idx=0

[in] Index of the series.

© 2000-2025, MetaQuotes Ltd.

Create

Virtual method that creates a graphical resource.

```
virtual bool  Create(
  const string       name,      // resource name
  const int          width,     // width
  const int          height,    // height
  ENUM_COLOR_FORMAT  clrfmt,    // format
  )
```

Parameters

name

[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

width

[in] Width (size along X axis) in pixels.

height

[in] Height (size along Y axis) in pixels.

clrfmt

[in] Color processing method. See the ResourceCreate() function description to learn more about color processing methods.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

AllowedShowFlags

Sets the set of allowed visibility flags for chart elements.

```
void  AllowedShowFlags(
  const uint  flags,  // flags
  )
```

Parameters

flags

[in] Allowed flags.

© 2000-2025, MetaQuotes Ltd.

ShowLegend

Sets the visibility flag value for the legend (FLAG_SHOW_LEGEND).

```
void  ShowLegend(
  const bool  flag,  // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the legend becomes visible.
- false — the legend becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowScaleLeft

Sets the visibility flag value for the left scale (FLAG_SHOW_SCALE_LEFT).

```
void  ShowScaleLeft(
  const bool  flag,  // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the left scale becomes visible.
- false — the left scale becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowScaleRight

Sets the visibility flag value for the right scale (FLAG_SHOW_SCALE_RIGHT).

```
void  ShowScaleRight(
  const bool  flag,  // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the right scale becomes visible.
- false — the right scale becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowScaleTop

Sets the visibility flag value for the top scale (FLAG_SHOW_SCALE_TOP).

```
void  ShowScaleTop(
  const bool  flag,  // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the top scale becomes visible.
- false — the top scale becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowScaleBottom

Sets the visibility flag value for the bottom scale (FLAG_SHOW_SCALE_BOTTOM).

```
void  ShowScaleBottom(
  const bool  flag,     // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the bottom scale becomes visible.
- false — the bottom scale becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowGrid

Sets the visibility flag value for the grid (FLAG_SHOW_GRID).

```
void  ShowGrid(
  const bool  flag,  // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the grid becomes visible.
- false — the grid becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowDescriptors

Sets the visibility flag value for the descriptors (FLAG_SHOW_DESCRIPTORS).

```
void  ShowDescriptors(
  const bool  flag,    // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the descriptor becomes visible.
- false — the descriptor becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowValue

Sets the visibility flag for the values (FLAG_SHOW_VALUE).

```
void  ShowValue(
  const bool  flag,  // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the value becomes visible.
- false — the value becomes invisible.

© 2000-2025, MetaQuotes Ltd.

ShowPercent

Sets the visibility flag value for the percentages (FLAG_SHOW_PERCENT).

```
void  ShowPercent(
  const bool  flag,  // flag value
  )
```

Parameters

flag

[in] Flag value:

- true — the percentage becomes visible.
- false — the percentage becomes invisible.

© 2000-2025, MetaQuotes Ltd.

LegendAlignment

Sets the text alignment for the legend.

```
void  LegendAlignment(
  const ENUM_ALIGNMENT  value,  // flag
  )
```

Parameters

value

[in] Takes one of the values of the ENUM_ALIGNMENT enumeration:

- ALIGNMENT_LEFT — alignment to the left.
- ALIGNMENT_TOP — alignment to the top.
- ALIGNMENT_RIGHT — alignment to the right.
- ALIGNMENT_BOTTOM — alignment to the bottom.

© 2000-2025, MetaQuotes Ltd.

Accumulative

Sets the value accumulation flag for the series.

```
void  Accumulative(
  const bool  flag=true,  // flag value
  )
```

Parameters

flag=true

[in] Flag value:

- true — the current value of the series is replaced by the sum of all previous values.
- false — the standard mode for drawing series.

© 2000-2025, MetaQuotes Ltd.

VScaleParams

Sets the parameters for the vertical scale of values.

```
void  VScaleParams(
  const double  max,   // maximum
  const double  min,   // minimum
  const uint    grid,  // number of divisions
  )
```

Parameters

max

[in] The minimum value.

min

[in] The maximum value.

grid

[in] The number of scale divisions.

© 2000-2025, MetaQuotes Ltd.

DescriptorUpdate

Updates the value of the series descriptor (at the specified position).

```
bool  DescriptorUpdate(
  const uint    pos,    // index
  const string  descr,  // value
  )
```

Parameters

pos

[in] Index of the series — the serial number of its addition, starting with 0.

descr

[in] Descriptor value.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ColorUpdate

Updates the series colors (at the specified position).

```
bool  ColorUpdate(
  const uint  pos,  // index
  const uint  clr,  // color
  )
```

Parameters

pos

[in] Index of the series — the serial number of its addition, starting with 0.

clr

[in] Color value.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ValuesCheck

Auxiliary virtual method, performs internal calculations for plotting the chart.

```
virtual void  ValuesCheck()
```

© 2000-2025, MetaQuotes Ltd.

Redraw

Virtual method for redrawing the chart.

```
virtual void  Redraw()
```

© 2000-2025, MetaQuotes Ltd.

DrawBackground

Virtual method for redrawing the background.

```
virtual void  DrawBackground()
```

© 2000-2025, MetaQuotes Ltd.

DrawLegend

Virtual method for redrawing the legend.

```
virtual void  DrawLegend()
```

© 2000-2025, MetaQuotes Ltd.

DrawLegendVertical

Draws a vertical legend.

```
int  DrawLegendVertical(
  const int  w,  // width
  const int  h,  // height
  )
```

Parameters

w

[in] The maximum width of the text in the legend.

h

[in] The maximum height of the text in the legend.

Return Value

Width of the legend in pixels.

© 2000-2025, MetaQuotes Ltd.

DrawLegendHorizontal

Draws a horizontal legend.

```
int  DrawLegendHorizontal(
  const int  w,  //
  const int  h,  //
  )
```

Parameters

w

[in] The maximum width of the text in the legend.

h

[in] The maximum height of the text in the legend.

Return Value

Height of the legend in pixels.

© 2000-2025, MetaQuotes Ltd.

CalcScales

Virtual method for calculating the coordinates of labels for the scale of values.

```
virtual void  CalcScales()
```

© 2000-2025, MetaQuotes Ltd.

DrawScales

Virtual method for redrawing the all scales of values.

```
virtual void  DrawScales()
```

© 2000-2025, MetaQuotes Ltd.

DrawScaleLeft

Virtual method for redrawing the left scale of values.

```
virtual int  DrawScaleLeft(
  const bool  draw,  // flag
  )
```

Parameters

draw

[in] Flag that indicates if the scale needs to be redrawn.

Return Value

Width of the scale of values.

© 2000-2025, MetaQuotes Ltd.

DrawScaleRight

Virtual method for redrawing the right scale of values.

```
virtual int  DrawScaleRight(
  const bool  draw,  // flag
  )
```

Parameters

draw

[in] Flag that indicates if the scale needs to be redrawn.

Return Value

Width of the scale of values.

© 2000-2025, MetaQuotes Ltd.

DrawScaleTop

Virtual method for redrawing the top scale of values.

```
virtual int  DrawScaleTop(
  const bool  draw,  // flag
  )
```

Parameters

draw

[in] Flag that indicates if the scale needs to be redrawn.

Return Value

Height of the scale of values.

© 2000-2025, MetaQuotes Ltd.

DrawScaleBottom

Virtual method for redrawing the bottom scale of values.

```
virtual int  DrawScaleBottom(
  const bool  draw,  // flag
  )
```

Parameters

draw

[in] Flag that indicates if the scale needs to be redrawn.

Return Value

Height of the scale of values.

© 2000-2025, MetaQuotes Ltd.

DrawGrid

Virtual method for redrawing the grid.

```
virtual void  DrawGrid()
```

© 2000-2025, MetaQuotes Ltd.

DrawChart

Virtual method for redrawing the chart.

```
virtual void  DrawChart()
```

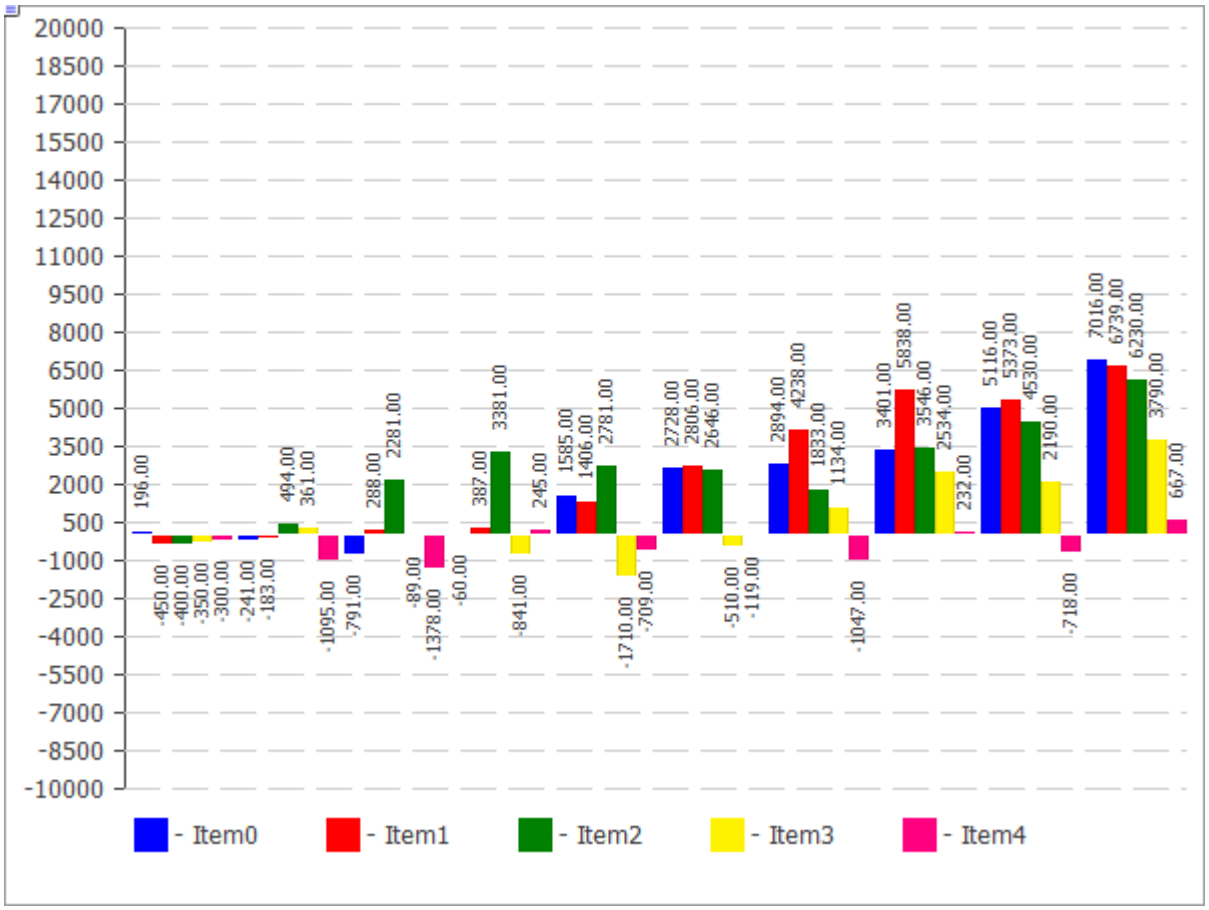
© 2000-2025, MetaQuotes Ltd.

CHistogramChart

Class for plotting histograms.

Description

All methods for working with the plotting of histograms are implemented in this class. They can be used to set the column width and for configuring the work with data series. The methods for working with gradient filling of histogram columns are included, which allow to visualize the data more clearly.



The code of the above figure is provided below.

Declaration

```
class CHistogramChart : public CChartCanvas
```

Title

```
#include <Canvas\Charts\HistogramChart.mqh>
```

Inheritance hierarchy

CCanvas

CChartCanvas

CHistogramChart

© 2000-2025, MetaQuotes Ltd.

Class methods

Method	Action
Gradient	Sets the flag indicating whether the gradient fill of the histogram columns will be applied.
BarGap	Set the value of the histogram offset from the origin.
BarMinSize	Sets the minimum width of the histogram columns.
BarBorder	Sets the flag indicating the need to draw the border for each column.
Create	Virtual method that creates a graphical resource.
SeriesAdd	Adds a new data series.
SeriesInsert	Inserts data series to the chart.
SeriesUpdate	Updates data series on the chart.
SeriesDelete	Deletes data series from the chart.
ValueUpdate	Updates the element value in the specified series.
DrawData	Virtual method that plots a histogram for the specified series.
DrawBar	Draws a histogram column as a filled rectangle.
GradientBrush	Creates a brush for the gradient fill.

Methods inherited from class CCanvas

Gradient

Sets the flag indicating whether the gradient fill of the histogram columns will be applied.

```
void  Gradient(
  const bool  flag=true,  // flag value
  )
```

Parameters

flag=true

Flag value: true if the gradient fill is enabled, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

BarGap

Set the value of the histogram offset from the origin.

```
void  BarGap(
  const uint  value,  // offset
  )
```

Parameters

value

[in] Value of the histogram offset.

© 2000-2025, MetaQuotes Ltd.

BarMinSize

Sets the minimum width of the histogram columns.

```
void  BarMinSize(
  const uint  value,  // minimum width
  )
```

Parameters

value

[in] The minimum width.

© 2000-2025, MetaQuotes Ltd.

BarBorder

Sets the flag indicating the need to draw the border for each column.

```
void  BarBorder(
  const uint  value,  // flag
  )
```

Parameters

value

[in] Flag value:

- true — borders will be drawn
- false — borders will not be drawn

© 2000-2025, MetaQuotes Ltd.

Create

Virtual method that creates a graphical resource.

```
virtual bool  Create(
  const string        name,    // name
  const int           width,   // width
  const int           height,  // height
  ENUM_COLOR_FORMAT   clrfmt,  // format
  )
```

Parameters

name

[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

width

[in] Width (size along X axis) in pixels.

height

[in] Height (size along Y axis) in pixels.

clrfmt

[in] Color processing method. See the ResourceCreate() function description to learn more about color processing methods.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesAdd

Adds a new data series.

```
bool  SeriesAdd(
  const double&  value[],  // values
  const string   descr,    // label
  const uint     clr,      // color
  )
```

Parameters

value[]

[in] Data series.

descr

[in] Series label.

clr

[in] Series display color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesInsert

Inserts data series to the chart.

```
bool  SeriesInsert(
  const uint    pos,        // index
  const double&  value[],   // values
  const string  descr,      // label
  const uint    clr,        // color
  )
```

Parameters

pos

[in] Index for insertion.

value[]

[in] Dara series.

descr

[in] Series label.

clr

[in] Series display color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesUpdate

Updates data series on the chart.

```
bool  SeriesUpdate(
  const uint    pos,        // index
  const double  &value[],   // values
  const string  descr,      // label
  const uint    clr,        // color
  )
```

Parameters

pos

[in] Index of the series — the serial number of its addition, starting with 0.

&value[]

[in] New values for the data series.

descr

[in] Series label.

clr

[in] Series display color.

Return Value

true if successful, otherwise false.

© 2000-2025, MetaQuotes Ltd.

SeriesDelete

Deletes data series from the chart.

```
bool  SeriesDelete(
  const uint  pos,  // index
  )
```

Parameters

pos

[in] Index of the series — the serial number of its addition, starting with 0.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ValueUpdate

Updates the specified value in the specified series.

```
bool  ValueUpdate(
  const uint  series,  // index of the series
  const uint  pos,     // index of the element
  double      value,   // value
  )
```

Parameters

series

[in] Index of the series — the serial number of its addition, starting with 0.

pos

[in] Index of element in the series.

value

[in] New value.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

DrawData

Virtual method that plots a histogram for the specified series.

```
virtual void  DrawData(
  const uint  index,  // index
  )
```

Parameters

index

[in] Index of the series — the serial number of its addition, starting with 0.

© 2000-2025, MetaQuotes Ltd.

DrawBar

Draws a histogram column as a filled rectangle.

```
void  DrawBar(
  const int   x,    // X coordinate
  const int   y,    // Y coordinate
  const int   w,    // width
  const int   h,    // height
  const uint  clr,  // color
  )
```

Parameters

x

[in] X coordinate of the top left point of the rectangle.

y

[in] Y coordinate of the top left point of the rectangle.

w

[in] The width of the rectangle.

h

[in] The height of the rectangle.

clr

[in] The color of the rectangle.

© 2000-2025, MetaQuotes Ltd.

GradientBrush

Creates a brush for the gradient fill.

```
void  GradientBrush(
  const int   size,      // size
  const uint  fill_clr,  // fill color
  )
```

Parameters

size

[in] Brush thickness

fill_clr

[in] Fill color

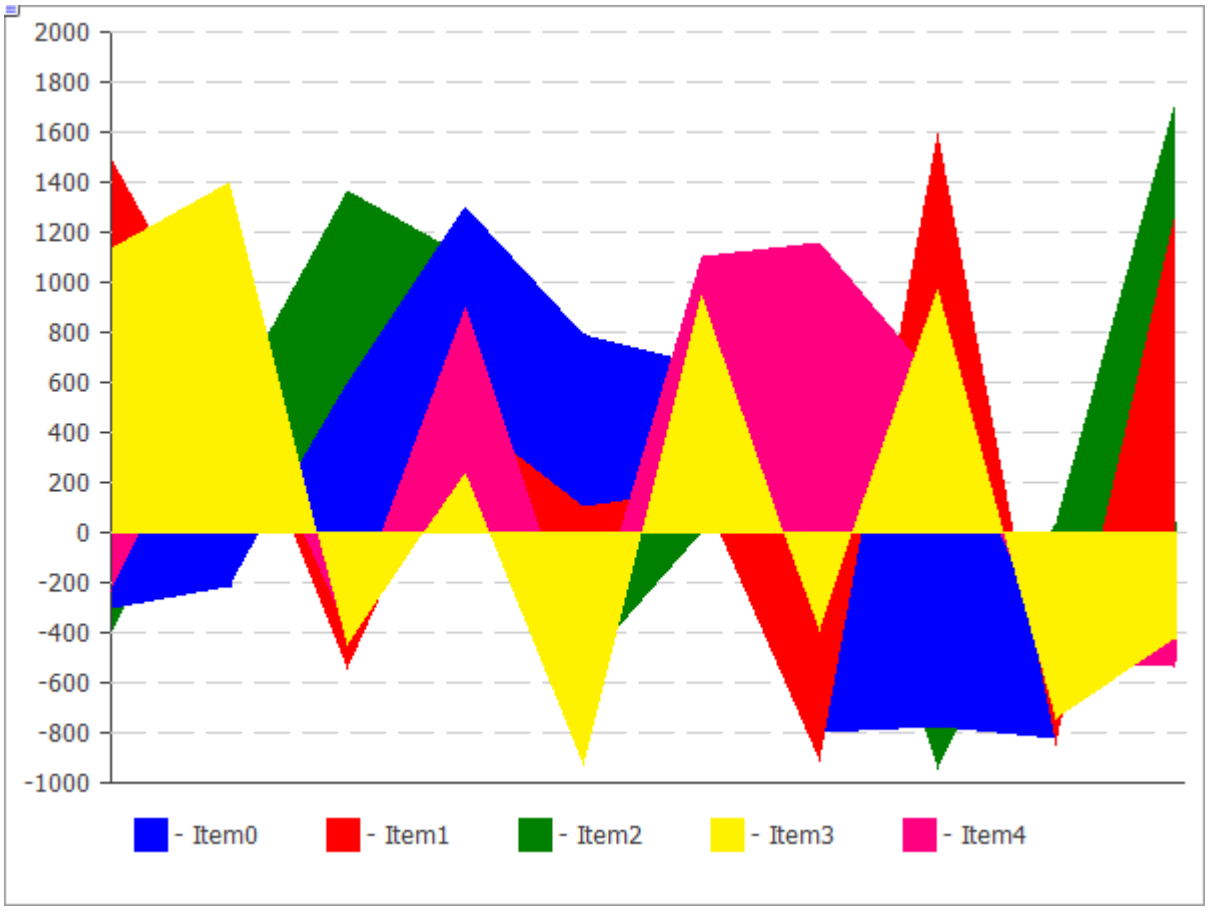
© 2000-2025, MetaQuotes Ltd.

CLineChart

A class for plotting curves.

Description

The methods included in this class are designed for working with curves on the chart. It features the ability to fill the area limited by the plotted curve.



The code of the above figure is provided below.

Declaration

```
class CLineChart : public CChartCanvas
```

Title

```
#include <Canvas\Charts\LineChart.mqh>
```

Inheritance hierarchy

CCanvas
  CChartCanvas
    CLineChart

Class methods

© 2000-2025, MetaQuotes Ltd.

Method	Action
Filled	Sets the flag for filling the area under the curve defined by the data series.
Create	Creates a graphical resource.
SeriesAdd	Adds a new data series.
SeriesInsert	Inserts data series to the chart.
SeriesUpdate	Updates data series on the chart.
SeriesDelete	Deletes data series from the chart.
ValueUpdate	Updates the specified value in the specified series.
DrawChart	Virtual method which draws a curve and all its elements.
DrawData	Virtual method which draws a curve for the specified series.
CalcArea	Calculates the area under the curve defined by the data series.

Methods inherited from class CCanvas

CreateBitmap, CreateBitmap, CreateBitmapLabel, CreateBitmapLabel, Attach, Attach, Destroy, ChartObjectName, ResourceName, Width, Height, Update, Resize, Erase, PixelGet, PixelSet, LineVertical, LineHorizontal, Line, Polyline, Polygon, Rectangle, Triangle, Circle, Ellipse, Arc, Arc, Arc, Pie, Pie, FillRectangle, FillTriangle, FillPolygon, FillCircle, FillEllipse, Fill, Fill, PixelSetAA, LineAA, PolylineAA, PolygonAA, TriangleAA, CircleAA, EllipseAA, LineWu, PolylineWu, PolygonWu, TriangleWu, CircleWu, EllipseWu, LineThickVertical, LineThickHorizontal, LineThick, PolylineThick, PolygonThick, PolylineSmooth, PolygonSmooth, FontSet, FontNameSet, FontSizeSet, FontFlagsSet, FontAngleSet, FontGet, FontNameGet, FontSizeGet, FontFlagsGet, FontAngleGet, TextOut, TextWidth, TextHeight, TextSize, GetDefaultColor, TransparentLevelSet, LoadFromFile, LineStyleGet, LineStyleSet

         if(k>0)
            arr[i]=k*(i+10-j);
         else
            arr[i]=k*(i+10-j)/2;
        }
      chart.SeriesAdd(arr,"Item"+IntegerToString(j));
     }
//--- play with values
   while(!IsStopped())
     {
      int i=rand()%5;
      int j=rand()%10;
      k=rand()%3000-1000;
      chart.ValueUpdate(i,j,k);
      Sleep(200);
     }
```

© 2000-2025, MetaQuotes Ltd.

```
//--- finish
   chart.Destroy();
   return(0);
  }
```

© 2000-2025, MetaQuotes Ltd.

Filled

Sets the flag indicating whether it is necessary to fill the area under the curve defined by the data series.

```
void  Filled(
  const bool  flag=true,  // flag
  )
```

Parameters

flag=true

[in] Flag value:

- true — fill the area under the curve
- false — do not fill the area under the curve

© 2000-2025, MetaQuotes Ltd.

Create

Virtual method that creates a graphical resource.

```
virtual bool  Create(
  const string       name,    // name
  const int          width,   // width
  const int          height,  // height
  ENUM_COLOR_FORMAT  clrfmt,  // format
  )
```

Parameters

name

[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

width

[in] Width (size along X axis) in pixels.

height

[in] Height (size along Y axis) in pixels.

clrfmt

[in] Color processing method. See the ResourceCreate() function description to learn more about color processing methods.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesAdd

Adds a new data series.

```
bool  SeriesAdd(
  const double&  value[],  // values
  const string   descr,    // label
  const uint     clr,      // color
  )
```

Parameters

value[]

[in] Dara series.

descr

[in] Series label.

clr

[in] Series display color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesInsert

Inserts data series to the chart.

```
bool  SeriesInsert(
  const uint     pos,        // index
  const double&  value[],    // values
  const string   descr,      // label
  const uint     clr,        // color
  )
```

Parameters

pos

[in] Index for insertion.

value[]

[in] Dara series.

descr

[in] Series label.

clr

[in] Series display color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesUpdate

Updates data series on the chart.

```
bool  SeriesUpdate(
  const uint     pos,        // index
  const double&  value[],    // values
  const string   descr,      // label
  const uint     clr,        // color
  )
```

Parameters

pos

[in] Index of the series — the serial number of its addition, starting with 0.

value[]

[in] New values for the data series.

descr

[in] Series label.

clr

[in] Series display color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesDelete

Deletes data series from the chart.

```
bool  SeriesDelete(
  const uint  pos,  // index
  )
```

Parameters

pos

[in] Index of the series — the serial number of its addition, starting with 0.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ValueUpdate

Updates the specified value in the specified series.

```
bool  ValueUpdate(
  const uint  series,  // index of the series
  const uint  pos,     // index of the element
  double      value,   // value
  )
```

Parameters

series

[in] Index of the series — the serial number of its addition, starting with 0.

pos

[in] Index of element in the series.

value

[in] New value.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

DrawChart

Virtual method which draws a curve and all its elements.

```
virtual void  DrawChart()
```

© 2000-2025, MetaQuotes Ltd.

DrawData

Virtual method which draws a curve for the specified series.

```
virtual void  DrawData(
  const uint  index,  // index
  )
```

Parameters

index

[in] Index of the series — the serial number of its addition, starting with 0.

© 2000-2025, MetaQuotes Ltd.

CalcArea

Calculates the area under the curve defined by the data series.

```
double  CalcArea(
  const uint  index,  // index
  )
```

Parameters

index

[in] Index of the series — the serial number of its addition, starting with 0.

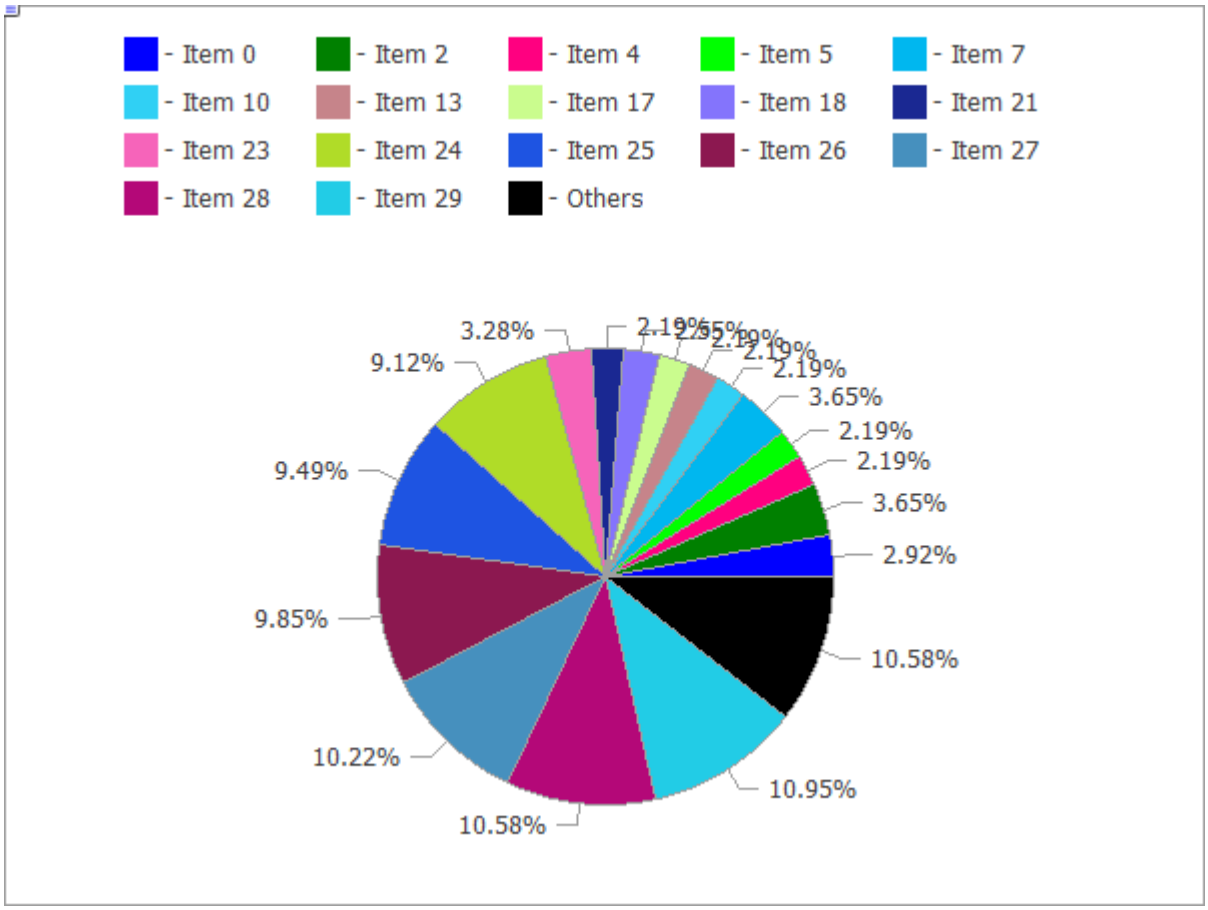
Return Value

Area of the figure limited by the curve which is defined by the data series.

© 2000-2025, MetaQuotes Ltd.

CPieChart

Class for plotting pie charts.



The code of the above figure is provided below.

Description

The methods included in this class are designed for full-scale operation with pie charts, from the creating a graphical resource to designing labels to segments.

Declaration

```
class CPieChart : public CChartCanvas
```

Title

```
#include <Canvas\Charts\PieChart.mqh>
```

Inheritance hierarchy

CCanvas

CPieChart

Class methods

© 2000-2025, MetaQuotes Ltd.

Method	Action
Create	Virtual method that creates a graphical resource.
SeriesSet	Sets a series of values that will be shows on the pie chart.
ValueAdd	Adds a new value to the pie chart (to the end).
ValueInsert	Inserts a new value to the pie chart (at the specified position).
ValueUpdate	Updates the value on the pie chart (at the specified position).
ValueDelete	Removes a value from the pie chart (at the specified position).
DrawChart	Virtual method which draws a pie chart and all its elements.
DrawPie	Draws a segment of the pie chart, which corresponds to a specified value.
LabelMake	Generates a segment label based on its value and the original label.

Methods inherited from class CCanvas

CreateBitmap, CreateBitmap, CreateBitmapLabel, CreateBitmapLabel, Attach, Attach, Destroy, ChartObjectName, ResourceName, Width, Height, Update, Resize, Erase, PixelGet, PixelSet, LineVertical, LineHorizontal, Line, Polyline, Polygon, Rectangle, Triangle, Circle, Ellipse, Arc, Arc, Arc, Pie, Pie, FillRectangle, FillTriangle, FillPolygon, FillCircle, FillEllipse, Fill, Fill, PixelSetAA, LineAA, PolylineAA, PolygonAA, TriangleAA, CircleAA, EllipseAA, LineWu, PolylineWu, PolygonWu, TriangleWu, CircleWu, EllipseWu, LineThickVertical, LineThickHorizontal, LineThick, PolylineThick, PolygonThick, PolylineSmooth, PolygonSmooth, FontSet, FontNameSet, FontSizeSet, FontFlagsSet, FontAngleSet, FontGet, FontNameGet, FontSizeGet, FontFlagsGet, FontAngleGet, TextOut, TextWidth, TextHeight, TextSize, GetDefaultColor, TransparentLevelSet, LoadFromFile, LineStyleGet, LineStyleSet

Methods inherited from class CChartCanvas

ColorBackground, ColorBackground, ColorBorder, ColorBorder, ColorText, ColorText, ColorGrid, ColorGrid, MaxData, MaxData, MaxDescrLen, MaxDescrLen, AllowedShowFlags, ShowFlags, ShowFlags, IsShowLegend, IsShowScaleLeft, IsShowScaleRight, IsShowScaleTop, IsShowScaleBottom, IsShowGrid, IsShowDescriptors, IsShowPercent, ShowLegend, ShowScaleLeft, ShowScaleRight, ShowScaleTop, ShowScaleBottom, ShowGrid, ShowDescriptors, ShowValue, ShowPercent, LegendAlignment, Accumulative, VScaleMin, VScaleMin, VScaleMax, VScaleMax, NumGrid, NumGrid, VScaleParams, DataOffset, DataOffset, DataTotal, DescriptorUpdate, ColorUpdate

Create

Virtual method that creates a graphical resource.

```
virtual bool  Create(
  const string        name,    // name
  const int           width,   // width
  const int           height,  // height
  ENUM_COLOR_FORMAT   clrfmt,  // format
  )
```

Parameters

name

[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

width

[in] Width (size along X axis) in pixels.

height

[in] Height (size along Y axis) in pixels.

clrfmt

[in] Color processing method. See the ResourceCreate() function description to learn more about color processing methods.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

SeriesSet

Sets a series of values that will be shows on the pie chart.

```
bool  SeriesSet(
  const double&  value[],  // values
  const string&  text[],   // labels
  const uint&    clr[],    // color
  )
```

Parameters

value[]

[in] Array of values.

text[]

[in] Array of value labels.

clr[]

[in] Array of value colors.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ValueAdd

Adds a new value to the pie chart (to the end).

```
bool  ValueAdd(
  const double  value,  // value
  const string  descr,  // label
  const uint    clr,    // color
  )
```

Parameters

value

[in] Value.

descr

[in] Value label.

clr

[in] Value color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ValueInsert

Inserts a new value to the pie chart (at the specified position).

```
bool  ValueInsert(
  const uint    pos,    // index
  const double  value,  // value
  const string  descr,  // label
  const uint    clr,    // color
  )
```

Parameters

pos

[in] Index for insertion.

value

[in] Value.

descr

[in] Value label.

clr

[in] Value color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ValueUpdate

Updates the value on the pie chart (at the specified position).

```
bool  ValueUpdate(
  const uint    pos,    // index
  const double  value,  // value
  const string  descr,  // label
  const uint    clr,    // color
  )
```

Parameters

pos

[in] Index of the value — the serial number of its addition, starting with 0.

value

[in] Value.

descr

[in] Value label.

clr

[in] Value color.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

ValueDelete

Removes a value from the pie chart (at the specified position).

```
bool  ValueDelete(
  const uint  pos,  // index
  )
```

Parameters

pos

[in] Index of the value — the serial number of its addition, starting with 0.

Return Value

true if successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

DrawChart

Virtual method which draws a pie chart and all its elements.

```
virtual void  DrawChart()
```

© 2000-2025, MetaQuotes Ltd.

DrawPie

Draws a segment of the pie chart, which corresponds to a specified value.

```
void  DrawPie(
  double      fi3,   // angle of ray from pie chart center, which defines the first b
  double      fi4,   // angle of ray from pie chart center, which defines the second
  int         idx,   // index
  CPoint&     p[],  //
  const uint  clr,   //
  )
```

Parameters

fi3

[in] Angle in radians, which defines the first boundary of the arc.

fi4

[in] Angle in radians, which defines the second boundary of the arc.

idx

[in] Index of the value the segment corresponds to.

p[]

[in] Array of reference points (x, y) for plotting the segments.

clr

[in] Color of the segment.

© 2000-2025, MetaQuotes Ltd.

LabelMake

Generates a segment label based on its value and the original label.

```
string  LabelMake(
  const string  text,     // label
  const double  value,    // value
  const bool    to_left,  // flag
  )
```

Parameters

text

[in] Label.

value

[in] Value.

to_left

[in] Defines the order of the label layout:

- true — label, then value.
- false — value, then label.

Return Value

Label of the segment.

© 2000-2025, MetaQuotes Ltd.

3D graphics

The section features the classes for the three-dimensional graphics development. The classes are based on the functions for working with DirectX. CCnavas3D is a base class containing the methods for managing camera and lighting, as well as featuring the manager of graphic resources – textures, shaders, vertex buffers, indexes and shader parameters.

To start working with the library, simply read the article How to create 3D graphics using DirectX in MetaTrader 5.

Besides, there are the classes of the scene base objects, such as a box, a three-dimensional surface on user data and an arbitrary grid.

© 2000-2025, MetaQuotes Ltd.

CCanvas3D

CCanvas3D is a class for simplified creation and visualization of 3D objects on a chart.

Description

CCanvas3D greatly simplifies creation and visualization of large amounts of data in the form of animated 3D graphics. The class contains the methods for managing camera and lighting, as well as features the resource manager for creating graphic resources: textures, shaders, vertex buffers, indexes, and shader parameters.

Besides, the library contains the classes of the scene base objects, such as a box, a three-dimensional surface on user data, or an arbitrary grid.

A video card should support DX 11 and Shader Model 5.0 for the functions to work.

Declaration

```
class CCanvas
```

Title

```
#include <Canvas\Canvas.mqh>
```

Inheritance hierarchy

CCanvas

CCanvas3D

Class methods by groups

Creating/deleting	Description
Create	Creates a graphic resource for rendering a 3D scene without binding to a chart object.
Attach	Gets a graphical resource from the OBJ_BITMAP_LABEL object and attaches it to an instance of the CCanvas class.
ObjectAdd	Adds an object to a 3D scene for subsequent rendering.
Destroy	Destroys a graphic resource and releases a graphic 3D context.
Light	
AmbientColorSet	Sets the color and intensity of the ambient all-round lighting.
AmbientColorGet	Gets the color and intensity of the ambient all-round lighting.
LightDirectionSet	Sets the direction of a directed light source.
LightDirectionGet	Gets the direction of a directed light source.
LightColorSet	Sets the color and intensity of a directed light source.

© 2000-2025, MetaQuotes Ltd.

Creating/deleting	Description
LightColorGet	Gets the color and intensity of a directed light source.
Camera	
ProjectionMatrixSet	Calculates and sets a 3D coordinate projection matrix to a 2D frame.
ProjectionMatrixGet	Gets a 3D scene projection matrix to a 2D frame.
ViewMatrixSet	Sets a 3D scene view matrix.
ViewMatrixGet	Returns a 3D scene view matrix.
ViewPositionSet	Sets a viewpoint on a 3D scene.
ViewRotationSet	Sets the direction of a gaze at a 3D scene.
ViewTargetSet	Sets the coordinates of the point a gaze is directed at.
ViewUpDirectionSet	Sets the direction of the upper frame border in 3D space.
Rendering	
Render	Renders all scene objects in the frame inner buffer for subsequent display.
RenderBegin	Prepares a graphic context for rendering a new frame.
RenderEnd	Copies a rendered frame to the inner buffer and updates a chart image if necessary.
Getting resources	
DXContext	Gets the graphic context handle.
DXDispatcher	Gets the resource dispatcher handle.
InputScene	Gets the pointer to the buffer of scene parameters.

© 2000-2025, MetaQuotes Ltd.

AmbientColorGet

Gets the color and intensity of the ambient all-round lighting.

```
void  AmbientColorGet(
   DXColor  &ambient_color      // all-round lighting color and intensity
   );
```

Parameters

&ambient_color

[out] All-round lighting color.

Return Value

No

Note

Intensity is stored in the alpha channel of the DXColor structure.

© 2000-2025, MetaQuotes Ltd.

AmbientColorSet

Sets the color and intensity of the ambient all-round lighting.

```
void  AmbientColorSet(
   const DXColor  &ambient_color      // all-round lighting color and intensity
   );
```

Parameters

&ambient_color

[in] All-round lighting color.

Return Value

No

Note

Intensity is set in the alpha channel of the DXColor structure.

© 2000-2025, MetaQuotes Ltd.

Attach

Gets the graphical resource from an OBJ_BITMAP_LABEL object and attaches it to an instance of the CCanvas class.

```
bool  Attach(
   const long          chart_id,                              // chart ID
   const string        objname,                               // object name
   ENUM_COLOR_FORMAT   clrfmt=COLOR_FORMAT_XRGB_NOALPHA       // color handling method
   )
```

Creates a graphical resource for an OBJ_BITMAP_LABEL object and attaches it to an instance of the CCanvas class.

```
bool  Attach(
   const long          chart_id,                              // chart ID
   const string        objname,                               // object name
   const int           width,                                 // image width in pixels
   const int           height,                                // image height in pixels
   ENUM_COLOR_FORMAT   clrfmt=COLOR_FORMAT_XRGB_NOALPHA       // color handling method
   )
```

Parameters

chart_id

[in] Chart ID.

objname

[in] Name of the graphical object.

width

[in] Frame width in a resource.

height

[in] Frame height.

clrfmt=COLOR_FORMAT_XRGB_NOALPHA

[in] Color handling method. See ResourceCreate() function description to learn more about color handling methods.

Note

true - if successful, false - if failed to add a graphic object.

© 2000-2025, MetaQuotes Ltd.

Create

Creates a graphic resource for rendering a 3D scene without binding to a chart object.

```
virtual bool  Create(
   const string       name,                              // graphical object name
   const int          width,                             // width
   const int          height,                            // height
   ENUM_COLOR_FORMAT  clrfmt=COLOR_FORMAT_XRGB_NOALPHA   // color format
   );
```

Parameters

name

[in] Graphical object name.

width

[in] Frame width.

height

[in] Frame height.

clrfmt=COLOR_FORMAT_XRGB_NOALPHA

[in] Color handling method. See ResourceCreate() function description to learn more about color handling methods.

Note

true - if a resource is created, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Destroy

Destroys a graphic resource and releases a graphic 3D context.

```
virtual void  Destroy()
```

Return Value

No

Note

If a graphical resource has been bound to a chart object, the latter is deleted.

© 2000-2025, MetaQuotes Ltd.

DXContext

Gets the graphic context handle.

```
int  DXContext()
```

Return Value

Graphic context handle.

© 2000-2025, MetaQuotes Ltd.

DXDispatcher

Gets the resource dispatcher handle.

```
CDXDispatcher*  DXDispatcher()
```

Return Value

Resource dispatcher handle.

© 2000-2025, MetaQuotes Ltd.

InputScene

Gets the pointer to the buffer of scene parameters.

```
CDXInput*  InputScene()
```

Return Value

Pointer to the buffer of scene parameters.

© 2000-2025, MetaQuotes Ltd.

LightColorGet

Gets the color and intensity of a directed light source.

```
void  LightColorGet(
   DXColor  &light_color      // directional lighting color and intensity
   );
```

Parameters

&light_color

[out] Directional lighting color and intensity.

Return Value

None.

Note

Intensity is stored in the alpha channel of the DXColor structure.

© 2000-2025, MetaQuotes Ltd.

LightColorSet

Sets the color and intensity of a directed light source.

```
void  LightColorSet(
   const DXColor  &light_color      // directional lighting color and intensity
   );
```

Parameters

&light_color

[in] Directional lighting color and intensity.

Return Value

None.

Note

Intensity is set in the alpha channel of the DXColor structure.

© 2000-2025, MetaQuotes Ltd.

LightDirectionGet

Gets the direction of a directed light source.

```
void  LightDirectionGet(
   DXVector3  &light_direction      // direction vector
   );
```

Parameters

&light_direction

[out] Direction vector.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

LightDirectionSet

Sets the direction of a directed light source.

```
void  LightDirectionSet(
   const DXVector3  &light_direction      // direction vector
   );
```

Parameters

&light_direction

[in] Direction vector.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ObjectAdd

Adds an object to a 3D scene for subsequent rendering.

```
bool  ObjectAdd(
   CDXObject  *object      // pointer to the object
   );
```

Parameters

object

[in] Pointer to an instance of the class derived from the CDXObject abstract class.

Return Value

true - if successful, false - if failed to add a 3D graphic object.

© 2000-2025, MetaQuotes Ltd.

ProjectionMatrixGet

Gets a 3D scene projection matrix to a 2D frame.

```
void  ProjectionMatrixGet(
   DXMatrix  &projection_matrix      // projection matrix
   );
```

Parameters

&projection_matrix

[out] Projection matrix.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ProjectionMatrixSet

Calculates and sets a 3D coordinate projection matrix to a 2D frame.

```
void  ProjectionMatrixSet(
   float  fov,              // field of view
   float  aspect_ratio,     // frame aspect ratio
   float  z_near,           //
   float  z_far             //
   );
```

Parameters

fov

[in] Field of view width in radians to create a scene projection.

aspect_ratio

[in] 2D frame aspect ratio.

z_near

[in] Distance to the near clipping plane.

z_far

[in] Distance to the far clipping plane.

Return Value

None.

Note

2D frame displays only projections of 3D objects falling into the specified field of view and located between the near and far clipping planes.

© 2000-2025, MetaQuotes Ltd.

Render

Renders all scene objects in the frame inner buffer for subsequent display.

```
bool  Render(
   uint  flags,                  // combination of flags
   uint  background_color=0      // background color
   );
```

Parameters

flags

[in] Combination of flags that sets the rendering mode. Possible values:
DX_CLEAR_COLOR - clear the image buffer using *background_color*.
DX_CLEAR_DEPTH - clear the depth buffer.

background_color=0

[in] 3D scene background color.

Return Value

true - if successful, false - if failed to render.

Note

Calling Render() does not update a scene on a chart. Instead, it only updates the inner buffer of the image. The Update() method should be explicitly called to render the updated frame.

Render() features the RenderBegin and RenderEnd() calls.

© 2000-2025, MetaQuotes Ltd.

RenderBegin

Prepares a graphic context for rendering a new frame.

```
virtual bool  RenderBegin(
   uint  flags,                  // combination of flags
   uint  background_color=0      // background color
   );
```

Parameters

flags

[in] Combination of flags that sets the rendering mode. Possible values:
DX_CLEAR_COLOR - clear the image buffer using *background_color*.
DX_CLEAR_DEPTH - clear the depth buffer.

background_color=0

[in] 3D scene background color.

Return Value

true - if successful, false - if failed to update shader inputs.

© 2000-2025, MetaQuotes Ltd.

RenderEnd

Copies a rendered frame to the inner buffer and updates a chart image if necessary.

```
virtual bool  RenderEnd(
   bool  redraw=false      // update flag
   );
```

Parameters

redraw=false

[in] Flag of a chart redrawing necessity.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ViewMatrixGet

Returns a 3D scene view matrix.

```
void  ViewMatrixGet(
   DXMatrix  &view_matrix      // view matrix
   );
```

Parameters

&view_matrix

[out] View matrix setting the camera position and direction in 3D space.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ViewMatrixSet

Sets a 3D scene view matrix.

```
void  ViewMatrixSet(
   const DXMatrix  &view_matrix      // view matrix
   );
```

Parameters

&view_matrix

[in] View matrix setting the camera position and direction in 3D space.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ViewPositionSet

Sets a viewpoint on a 3D scene.

```
void  ViewPositionSet(
   const DXVector3  &position      // viewpoint position
   );
```

Parameters

&position

[in] Setting a viewpoint position on a 3D scene.

Return Value

None.

Note

Setting a viewpoint position using ViewPositionSet() changes the view matrix obtained in ViewMatrixGet().

© 2000-2025, MetaQuotes Ltd.

ViewRotationSet

Sets the direction of a gaze at a 3D scene.

```
void  ViewRotationSet(
   const DXVector3  &rotation      // vector of turning angles
   );
```

Parameters

&rotation

[in] Vector setting Euler angles to calculate the direction of a gaze at a 3D scene.

Return Value

None.

Note

Setting the gaze direction using ViewRotationSet() changes the view matrix obtained in ViewMatrixGet().

© 2000-2025, MetaQuotes Ltd.

ViewTargetSet

Sets the coordinates of the point a gaze is directed at.

```
void  ViewTargetSet(
   const DXVector3  &target      // target coordinates
   );
```

Parameters

&target

[in] Coordinates of the point a gaze is directed at.

Return Value

None.

Note

Used to fix the gaze at one scene point when moving the viewpoint.

Setting a new target coordinate using ViewRotationSet() changes the view matrix obtained in ViewMatrixGet().

ViewTargetSet() is used together with ViewUpDirectionSet() to define the gaze direction.

© 2000-2025, MetaQuotes Ltd.

ViewUpDirectionSet

Sets the direction of the upper frame border in 3D space.

```
void  ViewUpDirectionSet(
   const DXVector3  &up_direction      // top direction
   );
```

Parameters

&up_direction

[in] Direction of the upper part of the frame in 3D space.

Return Value

None.

Note

Setting a new direction using ViewUpDirectionSet() changes the view matrix obtained in ViewMatrixGet().

ViewUpDirectionSet() is used together with ViewTargetSet() to define the gaze direction.

© 2000-2025, MetaQuotes Ltd.

CChart

CChart is a class for simplified access to "Chart" graphic object properties.

Description

CChart class provides access to "Chart" object properties.

Declaration

```
class CChart : public CObject
```

Title

```
#include <Charts\Chart.mqh>
```

Inheritance hierarchy

CObject

CChart

Class Methods by Groups

Access to protected data	
ChartID	Gets identifier of the chart
General properties	
Mode	Gets/sets the value of "Mode" property (bars, candles, or line)
Foreground	Gets/sets the value of "Foreground" property
Shift	Gets/sets the value of "Shift" property
ShiftSize	Gets/sets the value of "ShiftSize" property (in percents)
AutoScroll	Gets/sets the value of "AutoScroll" property
Scale	Gets/sets the value of "Scale" property
ScaleFix	Gets/sets the value of "ScaleFix" property (fixed chart scale or not)
ScaleFix_11	Gets/sets the value of "ScaleFix_11" property (chart scale is 1:1, or not)
FixedMax	Gets/sets the value of "FixedMax" property (fixed maximal price)
FixedMin	Gets/sets the value of "FixedMin" property (fixed minimal price)
ScalePPB	Gets/sets the value of "ScalePPB" property (scale is "point per bar" or not)

© 2000-2025, MetaQuotes Ltd.

Access to protected data	
PointsPerBar	Gets/sets the value of "PointsPerBar" property (in points per bar)
Show properties	
ShowOHLC	Gets/sets the value of "ShowOHLC" property
ShowLineBid	Gets/sets the value of "ShowLineBid" property
ShowLineAsk	Gets/sets the value of "ShowLineAsk" property
ShowLastLine	Gets/sets the value of "ShowLastLine" property
ShowPeriodSep	Gets/sets the value of "ShowPeriodSep" property (show period separators)
ShowGrid	Gets/sets the value of "ShowGrid" property
ShowVolumes	Gets/sets the value of "ShowVolumes" property (color for volumes and levels of opened positions)
ShowObjectDescr	Gets/sets the value of "ShowObjectDescr" property (show description for graphic objects)
ShowDateScale	Sets the value of "ShowDateScale" property (date scale of the chart)
ShowPriceScale	Sets the value of "ShowPriceScale" property (price scale of the chart)
Color properties	
ColorBackground	Gets/sets the value of "ColorBackground" property (background color of the chart)
ColorForeground	Gets/sets the value of "ColorForeground" property (color of axes, scale and OHLC strings of the chart)
ColorGrid	Gets/sets the value of "ColorGrid" property (color of the grid)
ColorBarUp	Gets/sets the value of "ColorBarUp" property (color for bull bars, their shadow and candle body outlines)
ColorBarDown	Gets/sets the value of "ColorBarDown" property (color for bear bars, their shadow and candle body outlines)
ColorCandleBull	Gets/sets the value of "ColorCandleBull" property (body color of the bull candle)
ColorCandleBear	Gets/sets the value of "ColorCandleBear" property (body color of the bear candle)
ColorChartLine	Gets/sets the value of "ColorChartLine" property (color for line chart and Doji candles)
ColorVolumes	Gets/sets the value of "ColorVolumes" property (color for volumes and levels of opened positions)

© 2000-2025, MetaQuotes Ltd.

Access to protected data	
ColorLineBid	Gets/sets the value of "ColorLineBid" property (color of Bid line)
ColorLineAsk	Gets/sets the value of "ColorLineAsk" property (color of Ask line)
ColorLineLast	Gets/sets the value of "ColorLineLast" property (color of the last deal price line)
ColorStopLevels	Gets/sets the value of "ColorStopLevels" property (color of the SL and TP levels)
Read only properties	
VisibleBars	Gets total number of visible chart bars
WindowsTotal	Gets total number of chart windows, including the chart indicator subwindows
WindowIsVisible	Gets visibility flag of the specified chart subwindow
WindowHandle	Gets window handle of the chart (HWND)
FirstVisibleBar	Gets the number of the first visible bar of the chart
WidthInBars	Gets window width in bars.
WidthInPixels	Gets subwindow width in pixels.
HeightInPixels	Gets subwindow height in pixels.
PriceMin	Gets minimal price of the specified subwindow
PriceMax	Gets maximal price of the specified subwindow
Properties	
Attach	Assigns the current chart to the class instance
FirstChart	Assigns the first chart of the client terminal to the class instance
NextChart	Assigns the next chart of the client terminal to the class instance
Open	Opens chart with specified parameters and assign it to the class instance
Detach	Detaches chart from the class instance
Close	Closes chart assigned to the class instance
BringToTop	Show chart on top of other charts
EventObjectCreate	Sets a flag to send notifications of an event of new object creation on a chart

© 2000-2025, MetaQuotes Ltd.

Access to protected data	
EventObjectDelete	Sets a flag to send notifications of an event of object deletion on a chart
Indicators	
IndicatorAdd	Adds an indicator with the specified handle into a specified chart subwindow
IndicatorDelete	Removes an indicator with a specified name from the specified chart subwindow
IndicatorsTotal	Returns the number of all indicators applied to the specified chart subwindow
IndicatorName	Returns the short name of the indicator on the specified chart subwindow
Navigation	
Navigate	Navigates the chart
Access to MQL5 API	
Symbol	Gets symbol of the chart
Period	Gets period of the chart
Redraw	Redraws chart, assigned to the class instance
GetInteger	The function returns the value of the corresponding object property
SetInteger	Sets new value for the property of the integer type
GetDouble	The function returns the value of the corresponding object property
SetDouble	Sets new value for the property of the double type
GetString	The function returns the value of the corresponding object property
SetString	Sets new value for the property of the string type
SetSymbolPeriod	Changes symbol and period of the chart assigned to the class instance
ApplyTemplate	Applies specified template to the chart
ScreenShot	Creates screenshot of the specified chart and saves it to .gif file
WindowOnDropped	Gets chart subwindow number corresponding to the object (expert or script) drop point
PriceOnDropped	Gets price coordinate corresponding to the object (expert or script) drop point

© 2000-2025, MetaQuotes Ltd.

Access to protected data	
TimeOnDropped	Gets time coordinate corresponding to the object (expert or script) drop point
XOnDropped	Gets X coordinate corresponding to the object (expert or script) drop point
YOnDropped	Gets Y coordinate corresponding to the object (expert or script) drop point
Input/Output	
virtual Save	Saves object parameters to file
virtual Load	Loads object parameters from file
virtual Type	Gets graphic object type identifier

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

© 2000-2025, MetaQuotes Ltd.

ChartID

Returns identifier of the chart.

```
long  ChartID() const
```

Return Value

Chart identifier assigned to the chart class instance. If there is no chart assigned, it returns -1.

© 2000-2025, MetaQuotes Ltd.

Mode (Get Method)

Gets the value of "Mode" property (bars, candles, or line).

```
ENUM_CHART_MODE  Mode() const
```

Return Value

Value of "Mode" property of the object assigned to the class instance. If there is no chart assigned, it returns WRONG_VALUE.

Mode (Set Method)

Sets new value for "Mode" property (bars, candles, or line).

```
bool  Mode(
   ENUM_CHART_MODE  mode       // chart mode
   )
```

Parameters

mode

[in] Chart mode (candles, bars or line) of ENUM_CHART_MODE enumeration.

Return Value

true - successful, false - cannot change the mode.

© 2000-2025, MetaQuotes Ltd.

Foreground (Get Method)

Gets the value of "Foreground" property.

```
bool  Foreground() const
```

Return Value

Value of "Foreground" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

Foreground (Set Method)

Sets new value for "Foreground" property.

```
bool  Foreground(
   bool  foreground      // flag value
   )
```

Parameters

foreground

[in] New value for "Foreground" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Shift (Get Method)

Gets the value of "Shift" property.

```
bool  Shift() const
```

Return Value

Value of "Shift" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

Shift (Set Method)

Sets new value for "Shift" property.

```
bool  Shift(
   bool  shift      // flag value
   )
```

Parameters

shift

[in] New value for "Shift" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShiftSize (Get Method)

Gets the value of "ShiftSize" property (in percents).

```
double  ShiftSize() const
```

Return Value

Value of "ShiftSize" property of the chart assigned to the class instance. If there is no chart assigned, it returns EMPTY_VALUE.

ShiftSize (Set Method)

Sets new value for "Shift" property (in percents).

```
bool  ShiftSize(
   double  shift_size      // property value
   )
```

Parameters

shift_size

[in] New value for "ShiftSize" property (in percents).

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

AutoScroll (Get Method)

Gets the value of "AutoScroll" property.

```
bool  AutoScroll() const
```

Return Value

Value of "AutoScroll" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

AutoScroll (Set Method)

Sets new value for "AutoScroll" property.

```
bool  AutoScroll(
   bool  autoscroll      // flag value
   )
```

Parameters

autoscroll

[in] New value for "Autoscroll" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

Scale (Get Method)

Gets the value of "Scale" property.

```
int  Scale() const
```

Return Value

Value of "Scale" property of the chart assigned to the class instance. If there is no chart assigned, it returns 0.

Scale (Set Method)

Sets new value for "Scale" property.

```
bool  Scale(
   int  scale      // property value
   )
```

Parameters

scale

[in] New value for "Scale" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ScaleFix (Get Method)

Gets the value of "ScaleFix" property (fixed chart scale or not).

```
bool  ScaleFix() const
```

Return Value

Value of "ScaleFix" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ScaleFix (Set Method)

Sets new value for "ScaleFix" property.

```
bool  ScaleFix(
   bool  scale_fix      // property value
   )
```

Parameters

scale_fix

[in] New value for "ScaleFix" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ScaleFix_11 (Get Method)

Gets the value of "ScaleFix_11" property (chart scale is 1:1, or not).

```
bool  ScaleFix_11() const
```

Return Value

Value of "ScaleFix_11" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ScaleFix_11 (Set Method)

Sets new value for "ScaleFix_11" property.

```
bool  ScaleFix_11(
   string  scale_11      // property value
   )
```

Parameters

scale_11

[in] New value for "ScaleFix_11" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

FixedMax (Get Method)

Gets the value of "FixedMax" property (fixed maximal price).

```
double  FixedMax() const
```

Return Value

Value of "FixedMax" property of the chart assigned to the class instance. If there is no chart assigned, it returns EMPTY_VALUE.

FixedMax (Set Method)

Sets the new value for "FixedMax" property.

```
bool  FixedMax(
   double  max       // fixed maximum
   )
```

Parameters

max

[in] New value for "FixedMax" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

FixedMin (Get Method)

Gets the value of "FixedMin" property (fixed minimal price).

```
double  FixedMin() const
```

Return Value

Value of "FixedMin" property of the chart assigned to the class instance. If there is no chart assigned, it returns EMPTY_VALUE.

FixedMin (Set Method)

Sets new value for "FixedMin" property.

```
bool  FixedMax(
   double  min      // fixed minimum
   )
```

Parameters

max

[in] New value for "FixedMin" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

PointsPerBar (Get Method)

Gets the value of "PointsPerBar" property (in points per bar).

```
double  PointsPerBar() const
```

Return Value

Value of "PointsPerBar" property of the chart assigned to the class instance. If there is no chart assigned, it returns EMPTY_VALUE.

PointsPerBar (Set Method)

Sets new value for "PointsPerBar" property.

```
bool  PointsPerBar(
   double  ppb      // scale
   )
```

Parameters

ppb

[in] New scale (in points per bar).

Return Value

true - successful, false - cannot change the scale.

© 2000-2025, MetaQuotes Ltd.

ScalePPB (Get Method)

Gets the value of "ScalePPB" property (scale is "point per bar" or not).

```
bool  ScalePPB() const
```

Return Value

Value of "ScalePPB" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ScalePPB (Set Method)

Sets new value for "ScalePPB" property.

```
bool  ScalePPB(
   bool  scale_ppb      // flag value
   )
```

Parameters

scale_ppb

[in] New value for "ScalePPB" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowOHLC (Get Method)

Gets the value of "ShowOHLC" property.

```
bool  ShowOHLC() const
```

Return Value

Value of "ShowOHLC" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowOHLC (Set Method)

Sets new value for "ShowOHLC" property.

```
bool  ShowOHLC(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowOHLC" property.

Return Value

true - success, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowLineBid (Get Method)

Gets the value of "ShowLineBid" property.

```
bool  ShowLineBid() const
```

Return Value

Value of "ShowLineBid" property of the char, assigned to the class instance. If there is no chart assigned, it returns false.

ShowLineBid (Set Method)

Sets new value for "ShowLineBid" property.

```
bool  ShowLineBid(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowLineBid" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowLineAsk (Get Method)

Gets the value of "ShowLineAsk" property.

```
bool  ShowLineAsk() const
```

Return Value

Value of "ShowLineAsk" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowLineAsk (Set Method)

Sets new value for "ShowLineAsk" property.

```
bool  ShowLineAsk(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowLineAsk" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowLastLine (Get Method)

Gets the value of "ShowLastLine" property.

```
bool  ShowLastLine() const
```

Return Value

Value of "ShowLastLine" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowLastLine (Set Method)

Sets new value for "ShowLastLine" property.

```
bool  ShowLastLine(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowLastLine" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowPeriodSep (Get Method)

Gets the value of "ShowPeriodSep" property (show period separators).

```
bool  ShowPeriodSep() const
```

Return Value

Value of "ShowPeriodSep" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowPeriodSep (Set Method)

Sets new value for "ShowPeriodSep" property.

```
bool  ShowPeriodSep(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowPeriodSep" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowGrid (Get Method)

Gets the value of "ShowGrid" property.

```
bool  ShowGrid() const
```

Return Value

Value of "ShowGrid" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowGrid (Set Method)

Sets new value for "ShowGrid" property.

```
bool  ShowGrid(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowGrid" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowVolumes (Get Method)

Gets the value of "ShowVolumes" property.

```
bool  ShowVolumes() const
```

Return Value

Value of "ShowVolumes" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowVolumes (Set Method)

Sets new value for "ShowVolumes" property.

```
bool  ShowVolumes(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowVolumes" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowObjectDescr (Get Method)

Gets the value of "ShowObjectDescr" property (show description for graphic objects).

```
bool  ShowObjectDescr() const
```

Return Value

Value of "ShowObjectDescr" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowObjectDescr (Set Method)

Sets new value for "ShowObjectDescr" property.

```
bool  ShowObjectDescr(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowObjectDescr" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowDateScale

Sets new value for "ShowDateScale" property.

```
bool  ShowDateScale(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowDateScale" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ShowPriceScale

Sets new value for "ShowPriceScale" property.

```
bool  ShowPriceScale(
   bool  show      // property value
   )
```

Parameters

show

[in] New value for "ShowPriceScale" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ColorBackground (Get Method)

Gets the value of "ColorBackground" property (background color of the chart).

```
color  ColorBackground() const
```

Return Value

Value of "ColorBackground" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorBackground (Set Method)

Sets new value for "ColorBackground" property.

```
bool  ColorBackground(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New background color.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorForeground (Get Method)

Gets the value of "ColorForeground" property (color of axes, scale and OHLC strings of the chart).

```
color  ColorForeground() const
```

Return Value

Value of "ColorForeground" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorForeground (Set Method)

Sets new value for "ColorForeground" property (for axes, scale, and OHLC string).

```
bool  ColorForeground(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color for axes, scale and OHLC string.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorGrid (Get Method)

Gets the value of "ColorGrid" property (color of the grid).

```
color  ColorGrid() const
```

Return Value

Value of "ColorGrid" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorGrid (Set Method)

Sets new value for "ColorGrid" property.

```
bool  ColorGrid(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New grid color.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorBarUp (Get Method)

Gets the value of "ColorBarUp" property (color for bullish bars, their shadow, and candle body outlines).

```
color  ColorBarUp() const
```

Return Value

Value of "ColorBarUp" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorBarUp (Set Method)

Sets new value for "ColorBarUp" property.

```
bool  ColorBarUp(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color for bullish bars, their shadow and candle body outlines.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorBarDown (Get Method)

Gets the value of "ColorBarDown" property (color for bearish bars, their shadow, and candle body outlines).

```
color  ColorBarDown() const
```

Return Value

Value of "ColorBarDown" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorBarDown (Set Method)

Sets new value for "ColorBarDown" property.

```
bool  ColorBarDown(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color for bearish bars, their shadow, and candle body outlines.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorCandleBull (Get Method)

Gets the value of "ColorCandleBull" property (body color of the bullish candle).

```
color  ColorCandleBull() const
```

Return Value

Value of "ColorCandleBull" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorCandleBull (Set Method)

Sets new value for "ColorCandleBull" property.

```
bool  ColorCandleBull(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color of the bullish candle body.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorCandleBear (Get Method)

Gets the value of "ColorCandleBear" property (body color of the bearish candle).

```
color  ColorCandleBear() const
```

Return Value

Value of "ColorCandleBear" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorCandleBear (Set Method)

Sets new value for "ColorCandleBear" property.

```
bool  ColorCandleBear(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color of the bearish candle body.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorChartLine (Get Method)

Gets the value of "ColorChartLine" property (color for line chart and Doji candles).

```
color  ColorChartLine() const
```

Return Value

Value of "ColorChartLine" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorChartLine (Set Method)

Sets new value for "ColorChartLine" property.

```
bool  ColorChartLine(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color of the chart lines and Doji candles.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorVolumes (Get Method)

Gets the value of "ColorVolumes" property (color for volumes and levels of opened positions).

```
color  ColorVolumes() const
```

Return Value

Value of "ColorVolumes" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorVolumes (Set Method)

Sets new value for "ColorVolumes" property.

```
bool  ColorVolumes(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color of the volumes and open position levels.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorLineBid (Get Method)

Gets the value of "ColorLineBid" property (color of Bid line).

```
color  ColorLineBid() const
```

Return Value

Value of "ColorLineBid" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorLineBid (Set Method)

Sets new value for "ColorLineBid" property.

```
bool  ColorLineBid(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color for Bid line.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorLineAsk (Get Method)

Gets the value of "ColorLineAsk" property (color of Ask line).

```
color  ColorLineAsk() const
```

Return Value

Value of "ColorLineAsk" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorLineAsk (Set Method)

Sets new value for "ColorLineAsk" property.

```
bool  ColorLineAsk(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color for Ask line.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorLineLast (Get Method)

Gets the value of "ColorLineLast" property (color of the last deal price line).

```
color  ColorLineLast() const
```

Return Value

Value of "ColorLineLast" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorLineLast (Set Method)

Sets new value for "ColorLineLast" property.

```
bool  ColorLineLast(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color of the last deal price line.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

ColorStopLevels (Get Method)

Gets the value of "ColorStopLevels" property (color of the SL and TP levels).

```
color  ColorStopLevels() const
```

Return Value

Value of "ColorStopLevels" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorStopLevels (Set Method)

Sets new value for "ColorStopLevels" property.

```
bool  ColorStopLevels(
   color  new_color      // color
   )
```

Parameters

new_color

[in] New color of the Stop Loss and Take Profit price levels.

Return Value

true - successful, false - cannot change the color.

© 2000-2025, MetaQuotes Ltd.

VisibleBars

Gets total number of visible chart bars.

```
int  VisibleBars() const
```

Return Value

Gets total number of visible bars of the chart assigned to the class instance. If there is no chart assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

WindowsTotal

Gets total number of chart windows, including the chart indicator subwindows.

```
int  WindowsTotal() const
```

Return Value

Total number of windows, including the chart indicator subwindows, assigned to the class instance. If there is no chart assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

WindowIsVisible

Gets visibility flag of the specified chart subwindow.

```
bool  WindowIsVisible(
   int  num      // subwindow
   ) const
```

Parameters

num

[in] Subwindow number (0 means main window).

Return Value

Returns visibility flag of the specified chart subwindow assigned to the chart instance. If there is no chart assigned, it returns false.

© 2000-2025, MetaQuotes Ltd.

WindowHandle

Gets window handle of the chart (HWND).

```
int  WindowHandle() const
```

Return Value

Window handle of the chart assigned to the chart instance. If there is no chart assigned, it returns INVALID_HANDLE.

© 2000-2025, MetaQuotes Ltd.

FirstVisibleBar

Gets the number of the first visible bar of the chart.

```
int  FirstVisibleBar() const
```

Return Value

Number of the first visible bar of the chart assigned to the class instance. If there is no chart assigned, it returns -1.

© 2000-2025, MetaQuotes Ltd.

WidthInBars

Gets chart width in bars.

```
int  WidthInBars() const
```

Return Value

Width in chart bars of the chart assigned to the class instance. If there is no chart assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

WidthInPixels

Gets chart width in pixels.

```
int  WidthInPixels() const
```

Return Value

Width in pixels of the chart assigned to the chart instance. If there is no chart assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

HeightInPixels

Gets window height in pixels.

```
int  HeightInPixels(
   int  num      // subwindow
   ) const
```

Parameters

num

[in] Checked subwindow number (0 means main window).

Return Value

Window height in pixels of the chart assigned to the class instance. If there is no chart assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

PriceMin

Gets window minimal price.

```
double  PriceMin(
   int  num      // subwindow
   ) const
```

Parameters

num

[in] Subwindow number (0 means main window).

Return Value

Window minimal price value of the chart assigned to the class instance. If there is not chart assigned, it returns EMPTY_VALUE.

© 2000-2025, MetaQuotes Ltd.

PriceMax

Gets window maximal price.

```
double  PriceMax(
   int  num      // subwindow
   ) const
```

Parameters

num

[in] Subwindow number (0 means main window).

Return Value

Window maximal price value of the chart assigned to the class instance. If there is not chart assigned, it returns EMPTY_VALUE.

© 2000-2025, MetaQuotes Ltd.

Attach

Assigns the current chart to the class instance.

```
void  Attach()
```

Attach

Assigns the specified chart to the class instance.

```
void  Attach(
   long  chart       // chart identifier
   )
```

Parameters

chart

[in] Identifier of the assigned chart.

© 2000-2025, MetaQuotes Ltd.

FirstChart

Assigns the first chart of the client terminal to the class instance.

```
void  FirstChart()
```

© 2000-2025, MetaQuotes Ltd.

NextChart

Assigns the next chart (following the already assigned one) to the class instance.

```
void  NextChart()
```

© 2000-2025, MetaQuotes Ltd.

Open

Opens chart with specified parameters and assigns it to the class instance.

```
long  Open(
   const string      symbol_name,      // symbol
   ENUM_TIMEFRAMES   timeframe         // period
   )
```

Parameters

symbol_name

[in] Chart symbol. NULL means the symbol of the current chart (to which an expert is attached).

timeframe

[in] Chart timeframe (from ENUM_TIMEFRAMES enumeration). 0 means the current timeframe.

Return Value

chart identifier.

© 2000-2025, MetaQuotes Ltd.

Detach

Detaches chart from the class instance.

```
void  Detach()
```

© 2000-2025, MetaQuotes Ltd.

Close

Closes chart assigned to the class instance.

```
void  Close()
```

© 2000-2025, MetaQuotes Ltd.

BringToTop

Show chart on top of other charts.

```
bool  BringToTop() const
```

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

EventObjectCreate

Sets a flag to send notifications of events of a graphical object creation.

```
bool  EventObjectCreate(
   bool  flag      // flag
   )
```

Parameters

flag

[in] New value of a flag to send notifications of events of a graphical object creation.

Return Value

true - successful, false - cannot change the flag.

© 2000-2025, MetaQuotes Ltd.

EventObjectDelete

Sets a flag to send notifications of events of a graphical object deletion.

```
bool  EventObjectDelete(
   bool  flag      // flag
   )
```

Parameters

flag

[in] New value of a flag to send notifications of events of a graphical object deletion.

Return Value

true - successful, false - cannot change the flag.

© 2000-2025, MetaQuotes Ltd.

IndicatorAdd

Adds an indicator with the specified handle into a specified chart window.

```
bool  IndicatorAdd(
   int   sub_win          // number of the subwindow
   int   handle           // handle of the indicator
   );
```

Parameters

sub_win

[in] The number of the chart subwindow. 0 means the main chart window. if the number of a non-existing window is specified, a new window will be created.

handle

[in] The handle of the indicator.

Return Value

The function returns true in case of success, otherwise it returns false. In order to obtain information about the error, call the GetLastError() function.

See also

IndicatorDelete(), IndicatorsTotal(), IndicatorName().

© 2000-2025, MetaQuotes Ltd.

IndicatorDelete

Removes an indicator with a specified name from the specified chart window.

```
bool  IndicatorDelete(
   int            sub_win       // number of the subwindow
   const string   name          // short name of the indicator
   );
```

Parameters

sub_win

[in] Number of the chart subwindow. 0 denotes the main chart subwindow.

const name

[in] The short name of the indicator which is set in the INDICATOR_SHORTNAME property with the IndicatorSetString() function. To get the short name of an indicator, use the IndicatorName() function.

Return Value

Returns true in case of successful deletion of the indicator. Otherwise it returns false. To get error details, use the GetLastError() function.

Note

If two indicators with identical short names exist in the chart subwindow, the first one in a row will be deleted.

If other indicators on this chart are based on the values of the indicator that is being deleted, such indicators will also be deleted.

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions iCustom() and IndicatorCreate(). If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

Deletion of an indicator from a chart does not mean that its calculation part will be deleted from the terminal memory. To release the indicator handle, use the IndicatorRelease() function.

The indicator's short name should be formed correctly. It will be written to the INDICATOR_SHORTNAME property using the IndicatorSetString() function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the IndicatorDelete() function is identified by the short name.

See also

IndicatorAdd(), IndicatorsTotal(), IndicatorName(), iCustom(), IndicatorCreate(), IndicatorSetString().

© 2000-2025, MetaQuotes Ltd.

IndicatorsTotal

Returns the number of all indicators applied to the specified chart window.

```
int  IndicatorsTotal(
   long    chart_id,  // chart identifier
   int     sub_win    // number of the subwindow
   );
```

Parameters

chart_id

[in] Chart identifier. 0 denotes the main chart.

sub_win

[in] Number of the chart subwindow. 0 denotes the main chart window.

Return Value

The number of indicators in the specified chart window. To get error details, use the GetLastError() function.

Note

The function allows going searching through all the indicators attached to the chart. The number of all the windows of the chart can be obtained from the CHART_WINDOWS_TOTAL property using the GetInteger() function.

See also

IndicatorAdd(), IndicatorDelete(), IndicatorsTotal(), iCustom(), IndicatorCreate(), IndicatorSetString().

© 2000-2025, MetaQuotes Ltd.

IndicatorName

Returns the short name of the indicator by the index in the indicators list on the specified chart window.

```
string  IndicatorName(
   int   sub_win     // number of the subwindow
   int   index       // index of the indicator in the list of indicators added to the
   );
```

Parameters

sub_win

[in] Number of the chart subwindow. 0 denotes the main chart window.

index

[in] Index of the indicator in the list of indicators. The numeration of indicators start with zero, i.e. the first indicator in the list has the 0 index. To obtain the number of indicators in the list, use the IndicatorsTotal() function.

Return Value

The short name of the indicator which is set in the INDICATOR_SHORTNAME property with the IndicatorSetString() function. To get error details, use the GetLastError() function.

Note

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions iCustom() and IndicatorCreate(). If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

The indicator's short name should be formed correctly. It will be written to the INDICATOR_SHORTNAME property using the IndicatorSetString() function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the IndicatorDelete() function is identified by the short name.

See also

IndicatorAdd(), IndicatorDelete, IndicatorsTotal, iCustom(), IndicatorCreate(), IndicatorSetString().

© 2000-2025, MetaQuotes Ltd.

Navigate

Shifts the chart.

```
bool  Navigate(
   ENUM_CHART_POSITION  position,     // position
   int                  shift=0       // shift
   )
```

Parameters

position

[in] Chart position (from ENUM_CHART_POSITION enumeration), relative to which a shift is performed.

shift=0

[in] Number of bars to shift.

Return Value

true - successful, false - cannot shift the chart.

© 2000-2025, MetaQuotes Ltd.

Symbol

Gets chart symbol name.

```
string  Symbol() const
```

Return Value

Symbol name of the chart, assigned to the class instance. If there is no chart assigned, it returns "".

© 2000-2025, MetaQuotes Ltd.

Period

Gets period of the chart.

```
ENUM_TIMEFRAMES  Period() const
```

Return Value

Period of the chart (from ENUM_TIMEFRAMES) assigned to the class instance. If there is no chart assigned, it returns 0.

© 2000-2025, MetaQuotes Ltd.

Redraw

Redraws chart assigned to the class instance.

```
void  Redraw()
```

© 2000-2025, MetaQuotes Ltd.

GetInteger

The function returns the value of the corresponding chart property. The chart property should be of the integer type. There are two variants of the function.

1. Immediately returns the property value.

```
long  GetInteger(
   ENUM_CHART_PROPERTY_INTEGER  prop_id,          // property identifier
   int                          sub_window=0      // subwindow number
   ) const
```

2. If successful, puts the value of property to the specified variable of integer type, passed by reference as last parameter.

```
bool  GetInteger(
   ENUM_CHART_PROPERTY_INTEGER  prop_id,        // property identifier
   int                          sub_window,     // subwindow number
   long&                        value           // link to the variable
   ) const
```

Parameters

prop_id

[in] Property identifier (ENUM_CHART_PROPERTY_INTEGER enumeration).

sub_window

[in] Chart subwindow number.

value

[in] Link to the variable that receives the value of the requested property.

Return Value

Value of property of the chart assigned to the class instance. If there is not any chart assigned, it returns -1.

For the second variant, the function returns true, if this property is maintained and the value has been placed into the value variable, otherwise it returns false. To read more about the error, call GetLastError().

© 2000-2025, MetaQuotes Ltd.

SetInteger

Sets new value for the property of the integer type.

```
bool  SetInteger(
   ENUM_CHART_PROPERTY_INTEGER  prop_id,      // property identifier
   long                         value         // value
   )
```

Parameters

prop_id

[in] Chart property identifier (from ENUM_CHART_PROPERTY_INTEGER enumeration).

value

[in] New value of the property.

Return Value

true - successful, false - cannot change the integer property.

© 2000-2025, MetaQuotes Ltd.

GetDouble

The function returns the value of the corresponding chart property. The object property should be of the double type. There are two variants of the function.

1. Immediately returns the property value.

```
double  GetDouble(
   ENUM_CHART_PROPERTY_DOUBLE  prop_id,          // property identifier
   int                         sub_window=0     // subwindow number
   ) const
```

2. If successful, puts the value of property to the specified variable of double type, passed by reference as last parameter.

```
bool  GetDouble(
   ENUM_CHART_PROPERTY_DOUBLE  prop_id,        // property identifier
   int                         sub_window,     // subwindow number
   double&                     value           // link to the variable
   ) const
```

Parameters

prop_id

[in] Chart property identifier (from ENUM_CHART_PROPERTY_DOUBLE enumeration).

sub_window

[in] Chart subwindow number.

value

[in] Variable of the double type that received the value of the requested property.

Return Value

Value of property of the chart assigned to the class instance. If there is not any chart assigned, it returns EMPTY_VALUE.

For the second variant the function, it returns true if the property value is received, otherwise returns false. To read more about the error, call GetLastError().

© 2000-2025, MetaQuotes Ltd.

SetDouble

Sets new value for the chart property of the double type.

```
bool  SetDouble(
   ENUM_CHART_PROPERTY_DOUBLE  prop_id,      // property identifier
   double                      value         // new value
   )
```

Parameters

prop_id

[in] Chart property identifier (from ENUM_CHART_PROPERTY_DOUBLE enumeration).

value

[in] New value for the property.

Return Value

true - successful, false - cannot change the double property.

© 2000-2025, MetaQuotes Ltd.

GetString

The function returns the value of the corresponding chart property. The chart property should be of the string type. There are two variants of the function.

1. Immediately returns the property value.

```
string  GetString(
   ENUM_CHART_PROPERTY_STRING  prop_id      // property identifier
   ) const
```

2. If successful, puts the value of property to the specified variable of string type, passed by reference as last parameter.

```
bool  GetString(
   ENUM_CHART_PROPERTY_STRING  prop_id,     // property identifier
   string&                     value        // link to the variable
   ) const
```

Parameters

prop_id

[in] Chart property identifier (from ENUM_CHART_PROPERTY_STRING enumeration).

value

[in] Link to the variable that receives the value of the requested property.

Return Value

Value of a chart property assigned to the class instance. If there is no chart assigned, it returns "".

For the second variant, the function returns true, if this property is maintained and the value has been placed into the value variable, otherwise it returns false. To read more about the error, call GetLastError().

© 2000-2025, MetaQuotes Ltd.

SetString

Sets new value for the chart property of the string type.

```
bool  SetString(
   ENUM_CHART_PROPERTY_STRING  prop_id,      // property identifier
   string                      value         // value
   )
```

Parameters

prop_id

[in] Chart property identifier (from ENUM_CHART_PROPERTY_STRING enumeration).

value

[in] New value for the property.

Return Value

true - successful, false - cannot change the string property.

© 2000-2025, MetaQuotes Ltd.

SetSymbolPeriod

Changes symbol and period of the chart assigned to the class instance.

```
bool  SetSymbolPeriod(
   const string      symbol_name,      // symbol
   ENUM_TIMEFRAMES   timeframe         // period
   )
```

Parameters

symbol_name

[in] New chart symbol. NULL means the symbol of the current chart (to which an expert is attached).

timeframe

[in] New chart timeframe (from ENUM_TIMEFRAMES enumeration). 0 means the current chart timeframe.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

ApplyTemplate

Applies specified template to the chart.

```
bool  ApplyTemplate(
   const string  filename      // template
   )
```

Parameters

filename

[in] File name of the template.

Return Value

true - successful, false - cannot apply the template.

© 2000-2025, MetaQuotes Ltd.

ScreenShot

Creates a screenshot of the specified chart in its current state in .gif format.

```
bool  ScreenShot(
   string           filename,                  // file name
   int              width,                     // width
   int              height,                    // height
   ENUM_ALIGN_MODE  align_mode=ALIGN_RIGHT     // align type
   ) const
```

Parameters

filename

[in] File name for screenshot.

width

[in] Screenshot width in pixels.

height

[in] Screenshot height in pixels.

align_mode=ALIGN_RIGHT

[in] Align mode, if screenshot is narrow.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

WindowOnDropped

Gets chart subwindow number corresponding to the object (expert or script) drop point.

```
int  WindowOnDropped() const
```

Return Value

Chart subwindow number of the object drop point. 0 means main chart window.

© 2000-2025, MetaQuotes Ltd.

PriceOnDropped

Gets price coordinate corresponding to the object (expert or script) drop point.

```
double  PriceOnDropped() const
```

Return Value

Price coordinate of the object drop point.

© 2000-2025, MetaQuotes Ltd.

TimeOnDropped

Gets time coordinate corresponding to the object (expert or script) drop point.

```
datetime  TimeOnDropped() const
```

Return Value

Time coordinate of the object drop point.

© 2000-2025, MetaQuotes Ltd.

XOnDropped

Gets X coordinate corresponding to the object (expert or script) drop point.

```
int  XOnDropped() const
```

Return Value

X coordinate of the object drop point.

© 2000-2025, MetaQuotes Ltd.

YOnDropped

Gets Y coordinate corresponding to the object (expert or script) drop point.

```
int  YOnDropped() const
```

Return Value

Y coordinate of the object drop point.

© 2000-2025, MetaQuotes Ltd.

Save

Saves object parameters to file.

```
virtual bool  Save(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen(...) function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Load

Loads object parameters from file.

```
virtual bool  Load(
   int  file_handle      // file handle
   )
```

Parameters

file_handle

[in] handle of the binary file already opened by FileOpen(...) function.

Return Value

true - successful, false - error.

© 2000-2025, MetaQuotes Ltd.

Type

Returns type identifier.

```
virtual int  Type() const
```

Return Value

Type identifier (0x1111 for CChart).

© 2000-2025, MetaQuotes Ltd.

Graphics

The graphics library contains classes and global functions for quick plotting of custom charts. The library provides convenient ready-made solutions for building axes, curves, as well as the methods for quick access to changing common properties of a custom chart.

To start working with the library, simply read the article Visualize this! MQL5 graphics library similar to 'plot' of R language.

The graphics library is placed to the Include\Graphics folder of the terminal's working directory.

Class	Description
CAxis	Class for working with coordinate axes
ColorGenerator	Class specifying the default color scheme
CCurve	Class for working with curves
CGraphic	Base class for creating custom charts

© 2000-2025, MetaQuotes Ltd.

GraphPlot

Functions for quick curve plotting.

Version for plotting a single curve using Y coordinates.

```
string  GraphPlot(
   const double      &y[],                  // Y coordinates
   ENUM_CURVE_TYPE   type=CURVE_POINTS      // curve type
   )
```

Note

Y array indices are used as X coordinates for the curve.

Version for plotting a single curve using X and Y coordinates

```
string  GraphPlot(
   const double      &x[],                  // X coordinates
   const double      &y[],                  // Y coordinates
   ENUM_CURVE_TYPE   type=CURVE_POINTS      // curve type
   )
```

Version for plotting two curves using X and Y coordinates

```
string  GraphPlot(
   const double      &x1[],                 // X coordinates
   const double      &y1[],                 // Y coordinates
   const double      &x2[],                 // X coordinates
   const double      &y2[],                 // Y coordinates
   ENUM_CURVE_TYPE   type=CURVE_POINTS      // curve type
   )
```

Version for plotting three curves using X and Y coordinates

```
string  GraphPlot(
   const double      &x1[],                 // X coordinates
   const double      &y1[],                 // Y coordinates
   const double      &x2[],                 // X coordinates
   const double      &y2[],                 // Y coordinates
   const double      &x3[],                 // X coordinates
   const double      &y3[],                 // Y coordinates
   ENUM_CURVE_TYPE   type=CURVE_POINTS      // curve type
   )
```

© 2000-2025, MetaQuotes Ltd.

Version for plotting a curve using CPoint2D points coordinates

```
string  GraphPlot(
   const CPoint2D   &points[],            // curve coordinates
   ENUM_CURVE_TYPE  type=CURVE_POINTS     // curve type
   )
```

Version for plotting two curves using CPoint2D points coordinates

```
string  GraphPlot(
   const CPoint2D   &points1[],           // curve coordinates
   const CPoint2D   &points2[],           // curve coordinates
   ENUM_CURVE_TYPE  type=CURVE_POINTS     // curve type
   )
```

Version for plotting three curves using CPoint2D points coordinates

```
string  GraphPlot(
   const CPoint2D   &points1[],           // curve coordinates
   const CPoint2D   &points2[],           // curve coordinates
   const CPoint2D   &points3[],           // curve coordinates
   ENUM_CURVE_TYPE  type=CURVE_POINTS     // curve type
   )
```

Version for plotting a curve using the pointer to CurveFunction

```
string  GraphPlot(
   CurveFunction    function,             // pointer to the function
   const double     from,                 // initial value of the argument
   const double     to,                   // final value of the argument
   const double     step,                 // increment by the argument
   ENUM_CURVE_TYPE  type=CURVE_POINTS     // curve type
   )
```

Version for plotting two curves using the pointers to the CurveFunction functions

```
string  GraphPlot(
   CurveFunction    function1,            // pointer to the function
   CurveFunction    function2,            // pointer to the function
   const double     from,                 // initial value of the argument
   const double     to,                   // final value of the argument
   const double     step,                 // increment by the argument
   ENUM_CURVE_TYPE  type=CURVE_POINTS     // curve type
   )
```

© 2000-2025, MetaQuotes Ltd.

Version for plotting three curves using the pointers to the CurveFunction functions

```
string  GraphPlot(
   CurveFunction    function1,            // pointer to the function
   CurveFunction    function2,            // pointer to the function
   CurveFunction    function3,            // pointer to the function
   const double     from,                 // initial value of the argument
   const double     to,                   // final value of the argument
   const double     step,                 // increment by the argument
   ENUM_CURVE_TYPE  type=CURVE_POINTS     // curve type
   )
```

Parameters

&x[]

[in] X coordinates.

&y[]

[in] Y coordinates.

&x1[]

[in] X coordinates for the first curve.

&y1[]

[in] Y coordinates for the first curve.

&x2[]

[in] X coordinates for the second curve.

&y2[]

[in] Y coordinates for the second curve.

&x3[]

[in] X coordinates for the third curve.

&y3[]

[in] Y coordinates for the third curve.

&points[]

[in] Coordinates of the curve dots.

&points1[]

[in] Coordinates of the first curve dots.

&points2[]

[in] Coordinates of the second curve dots.

&points3[]

[in] Coordinates of the third curve dots.

© 2000-2025, MetaQuotes Ltd.

function

[in] Pointer to the CurveFunction function.

function1

[in] Pointer to the first function.

function2

[in] Pointer to the second function.

function3

[in] Pointer to the third function.

from

[in] Corresponds to the first X coordinate.

to

[in] Corresponds to the last X coordinate.

step

[in] Parameter for calculating the X coordinates.

type=CURVE_POINTS

[in] Curve type.

Return Value

Name of a graphical resource.

© 2000-2025, MetaQuotes Ltd.

CAxis

CAxis is an auxiliary graphics library class for working with the coordinate axes.

Description

The CAxis class receives and stores various parameters of the coordinate axes. The class implements the ability to auto scale the coordinate axes dynamically.

Declaration

```
class CAxis
```

Title

```
#include <Graphics\Axis.mqh>
```

Class methods

Method	Description
AutoScale	Get/set the auto-scaling flag
Min	Get/set the minimum axis value
Max	Get/set the maximum axis value
Step	Get the step value by axis
Name	Get/set the axis name
Color	Get/set the axis color
ValuesSize	Get/set the size of the axis numbers
ValuesWidth	Get/set the maximum displayed length of the axis numbers
ValuesFormat	Get/set the format of the axis numbers
ValuesDateTimeMode	Get the format of converting a date into a string.
ValuesFunctionFormat	Get the pointer to the function defining the format of displaying values on the axis.
ValuesFunctionFormatCBData	Get the pointer to the object that may contain additional data on converting axis values.
NameSize	Get/set the font size of the axis name
ZeroLever	Get/set the "zero lever" value
DefaultStep	Get/set the initial step value by axis
MaxLabels	Get/set the maximum amount of numbers on the axis

© 2000-2025, MetaQuotes Ltd.

Method	Description
MinGrace	Get/set the "tolerance" value for the axis minimum
MaxGrace	Get/set the "tolerance" value for the axis maximum
SelectAxisScale	Auto scale the axis.

© 2000-2025, MetaQuotes Ltd.

AutoScale (Get method)

Returns the flag defining the need for auto-scale.

```
bool  AutoScale()
```

Return Value

The flag value.

Note

true — perform auto-scaling.

false — do not perform auto-scaling.

AutoScale (Set method)

Sets the flag defining the need for auto-scale.

```
void  AutoScale(
   const bool  auto      // flag value
   )
```

Parameters

auto

[in]

Note

true — perform auto-scaling.

false — do not perform auto-scaling.

© 2000-2025, MetaQuotes Ltd.

Min (Get method)

Returns the minimum axis value.

```
double  Min()
```

Return Value

Minimum axis value.

Min (Set method)

Sets the minimum axis value.

```
void  Min(
   const double  min      // minimum value
   )
```

Parameters

min

[in] Minimum value.

© 2000-2025, MetaQuotes Ltd.

Max (Get method)

Returns the maximum axis value.

```
double  Max()
```

Return Value

Maximum axis value.

Max (Set method)

Sets the maximum axis value.

```
void  Max(
   const double  max       // maximum value
   )
```

Parameters

max

[in] Maximum axis value.

© 2000-2025, MetaQuotes Ltd.

Step (Get method)

Return the step value by axis.

```
double  Step()
```

Return Value

Step value.

© 2000-2025, MetaQuotes Ltd.

Name (Get method)

Returns the axis name.

```
string  Name()
```

Return Value

Axis name.

Name (Set method)

Sets the axis name.

```
void  Name(
   const string  name      // axis name
   )
```

Parameters

name

[in] Axis name.

© 2000-2025, MetaQuotes Ltd.

Color (Get method)

Returns the axis color.

```
color  Color()
```

Return Value

Axis color.

Color (Set method)

Sets the axis color.

```
void  Color(
   const color  clr      // axis color
   )
```

Parameters

clr

[in] Axis color.

© 2000-2025, MetaQuotes Ltd.

ValuesSize (Get method)

Returns the size of the axis numbers.

```
int  ValuesSize()
```

Return Value

Size of the axis numbers.

ValuesSize (Set method)

Sets the size of the axis numbers.

```
void  ValuesSize(
   const int  size      // size of the axis numbers
   )
```

Parameters

size

[in] Size of the axis numbers

© 2000-2025, MetaQuotes Ltd.

ValuesWidth (Get method)

Returns the maximum allowed length in pixels for displaying the axis numbers.

```
int  ValuesWidth()
```

Return Value

Length of the axis numbers in pixels.

Note

If a length in pixels for a specified number exceeds the maximum allowed display length, it is truncated and ends in dots.

ValuesWidth (Set method)

Sets the maximum allowed length in pixels for displaying the axis numbers.

```
void  ValuesWidth(
   const int  width      // maximum allowed length in pixels
   )
```

Parameters

width

[in] Maximum allowed length of the axis numbers.

Note

If a length in pixels for a specified number exceeds the maximum allowed display length, it is truncated and ends in dots.

© 2000-2025, MetaQuotes Ltd.

ValuesFormat (Get method)

Returns the format of the axis numbers.

```
string  ValuesFormat()
```

Return Value

Number format.

ValuesFormat (Set method)

Sets the format of the axis numbers.

```
void  ValuesFormat(
   const string  format      // format of the axis numbers
   )
```

Parameters

format

[in] Format of the axis numbers.

© 2000-2025, MetaQuotes Ltd.

ValuesDateTimeMode (Get method)

Get the format of converting a date into a string.

```
int  ValuesDateTimeMode()
```

Return Value

Format of converting a date into a string.

ValuesDateTimeMode (Set method)

Set the format of converting a date into a string.

```
void  ValuesDateTimeMode(
   const int  mode      // format of converting a date into a string
   )
```

Parameters

mode

[in] Conversion format.

Note

Find out more about the formats of converting a date into a string in the TimeToString() function description.

© 2000-2025, MetaQuotes Ltd.

ValuesFunctionFormat (Get method)

Get the pointer to the function defining the format of displaying values on the axis.

```
DoubleToStringFunction  ValuesFunctionFormat()
```

Return Value

Pointer to the function defining the format of displaying values on the axis.

ValuesFunctionFormat (Set method)

Set the pointer to the function defining the format of displaying values on the axis.

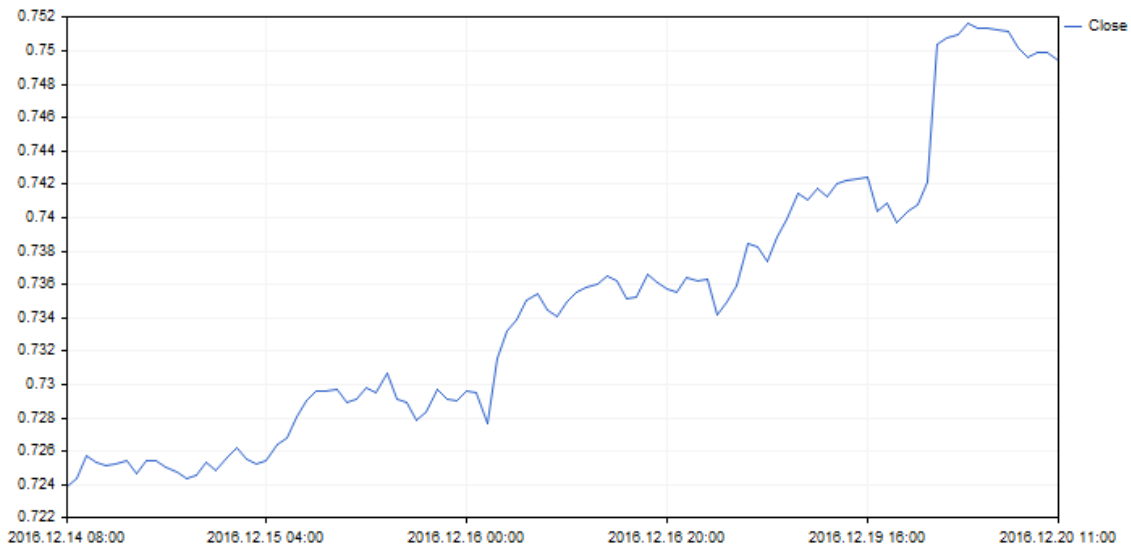
```
void  ValuesFunctionFormat(
   DoubleToStringFunction  func      // function for converting numerical values into
   )
```

Parameters

func

[in] Custom function for converting numerical values into a string.

Example:



The format of displaying X axis values has been changed using the following code:

© 2000-2025, MetaQuotes Ltd.

```
//+------------------------------------------------------------------+
//|                                              DateAxisGraphic.mq5 |

//+------------------------------------------------------------------+
#include <Graphics\Graphic.mqh>
//--- array for store values
double arrX[];
double arrY[];
//+------------------------------------------------------------------+
//| Custom function for create values on X-axis                      |
//+------------------------------------------------------------------+
string TimeFormat(double x,void *cbdata)
  {
   return(TimeToString((datetime)arrX[ArraySize(arrX)-(int)x-1]));
  }
//+------------------------------------------------------------------+
void OnStart()
  {
   MqlRates rates[];
   CopyRates(Symbol(),Period(),0,100,rates);
   ArraySetAsSeries(rates,true);
   int size=ArraySize(rates);
   ArrayResize(arrX,size);
   ArrayResize(arrY,size);
   for(int i=0; i<size;++i)
     {
      arrX[i]=(double)rates[i].time;
      arrY[i]=rates[i].close;
     }
//--- create graphic
   CGraphic graphic;
   if(!graphic.Create(0,"DateAxisGraphic",0,30,30,780,380))
     {
      graphic.Attach(0,"DateAxisGraphic");
     }
//--- create curve
   CCurve *curve=graphic.CurveAdd(arrY,CURVE_LINES);
//--- gets the X-axis
   CAxis *xAxis=graphic.XAxis();
//--- sets the X-axis properties
   xAxis.AutoScale(false);
   xAxis.Type(AXIS_TYPE_CUSTOM);
   xAxis.ValuesFunctionFormat(TimeFormat);
   xAxis.DefaultStep(20.0);
//--- plot
   graphic.CurvePlotAll();
   graphic.Update();
  }
```

© 2000-2025, MetaQuotes Ltd.

ValuesFunctionFormatCBData (Get method)

Get the pointer to the object that may contain additional data on converting axis values.

```
void*  ValuesFunctionFormatCBData()
```

Return Value

The pointer to the object that may contain additional data on converting axis values.

ValuesFunctionFormatCBData (Set method)

Set the pointer to the class object that may contain additional data on converting axis values.

```
void  ValuesFunctionFormatCBData(
   void*  cbdata      // pointer to the class object
   )
```

Parameters

cbdata

[in] Pointer to any class object containing additional data on converting axis values

© 2000-2025, MetaQuotes Ltd.

NameSize (Get method)

Returns the font size of the axis name.

```
int  NameSize()
```

Return Value

Font size of the axis name.

NameSize (Set method)

Sets the font size of the axis name.

```
void  NameSize(
   const int  size      // font size of the axis name
   )
```

Parameters

size

[in] Font size of the axis name.

© 2000-2025, MetaQuotes Ltd.

ZeroLever (Get method)

Retuns the "zero lever" value.

```
double  ZeroLever()
```

Return Value

"Zero lever".

Note

The value is used to define when the axis scale range should be expanded to include a zero value.

ZeroLever (Set method)

Sets the "zero lever" value.

```
void  ZeroLever(
   const double  value      // "zero lever" value
   )
```

Parameters

value

[in] "Zero lever" value.

Note

The value is used to define when the axis scale range should be expanded to include a zero value.

© 2000-2025, MetaQuotes Ltd.

DefaultStep (Get method)

Returns the initial step value by axis

```
double  DefaultStep()
```

Return Value

Step by axis.

DefaultStep (Set method)

Sets the initial step value by axis

```
void  DefaultStep(
   const double  value      // step by axis
   )
```

Parameters

value

[in] Initial step value by axis.

© 2000-2025, MetaQuotes Ltd.

MaxLabels (Get method)

Returns the maximum allowed amount of numbers displayed on the axis.

```
double  MaxLabels()
```

Return Value

Maximum amount of numbers on the axis.

MaxLabels (Set method)

Sets the maximum allowed amount of numbers displayed on the axis.

```
void  MaxLabels(
   const double  value      // maximum number
   )
```

Parameters

value

[in] Maximum allowed amount of numbers displayed on the axis

© 2000-2025, MetaQuotes Ltd.

MinGrace (Get method)

Returns the "tolerance" applied to the axis minimum.

```
double  MinGrace()
```

Return Value

"Tolerance" value for the axis minimum.

Note

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MinGrace is equal to 0.1, then 10% of the axis length (or 1.2) is subtracted from the minimum value. As a result, the axis covers the interval from 2.8 to 16.0.

MinGrace (Set method)

Sets the "tolerance" applied to the axis minimum.

```
void  MinGrace(
   const double  value      // "tolerance" value
   )
```

Parameters

value

[in] "Tolerance" applied to the axis minimum.

Note

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MinGrace is equal to 0.1, then 10% of the axis length (or 1.2) is subtracted from the minimum value. As a result, the axis covers the interval from 2.8 to 16.0.

© 2000-2025, MetaQuotes Ltd.

MaxGrace (Get method)

Returns the "tolerance" applied to the axis maximum.

```
double  MaxGrace()
```

Return Value

"Tolerance" value for the axis maximum.

Note

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MaxGrace is equal to 0.1, then 10% of the axis length (or 1.2) is added to the maximum value. As a result, the axis covers the interval from 4.0 to 17.2.

MaxGrace (Set method)

Sets the "tolerance" applied to the axis maximum.

```
void  MaxGrace(
   const double  value      // "tolerance" value
   )
```

Parameters

value

[in] "Tolerance" value applied to the axis maximum.

Note

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MinGrace is equal to 0.1, then 10% of the axis length (or 1.2) is subtracted from the minimum value. As a result, the axis covers the interval from 2.8 to 16.0.

© 2000-2025, MetaQuotes Ltd.

SelectAxisScale

Auto scale the axis.

```
void  SelectAxisScale()
```

© 2000-2025, MetaQuotes Ltd.

CColorGenerator

CColorGenerator class is an auxiliary graphics library class for working with the color palette.

Description

The CColorGenerator class contains the initial color palette used for curves by default (if a color is not specified by a user).

If all colors from the initial palette are used already, new colors are automatically generated and the palette is refilled.

Declaration

```
class CColorGenerator
```

Title

```
#include <Graphics\ColorGenerator.mqh>
```

Class methods

Method	Description
Next	Returns the next color from the palette
Reset	Resets the generator

© 2000-2025, MetaQuotes Ltd.

Next

Returns the next color from the palette.

```
uint  Next()
```

Return Value

Color.

Note

If all colors from the palette have already been passed through, new colors are automatically generated in order to replace the old ones in the palette.

© 2000-2025, MetaQuotes Ltd.

Reset

Resets the generator.

```
void  Reset()
```

© 2000-2025, MetaQuotes Ltd.

CCurve

The CCurve class works with the properties of the curves generated on the chart.

Description

The CCurve class sets, installs and receives the coordinates and various properties of the curves when working with the CGraphic class.

There are three curve plotting modes: dots, lines and histogram. Separate parameters are implemented for each plotting mode in the class.

Declaration

```
class CCurve : public CObject
```

Title

```
#include <Graphics\Curve.mqh>
```

Inheritance hierarchy

CObject

CCurve

Class methods

Method	Description
Type	Get the curve type
Name	Get the curve name
Color	Get the curve color
XMax	Get the maximum value of the X function
XMin	Get the minimum value of the X function
YMax	Get the maximum value of the Y function
YMin	Get the minimum value of the Y function
Size	Get the number of dots defining a curve
PointsSize	Get/set the linear size of dots defining a curve
PointsFill	Get/set the flag for filling dots defining a curve
PointsColor	Get/set the dot filling color
GetX	Gets X values of all curve dots to the array
GetY	Gets Y values of all curve dots to the array
LinesStyle	Get/set a line style when plotting a curve using lines

© 2000-2025, MetaQuotes Ltd.

Method	Description
LinesIsSmooth	Get/set the smoothing flag when drawing using lines
LinesSmoothTension	Get/set the curve smoothing parameter when drawing using lines
LinesSmoothStep	Get/set the length of the approximating lines for smoothing when plotting by lines
LinesWidth	Get/set a line width when plotting a curve using lines
HistogramWidth	Get/set the width of columns when plotting using a histogram
CustomPlotCBData	Get/set the pointer to the object to be used in the custom curve plotting mode.
CustomPlotFunction	Get/set the pointer to the function implementing the custom curve plotting mode.
PointsType	Get/set the flag pointing at the type of dots used when plotting a dotted curve.
StepsDimension	Get/set the value indicating the dimension used in step-type curve rendering.
TrendLineCoefficients	Get/set trend line ratios for writing them into an array.
TrendLineColor	Get/set a color of a trend line for a curve.
TrendLineVisible	Get/set the trend line visibility flag.
Update	Update the curve coordinates.
Visible	Get/set the flag defining if a function is visible on the chart.

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Compare

© 2000-2025, MetaQuotes Ltd.

Type

Return the curve type.

```
ENUM_CURVE_TYPE   Type()
```

Return Value

Curve type.

© 2000-2025, MetaQuotes Ltd.

Name

Returns the curve name.

```
string  Name()
```

Return Value

Curve name.

© 2000-2025, MetaQuotes Ltd.

Color

Returns the curve color.

```
uint  Color()
```

Return Value

Curve color.

© 2000-2025, MetaQuotes Ltd.

XMax

Returns the maximum value of the X function (real numbers only).

```
double  XMax()
```

Return Value

Maximum real number among all the function arguments.

© 2000-2025, MetaQuotes Ltd.

XMin

Returns the minimum value of the X function (real numbers only).

```
double  XMin()
```

Return Value

Minimum real number among all the function arguments.

© 2000-2025, MetaQuotes Ltd.

YMax

Returns the maximum value of the Y function (real numbers only).

```
double   YMax()
```

Return Value

Maximum value of the Y function (real numbers only).

© 2000-2025, MetaQuotes Ltd.

YMin

Returns the minimum value of the Y function (real numbers only).

```
double   YMin()
```

Return Value

Minimum value of the Y function (real numbers only).

© 2000-2025, MetaQuotes Ltd.

Size

Returns the number of dots defining the curve.

```
int  Size()
```

Return Value

Number of dots defining the curve.

© 2000-2025, MetaQuotes Ltd.

PointsSize (Get method)

Returns the linear size (in pixels) of dots used in plotting the curve.

```
int  PointsSize()
```

Return Value

Size of dots defining the curve in pixels.

PointsSize (Set method)

Sets the linear size (in pixels) of dots used in plotting the curve.

```
void  PointsSize(
   const int  size      // dot size in pixels
   )
```

Parameters

size

[in] Linear size (in pixels) of dots used in plotting the curve.

© 2000-2025, MetaQuotes Ltd.

PointsFill (Get method)

Returns a flag determining if a filling for dots defining a curve should be performed.

```
bool  PointsFill ()
```

Return Value

The flag value.

Note

true — perform a filling

false — do not perform a filling

PointsFill (Set method)

Sets a flag determining if a filling for dots defining a curve should be performed.

```
void  PointsFill(
   const bool  fill      // flag value
   )
```

Parameters

fill

[in] Flag value.

Note

true — perform a filling

false — do not perform a filling

© 2000-2025, MetaQuotes Ltd.

PointsColor (Get method)

Returns the dot filling color.

```
uint  PointsColor ()
```

Return Value

Color of filling dots defining the curve.

PointsColor (Set method)

Sets the dot filling color

```
void  PointsColor(
   const uint  clr      //dot filling color
   )
```

Parameters

clr

[in] Color of filling dots defining the curve.

© 2000-2025, MetaQuotes Ltd.

GetX

Gets X values of all curve dots to the array.

```
void  GetX(
   double&  x[]      // array for writing X values
   )
```

Parameters

x[]

[out] Array for getting X values of all curve dots.

Note

Each curve dot is defined by a couple of X and Y values. These values are not coordinates in pixels for drawing in the CGraphic class.

© 2000-2025, MetaQuotes Ltd.

GetY

Gets Y values of all curve dots to the array.

```
void  GetY(
   double&  y[]      // array for writing Y values
   )
```

Parameters

y[]

[out] Array for getting Y values of all curve dots.

Note

Each curve dot is defined by a couple of X and Y values. These values are not coordinates in pixels for drawing in the CGraphic class.

© 2000-2025, MetaQuotes Ltd.

LinesStyle (Get method)

Returns a line style when plotting a curve using lines.

```
ENUM_LINE_STYLE  LinesStyle()
```

Return Value

Line style.

LinesStyle (Set method)

Sets a line style when plotting a curve using lines.

```
void  LinesStyle (
   ENUM_LINE_STYLE  style      // line style
   )
```

Parameters

style

[in] Line style.

© 2000-2025, MetaQuotes Ltd.

LinesIsSmooth (Get method)

Returns a flag defining if smoothing should be done when plotting a curve by lines.

```
bool  LinesIsSmooth()
```

Return Value

Flag value

Note

true — perform smoothing

false — do not perform smoothing

LinesIsSmooth (Set method)

Sets a flag defining if smoothing should be done when plotting a curve by lines.

```
void  LinesIsSmooth(
   const bool  smooth      // flag value
   )
```

Parameters

smooth

[in] Flag value

Note

true — perform smoothing

false — do not perform smoothing

© 2000-2025, MetaQuotes Ltd.

LinesSmoothTension (Get method)

Returns the curve smoothing parameter when drawing using lines.

```
double  LinesSmoothTension()
```

Return Value

Smoothing parameter value

Note

The 'tension' value is within the (0.0; 1.0] range.

LinesSmoothTension (Set method)

Sets the curve smoothing parameter when drawing using lines.

```
void  LinesSmoothTension(
   const double  tension      // parameter value
   )
```

Parameters

tension

[in] Smoothing parameter value.

Note

The 'tension' value is within the (0.0; 1.0] range.

© 2000-2025, MetaQuotes Ltd.

LinesSmoothStep (Get method)

Returns the length of the approximating lines for smoothing when plotting by lines.

```
double  LinesSmoothStep()
```

Return Value

Length of approximating lines in pixels.

LinesSmoothStep (Set method)

Sets the length of the approximating lines for smoothing when plotting by lines.

```
void  LinesSmoothStep(
   const double  step      // line length
   )
```

Parameters

step

[in] Length of approximating lines

© 2000-2025, MetaQuotes Ltd.

LinesEndStyle (Set method)

Get the flag indicating lines end plotting style when using lines to plot a curve.

```
ENUM_LINE_END  LinesEndStyle()
```

Return Value

A value of the flag indicating lines end plotting style when using lines to plot a curve.

LinesEndStyle (Get method)

Set the flag indicating lines end plotting style when using lines to plot a curve.

```
void  LinesEndStyle(
   ENUM_LINE_END  end_style      // flag value
   )
```

Parameters

end_style

[in] A value of the flag indicating line end plotting style when using lines to plot a curve.

© 2000-2025, MetaQuotes Ltd.

LinesWidth (Get method)

Get lines width when plotting a curve using lines.

```
int  LinesWidth()
```

Return Value

Lines width.

LinesWidth (Set method)

Set lines width when plotting a curve using lines.

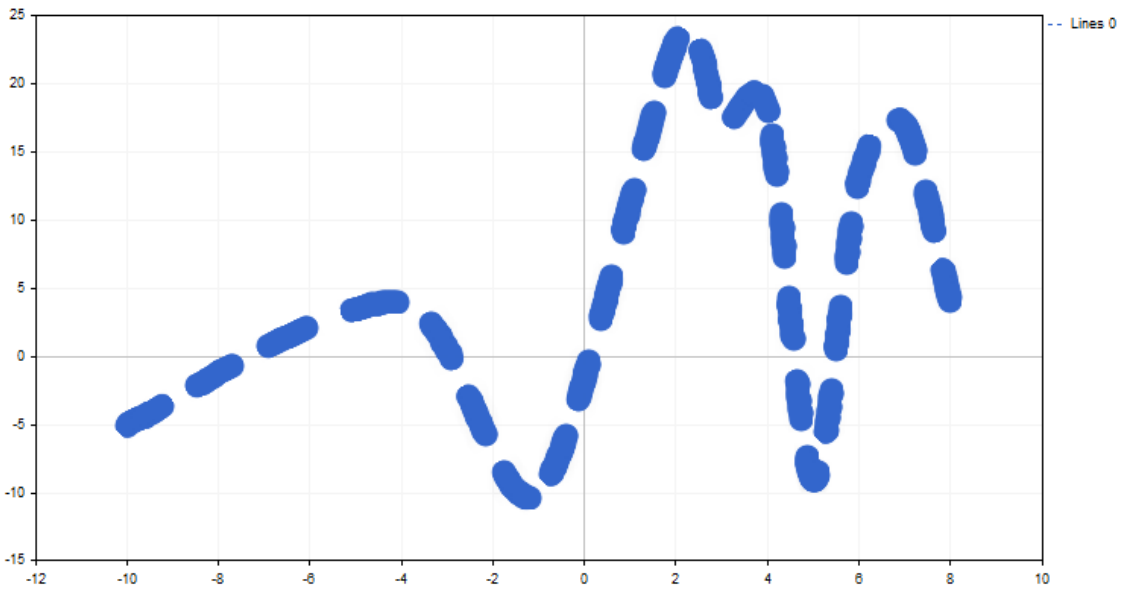
```
void  LinesWidth(
   const int  width      // lines width
   )
```

Parameters

width

[in] Lines width when plotting a curve using lines.

Example:



A line width has been changed using the following code:

© 2000-2025, MetaQuotes Ltd.

```
//+------------------------------------------------------------------+
//|                                                CandleGraphic.mq5 |
//|                        Copyright 2000-2024, MetaQuotes Ltd.      |
//|                                             https://www.mql5.com |
//+------------------------------------------------------------------+
#include <Graphics\Graphic.mqh>
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
  {
   double x[]= { -100,-40,-10,20,30,40,50,60,70,80,120 };
   double y[]= { -5,4,-10,23,17,18,-9,13,17,4,9 };
//--- create graphic
   CGraphic graphic;
   if(!graphic.Create(0,"ThickLineGraphic",0,30,30,780,380))
     {
      graphic.Attach(0,"ThickLineGraphic");
     }
//--- create curve
   CCurve *curve=graphic.CurveAdd(x,y,CURVE_LINES);
//--- sets the curve properties
   curve.LinesSmooth(true);
   curve.LinesStyle(STYLE_DASH);
   curve.LinesEndStyle(LINE_END_ROUND);
   curve.LinesWidth(10);
//--- plot
   graphic.CurvePlotAll();
   graphic.Update();
  }
```

© 2000-2025, MetaQuotes Ltd.

HistogramWidth (Get method)

Returns the width of columns when plotting using a histogram.

```
int  HistogramWidth()
```

Return Value

Column width in pixels.

HistogramWidth (Set method)

Sets the width of columns when plotting using a histogram.

```
void  HistogramWidth(
   const int  width      // column width
   )
```

Parameters

width

[in] Column width in pixels.

© 2000-2025, MetaQuotes Ltd.

CustomPlotCBData (Get method)

Get the pointer to the object to be used in the custom curve plotting mode.

```
void*  CustomPlotCBData()
```

Return Value

Pointer to the object for the custom curve plotting mode.

CustomPlotCBData (Set method)

Set the pointer to the object to be used in the custom curve plotting mode.

```
void  CustomPlotCBData(
   void*  cbdata      // pointer to the object
   )
```

Parameters

cbdata

[in] The pointer to the object to be used in the custom curve plotting mode

© 2000-2025, MetaQuotes Ltd.

CustomPlotFunction (Get method)

Get the pointer to the function implementing the custom curve plotting mode.

```
PlotFucntion  CustomPlotFunction()
```

Return Value

Pointer to the function implementing the custom curve plotting mode.

CustomPlotFunction (Set method)

Set the pointer to the function implementing the custom curve plotting mode.

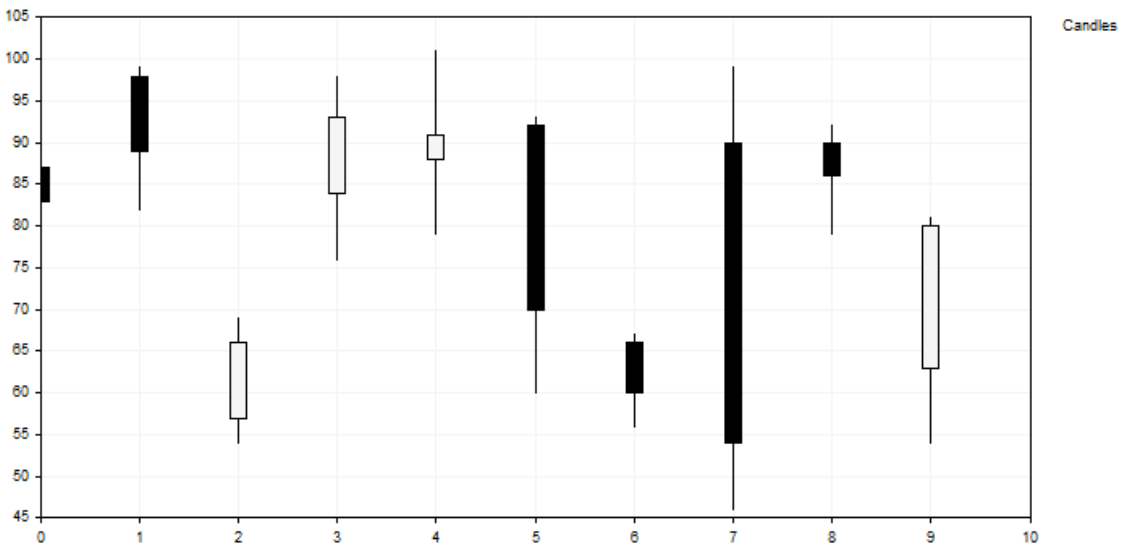
```
void  CustomPlotFunction(
   PlotFucntion  func      // pointer to the function
   )
```

Parameters

func

[in] Pointer to the function implementing the custom curve plotting mode

Example:



This curve consisting of bars is built using the following code:

© 2000-2025, MetaQuotes Ltd.

```
//+------------------------------------------------------------------+

```

© 2000-2025, MetaQuotes Ltd.

PointsType (Get method)

Get the flag pointing at the type of dots used when plotting a dotted curve.

```
ENUM_POINT_TYPE  PointsType()
```

Return Value

A value of the flag indicating a type of dots.

PointsType (Set method)

Set the flag pointing at the type of dots used when plotting a dotted curve.

```
void  PointsType(
   ENUM_POINT_TYPE  type      // flag value
   )
```

Parameters

type

[in] A value of the flag pointing at the type of dots used when plotting a dotted curve.

© 2000-2025, MetaQuotes Ltd.

StepsDimension (Get method)

Get the value indicating the dimension used in step-type curve rendering.

```
int  StepsDimension()
```

Return Value

Dimension used in step-type curve rendering.

StepsDimension (Set method)

Set the value indicating the dimension used in step-type curve rendering.

```
void  StepsDimension(
   const int  dimension      // dimension
   )
```

Parameters

dimension

[in] Dimension (0 or 1).

Note

0 — x (the horizontal line is followed by the vertical one).

1 — y (the vertical line is followed by the horizontal one).

© 2000-2025, MetaQuotes Ltd.

TrendLineCoefficients (Get method)

Get trend line ratios for writing them into an array.

```
double&  TrendLineCoefficients()
```

Return Value

Trend line ratios.

TrendLineCoefficients (Set method)

Set trend line ratios for writing then into an array.

```
void  TrendLineCoefficients(
   double&  coefficients[]      // array for writing ratios
   )
```

Parameters

coefficients[]

[out] Array for writing ratios.

© 2000-2025, MetaQuotes Ltd.

TrendLineColor (Get method)

Get a color of a trend line for a curve.

```
uint  TrendLineColor()
```

Return Value

Color of the trend line.

TrendLineColor (Set method)

Set a color of a trend line for a curve.

```
void  TrendLineColor(
   const uint  clr      // trend line color
   )
```

Parameters

clr

[in] Line color

© 2000-2025, MetaQuotes Ltd.

TrendLineVisible (Get method)

Get the trend line visibility flag.

```
bool  TrendLineVisible()
```

Return Value

A value of the flag that specifies if a trend line is visible.

TrendLineVisible (Set method)

Set the trend line visibility flag.

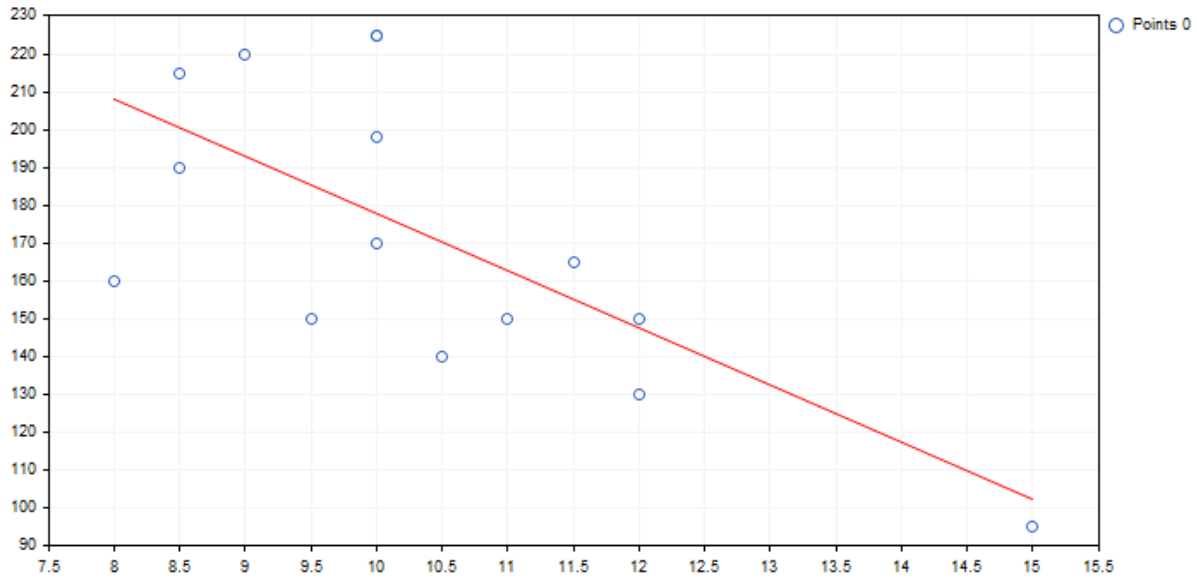
```
void  TrendLineVisible(
   const bool  visible      // flag value
   )
```

Parameters

visible

[in] A value of the trend line visibility flag.

Example:



Below is the code of the mentioned trend line and its plotting on the chart:

© 2000-2025, MetaQuotes Ltd.

```
//+------------------------------------------------------------------+

//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
  {
   double x[]={12.0,11.5,11.0,12.0,10.5,10.0,9.0,8.5,10.0,8.5,10.0,8.0,9.5,10.0,15.0};
   double y[]={130.0,165.0,150.0,150.0,140.0,198.0,220.0,215.0,225.0,190.0,170.0,160.0
//--- create graphic
   CGraphic graphic;
   if(!graphic.Create(0,"TrendLineGraphic",0,30,30,780,380))
     {
      graphic.Attach(0,"TrendLineGraphic");
     }
//--- create curve
   CCurve *curve=graphic.CurveAdd(x,y,CURVE_POINTS);
//--- sets the curve properties
   curve.TrendLineVisible(true);
   curve.TrendLineColor(ColorToARGB(clrRed));
//--- plot
   graphic.CurvePlotAll();
   graphic.Update();
  }
```

© 2000-2025, MetaQuotes Ltd.

Update

Update the curve coordinates.

The version for working by Y coordinate. Passed array indexes are used as X coordinates here.

```
void  Update(
   const double&  y[]   // Y coordinates
   )
```

This version uses X and Y coordinates.

```
void  Update(
   const double&  x[],     // X coordinates
   const double&  y[]      // Y coordinates
   )
```

The version for working with CPoint2D points.

```
void  Update(
   const CPoint2D&  points[]      // Curve coordinates
   )
```

The version for working with a pointer to the CurveFunction function.

```
void  Update(
   CurveFunction  function,     // pointer to the function describing a curve
   const double   from,         // initial value of the function argument
   const double   to,           // final value of the function argument
   const double   step          // argument increment
   )
```

Parameters

x[]

[in] X coordinates.

y[]

[in] Y coordinates.

points[]

[in] Curve coordinates.

function

[in] A pointer to the function describing a curve

from

[in] Initial value of the function argument

to

[in] End value of the function argument

step

[in] Argument increment

© 2000-2025, MetaQuotes Ltd.

Visible (Get method)

Get the flag defining if a function is visible on the chart.

```
void  Visible(
   const bool  visible      //
   )
```

Return Value

A value of the flag defining a function visibility on the chart.

Visible (Set method)

Set the flag defining if a function is visible on the chart.

```
void  Visible(
   const bool  visible      // flag value
   )
```

Parameters

visible

[in] A value of the flag defining a function visibility on the chart.

© 2000-2025, MetaQuotes Ltd.

CGraphic

CGraphic is a base class for creating custom charts.

Description

The CGraphic class provides numerous aspects of working with custom charts.

The class stores the main chart elements, sets their parameters and performs plotting.

Also, the class stores the curves for the chart and provides various display options.

Declaration

```
class CGraphic
```

Title

```
#include <Graphics\Graphic.mqh>
```

Class methods

Method	Description
Create	Create a graphical resource bound to a chart object
Destroy	Remove a chart and destroy a graphical resource
Update	Display implemented changes
ChartObjectName	Get the name of an object bound to a chart
ResourceName	Get the graphical resource name
XAxis	Get the pointer to the X axis
YAxis	Get the pointer to the Y axis
GapSize	Get/set the size of indents between the chart elements
BackgroundColor	Get/set a background color
BackgroundMain	Get/set a chart header
BackgroundMainSize	Get/set a sub-header font size
BackgroundMainColor	Get/set a chart header color
BackgroundSub	Get/set a sub-header
BackgroundSubSize	Get/set a sub-header font size
BackgroundSubColor	Get/set a chart sub-header color
GridLineColor	Get/set a grid line color

© 2000-2025, MetaQuotes Ltd.

Method	Description
GridBackgroundColor	Get/set a grid background color
GridCircleRadius	Get/set the dot radius in the grid nodes
GridCircleColor	Get/set the dot color in the grid nodes
GridHasCircle	Get/set the dot plotting flag in the grid nodes
GridAxisLineColor	Get the value of a real chart axes color.
HistoryNameWidth	Get/set the maximum allowed length for displaying a curve name
HistoryNameSize	Get/set the font size of a curve name
HistorySymbolSize	Get/set a size of notational convention symbols
TextAdd	Add a text to the chart
LineAdd	Add a line to the chart
CurveAdd	Create and add a curve to the chart
CurvePlot	Plot a previously created curve by index
CurvePlotAll	Plot all previously created curves
CurveGetByIndex	Get a curve by a specified index
CurveGetByName	Get a curve by a specified name
CurveRemoveByIndex	Remove a curve by a specified index.
CurveRemoveByName	Remove a curve by a specified name.
CurvesTotal	Get the number of curves for the given chart.
MarksToAxisAdd	Add a scale mark to the chart axis
MajorMarkSize	Get/set the size of the scale's ticks on the chart axis
FontSet	Set the current font parameters
FontGet	Get the current font parameters
Attach	Get/set a graphical resource and bind it to the CGraphic class instance
CalculateMaxMinValues	Calculate (re-calculate) minimum and maximum chart values on both axes.
Height	Get a chart height in pixels.
IndentDown	Get/set a chart indent from the lower border.
IndentLeft	Get/set a chart indent from the left border.
IndentRight	Get/set a chart indent from the right border.

© 2000-2025, MetaQuotes Ltd.

Method	Description
IndentUp	Get/set a chart indent from the upper border.
Redraw	Redraw the chart.
ResetParameters	Reset the chart redrawing parameters.
ScaleX	Scale the value by X axis.
ScaleY	Scale the value by Y axis.
SetDefaultParameters	Set the chart parameters to default values.
Width	Get the chart width in pixels.

© 2000-2025, MetaQuotes Ltd.

Create

Creates a graphical resource bound to a chart object.

```
bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // sub-window index
   const int      x1,          // x1 coordinate
   const int      y1,          // y1 coordinate
   const int      x2,          // x2 coordinate
   const int      y2           // y1 coordinate
   )
```

Parameters

chart

[in] Chart ID.

name

[in] Name.

subwin

[in] Sub-window index.

x1

[in] X1 coordinate.

y1

[in] Y1 coordinate.

x2

[in] X2 coordinate.

y2

[in] Y2 coordinate.

© 2000-2025, MetaQuotes Ltd.

Destroy

Removes a chart and destroys a graphical resource.

```
void  Destroy()
```

© 2000-2025, MetaQuotes Ltd.

Update

Displays implemented changes.

```
void  Update(
   const bool  redraw=true      // flag
   )
```

Parameters

redraw=true

[in] Flag value

© 2000-2025, MetaQuotes Ltd.

ChartObjectName

Gets the name of an object bound to a chart.

```
string  ChartObjectName()
```

Return Value

Name of an object bound to a chart.

© 2000-2025, MetaQuotes Ltd.

ResourceName

Receives the name of a graphical resource.

```
string  ResourceName()
```

Return Value

Name of a graphical resource.

© 2000-2025, MetaQuotes Ltd.

XAxis

Returns the pointer to the X axis.

```
CAxis  *XAxis()
```

Return Value

Pointer to the X axis.

© 2000-2025, MetaQuotes Ltd.

YAxis

Returns the pointer to the Y axis.

```
CAxis  *YAxis()
```

Return Value

Pointer to the Y axis.

© 2000-2025, MetaQuotes Ltd.

GapSize (Get method)

Returns the size of indents between the chart elements.

```
int  GapSize()
```

Return Value

Indent size in pixels.

GapSize (Set method)

Sets the size of indents between the chart elements.

```
void  GapSize(
   const int  size     // indent size
   )
```

Parameters

size

[in] Indent size in pixels.

© 2000-2025, MetaQuotes Ltd.

BackgroundColor (Get method)

Returns the background color.

```
color  BackgroundColor()
```

BackgroundColor (Set method)

Sets the background color.

```
void  BackgroundColor(
   const color  clr      // background color
   )
```

Parameters

clr

[in] Background color.

© 2000-2025, MetaQuotes Ltd.

BackgroundMain (Get method)

Returns a chart header

```
string  BackgroundMain()
```

BackgroundMain (Set method)

Sets a chart header text.

```
void  BackgroundMain(
   const string  main      // header text
   )
```

Parameters

main

[in] Chart header text

© 2000-2025, MetaQuotes Ltd.

BackgroundMainSize (Get method)

Returns the header size.

```
int  BackgroundMainSize()
```

Return Value

Header font size.

BackgroundMainSize (Set method)

Sets the header size.

```
void  BackgroundMainSize(
   const int  size     // header size
   )
```

Parameters

size

[in] Header font size.

© 2000-2025, MetaQuotes Ltd.

BackgroundMainColor (Get method)

Returns the header color.

```
color  BackgroundMainColor()
```

Return Value

Header color.

BackgroundMainColor (Set method)

Sets the header color.

```
void  BackgroundMainColor(
   const color  clr      // header color
   )
```

Parameters

clr

[in] Header color.

© 2000-2025, MetaQuotes Ltd.

BackgroundSub (Get method)

Returns the sub-header.

```
string  BackgroundSub()
```

Return Value

Sub-header text.

BackgroundSub (Set method)

Sets the sub-header text.

```
void  BackgroundSub (Set method)(
   const string  sub       // sub-header text
   )
```

Parameters

sub

[in] Sub-header text.

© 2000-2025, MetaQuotes Ltd.

BackgroundSubSize (Get method)

Returns the sub-header font size

```
int BackgroundSubSize()
```

BackgroundSubSize (Get method)

Sets the sub-header size

```
void  BackgroundSubSize(
   const int  size      // sub-header font size
   )
```

Parameters

size

[in] Sub-header font size

© 2000-2025, MetaQuotes Ltd.

BackgroundSubColor (Get method)

Returns the sub-header color.

```
color  BackgroundSubColor()
```

BackgroundSubColor (Set method)

Sets the sub-header color.

```
void  BackgroundSubColor(
   const color  clr      // sub-header color
   )
```

Parameters

clr

[in] Sub-header color.

© 2000-2025, MetaQuotes Ltd.

GridLineColor (Get method)

Returns the grid line color

```
color  GridLineColor()
```

Return Value

Grid line color.

GridLineColor (Set method)

Sets the grid line color.

```
void  GridLineColor(
   const color  clr      // line color
   )
```

Parameters

clr

[in] Grid line color.

© 2000-2025, MetaQuotes Ltd.

GridBackgroundColor (Get method)

Returns the grid background color

```
color  GridBackgroundColor()
```

Return Value

Grid background color

GridBackgroundColor (Set method)

Sets the grid background color

```
void  GridBackgroundColor(
   const color  clr      // grid background color
   )
```

Parameters

clr

[in] Grid background color

© 2000-2025, MetaQuotes Ltd.

GridCircleRadius (Get method)

Returns radius of dots in the grid nodes.

```
int  GridCircleRadius()
```

Return Value

Dot radius in pixels.

GridCircleRadius (Set method)

Sets the dot radius in the grid nodes

```
void  GridCircleRadius(
   const int  r      // radius
   )
```

Parameters

r

[in] Dot radius in pixels.

© 2000-2025, MetaQuotes Ltd.

GridCircleColor (Get method)

Returns color of dots in the grid nodes.

```
color  GridCircleColor()
```

Return Value

Dot color.

GridCircleColor (Set method)

Sets the dot color in the grid nodes.

```
void  GridCircleColor(
   const color  clr      // dot color
   )
```

Parameters

clr

[in] Dot color.

© 2000-2025, MetaQuotes Ltd.

GridHasCircle (Get method)

Returns the flag defining whether the dots in the grid nodes should be displayed.

```
bool  GridHasCircle()
```

Return Value

The flag value.

Note

true — display the dots

false — do not display the dots

GridHasCircle (Set method)

Sets the flag defining whether the dots in the grid nodes should be displayed.

```
void  GridHasCircle(
   const bool  has
   )
```

Parameters

has

[in] Flag value.

Note

true — display the dots

false — do not display the dots

© 2000-2025, MetaQuotes Ltd.

GridAxisLineColor (Get method)

Get the value of a real chart axes color.

```
uint  GridAxisLineColor()
```

Return Value

Color of real chart axes.

GridAxisLineColor (Set method)

Set the value of a real chart axes color.

```
void  GridAxisLineColor(
   const uint  clr      // chart axes color
   )
```

Parameters

clr

[in] Color of real chart axes.

© 2000-2025, MetaQuotes Ltd.

HistoryNameWidth (Get method)

Returns the maximum allowed length for displaying a curve name.

```
int  HistoryNameWidth()
```

Return Value

Maximum length in pixels.

Note

If the curve name exceeds the maximum allowed length, it is truncated and dots are added to its end.

HistoryNameWidth (Set method)

Sets the maximum allowed length for displaying a curve name.

```
void  HistoryNameWidth(
   const int  width      // maximum length
   )
```

Parameters

width

[in] Maximum length in pixels.

Note

If the curve name exceeds the maximum allowed length, it is truncated and dots are added to its end.

© 2000-2025, MetaQuotes Ltd.

HistoryNameSize (Get method)

Returns the font size of the curve name.

```
int  HistoryNameSize()
```

Return Value

Font size of the curve name.

HistoryNameSize (Set method)

Sets the font size of the curve name.

```
void  HistoryNameSize (Set method)(
   const int  size      // name font size
   )
```

Parameters

size

[in] Name font size.

© 2000-2025, MetaQuotes Ltd.

HistorySymbolSize (Get method)

Returns a size of a chart's notational convention symbols

```
int  HistorySymbolSize()
```

Return Value

Size of notational convention symbols

HistorySymbolSize (Set method)

Sets a size of a chart's notational convention symbols

```
void  HistorySymbolSize(
   const int  size      // symbol size
   )
```

Parameters

size

[in] Size of notational convention symbols.

© 2000-2025, MetaQuotes Ltd.

TextAdd

Adds a text to a chart.

Version for working with X and Y coordinates

```
void  TextAdd(
   const int     x,              // X coordinate
   const int     y,              // Y coordinate
   const string  text,           // text
   const uint    clr,            // color
   const uint    alignment=0     // alignment
   )
```

Version for CPoint

```
void  TextAdd(
   const CPoint  &point,         // point coordinate
   const string  text,           // text
   const uint    clr,            // color
   const uint    alignment=0     // alignment
   )
```

Parameters

x

[in] X coordinate.

y

[in] Y coordinate.

&point

[in] Point coordinate.

text

[in] Text.

clr

[in] Color.

alignment=0

[in] Alignment.

© 2000-2025, MetaQuotes Ltd.

LineAdd

Adds a line to a chart.

This version uses X and Y coordinates

```
void  LineAdd(
   const int   x1,         // x1 coordinate
   const int   y1,         // y1 coordinate
   const int   x2,         // x2 coordinate
   const int   y2,         // y2 coordinate
   const uint  clr,        // color
   const uint  style       // style
   )
```

Version for CPoint

```
void  LineAdd2(
   const CPoint  &point1,     // first point coordinate
   const CPoint  &point2,     // second point coordinate
   const uint    clr,         // color
   const uint    style        // style
   )
```

Parameters

x1

[in] X1 coordinate.

y1

[in] Y1 coordinate.

x2

[in] X2 coordinate.

y2

[in] Y2 coordinate.

&point1

[in] First point coordinate.

&point2

[in] Second point coordinate.

clr

[in] Color.

style

[in] Style.

© 2000-2025, MetaQuotes Ltd.

CurveAdd

Create and add a new curve to the chart.

This version uses the Y coordinate (a curve color is set automatically)

```
CCurve* CurveAdd(
   const double      &y[],          // Y coordinates
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

Note

Y array indices are used as X coordinates for the curve.

This version uses the X and Y coordinates (a curve color is set automatically)

```
CCurve*  CurveAdd(
   const double      &x[],          // X coordinates
   const double      &y[],          // Y coordinates
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

The version for working with CPoint2D dots (curve color is set automatically)

```
CCurve*  CurveAdd(
   const CPoint2D    &points[],     // dot coordinates
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

Version for working with the pointer to the CurveFunction function (curve color is set automatically)

```
CCurve*  CurveAdd(
   CurveFunction     function,      // pointer to the function
   const double      from,          // initial value of the argument
   const double      to,            // final value of the argument
   const double      step,          // increment by the argument
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

© 2000-2025, MetaQuotes Ltd.

Version for working by Y coordinate (a curve color is set by a user)

```
CCurve*  CurveAdd(
   const double      &y[],          // Y coordinates
   const uint        clr,           // curve color
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

Note

Y array indices are used as X coordinates for the curve.

This version uses the X and Y coordinates (a curve color is set by a user)

```
CCurve*  CurveAdd(
   const double      &x[],          // X coordinates
   const double      &y[],          // Y coordinates
   const uint        clr,           // curve color
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

The version for working with CPoint2D dots (curve color is set by a user)

```
CCurve*  CurveAdd(
   const CPoint2D    &points[],     // dot coordinates
   const uint        clr,           // curve color
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

Version for working with the pointer to the CurveFunction function (curve color is set by a user)

```
CCurve*  CurveAdd(
   CurveFunction     function,      // pointer to the function
   const double      from,          // initial value of the argument
   const double      to,            // final value of the argument
   const double      step,          // increment by the argument
   const uint        clr,           // curve color
   ENUM_CURVE_TYPE   type,          // curve type
   const string      name=NULL      // curve name
   )
```

© 2000-2025, MetaQuotes Ltd.

Parameters

&x[]

[in] X coordinate.

&y[]

[in] Y coordinate.

&points[]

[in] Coordinates of dots.

function

[in] Pointer to the function.

from

[in] Initial value of the argument.

to

[in] Final value of the argument.

step

[in] Increment by the argument.

type

[in] Curve type.

name=NULL

[in] Curve name.

clr

[in] Curve color.

Return Value

Pointer to the created curve.

© 2000-2025, MetaQuotes Ltd.

CurvePlot

Displays the previously created curve with a specified index.

```
bool  CurvePlot(
   const int  index      // index
   )
```

Parameters

index

[in] Curve index

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CurvePlotAll

Displays all curves previously added to a chart.

```
bool  CurvePlotAll()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CurveGetByIndex

Gets the curve by a specified index.

```
CCurve*  CurveGetByIndex(
   const int  index      // curve index
   )
```

Parameters

index

[in] Curve index.

Return Value

Pointer to the curve with a specified index.

© 2000-2025, MetaQuotes Ltd.

CurveGetByName

Gets a curve by a specified name.

```
CCurve*  CurveGetByName(
   const string  name      // curve name
   )
```

Parameters

name

[in] Curve name.

Return Value

Pointer to the first found curve having a specified name.

© 2000-2025, MetaQuotes Ltd.

CurveRemoveByIndex

Remove a curve by a specified index.

```
bool  CurveRemoveByIndex(
   const int  index      // curve index
   )
```

Parameters

index

[in] Index of the curve to be removed.

Return Value

true — successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

CurveRemoveByName

Remove a curve by a specified name.

```
bool  CurveRemoveByName(
   const string  name      // curve name
   )
```

Parameters

name

[in] Name of the curve to be removed.

Return Value

true — successful, otherwise — false.

© 2000-2025, MetaQuotes Ltd.

CurvesTotal

Get the number of curves for the given chart.

```
int  CurvesTotal()
```

Return Value

Number of curves.

Note

All curves on the current chart are considered regardless of drawing and visibility style.

© 2000-2025, MetaQuotes Ltd.

MarksToAxisAdd

Add a scale mark (ticks) to the specified chart axis.

```
bool  MarksToAxisAdd(
   const double         &marks[],        // tick coordinates
   const int            mark_size,       // tick size
   ENUM_MARK_POSITION   position,        // tick location
   const int            dimension=0      // dimension
   )
```

Parameters

&marks[]

[in] Tick coordinates

mark_size

[in] Tick size

position

[in] Tick location

dimension=0

[in] 0 — adding to X axis,

1 — adding to Y axis

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

MajorMarkSize (Get method)

Returns the size of the scale's ticks on the coordinate axes.

```
int  MajorMarkSize()
```

MajorMarkSize (Set method)

Returns the size of the scale's ticks on the coordinate axes.

```
void  MajorMarkSize(
   const int  size      // tick size
   )
```

Parameters

size

[in] Tick size in pixels.

© 2000-2025, MetaQuotes Ltd.

FontSet

Sets the current font parameters.

```
bool  FontSet(
   const string  name,        // name
   const int     size,        // size
   const uint    flags=0,     // flags
   const uint    angle=0      // angle
   )
```

Parameters

name

[in] Name.

size

[in] Size.

flags=0

[in] Flags.

angle=0

[in] Angle.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

FontGet

Gets the current font parameters.

```
void  FontGet(
   string  &name,      // name
   int     &size,      // size
   uint    &flags,     // flags
   uint    &angle      // angle
   )
```

Parameters

&name

[out] Name.

&size

[out] Size.

&flags

[out] Flags.

&angle

[out] Angle.

© 2000-2025, MetaQuotes Ltd.

Attach

The version for getting a graphical resource from the OBJ_BITMAP_LABEL object and binding it to the CGraphic class instance:

```
bool  Attach(
   const long     chart_id,      // chart ID
   const string   objname        // graphical object name
   )
```

The version for creating a graphical resource for the OBJ_BITMAP_LABEL object and binding it to the CGraphic class instance:

```
bool  Attach(
   const long     chart_id,      // chart ID
   const string   objname,       // graphical object name
   const int      width,         // image width
   const int      height         // image height
   )
```

Parameters

chart_id

[in] Chart ID.

objname

[in] Name of the graphical object.

width

[in] Image width in the resource.

height

[in] Image height in the resource.

Return Value

true — successful, false — failed to bind the object.

© 2000-2025, MetaQuotes Ltd.

CalculateMaxMinValues

Calculate (re-calculate) minimum and maximum chart values on both axes.

```
void  CalculateMaxMinValues()
```

© 2000-2025, MetaQuotes Ltd.

Height

Get a chart height in pixels.

```
int  Height()
```

Return Value

Chart height in pixels.

© 2000-2025, MetaQuotes Ltd.

IndentDown (Get method)

Get a chart indent from the lower border.

```
int  IndentDown()
```

Return Value

Indent size in pixels.

IndentDown (Set method)

Set a chart indent from the lower border.

```
void  IndentDown(
   const int  down      // indent size
   )
```

Parameters

down

[in] Indent size in pixels.

© 2000-2025, MetaQuotes Ltd.

IndentLeft (Get method)

Get a chart indent from the left border.

```
int  IndentLeft()
```

Return Value

Indent size in pixels.

IndentLeft (Set method)

Set a chart indent from the left border.

```
void  IndentLeft(
   const int  left      // indent size
   )
```

Parameters

left

[in] Indent size in pixels.

© 2000-2025, MetaQuotes Ltd.

IndentRight (Get method)

Get a chart indent from the right border.

```
int  IndentRight()
```

Return Value

Indent size in pixels.

IndentRight (Set method)

Set a chart indent from the right border.

```
void  IndentRight(
   const int  right      // indent size
   )
```

Parameters

right

[in] Indent size in pixels.

© 2000-2025, MetaQuotes Ltd.

IndentUp (Get method)

Get a chart indent from the upper border.

```
int  IndentUp()
```

Return Value

Indent size in pixels.

IndentUp (Set method)

Set a chart indent from the upper border.

```
void  IndentUp(
   const int  up      // indent size
   )
```

Parameters

up

[in] Indent value in pixels.

© 2000-2025, MetaQuotes Ltd.

Redraw

Redraw the chart.

```
bool  Redraw(
   const bool  rescale=false      // flag value
   )
```

Parameters

rescale=false

[in] The flag indicating if a chart should be re-scaled.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ResetParameters

Reset the chart redrawing parameters.

```
void  ResetParameters()
```

© 2000-2025, MetaQuotes Ltd.

ScaleX

Scale the value by X axis.

```
virtual int  ScaleX(
   double  x      // value by X axis
   )
```

Parameters

x

[in] Real value by X axis.

Return Value

A value in pixels.

Note

Scale a real value to pixels for displaying on the chart.

© 2000-2025, MetaQuotes Ltd.

ScaleY

Scale the value by Y axis.

```
virtual int  ScaleY(
   double  y      // value by Y axis
   )
```

Parameters

y

[in] Real value by Y axis.

Return Value

A value in pixels.

Note

Scale a real value to pixels for displaying on the chart.

© 2000-2025, MetaQuotes Ltd.

SetDefaultParameters

Set the chart parameters to default values.

```
void  SetDefaultParameters()
```

© 2000-2025, MetaQuotes Ltd.

Width

Get the chart width in pixels.

```
int  Width()
```

Return Value

Chart width in pixels.

© 2000-2025, MetaQuotes Ltd.

Technical Indicators and Timeseries

This section contains the technical details of the technical indicator and timeseries classes and description of the corresponding components of the standard MQL5 library.

The use of the technical indicator and timeseries classes will save time in developing applications (scripts, Expert Advisors).

The MQL5 Standard Library (in terms of technical indicators and timeseries) is located in the working directory of the terminal in the Include\Indicators folder.

Class/group	Description
Base classes	Group of base and auxiliary classes
Timeseries classes	Group of timeseries classes
Trend Indicators	Group of Trend indicator classes
Oscillators	Group of Oscillator indicator classes
Volume Indicators	Group of Volume indicator classes
Bill Williams Indicators	Group of Bill Williams indicator classes
Custom indicators	Custom indicator class

Base and Auxiliary Technical Indicator and Timeseries Classes

This section contains the technical details of base and auxiliary technical indicator and timeseries classes and description of the corresponding components of the Standard MQL5 library.

Class/group	Description
CSpreadBuffer	Historical spread buffer class
CTimeBuffer	Historical opening prices buffer class
CTickVolumeBuffer	Historical tick volumes buffer class
CRealVolumeBuffer	Historical real volumes buffer class
CDoubleBuffer	Base class of double type data buffer
COpenBuffer	Opening bar prices buffer class
CHighBuffer	High bar prices buffer class
CLowBuffer	Low bar prices buffer class
CCloseBuffer	Closing bar prices buffer class
CIndicatorBuffer	Technical indicator buffer class
CSeries	Base class for access to timeseries data
CPriceSeries	Base class for access to price data
CIndicator	Base class of technical indicator
CIndicators	Technical indicator and timeseries collection

Methods inherited from class CArrayObj

FreeMode, FreeMode, CreateElement, Reserve, Resize, Shutdown, Add, AddArray, Insert, InsertArray, AssignArray, At, Update, Shift, Detach, Delete, DeleteRange, Clear, CompareArray, InsertSort, Search, SearchGreat, SearchLess, SearchGreatOrEqual, SearchLessOrEqual, SearchFirst, SearchLast

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

CSpreadBuffer

CSpreadBuffer is a class for simplified access to spreads of the bars in the history.

Description

The CSpreadBuffer class provides a simplified access to spreads of the bars in the history.

Declaration

```
class CSpreadBuffer: public CArrayInt
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayInt
      CSpreadBuffer

Class Methods by Groups

Attributes	
Size	Sets buffer size
Settings	
SetSymbolPeriod	Sets symbol and period
Data Access	
At	Gets the buffer element
Data Update	
virtual Refresh	Updates the buffer
virtual RefreshCurrent	Updates the current value

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Methods inherited from class CArrayInt

Type, Save, Load, Reserve, Resize, Shutdown, Add, AddArray, AddArray, Insert, InsertArray, InsertArray, AssignArray, AssignArray, At, operator, Minimum, Maximum, Update, Shift, Delete,

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

DeleteRange, CompareArray, CompareArray, InsertSort, Search, SearchGreat, SearchLess, SearchGreatOrEqual, SearchLessOrEqual, SearchFirst, SearchLast, SearchLinear

© 2000-2025, MetaQuotes Ltd.

Size

Sets buffer size.

```
void  Size(
   const int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

SetSymbolPeriod

Sets symbol and period.

```
void  SetSymbolPeriod(
   const string           symbol,     // symbol
   const ENUM_TIMEFRAMES  period      // period
   )
```

Parameters

symbol

[in] New symbol.

period

[in] New period (ENUM_TIMEFRAMES enumeration).

© 2000-2025, MetaQuotes Ltd.

At

Gets the buffer element.

```
int  At(
   const int  index      // index
   ) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CTimeBuffer

CTimeBuffer is a class for simplified access to opening times of the bars in the history.

Description

The CTimeBuffer class provides a simplified access to opening times of the bars in the history.

Declaration

```
class CTimeBuffer: public CArrayLong
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayLong
      CTimeBuffer

Class Methods by Groups

Attributes	
Size	Sets buffer size
Settings	
SetSymbolPeriod	Sets symbol and period
Data Access Methods	
At	Gets the buffer element by index
Data Update Methods	
virtual Refresh	Updates the buffer
virtual RefreshCurrent	Updates the current value

Size

Sets buffer size.

```
void  Size(
   const int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

SetSymbolPeriod

Sets symbol and period.

```
void  SetSymbolPeriod(
   const string           symbol,     // symbol
   const ENUM_TIMEFRAMES  period      // period
   )
```

Parameters

symbol

[in] New symbol.

period

[in] New period (ENUM_TIMEFRAMES enumeration).

© 2000-2025, MetaQuotes Ltd.

At

Gets the buffer element.

```
long  At(
   const int  index      // index
   ) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CTickVolumeBuffer

CTickVolumeBuffer is a class for simplified access to tick volumes of bars in the history.

Description

The CTickVolumeBuffer class provides a simplified access to tick volumes of bars in the history.

Declaration

```
class CTickVolumeBuffer: public CArrayLong
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayLong
      CTickVolumeBuffer

Class Methods by Groups

Size

Sets buffer size.

```
void  Size(
   const int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

SetSymbolPeriod

Sets symbol and period.

```
void  SetSymbolPeriod(
   const string           symbol,     // symbol
   const ENUM_TIMEFRAMES  period      // period
   )
```

Parameters

symbol

[in] New symbol.

period

[in] New period (ENUM_TIMEFRAMES enumeration).

© 2000-2025, MetaQuotes Ltd.

At

Gets the buffer element.

```
long  At(
   const int  index      // index
   ) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CRealVolumeBuffer

CRealVolumeBuffer is a class for simplified access to real volumes of bars in the history.

Description

CTickVolumeBuffer class provides a simplified access to real volumes of bars in the history.

Declaration

```
class CRealVolumeBuffer: public CArrayLong
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayLong
      CRealVolumeBuffer

Size

Sets buffer size.

```
void  Size(
   const int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

SetSymbolPeriod

Sets symbol and period.

```
void  SetSymbolPeriod(
   const string           symbol,     // symbol
   const ENUM_TIMEFRAMES  period      // period
   )
```

Parameters

symbol

[in] New symbol.

period

[in] New period (ENUM_TIMEFRAMES enumeration).

© 2000-2025, MetaQuotes Ltd.

At

Gets the buffer element.

```
long  At(
   const int  index      // index
   ) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CDoubleBuffer

CDoubleBuffer is a base class for simplified access to data buffers of double type.

Description

The CDoubleBuffer class provides a simplified access to the data of the buffer of double type.

Declaration

```
class CDoubleBuffer: public CArrayDouble
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayDouble
      CDoubleBuffer

Direct descendants

CCloseBuffer, CHighBuffer, CIndicatorBuffer, CLowBuffer, COpenBuffer

Class Methods by Groups

Attributes	
Size	Sets buffer size
Settings

Size

Sets buffer size.

```
void  Size(
   const int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

SetSymbolPeriod

Sets symbol and period.

```
void  SetSymbolPeriod(
   const string           symbol,     // symbol
   const ENUM_TIMEFRAMES  period      // period
   )
```

Parameters

symbol

[in] New symbol.

period

[in] New period (ENUM_TIMEFRAMES enumeration).

© 2000-2025, MetaQuotes Ltd.

At

Gets the buffer element.

```
double  At(
   const int  index      // index
   ) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

COpenBuffer

COpenBuffer is a class for simplified access to open prices of bars in the history.

Description

COpenBuffer class provides a simplified access to open prices of bars in the history.

Declaration

```
class COpenBuffer: public CDoubleBuffer
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayDouble
CDoubleBuffer

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CHighBuffer

CHighBuffer is a class for simplified access to high prices of bars in the history.

Description

CHighBuffer class provides a simplified access to high prices of bars in the history.

Declaration

```
class CHighBuffer: public CDoubleBuffer
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayDouble
      CDoubleBuffer
        CHighBuffer

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CLowBuffer

CLowBuffer is a class for simplified access to low prices of bars in the history.

Description

The CLowBuffer class provides a simplified access to low prices of bars in the history.

Declaration

```
class CLowBuffer: public CDoubleBuffer
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayDouble
CDoubleBuffer
CLowBuffer

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CCloseBuffer

CCloseBuffer is a class for simplified access to close prices of bars in the history.

Description

CCloseBuffer class provides a simplified access to close prices of bars in the history.

Declaration

```
class CCloseBuffer: public CDoubleBuffer
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayDouble
      CDoubleBuffer
        CCloseBuffer

Class Methods by Groups

Data Update	
virtual Refresh	Updates the buffer
virtual RefreshCurrent	Updates the current value

Refresh

Updates the buffer.

```
virtual bool  Refresh()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool  RefreshCurrent()
```

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CIndicatorBuffer

CIndicatorBuffer is a class for simplified access to the data of the indicator's buffer.

Description

CIndicatorBuffer class provides the simplified access to the data buffer of technical indicator.

Declaration

```
class CIndicatorBuffer: public CDoubleBuffer
```

Title

```
#include <Indicators\Indicator.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayDouble
CDoubleBuffer
CIndicatorBuffer

Class Methods by Groups

Attributes	
Offset	Gets/sets offset of the buffer
Name	Gets/sets buffer name
Data Access	
At	Gets buffer's element
Data Update	
Refresh	Updates the buffer
RefreshCurrent	Updates only the current value

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Methods inherited from class CArrayDouble

Delta, Type, Save, Load, Reserve, Resize, Shutdown, Add, AddArray, AddArray, Insert, InsertArray, InsertArray, AssignArray, AssignArray, At, operator, Minimum, Maximum, Update,

Offset

Gets offset of the buffer.

```
int  Offset() const
```

Return Value

Buffer offset.

Offset

Sets offset of the buffer.

```
void  Offset(
   const int  offset      // offset
   )
```

Parameters

offset

[in] New buffer offset.

© 2000-2025, MetaQuotes Ltd.

Name

Gets the name of the buffer.

```
string  Name() const
```

Return Value

Name of the buffer.

Name

Sets the name of the buffer.

```
void  Name(
   const string  name      // name
   )
```

Parameters

name

[in] New name of the buffer.

© 2000-2025, MetaQuotes Ltd.

At

Gets buffer element.

```
double  At(
   int  index      // index
   ) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the whole buffer.

```
bool  Refresh(
   const int  handle,     // indicator handle
   const int  num         // buffer number
   )
```

Parameters

handle

[in] Handle of the indicator.

num

[in] Buffer index of the indicator.

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Updates the current (zeroth) buffer element.

```
bool  RefreshCurrent(
   const int  handle,     // handle of the indicator
   const int  num         // buffer number
   )
```

Parameters

handle

[in] Handle of the indicator.

num

[in] Indicator buffer number.

Return Value

true - successful, false - cannot update the buffer.

© 2000-2025, MetaQuotes Ltd.

CSeries

CSeries is a base class for an access to the timeseries data of the Standard Library.

Description

CSeries class provides the simplified access to all the MQL5 API general functions related to working with the series data for all its descendants (timeseries and indicator classes).

Declaration

```
class CSeries: public CArrayObj
```

Title

```
#include <Indicators\Series.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayObj
      CSeries

Direct descendants

CIndicator, CiRealVolume, CiSpread, CiTickVolume, CiTime, CPriceSeries

Class Methods by Groups

Attributes	
Name	Gets the name of timeseries or indicator
BuffersTotal	Gets the number of buffers of timeseries or indicator
Timeframe	Gets the timeframe flag of timeseries or indicator
Symbol	Gets the symbol of timeseries or indicator
Period	Gets the period of timeseries or indicator
RefreshCurrent	Sets/resets the flag of updating the current data
Data Access	
virtual BufferResize	Sets buffer size of timeseries or indicator
Data Update	
virtual Refresh	Update the data of timeseries or indicator
PeriodDescription	Transforms ENUM_TIMEFRAMES into a string

© 2000-2025, MetaQuotes Ltd.

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Methods inherited from class CArrayObj

FreeMode, FreeMode, Type, Save, Load, CreateElement, Reserve, Resize, Shutdown, Add, AddArray, Insert, InsertArray, AssignArray, At, Update, Shift, Detach, Delete, DeleteRange, Clear, CompareArray, InsertSort, Search, SearchGreat, SearchLess, SearchGreatOrEqual, SearchLessOrEqual, SearchFirst, SearchLast

© 2000-2025, MetaQuotes Ltd.

Name

Gets the name of timeseries or indicator.

```
string  Name() const
```

Return Value

The name of timeseries or indicator.

© 2000-2025, MetaQuotes Ltd.

BuffersTotal

Gets the number of buffers of timeseries or indicator.

```
int  BuffersTotal() const
```

Return Value

The number of buffers of timeseries or indicator.

Note

The timeseries has only one buffer.

© 2000-2025, MetaQuotes Ltd.

Timeframe

Gets the timeframe flag of timeseries or indicator.

```
int  Timeframe() const
```

Return Value

The timeframe flag of timeseries or indicator.

Note

It is generated as the object visibility flags.

© 2000-2025, MetaQuotes Ltd.

Symbol

Gets the symbol of timeseries or indicator.

```
string  Symbol() const
```

Return Value

The symbol of timeseries or indicator.

© 2000-2025, MetaQuotes Ltd.

Period

Gets the period of timeseries or indicator.

```
ENUM_TIMEFRAMES  Period() const
```

Return Value

The period (value of ENUM_TIMEFRAMES enumeration) of timeseries or indicator.

© 2000-2025, MetaQuotes Ltd.

RefreshCurrent

Sets a flag to constantly update the current values of timeseries or indicator.

```
string  RefreshCurrent(
   const bool  flag      // value
   )
```

Parameters

flag

[in] New flag.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

BufferSize

Returns the amount of data available in timeseries buffer or indicator buffer.

```
int  BufferSize() const
```

Return Value

Amount of data available in timeseries buffer or indicator buffer.

© 2000-2025, MetaQuotes Ltd.

BufferResize

Sets buffer size of timeseries or indicator.

```
virtual bool  BufferResize(
   const int  size      // size
   )
```

Parameters

size

[in] New size of the buffers.

Return Value

true - successful, otherwise - false.

Note

All the timeseries or indicator buffers have the same size.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the data of timeseries or indicator.

```
virtual void  Refresh(
   const int  flags      // flags
   )
```

Parameters

flags

[in] Timeframes to update (flag).

© 2000-2025, MetaQuotes Ltd.

PeriodDescription

Gets the string representation of the specified ENUM_TIMEFRAMES enumeration.

```
string  PeriodDescription(
   const int  val=0      // value
   )
```

Parameters

val=0

[in] Value to convert.

Return Value

The string representation of the specified ENUM_TIMEFRAMES enumeration.

Note

If the value is not specified or equal to zero,the timeframe of timeseries or indicator is transformed into a string.

© 2000-2025, MetaQuotes Ltd.

CPriceSeries

CPriceSeries is a base class for access to the price data.

Description

CSeries class provides the simplified access to MQL5 API general functions for working with price data to all its descendants.

Declaration

```
class CPriceSeries: public CSeries
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayObj
      CSeries
        CPriceSeries

Direct descendants

CiClose, CiHigh, CiLow, CiOpen

Class Methods by Groups

Create	
virtual BufferResize	Sets size of the series buffer
Data Access	
virtual GetData	Gets the specified series buffer element
Data Update	
virtual Refresh	Updates timeseries data
Search for Extreme Values	
virtual MinIndex	Gets the index of minimal value in the specified range
virtual MinValue	Gets the minimal value in the specified range
virtual MaxIndex	Gets the index of maximal value in the specified range
virtual MaxValue	Gets the maximal value in the specified range

© 2000-2025, MetaQuotes Ltd.

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Methods inherited from class CArrayObj

FreeMode, FreeMode, Type, Save, Load, CreateElement, Reserve, Resize, Shutdown, Add, AddArray, Insert, InsertArray, AssignArray, At, Update, Shift, Detach, Delete, DeleteRange, Clear, CompareArray, InsertSort, Search, SearchGreat, SearchLess, SearchGreatOrEqual, SearchLessOrEqual, SearchFirst, SearchLast

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent

© 2000-2025, MetaQuotes Ltd.

BufferResize

Sets the series buffer size.

```
virtual void  BufferResize(
   const int  size      // size
   )
```

Parameters

size

[in] New buffer size.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

GetData

Gets the specified series buffer element.

```
double  GetData(
   const int  index      // index
   ) const
```

Parameters

index

[in] Index of a buffer element.

Return Value

The series buffer element, or EMPTY_VALUE.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the timeseries data

```
virtual void  Refresh(
   const int  flags=OBJ_ALL_PERIODS      // flags
   )
```

Parameters

flags=OBJ_ALL_PERIODS

[in] Timeframe flags.

© 2000-2025, MetaQuotes Ltd.

MinIndex

Gets the index of minimal value in the specified range.

```
virtual int  MinIndex(
   const int  start,      // size
   const int  count       // number
   ) const
```

Parameters

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

Return Value

The index of minimal value of a series buffer in the specified range, or -1.

© 2000-2025, MetaQuotes Ltd.

MinValue

Gets the minimal value in the specified range.

```
virtual double  MinValue(
   const int    start,      // size
   const int    count,      // number
   int&         index       // reference
   ) const
```

Parameters

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

index

[out] Reference to the variable for placing the found element's index value.

Return Value

The minimal value of the series buffer in the specified range, or EMPTY_VALUE.

Note

The index of the found element is stored by index reference.

© 2000-2025, MetaQuotes Ltd.

MaxIndex

Gets the index of maximal value in the specified range.

```
virtual int  MaxIndex(
   const int  start,      // index
   const int  count       // number
   ) const
```

Parameters

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

Return Value

The index of the maximal value of the series buffer in the specified range, or -1.

© 2000-2025, MetaQuotes Ltd.

MaxValue

Gets the maximal value in the specified range.

```
virtual double  MaxValue(
   const int    start,      // size
   const int    count,      // amount
   int&         index       // reference
   ) const
```

Parameters

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

index

[out] Reference to the variable for placing the found element's index value.

Return Value

The maximal value of a series buffer in the specified range, or EMPTY_VALUE.

Note

The index of the found element is stored by index reference.

Class Methods by Groups

Attributes	
Handle	Gets the indicator's handle.
Status	Gets the status of the indicator.
FullRelease	Sets a flag to release the handle.
Creation	
Create	Creates the indicator
BufferResize	Sets the new buffer sizes
Data Access	
GetData	Copies the data from the indicator buffer
Data Update Methods	
Refresh	Updates the indicator data

© 2000-2025, MetaQuotes Ltd.

Attributes	
Finding Min/Max Values	
Minimum	Gets the index of minimal value in a specified range.
MinValue	Gets the minimal value in a specified range.
Maximum	Gets the index of maximal value in a specified range.
MaxValue	Gets the maximal value in a specified range.
Conversion of Enumerations	
MethodDescription	Converts ENUM_MA_METHOD into a string
PriceDescription	Converts ENUM_APPLIED_PRICE into a string
VolumeDescription	Converts ENUM_APPLIED_VOLUME into a string
Working with chart	
AddToChart	Adds an indicator to the chart
DeleteFromChart	Deletes an indicator from the chart

Methods inherited from class CObject

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Methods inherited from class CArrayObj

FreeMode, FreeMode, Type, Save, Load, CreateElement, Reserve, Resize, Shutdown, Add, AddArray, Insert, InsertArray, AssignArray, At, Update, Shift, Detach, Delete, DeleteRange, Clear, CompareArray, InsertSort, Search, SearchGreat, SearchLess, SearchGreatOrEqual, SearchLessOrEqual, SearchFirst, SearchLast

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent

© 2000-2025, MetaQuotes Ltd.

Handle

Gets the indicator's handle.

```
int  Handle() const
```

Return Value

Handle of the indicator.

© 2000-2025, MetaQuotes Ltd.

Status

Gets the status of the indicator.

```
string  Status() const
```

Return Value

The status of indicator creation.

© 2000-2025, MetaQuotes Ltd.

FullRelease

Sets a flag to release the handle.

```
void  FullRelease(
   const bool  flag=true      // flag
   )
```

Parameters

flag

[in] New value of the handle release flag.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator of the specified type with the specified parameters.

```
bool  Create(
   const string           symbol,          // symbol
   const ENUM_TIMEFRAMES  period,          // period
   const ENUM_INDICATOR   type,            // type
   const int              num_params,      // number of parameters
   const MqlParam&        params[]         // array of parameters
   )
```

Parameters

symbol

[in] Indicator symbol.

period

[in] Indicator timeframe (ENUM_TIMEFRAMES enumeration).

type

[in] Indicator type (ENUM_INDICATOR enumeration).

num_params

[in] Number of indicator's parameters.

params

[in] Reference to the parameters array for the indicator.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

BufferResize

Sets the sizes of the indicator buffers.

```
virtual bool  BufferResize(
   const int  size      // size
   )
```

Parameters

size

[in] New buffer size.

Return Value

true - successful, otherwise - false.

Note

All the indicator buffers have the same size.

© 2000-2025, MetaQuotes Ltd.

BarsCalculated

Returns the amount of calculated data for the indicator.

```
int  BarsCalculated() const;
```

Return Value

Returns the amount of calculated data in the indicator buffer, or -1 in the case of error (data is not calculated yet).

© 2000-2025, MetaQuotes Ltd.

GetData

Gets the specified element of the specified buffer of the indicator. Refresh() should be called for working with recent data before using the method.

```
double  GetData(
   const int  buffer_num,     // buffer number
   const int  index           // index
   ) const
```

Parameters

buffer_num

[in] Indicator buffer number.

index

[in] Indicator buffer element index.

Return Value

value - success, EMPTY_VALUE - cannot receive the data.

GetData

Gets the data from the indicator's buffer by starting position and number.

```
int  GetData(
   const int      start_pos,      // position
   const int      count,          // number
   const int      buffer_num,     // buffer number
   double&        buffer[]        // array
   ) const
```

Parameters

start_pos

[in] Starting position of the indicator buffer.

count

[in] Number of indicator buffer elements.

buffer_num

[in] Number of the indicator buffer.

buffer

[in] Reference to the array for storing data.

Return Value

Number of the indicator values received from the specified indicator buffer - success, otherwise -1.

GetData

Gets the data from the indicator buffer by start time and number.

© 2000-2025, MetaQuotes Ltd.

```
int  GetData(
   const datetime  start_time,      // starting time
   const int       count,           // amount
   const int       buffer_num,      // buffer number
   double&         buffer[]         // array
   ) const
```

Parameters

start_time

[in] Indicator buffer element starting time.

count

[in] Number of indicator buffer elements.

buffer_num

[in] Number of the indicator buffer.

buffer

[in] Reference to the array for storing data.

Return Value

Number of the indicator values received from the specified buffer, otherwise -1.

GetData

Gets the data from the indicator buffer by start and end time.

```
int  GetData(
   const datetime  start_time,      // start time
   const datetime  stop_time,       // end time
   const int       buffer_num,      // number of buffer
   double&         buffer[]         // array
   ) const
```

Parameters

start_time

[in] Indicator buffer initial element time.

stop_time

[in] Indicator buffer end element time.

buffer_num

[in] Number of the indicator buffer.

buffer

[in] Reference to the array for storing data.

Return Value

Number of the indicator values received from the specified buffer - success, otherwise -1.

© 2000-2025, MetaQuotes Ltd.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the indicator data. It is recommended calling the method before using GetData().

```
virtual void  Refresh(
   int  flags=OBJ_ALL_PERIODS      // flags
   )
```

Parameters

flags=OBJ_ALL_PERIODS

[in] Timeframe update flags.

© 2000-2025, MetaQuotes Ltd.

Minimum

Returns the index of minimal element of the specified buffer in a specified range.

```
int  Minimum(
   const int  buffer_num,     // buffer number
   const int  start,          // starting index
   const int  count           // number
   ) const
```

Parameters

buffer_num

[in] Buffer number to search the value in.

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

Return Value

Index of the minimal element of the specified buffer in a specified range.

© 2000-2025, MetaQuotes Ltd.

MinValue

Returns the value of minimal element of the specified buffer in a specified range.

```
double  MinValue(
   const int   buffer_num,     // buffer number
   const int   start,          // starting index
   const int   count,          // number
   int&        index           // reference
   ) const
```

Parameters

buffer_num

[in] Buffer number to search the value in.

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

index

[out] Reference to the variable for storing the found element index value.

Return Value

The value of the minimal element of the specified buffer in a specified range.

Note

The index of the found element is stored by index reference.

© 2000-2025, MetaQuotes Ltd.

Maximum

Returns the index of maximal element of the specified buffer in a specified range.

```
int  Maximum(
   const int  buffer_num,     // buffer number
   const int  start,          // starting index
   const int  count           // number
   ) const
```

Parameters

buffer_num

[in] Buffer number to search the value in.

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

Return Value

Index of the maximal element of the specified buffer in a specified range.

© 2000-2025, MetaQuotes Ltd.

MaxValue

Returns the value of maximal element of the specified buffer in a specified range.

```
double  MaxValue(
   const int   buffer_num,     // buffer number
   const int   start,          // starting index
   const int   count,          // number
   int&        index           // reference
   ) const
```

Parameters

buffer_num

[in] Buffer number to search the value in.

start

[in] Search range initial index.

count

[in] Search range size (number of elements).

index

[out] Reference to the variable for storing the found element index value.

Return Value

The value of the maximal element of the specified buffer in a specified range.

Note

The index of maximal buffer element is stored by index reference.

© 2000-2025, MetaQuotes Ltd.

MethodDescription

Converts ENUM_MA_METHOD enumeration value to a string.

```
string  MethodDescription(
   const int  val      // value
   ) const
```

Parameters

val

[in] Conversion value.

Return Value

The string corresponding to ENUM_MA_METHOD enumeration value.

© 2000-2025, MetaQuotes Ltd.

PriceDescription

Converts ENUM_APPLIED_PRICE enumeration value to a string.

```
string  PriceDescription(
   const int  val      // value
   ) const
```

Parameters

val

[in] Conversion value.

Return Value

The string corresponding to ENUM_APPLIED_PRICE enumeration value.

© 2000-2025, MetaQuotes Ltd.

VolumeDescription

Converts ENUM_APPLIED_VOLUME enumeration value to a string.

```
string  VolumeDescription(
   const int  val      // value
   ) const
```

Parameters

val

[in] Conversion value.

Return Value

The string corresponding to ENUM_APPLIED_VOLUME enumeration value.

© 2000-2025, MetaQuotes Ltd.

AddToChart

Adds the indicator to the chart.

```
bool  AddToChart(
   const long  chart,      // chart ID
   const int  subwin       // subwindow index
   )
```

Parameters

chart

[in] Chart ID.

subwin

[in] Chart subwindow index.

Return Value

true - successful, false - cannot add the indicator to the chart.

© 2000-2025, MetaQuotes Ltd.

DeleteFromChart

Deletes the indicator from the chart.

```
bool  DeleteFromChart(
   const long  chart,      // chart ID
   const int  subwin       // subwindow index
   )
```

Parameters

chart

[in] Chart ID.

subwin

[in] Chart subwindow index.

Return Value

true - successful, false - cannot remove the indicator from the chart.

© 2000-2025, MetaQuotes Ltd.

CIndicators

The CIndicators is a class for collecting instances of timeseries and technical indicators classes.

Description

CIndicators class provides creation of the technical indicators class instances, their storage and management (data synchronization, handle and memory management).

Declaration

```
class CIndicators: public CArrayObj
```

Title

```
#include <Indicators\Indicators.mqh>
```

Class Methods by Groups

Create	
Create	Creates an indicator
Data Update	
Refresh	Updates indicator data

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator of the specified type with the specified parameters.

```
CIndicator*  Create(
   const string           symbol,     // symbol name
   const ENUM_TIMEFRAMES  period,     // period
   const ENUM_INDICATOR   type,       // type
   const int              count,      // number of parameters
   const MqlParam&        params      // parameters array
   )
```

Parameters

symbol

[in] Indicator symbol name.

period

[in] Indicator timeframe (ENUM_TIMEFRAMES enumeration value).

type

[in] Indicator type (ENUM_INDICATOR enumeration value).

count

[in] Number of parameters for the indicator.

params

[in] Reference to the parameters array for the indicator.

Return Value

Reference to the created indicator - successful, NULL - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates data for all timeseries and technical indicators in the collection.

```
int  Refresh()
```

Return Value

Updated timeframe flags (formed as object visibility flags).

© 2000-2025, MetaQuotes Ltd.

Timeseries classes

This group of chapters contains technical details of timeseries classes of the MQL5 Standard Library and descriptions of all its key components.

Class	Description
CiSpread	Provides an access to spread historical data
CiTime	Provides an access to open times of the bars in the history
CiTickVolume	Provides an access to tick volumes of the bars in the history
CiRealVolume	Provides an access to real volumes of the bars in the history
CiOpen	Provides an access to open prices of the bars in the history
CiHigh	Provides an access to high prices of the bars in the history
CiLow	Provides an access to low prices of the bars in the history
CiClose	Provides an access to close prices of the bars in the history

© 2000-2025, MetaQuotes Ltd.

CiSpread

CiSpread is a class designed for access to spreads of the bars in the history.

Description

CiSpread class provides an access to spread historical data.

Declaration

```
class CiSpread: public CSeries
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayObj
      CSeries
        CiSpread

Class Methods by Groups

Create	
Create	Creates a timeseries
BufferResize	Sets a series buffer size

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent

© 2000-2025, MetaQuotes Ltd.

Create

Creates a timeseries with the specified parameters for access to the spreads history.

```
bool  Create(
   string           symbol,     // symbol
   ENUM_TIMEFRAMES  period      // period
   )
```

Parameters

symbol

[in] Timeseries symbol.

period

[in] Timeseries timeframe (ENUM_TIMEFRAMES enumeration value).

Return Value

true - successful, false - cannot create the timeseries.

© 2000-2025, MetaQuotes Ltd.

BufferResize

Sets size of the buffer series.

```
virtual void  BufferResize(
   int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

GetData

Gets the specified element of timeseries buffer.

```
int  GetData(
   int  index      // index
   ) const
```

Parameters

index

[in] Index of the buffer element.

Return Value

The timeseries buffer element, or 0.

GetData

Gets the element of timeseries by starting position and number of elements.

```
int  GetData(
   int   start_pos,     // position
   int   count,         // number
   int&  buffer         // array
   ) const
```

Parameters

start_pos

[in] Starting position of a timeseries buffer.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the array for storing the data.

Return Value

>=0 - successful, -1 - cannot receive the data.

GetData

Gets data from a timeseries buffer by initial time and number.

```
int  GetData(
   datetime  start_time,     // starting time
   int       count,          // number
   int&      buffer          // array
   ) const
```

Parameters

start_time

© 2000-2025, MetaQuotes Ltd.

[in] Time of the timeseries buffer's initial element.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the array for storing data.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets the data from a timeseries buffer by start and stop times.

```
int  GetData(
   datetime  start_time,     // starting time
   datetime  stop_time,      // stop time
   int&      buffer          // array
   ) const
```

Parameters

start_time

[in] Starting time of a timeseries buffer element.

stop_time

[in] Stop time of a timeseries buffer element.

buffer

[in] Reference to the array for storing data.

Return Value

>=0 - successful, -1 - cannot receive the data.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the data of timeseries.

```
virtual void  Refresh(
   int  flags      // flags
   )
```

Parameters

flags

[in] Timeframe flags.

© 2000-2025, MetaQuotes Ltd.

CiTime

CiTime is a class designed for access to open times of the bars in the history.

Description

CiTime class provides an access to open times of the bars in the history.

Declaration

```
class CiTime: public CSeries
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayObj
      CSeries

Create

Creates a timeseries with the specified parameters for access to the opening times of the bars in the history.

```
bool  Create(
   string           symbol,      // symbol
   ENUM_TIMEFRAMES  period       // period
   )
```

Parameters

symbol

[in] Timeseries symbol.

period

[in] Timeseries timeframe (ENUM_TIMEFRAMES enumeration value).

Return Value

true - successful, false - cannot create timeseries.

© 2000-2025, MetaQuotes Ltd.

BufferResize

Sets series buffer sizes.

```
virtual void  BufferResize(
   int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

GetData

Gets the specified element of a timeseries buffer.

```
datetime  GetData(
   int  index      // index
   ) const
```

Parameters

index

[in] Index of the buffer element.

Return Value

The timeseries buffer element, or 0.

GetData

Gets the data from a timeseries buffer by starting position and number.

```
int  GetData(
   int   start_pos,     // position
   int   count,         // number
   long& buffer         // array
   ) const
```

Parameters

start_pos

[in] Starting position of timeseries.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the array for storing data.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets the data from timeseries buffer by starting time and number.

```
int  GetData(
   datetime  start_time,     // starting time
   int       count,          // number
   long&     buffer          // array
   ) const
```

Parameters

start_time

© 2000-2025, MetaQuotes Ltd.

[in] Time of a timeseries buffer initial element.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the array for storing data.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets the data from a timeseries buffer by starting and stop times.

```
int  GetData(
   datetime  start_time,     // starting time
   datetime  stop_time,      // stop time
   long&     buffer          // array
   ) const
```

Parameters

start_time

[in] Time of a timeseries buffer initial element.

stop_time

[in] Time of a timeseries buffer end element.

buffer

[in] Reference to the array for storing data

Return Value

>=0 - successful, -1 - cannot receive data.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the data of timeseries.

```
virtual void  Refresh(
   int  flags      // flags
   )
```

Parameters

flags

[in] Timeframe flags.

© 2000-2025, MetaQuotes Ltd.

CiTickVolume

CiTickVolume is a class designed for access to tick volumes of the bars in the history.

Description

CiTickVolume class provides an access to tick volumes of the bars in the history.

Declaration

```
class CiTickVolume: public CSeries
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayObj
      CSeries
        CiTickVolume

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent

© 2000-2025, MetaQuotes Ltd.

Create

Creates a timeseries with the specified parameters for access to the tick volumes of the bars in the history.

```
bool  Create(
   string           symbol,      // symbol
   ENUM_TIMEFRAMES  period       // period
   )
```

Parameters

symbol

[in] Timeseires symbol.

period

[in] Timeseries timeframe (ENUM_TIMEFRAMES enumeration value).

Return Value

true - successful, false - cannot create a timeseries.

© 2000-2025, MetaQuotes Ltd.

BufferResize

Sets size of the series buffer.

```
virtual void  BufferResize(
   int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

GetData

Gets the specified timeseries buffer element.

```
long  GetData(
   int  index      // index
   ) const
```

Parameters

index

[in] Index of the buffer element.

Return Value

The timeseries buffer element, or 0.

GetData

Gets the data from the timeseries buffer by starting position and number.

```
int  GetData(
   int   start_pos,     // position
   int   count,         // number
   long& buffer         // array
   ) const
```

Parameters

start_pos

[in] Starting position of a timeseries buffer.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the array for storing the data.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets the data from a timeseries buffer by starting time and number.

```
int  GetData(
   datetime  start_time,     // starting time
   int       count,          // number
   long&     buffer          // array
   ) const
```

Parameters

start_time

© 2000-2025, MetaQuotes Ltd.

[in] Time of the timeseries buffer initial element.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the array for storing data.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets the data from a timeseries buffer by starting and stop times.

```
int  GetData(
   datetime  start_time,     // starting time
   datetime  stop_time,      // stop time
   long&     buffer          // array
   ) const
```

Parameters

start_time

[in] Time of the timeseries buffer initial element.

stop_time

[in] Time of the timeseries buffer end element.

buffer

[in] Reference to the array for storing data

Return Value

>=0 - successful, -1 - cannot receive data.

Create

Creates a timeseries with the specified parameters for access to the real volumes of the bars in the history.

```
bool  Create(
   string           symbol,      // symbol
   ENUM_TIMEFRAMES  period       // period
   )
```

Parameters

symbol

[in] Timeseries symbol.

period

[in] Timeseries timeframe (ENUM_TIMEFRAMES enumeration value).

Return Value

true - successful, false - cannot create a timeseries.

© 2000-2025, MetaQuotes Ltd.

BufferResize

Sets a series buffer size.

```
virtual void  BufferResize(
   int  size      // size
   )
```

Parameters

size

[in] New buffer size.

© 2000-2025, MetaQuotes Ltd.

GetData

Gets the specified series buffer element.

```
datetime  GetData(
   int  index      // index
   ) const
```

Parameters

index

[in] Buffer element index.

Return Value

Series buffer element, or 0.

GetData

Gets the data from timeseries buffer by starting position and number.

```
int  GetData(
   int   start_pos,     // position
   int   count,         // number
   long& buffer         // array
   ) const
```

Parameters

start_pos

[in] Starting position of timeseries buffer.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the data storage array.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets the data from timeseries buffer by starting time and number.

```
int  GetData(
   datetime  start_time,     // starting time
   int       count,          // number
   long&     buffer          // array
   ) const
```

Parameters

start_time

© 2000-2025, MetaQuotes Ltd.

[in] Time of the timeseries buffer initial element.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the data storage array.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets the element of timeseries by starting and stop times.

```
int  GetData(
   datetime  start_time,     // starting time
   datetime  stop_time,      // stop time
   long&     buffer          // target array
   ) const
```

Parameters

start_time

[in] Starting time.

stop_time

[in] Stop time.

buffer

[in] Reference to the target array for data

Return Value

>=0 if successful, -1 in the case of error.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates the data of timeseries.

```
virtual void  Refresh(
   int  flags      // flags
   )
```

Parameters

flags

[in] Timeframe flags.

© 2000-2025, MetaQuotes Ltd.

CiOpen

CiOpen is a class designed for access to open prices of the bars in the history.

Description

CiOpen class provides an access to open prices of the bars in the history.

Declaration

```
class CiOpen: public CPriceSeries
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

Create

Creates a timeseries with the specified parameters for access to the open prices of the bars in the history.

```
bool  Create(
   string           symbol,      // symbol
   ENUM_TIMEFRAMES  period       // period
   )
```

Parameters

symbol

[in] Timeseries symbol.

period

[in] Timeseries timeframe (ENUM_TIMEFRAMES enumeration value).

Return Value

true - successful, false - cannot create a timeseries.

© 2000-2025, MetaQuotes Ltd.

GetData

Gets the element of timeseries by starting position and number.

```
int  GetData(
   int    start_pos,      // starting position
   int    count,          // number
   double& buffer         // array
   ) const
```

Parameters

start_pos

[in] Starting position of timeseries buffer.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the data storage array.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets data from the timeseries buffer by starting time and number.

```
int  GetData(
   datetime  start_time,      // starting time
   int       count,           // number
   double&     buffer         // array
   ) const
```

Parameters

start_time

[in] Time of a timeseries buffer initial element.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the data storage array.

Return Value

>=0 - successful, -1 - cannot receive data.

Create

Creates a timeseries with the specified parameters for access to the closing prices of the bars in the history.

```
bool  Create(
   string           symbol,      // symbol
   ENUM_TIMEFRAMES  period       // period
   )
```

Parameters

symbol

[in] Timeseries symbol.

period

[in] Timeseries timeframe (ENUM_TIMEFRAMES enumeration value).

Return Value

true - successful, false - cannot create the timeseries.

© 2000-2025, MetaQuotes Ltd.

GetData

Gets data from a timeseries buffer by starting position and number.

```
int  GetData(
   int    start_pos,      // position
   int    count,          // number
   double& buffer         // array
   ) const
```

Parameters

start_pos

[in] Starting position of a timeseries buffer.

count

[in] Number of timeseries buffer elements.

buffer

[in] Reference to the data storage array.

Return Value

>=0 - successful, -1 - cannot receive data.

GetData

Gets data from a timeseries buffer by starting time and number.

```
int  GetData(
   datetime  start_time,      // starting time

Main and Auxiliary Classes of Technical Indicators and Timeseries

This group of chapters contains technical details of the main and auxiliary classes of technical indicators and timeseries, as well as descriptions of the appropriate components of the MQL5 Standard Library.

Class/group	Description
CiADX	Average Directional Index
CiADXWilder	Average Directional Index by Welles Wilder
CiBands	Bollinger Bands®
CiEnvelopes	Envelopes
CiIchimoku	Ichimoku Kinko Hyo
CiMA	Moving Average
CiSAR	Parabolic Stop And Reverse System
CiStdDev	Standard Deviation
CiDEMA	Double Exponential Moving Average
CiTEMA	Triple Exponential Moving Average
CiFrAMA	Fractal Adaptive Moving Average
CiAMA	Adaptive Moving Average
CiVIDyA	Variable Index Dynamic Average

© 2000-2025, MetaQuotes Ltd.

CiADX

CiADX is a class intended for using the Average Directional Index technical indicator.

Description

CiADX class provides the creation, configuration, and access to the data of the Average Directional Index indicator.

Declaration

```
class CiADX: public CIndicator
```

Title

```
#include <Indicators\Trend.mqh>
```

© 2000-2025, MetaQuotes Ltd.

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,        // symbol
   ENUM_TIMEFRAMES  period,        // period
   int              ma_period      // averaging period
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element of the main line by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Main line buffer element index.

Return Value

Main line buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Plus

Returns the buffer element of the +DI line by the specified index.

```
double  Plus(
   int  index      // index
   )
```

Parameters

index

[in] +DI line buffer element index.

Return Value

The buffer element of the +DI line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Minus

Returns the buffer element of the -DI line by the specified index.

```
double  Minus(
   int  index      // index
   )
```

Parameters

index

[in] -DI line buffer element index.

Return Value

The buffer element of the -DI line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_ADX for CiADX).

© 2000-2025, MetaQuotes Ltd.

CiADXWilder

CiADXWilder is a class intended for using the technical indicator Average Directional Index by Welles Wilder.

Description

CiADXWilder class provides the creation, configuration, and access to the data of the Average Directional Index by Welles Wilder.

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaShift

Returns the horizontal shift.

```
int  MaShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Deviation

Returns the deviation.

```
double  Deviation() const
```

Return Value

Returns the deviation, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,        // symbol
   ENUM_TIMEFRAMES  period,        // period
   int              ma_period,     // averaging period
   int              ma_shift,      // shift
   double           deviation,     // deviation
   int              applied        // applied price, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ma_shift

[in] Horizontal shift of the indicator.

deviation

[in] Deviation.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Base

Returns the buffer element of the base line by the specified index.

```
double  Base(
   int  index      // index
   )
```

Parameters

index

[in] Base line buffer element index.

Return Value

The buffer element of the base line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Upper

Returns the buffer element of the upper line by the specified index.

```
double  Upper(
   int  index      // index
   )
```

Parameters

index

[in] Upper line buffer element index.

Return Value

The buffer element of the upper line of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Lower

Returns the buffer element of the lower line by the specified index.

```
double  Lower(
   int  index      // index
   )
```

Parameters

index

[in] Lower line buffer element index.

Return Value

The buffer element of the lower line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_BANDS for CiBands).

© 2000-2025, MetaQuotes Ltd.

CiEnvelopes

CiEnvelopes is a class intended for using the Envelopes technical indicator.

Description

CiEnvelopes class provides the creation, configuration, and access to the data of the Envelopes indicator.

```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string            symbol,         // symbol
   ENUM_TIMEFRAMES   period,         // period
   int               ma_period,      // averaging period
   int               ma_shift,       // shift
   ENUM_MA_METHOD    ma_method,      // averaging method
   int               applied,        // price type, handle
   double            deviation       // deviation
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ma_shift

[in] Price axis shift.

ma_method

[in] Averaging method (ENUM_MA_METHOD enumeration value).

applied

[in] Object (price type or handle) to apply.

deviation

[in] Deviation.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Upper

Returns the buffer element of the upper line by the specified index.

```
double  Upper(
   int  index      // index
   )
```

Parameters

index

[in] Upper line buffer element index.

Return Value

The buffer element of the upper line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Lower

Returns the buffer element of the lower line by the specified index.

```
double  Lower(
   int  index      // index
   )
```

Parameters

index

[in] Lower line buffer element index.

Return Value

The buffer element of the lower line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_ENVELOPES for CiEnvelopes).

```

Return Value

Returns the SenkouSpanB period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,           // symbol
   ENUM_TIMEFRAMES  period,           // period
   int              tenkan_sen,       // period of TenkanSen
   int              kijun_sen,        // period of KijunSen
   int              senkou_span_b     // period of SenkouSpanB
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

tenkan_sen

[in] Period of TenkanSen.

kijun_sen

[in] Period of KijunSen.

senkou_span_b

[in] Period of SenkouSpanB.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

TenkanSen

Returns the buffer element of the TenkanSen line by the specified index.

```
double  TenkanSen(
   int  index      // index
   )
```

Parameters

index

[in] TenkanSen line buffer element index.

Return Value

The buffer element of the TenkanSen line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

KijunSen

Returns the buffer element of the KijunSen line by the specified index.

```
double  KijunSen(
   int  index      // index
   )
```

Parameters

index

[in] KijunSen line buffer element index.

Return Value

The buffer element of the KijunSen line of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

SenkouSpanA

Returns the buffer element of the SenkouSpanA line by the specified index.

```
double  SenkouSpanA(
   int  index      // index
   )
```

Parameters

index

[in] SenkouSpanA line buffer element index.

Return Value

The buffer element of the SenkouSpanA line of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

SenkouSpanB

Returns the buffer element of the SenkouSpanB line by the specified index.

```
double  SenkouSpanB(
   int  index      // index
   )
```

Parameters

index

[in] SenkouSpanB line buffer element index.

Return Value

The buffer element of the SenkouSpanB line of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

ChinkouSpan

Returns the buffer element of the ChinkouSpan line by the specified index.

```
double  ChinkouSpan(
   int  index      // index
   )
```

Parameters

index

[in] ChinkouSpan line buffer element index.

Return Value

The buffer element of the ChinkouSpan line of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_ICHIMOKU for Cilchimoku).

© 2000-2025, MetaQuotes Ltd.

CiMA

CiMA is a class intended for using the Moving Average technical indicator.

Description

CiMA class provides the creation, setup, and access to the data of the Moving Average indicator.

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaShift

Returns the horizontal shift of the indicator.

```
int  MaShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaMethod

Returns the averaging method.

```
ENUM_MA_METHOD  MaMethod() const
```

Return Value

Returns the averaging method (value of ENUM_MA_METHOD enumeration), defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string            string,        // symbol
   ENUM_TIMEFRAMES   period,        // period
   int               ma_period,     // averaging period
   int               ma_shift,      // shift
   ENUM_MA_METHOD    ma_method,     // averaging method
   int               applied        // price type, handle
   )
```

Parameters

string

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ma_shift

[in] Horizontal shift.

ma_method

[in] Averaging method (ENUM_MA_METHOD enumeration value).

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_MA for CiMA).

© 2000-2025, MetaQuotes Ltd.

CiSAR

CiSAR is a class intended for using the Parabolic Stop And Reverse System technical indicator.

Description

CiSAR class provides the creation, setup, and access to the data of the Parabolic Stop And Reverse System indicator.

Declaration

```
class CiSAR: public CIndicator
```

Title

```
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayObj
      CSeries
        CIndicator
          CiSAR

Class Methods by Groups

Attributes	
SarStep	Returns the step of price increment
Maximum	Returns the maximum value of the step
Create Methods	
Create	Creates the indicator
Data Access Methods	
Main	Returns the buffer data
Input/output	
virtual Type	Virtual identification method

SarStep

Returns the step of price increment.

```
double  SarStep() const
```

Return Value

The step of price increment, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Maximum

Returns the maximum value of the step.

```
double  Maximum() const
```

Return Value

The maximum value of the step, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,      // symbol
   ENUM_TIMEFRAMES  period,      // period
   double           step,        // step
   double           maximum      // coefficient
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

step

[in] Step for the velocity increasing.

maximum

[in] Price following coefficient.

Return Value

true - successful, false - cannot change the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_SAR for CiSAR).

© 2000-2025, MetaQuotes Ltd.

CiStdDev

CiStdDev is a class intended for using the Standard Deviation technical indicator.

Description

CiStdDev class provides the creation, setup, and access to the data of the Standard Deviation indicator.

Declaration

```
class CiStdDev: public CIndicator
```

Title

```
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayObj
      CSeries
        CIndicator
          CiStdDev

Class Methods by Groups

Attributes

© 2000-2025, MetaQuotes Ltd.

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaShift

Returns the horizontal shift of the indicator.

```
int  MaShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaMethod

Returns the averaging method.

```
ENUM_MA_METHOD  MaMethod() const
```

Return Value

Returns the averaging method (value of ENUM_MA_METHOD enumeration), defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string            symbol,         // symbol
   ENUM_TIMEFRAMES   period,         // period
   int               ma_period,      // averaging period
   int               ma_shift,       // shift
   ENUM_MA_METHOD    ma_method,      // averaging method
   int               applied         // price type, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ma_shift

[in] Horizontal shift.

ma_method

[in] Averaging method (ENUM_MA_METHOD enumeration value).

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index if successful, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_STDDEV for CiStdDev).

© 2000-2025, MetaQuotes Ltd.

CiDEMA

CiDEMA is a class intended for using the Double Exponential Moving Average technical indicator.

Description

CiDEMA class provides the creation, setup, and access to the data of the Double Exponential Moving Average indicator.

Declaration

```
class CiDEMA: public CIndicator
```

Title

```
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator
CiDEMA

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

IndShift

Returns the horizontal shift of the indicator.

```
int  IndShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           string,        // symbol
   ENUM_TIMEFRAMES  period,        // period
   int              ma_period,     // averaging period
   int              ind_shift,     // shift
   int              applied        // price type, handle
   )
```

Parameters

string

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ind_shift

[in] Horizontal shift.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_DEMA for CiDEMA).

© 2000-2025, MetaQuotes Ltd.

CiTEMA

CiTEMA is a class intended for using the Triple Exponential Moving Average technical indicator.

Description

CiTEMA class provides the creation, setup, and access to the data of the Triple Exponential Moving Average indicator.

Declaration

```
class CiTEMA: public CIndicator
```

Title

```
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator
CiTEMA

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

IndShift

Returns the horizontal shift of the indicator.

```
int  IndShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,         // symbol
   ENUM_TIMEFRAMES  period,         // period
   int              ma_period,      // averaging period
   int              ma_shift,       // shift
   int              applied         // price type, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ma_shift

[in] Horizontal shift.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_TEMA for CiTEMA).

© 2000-2025, MetaQuotes Ltd.

CiFrAMA

CiFrAMA is a class intended for using the Fractal Adaptive Moving Average technical indicator.

Description

CiFrAMA class provides the creation, setup, and access to the data of the Fractal Adaptive Moving Average indicator.

   int              ma_shift,       // shift
   int              applied         // price type, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ma_shift

[in] Horizontal shift.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element of the specified index if successful, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_FRAMA for CiFrAMA).

© 2000-2025, MetaQuotes Ltd.

CiAMA

CiAMA is a class intended for using the Adaptive Moving Average technical indicator.

Description

CiAMA class provides the creation, setup, and access to the data of the Adaptive Moving Average indicator.

   int              slow_ema_period,     // slow EMA period
   int              ind_shift,           // shift
   int              applied              // price type, handle
   )
```

Parameters

string

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

fast_ema_period

[in] Fast EMA averaging period.

slow_ema_period

[in] Slow EMA averaging period.

ind_shift

[in] Horizontal shift.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element of the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_AMA for CiAMA).

© 2000-2025, MetaQuotes Ltd.

CiVIDyA

CiVIDyA is a class intended for using the Variable Index Dynamic Average technical indicator.

Description

CiVIDyA class provides the creation, setup, and access to the data of the Variable Index Dynamic Average indicator.

   int              applied          // price type, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

cmo_period

[in] Momentum period.

ema_period

[in] Averaging period.

ind_shift

[in] Horizontal shift.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_VIDYA for CiVIDyA).

© 2000-2025, MetaQuotes Ltd.

Oscillator Classes

This group of chapters contains the technical details of Oscillators classes, as well as descriptions of the appropriate components of the MQL5 Standard Library.

Class/group	Description
CiATR	Average True Range
CiBearsPower	Bears Power
CiBullsPower	Bulls Power
CiCCI	Commodity Channel Index
CiChaikin	Chaikin Oscillator
CiDeMarker	DeMarker
CiForce	Force Index
CiMACD	Moving Averages Convergence-Divergence
CiMomentum	Momentum
CiOsMA	Moving Average of Oscillator (MACD histogram)
CiRSI	Relative Strength Index
CiRVI	Relative Vigor Index
CiStochastic	Stochastic Oscillator
CiWPR	Williams' Percent Range
CiTriX	Triple Exponential Moving Averages Oscillator

© 2000-2025, MetaQuotes Ltd.

CiATR

CiATR is a class intended for using the Average True Range technical indicator.

Description

CiATR class provides the creation, setup, and access to the data of the Average True Range indicator.

Declaration

```
class CiATR: public CIndicator
```

Title

```
#include <Indicators\Oscilators.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator
CiATR

Class Methods by Groups

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,        // symbol
   ENUM_TIMEFRAMES  period,        // period
   int              ma_period      // averaging period
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_ATR for CiATR).

© 2000-2025, MetaQuotes Ltd.

CiBearsPower

CiBearsPower is a class intended for using the Bears Power technical indicator.

Description

CiBearsPower class provides the creation, setup, and access to the data of the Bears Power indicator.

Declaration

```
class CiBearsPower: public CIndicator
```

Title

```
#include <Indicators\Oscilators.mqh>
```

MaPeriod

Returns the averaging period.

```
int  MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,        // symbol
   ENUM_TIMEFRAMES  period,        // period
   int              ma_period      // averaging period
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_BEARS for CiBearsPower).

© 2000-2025, MetaQuotes Ltd.

CiBullsPower

CiBullsPower is a class intended for using the Bulls Power technical indicator.

Description

CiBullsPower class provides the creation, setup, and access to the data of the Bulls Power indicator.

Declaration

```
class CiBullsPower: public CIndicator
```

Title

   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_BULLS for CiBullsPower).

© 2000-2025, MetaQuotes Ltd.

CiCCI

CiCCI is a class intended for using the Commodity Channel Index technical indicator.

Description

CiCCI class provides the creation, setup, and access to the data of the Commodity Channel Index indicator.

Declaration

```
class CiCCI: public CIndicator
```

Title

```
#include <Indicators\Oscilators.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator

   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_CCI for CiCCI).

© 2000-2025, MetaQuotes Ltd.

CiChaikin

CiChaikin is a class intended for using the Chaikin Oscillator technical indicator.

Description

CiChaikin class provides the creation, setup, and access to the data of the Chaikin Oscillator indicator.

Declaration

```
class CiChaikin: public CIndicator
```

Title

```

FastMaPeriod

Returns the averaging period for the fast EMA.

```
int  FastMaPeriod() const
```

Return Value

Returns the averaging period for the fast EMA, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

SlowMaPeriod

Returns the averaging period for the slow EMA.

```
int  SlowMaPeriod() const
```

Return Value

Returns the averaging period for the slow EMA, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaMethod

Returns the averaging method.

```
ENUM_MA_METHOD  MaMethod() const
```

Return Value

Returns the averaging method, defined at the indicator creation (ENUM_MA_METHOD enumeration value).

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the object (volume type) to apply.

```
ENUM_APPLIED_VOLUME  Applied() const
```

Return Value

Object (volume type) to apply, defined at the indicator creation (ENUM_APPLIED_VOLUME enumeration value).

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string               symbol,              // symbol
   ENUM_TIMEFRAMES      period,              // period
   int                  fast_ma_period,      // fast EMA period
   int                  slow_ma_period,      // slow EMA period
   ENUM_MA_METHOD       ma_method,           // averaging method
   ENUM_APPLIED_VOLUME  applied              // volume type
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

fast_ma_period

[in] Period for fast EMA.

slow_ma_period

[in] Period for slow EMA.

ma_method

[in] Averaging method (ENUM_MA_METHOD enumeration value).

applied

[in] Object (volume type) to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_CHAIKIN for CiChaikin).

© 2000-2025, MetaQuotes Ltd.

CiDeMarker

CiDeMarker is a class intended for using the DeMarker technical indicator.

Description

CiDeMarker class provides the creation, setup, and access to the data of the DeMarker indicator.

Declaration

```
class CiDeMarker: public CIndicator
```

Title

```
#include <Indicators\Oscilators.mqh>
```

Inheritance hierarchy

   int                   ma_period,      // averaging period
   ENUM_MA_METHOD        ma_method,      // averaging method
   ENUM_APPLIED_VOLUME   applied         // volume type
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

ma_method

[in] Averaging method (ENUM_MA_METHOD enumeration value).

applied

[in] Object (volume type) to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_FORCE for CiForce).

© 2000-2025, MetaQuotes Ltd.

CiMACD

CiMACD is a class intended for using the Moving Averages Convergence-Divergence technical indicator.

Description

CiMACD class provides the creation, setup, and access to the data of the Moving Averages Convergence-Divergence indicator.

Declaration

```
class CiMACD: public CIndicator
```

Title

```
#include <Indicators\Oscilators.mqh>
```

FastEmaPeriod

Returns the averaging period for the fast EMA.

```
int  FastEmaPeriod() const
```

Return Value

Returns the averaging period for the fast EMA, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

SlowEmaPeriod

Returns the averaging period for the slow EMA.

```
int  SlowEmaPeriod() const
```

Return Value

Returns the averaging period for the slow EMA, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

SignalPeriod

Returns the averaging period for the signal line.

```
int  SignalPeriod() const
```

Return Value

Returns the averaging period for the signal line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,              // symbol
   ENUM_TIMEFRAMES  period,              // period
   int              fast_ema_period,     // fast EMA period
   int              slow_ema_period,     // slow EMA period
   int              signal_period,       // signal period
   int              applied              // price type, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

fast_ema_period

[in] Fast EMA averaging period.

slow_ema_period

[in] Slow EMA averaging period.

signal_period

[in] Signal line averaging period.

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the main line buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Main line buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Signal

Returns the buffer element of the signal line by the specified index.

```
double  Signal(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

The buffer element of the signal line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_MACD for CiMACD).

© 2000-2025, MetaQuotes Ltd.

CiMomentum

CiMomentum is a class intended for using the Momentum technical indicator.

Description

CiMomentum class provides the creation, setup, and access to the data of the Momentum indicator.

Declaration

```
class CiMomentum: public CIndicator
```

Title

```
#include <Indicators\Oscilators.mqh>
```

Inheritance hierarchy

Kperiod

Returns the averaging period for the %K line.

```
int  Kperiod() const
```

Return Value

Returns the averaging period for the %K line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Dperiod

Returns the averaging period for the %D line.

```
int  Dperiod() const
```

Return Value

Returns the averaging period for the %D line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Slowing

Returns the period of slowing.

```
int  Slowing() const
```

Return Value

Returns the period of slowing, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaMethod

Returns the averaging method.

```
ENUM_MA_METHOD  MaMethod() const
```

Return Value

Returns the averaging method, defined at the indicator creation (ENUM_MA_METHOD enumeration value).

© 2000-2025, MetaQuotes Ltd.

PriceField

Returns the object (Low/High or Close/Close) to apply.

```
ENUM_STO_PRICE  PriceField() const
```

Return Value

The object (Low/High or Close/Close) to apply, defined at the indicator creation (ENUM_STO_PRICE enumeration value).

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,          // symbol
   ENUM_TIMEFRAMES  period,          // period
   int              Kperiod,         // %K period
   int              Dperiod,         // %D period
   int              slowing,         // slowing period
   ENUM_MA_METHOD   ma_method,       // averaging method
   ENUM_STO_PRICE   price_field      // application
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

Kperiod

[in] Averaging period of %K indicator.

Dperiod

[in] Averaging period of %D indicator.

slowing

[in] Slowing period.

ma_method

[in] Averaging method (ENUM_MA_METHOD enumeration value).

price_field

[in] Object (Low/High or Close/Close) to apply (ENUM_STO_PRICE enumeration value).

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the main line buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Main line buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Signal

Returns the buffer element of the signal line by the specified index.

```
double  Signal(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

The buffer element of the signal line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_STOCHASTIC for CiStochastic).

© 2000-2025, MetaQuotes Ltd.

CiTriX

CiTriX is a class intended for using the Triple Exponential Moving Averages Oscillator technical indicator.

Description

CiTriX class provides the creation, setup, and access to the data of the Triple Exponential Moving Averages Oscillator indicator.

© 2000-2025, MetaQuotes Ltd.

CalcPeriod

Returns the period for calculation.

```
int  CalcPeriod() const
```

Return Value

Returns the period for calculation, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,          // symbol
   ENUM_TIMEFRAMES  period,          // period
   int              calc_period      // calculation period
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

calc_period

[in] Period for calculation.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_WPR for CiWPR).

© 2000-2025, MetaQuotes Ltd.

Volume Indicators

This group of chapters contains technical details of Volume indicator classes and descriptions of all the appropriate key components of the MQL5 Standard Library.

Class/group	Description
CiAD	Accumulation/Distribution
CiMFI	Money Flow Index
CiOBV	On Balance Volume
CiVolumes	Volumes

© 2000-2025, MetaQuotes Ltd.

CiAD

CiAD is a class intended for using the Accumulation/Distribution technical indicator.

Description

CiAD class provides the creation, setup, and access to the data of the Accumulation/Distribution indicator.

Declaration

```
class CiAD: public CIndicator
```

Title

```
#include <Indicators\Volumes.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator
CiAD

Class Methods by Groups

Applied

Returns the volume type to apply.

```
ENUM_APPLIED_VOLUME  Applied() const
```

Return Value

Volume type to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string                symbol,      // symbol
   ENUM_TIMEFRAMES       period,      // period
   ENUM_APPLIED_VOLUME   applied      // volume type
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

applied

[in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_AD for CiAD).

© 2000-2025, MetaQuotes Ltd.

CiMFI

CiMFI is a class intended for using the Money Flow Index technical indicator.

Description

CiMFI class provides the creation, setup, and access to the data of the Money Flow Index indicator.

Declaration

```
class CiMFI: public CIndicator
```

Title

```
#include <Indicators\Volumes.mqh>
```

   ENUM_APPLIED_VOLUME   applied         // volume type
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

ma_period

[in] Averaging period.

applied

[in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_MFI for CiMFI).

© 2000-2025, MetaQuotes Ltd.

CiOBV

CiOBV is a class intended for using the On Balance Volume technical indicator.

Description

CiOBV class provides the creation, setup, and access to the data of the On Balance Volume indicator.

Declaration

```
class CiOBV: public CIndicator
```

Title

```
#include <Indicators\Volumes.mqh>

JawPeriod

Returns the averaging period for the Jaw line.

```
int  JawPeriod() const
```

Return Value

Returns the averaging period for the Jaw line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

JawShift

Returns the horizontal shift of the Jaws line.

```
int  JawShift() const
```

Return Value

Horizontal shift of the Jaws line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

TeethPeriod

Returns the averaging period for the Teeth line.

```
int  TeethPeriod() const
```

Return Value

Returns the averaging period for the Teeth line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

TeethShift

Returns the horizontal shift of the Teeth line.

```
int  TeethShift() const
```

Return Value

Horizontal shift of the Teeth line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

LipsPeriod

Returns the averaging period for the Lips line.

```
int  LipsPeriod() const
```

Return Value

Returns the averaging period for the Lips line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

LipsShift

Returns the horizontal shift of the Lips line.

```
int  LipsShift() const
```

Return Value

Horizontal shift of the Lips line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaMethod

Returns the averaging method.

```
ENUM_MA_METHOD  MaMethod() const
```

Return Value

Returns the averaging method, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,           // symbol
   ENUM_TIMEFRAMES  period,           // period
   int              jaw_period,       // jaws period
   int              jaw_shift,        // jaws shift
   int              teeth_period,     // teeth period
   int              teeth_shift,      // teeth shift
   int              lips_period,      // lips period
   int              lips_shift,       // lips shift
   ENUM_MA_METHOD   ma_method,        // averaging method
   int              applied           // price type, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

jaw_period

[in] Jaws averaging period.

jaw_shift

[in] Jaws horizontal shift.

teeth_period

[in] Teeth averaging period.

teeth_shift

[in] Teeth horizontal shift.

lips_period

[in] Lips averaging period.

lips_shift

[in] Lips horizontal shift.

ma_method

[in] Moving average method (ENUM_MA_METHOD enumeration value).

applied

[in] Price type, handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Jaw

Returns the buffer element of the Jaws line by the specified index.

```
double  Jaw(
   int  index      // index
   )
```

Parameters

index

[in] Jaws line buffer element index.

Return Value

The buffer element of the Jaws line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Teeth

Returns the buffer element of the Teeth line by the specified index.

```
double  Teeth(
   int  index      // index
   )
```

Parameters

index

[in] Teeth line buffer element index.

Return Value

The buffer element of the Teeth line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Lips

Returns the buffer element of the Lips line by the specified index.

```
double  Lips(
   int  index      // index
   )
```

Parameters

index

[in] Lips line buffer element index.

Return Value

The buffer element of the Lips line by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_ALLIGATOR for CiAlligator).

© 2000-2025, MetaQuotes Ltd.

CiAO

CiAO is a class intended for using the Awesome Oscillator technical indicator.

Description

CiAO class provides the creation, setup, and access to the data of the Awesome Oscillator indicator.

Declaration

CiFractals

CiFractals is a class intended for using the Fractals technical indicator.

Description

CiFractals class provides the creation, setup, and access to the data of the Fractals indicator.

Declaration

```
class CiFractals: public CIndicator
```

Title

```
#include <Indicators\BillWilliams.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator
CiFractals

Class Methods by Groups

Create	
Create	Creates the indicator
Data Access	
Upper	Returns the data of the upper buffer
Lower	Returns the data of the lower buffer
Input/output	
virtual Type	Virtual identification method

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Methods inherited from class CArrayObj

FreeMode, FreeMode, Save, Load, CreateElement, Reserve, Resize, Shutdown, Add, AddArray, Insert, InsertArray, AssignArray, At, Update, Shift, Detach, Delete, DeleteRange, Clear,

© 2000-2025, MetaQuotes Ltd.

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

CompareArray, InsertSort, Search, SearchGreat, SearchLess, SearchGreatOrEqual, SearchLessOrEqual, SearchFirst, SearchLast

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent

Methods inherited from class CIndicator

Handle, Status, FullRelease, Redrawer, Create, BufferResize, BarsCalculated, GetData, GetData, GetData, GetData, Minimum, MinValue, Maximum, MaxValue, Refresh, AddToChart, DeleteFromChart, MethodDescription, PriceDescription, VolumeDescription

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,      // symbol
   ENUM_TIMEFRAMES  period       // period
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Upper

Returns the element of the upper buffer by the specified index.

```
double  Upper(
   int  index      // index
   )
```

Parameters

index

[in] Upper buffer element index.

Return Value

The element of the upper buffer by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Lower

Returns the element of the lower buffer by the specified index.

```
double  Lower(
   int  index      // index
   )
```

Parameters

index

[in] Lower buffer element index.

Return Value

The element of the lower buffer by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_FRACTALS for CiFractals).

© 2000-2025, MetaQuotes Ltd.

CiGator

CiGator is a class intended for using the Gator Oscillator technical indicator.

Description

CiGator class provides the creation, setup, and access to the data of the Gator Oscillator indicator.

Declaration

```
class CiGator: public CIndicator
```

Title

```
#include <Indicators\BillWilliams.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator
CiGator

Class Methods by Groups

Attributes	
JawPeriod	Returns the averaging period for the Jaws line
JawShift	Returns the horizontal shift of the Jaws line
TeethPeriod	Returns the averaging period for the Teeth line
TeethShift	Returns the horizontal shift of the Teeth line
LipsPeriod	Returns the averaging period for the Lips line
LipsShift	Returns the horizontal shift of the Lips line
MaMethod	Returns the averaging method
Applied	Returns the price type or handle to apply
Create Methods	
Create	Creates the indicator
Data Access Methods	
Upper	Returns the data of the upper buffer
Lower	Returns the data of the lower buffer

© 2000-2025, MetaQuotes Ltd.

JawPeriod

Returns the averaging period for the Jaws line.

```
int  JawPeriod() const
```

Return Value

Returns the averaging period for the Jaws line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

JawShift

Returns the horizontal shift of the Jaws line.

```
int  JawShift() const
```

Return Value

Horizontal shift of the Jaws line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

TeethPeriod

Returns the averaging period for the Teeth line.

```
int  TeethPeriod() const
```

Return Value

Returns the averaging period for the Teeth line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

TeethShift

Returns the horizontal shift of the Teeth line.

```
int  TeethShift() const
```

Return Value

Horizontal shift of the Teeth line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

LipsPeriod

Returns the averaging period for the Lips line.

```
int  LipsPeriod() const
```

Return Value

Returns the averaging period for the Lips line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

LipsShift

Returns the horizontal shift of the Lips line.

```
int  LipsShift() const
```

Return Value

Horizontal shift of the Lips line, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

MaMethod

Returns the averaging method.

```
ENUM_MA_METHOD  MaMethod() const
```

Return Value

Returns the averaging method, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the price type or handle to apply.

```
int  Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string           symbol,           // symbol
   ENUM_TIMEFRAMES  period,           // period
   int              jaw_period,       // jaws period
   int              jaw_shift,        // jaws shift
   int              teeth_period,     // teeth period
   int              teeth_shift,      // teeth shift
   int              lips_period,      // lips period
   int              lips_shift,       // lips shift
   ENUM_MA_METHOD   ma_method,        // averaging method
   int              applied           // price type, handle
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

jaw_period

[in] Jaws averaging period.

jaw_shift

[in] Jaws horizontal shift.

teeth_period

[in] Teeth averaging period.

teeth_shift

[in] Teeth horizontal shift.

lips_period

[in] Lips averaging period.

lips_shift

[in] Lips horizontal shift.

ma_method

[in] Averaging method (ENUM_MA_METHOD enumeration value).

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Upper

Returns the element of the upper buffer by the specified index.

```
double  Upper(
   int  index      // index
   )
```

Parameters

index

[in] Upper buffer element index.

Return Value

The upper buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Lower

Returns the element of the lower buffer by the specified index.

```
double  Upper(
   int  index      // index
   )
```

Parameters

index

[in] Lower buffer element index.

Return Value

The element of the lower buffer by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_GATOR for CiGator).

© 2000-2025, MetaQuotes Ltd.

CiBWMFI

CiBWMFI is a class intended for using the Market Facilitation Index by Bill Williams technical indicator.

Description

CiBWMFI class provides the creation, setup, and access to the data of the Market Facilitation Index by Bill Williams indicator.

Declaration

```
class CiBWMFI: public CIndicator
```

Title

```
#include <Indicators\BillWilliams.mqh>
```

Inheritance hierarchy

CObject
CArray
CArrayObj
CSeries
CIndicator
CiBWMFI

Class Methods by Groups

Attributes	
Applied	Returns the volume type to apply
Create	
Create	Creates the indicator
Data Access	
Main	Returns the buffer data

© 2000-2025, MetaQuotes Ltd.

Applied

Returns the volume type to apply.

```
ENUM_APPLIED_VOLUME  Applied() const
```

Return Value

Volume type to apply, defined at the indicator creation (ENUM_APPLIED_VOLUME enumeration value).

© 2000-2025, MetaQuotes Ltd.

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```
bool  Create(
   string                symbol,      // symbol
   ENUM_TIMEFRAMES       period,      // period
   ENUM_APPLIED_VOLUME   applied      // volume type
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration value).

applied

[in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.

© 2000-2025, MetaQuotes Ltd.

Main

Returns the buffer element by the specified index.

```
double  Main(
   int  index      // index
   )
```

Parameters

index

[in] Buffer element index.

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_BWMFI for CiBWMFI).

© 2000-2025, MetaQuotes Ltd.

CiCustom

CiCustom is a class intended for using the custom technical indicators.

Description

CiCustom class provides the creation, setup, and access to the data of a custom indicator.

Declaration

```
class CiCustom: public CIndicator
```

Title

```
#include <Indicators\Custom.mqh>
```

Class Methods by Groups

Attributes	
NumBuffers	Sets the number of buffers
NumParams	Gets the number of parameters used when creating an indicator
ParamType	Gets the type of the specified parameter
ParamLong	Gets the value of the specified parameter of integer type
ParamDouble	Gets the value of the specified parameter of double type
ParamString	Gets the value of the specified parameter of string type
Input/output	
virtual Type	Virtual identification method

© 2000-2025, MetaQuotes Ltd.

NumBuffers

Sets the number of buffers.

```
bool  NumBuffers(
```

Return Value

true - successful, false - cannot set the necessary number of buffers.

© 2000-2025, MetaQuotes Ltd.

NumParams

Gets the number of parameters used when creating an indicator.

```
int  NumParams() const
```

Return Value

Number of parameters, used in creation of the indicator.

© 2000-2025, MetaQuotes Ltd.

ParamType

Gets a type of the parameter.

```
ENUM_DATATYPE  ParamType(
   int  index      // index
   ) const
```

Parameters

index

[in] Parameter index.

Return Value

Returns the data type of the specified parameter, used in indicator creation.

Note

If parameter index is invalid, it returns WRONG_VALUE.

© 2000-2025, MetaQuotes Ltd.

ParamLong

Gets the value of specified parameter of long type.

```
long  ParamLong(
   int  index      // index
   ) const
```

Parameters

index

[in] Parameter index.

Return Value

The value of specified parameter of long type, used in creation of the indicator.

Note

If the parameter index is invalid or the parameter is not of long type, it returns 0.

© 2000-2025, MetaQuotes Ltd.

ParamDouble

Gets the value of specified parameter of double type.

```
double  ParamDouble(
   int  index      // index
   ) const
```

Parameters

index

[in] Parameter index.

Return Value

The value of specified parameter of double type, used in creation of the indicator.

Note

If the parameter index is invalid or the parameter type is not of double type, it returns EMPTY_VALUE.

© 2000-2025, MetaQuotes Ltd.

ParamString

Gets the value of specified parameter of string type.

```
string  ParamString(
   int  index      // index
   ) const
```

Parameters

index

[in] Parameter index.

Return Value

The value of specified string parameter, used in creation of the indicator.

Note

If the number is invalid or the parameter is not of string type, it returns an empty string.

© 2000-2025, MetaQuotes Ltd.

Type

Virtual identification method.

```
virtual int  Type() const
```

Return Value

Indicator type (IND_CUSTOM for CiCustom).

© 2000-2025, MetaQuotes Ltd.

Trade Classes

This section contains technical details of working with trade classes and description of the relevant components of the MQL5 standard library.

Using trade classes will save time when creating custom programs (Expert Advisors).

MQL5 Standard Library (in terms of trade classes) is placed in the terminal working directory, in the Include\Trade folder.

Class/Group	Description
CAccountInfo	Class for working with trade account properties
CSymbolInfo	Class for working with trade instrument properties
COrderInfo	Class for working with pending order properties
CHistoryOrderInfo	Class for working with history order properties
CPositionInfo	Class for working with open position properties
CDealInfo	Class for working with history deal properties
CTrade	Class for trade operations execution
CTerminalInfo	Class for getting the properties of the terminal environment

© 2000-2025, MetaQuotes Ltd.

CAccountInfo

CAccountInfo is a class for easy access to the currently opened trade account properties.

Description

CAccountInfo class provides easy access to the currently opened trade account properties.

Declaration

```
class CAccountInfo : public CObject
```

Title

```
#include <Trade\AccountInfo.mqh>
```

Inheritance hierarchy

CObject

CAccountInfo

Class methods by groups

Access to integer type properties	
Login	Gets the account number
TradeMode	Gets the trade mode
TradeModeDescription	Gets the trade mode as a string
Leverage	Gets the amount of given leverage
StopoutMode	Gets the mode of stop out setting
StopoutModeDescription	Gets the mode of stop out setting as a string
TradeAllowed	Gets the flag of trade allowance
TradeExpert	Gets the flag of automated trade allowance
LimitOrders	Gets the maximal number of allowed pending orders
MarginMode	Gets margin calculation mode
MarginModeDescription	Gets margin calculation mode as a string
Access to double type properties	
Balance	Gets the balance of account
Credit	Gets the amount of given credit
Profit	Gets the amount of current profit on account

© 2000-2025, MetaQuotes Ltd.

Access to integer type properties	
Equity	Gets the amount of current equity on account
Margin	Gets the amount of reserved margin
FreeMargin	Gets the amount of free margin
MarginLevel	Gets the level of margin
MarginCall	Gets the level of margin for deposit
MarginStopOut	Gets the level of margin for Stop Out
Access to text properties	
Name	Gets the client name
Server	Gets the trade server name
Currency	Gets the deposit currency name
Company	Gets the company name that serves an account
Access to MQL5 API functions	
InfoInteger	Gets the value of specified integer type property
InfoDouble	Gets the value of specified double type property
InfoString	Gets the value of specified string type property
Additional methods	
OrderProfitCheck	Gets the evaluated profit based on the parameters passed
MarginCheck	Gets the amount of margin required to execute trade operation
FreeMarginCheck	Gets the amount of free margin left after execution of trade operation
MaxLotCheck	Gets the maximal possible volume of trade operation

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

Login

Gets the account number.

```
long  Login() const
```

Return Value

Account number.

© 2000-2025, MetaQuotes Ltd.

TradeMode

Gets the trade mode.

```
ENUM_ACCOUNT_TRADE_MODE  TradeMode() const
```

Return Value

Trade mode from the ENUM_ACCOUNT_TRADE_MODE enumeration.

© 2000-2025, MetaQuotes Ltd.

TradeModeDescription

Gets the trade mode as a string.

```
string  TradeModeDescription() const
```

Return Value

Trade mode as a string.

© 2000-2025, MetaQuotes Ltd.

Leverage

Gets the amount of given leverage.

```
long  Leverage() const
```

Return Value

Amount of given leverage.

© 2000-2025, MetaQuotes Ltd.

StopoutMode

Gets the mode of the Stop Out level specification.

```
ENUM_ACCOUNT_STOPOUT_MODE  StopoutMode() const
```

Return Value

The stop out setting mode from the ENUM_ACCOUNT_STOPOUT_MODE enumeration.

© 2000-2025, MetaQuotes Ltd.

StopoutModeDescription

Gets the mode of the Stop Out level specification as a string.

```
string  StopoutModeDescription() const
```

Return Value

The stop out setting mode as a string.

© 2000-2025, MetaQuotes Ltd.

MarginMode

Gets the margin calculation mode.

```
ENUM_ACCOUNT_MARGIN_MODE  MarginMode() const
```

Return Value

The margin calculation mode from the ENUM_ACCOUNT_MARGIN_MODE enumeration.

© 2000-2025, MetaQuotes Ltd.

MarginModeDescription

Gets the margin calculation mode as a string.

```
string  MarginModeDescription() const
```

Return Value

Margin calculation mode as a string.

© 2000-2025, MetaQuotes Ltd.

TradeAllowed

Gets the flag of trade allowance.

```
bool  TradeAllowed() const
```

Return Value

Flag of trade allowance.

© 2000-2025, MetaQuotes Ltd.

TradeExpert

Gets the flag of automated trade allowance.

```
bool  TradeExpert() const
```

Return Value

Flag of automated trade allowance.

© 2000-2025, MetaQuotes Ltd.

LimitOrders

Gets the maximal number of allowed pending orders

```
int  LimitOrders() const
```

Return Value

The maximal number of allowed pending orders.

Note

0 - no limits.

© 2000-2025, MetaQuotes Ltd.

Balance

Gets the balance of account.

```
double  Balance() const
```

Return Value

The balance of account (in deposit currency).

© 2000-2025, MetaQuotes Ltd.

Credit

Gets the amount of given credit.

```
double  Credit() const
```

Return Value

Amount of given credit (in deposit currency).

© 2000-2025, MetaQuotes Ltd.

Profit

Gets the amount of current profit on account.

```
double  Profit() const
```

Return Value

Amount of current profit on account (in deposit currency).

© 2000-2025, MetaQuotes Ltd.

Equity

Gets the amount of current equity on account.

```
double  Equity() const
```

Return Value

Amount of current equity on account (in deposit currency).

© 2000-2025, MetaQuotes Ltd.

Margin

Gets the amount of reserved margin.

```
double  Margin() const
```

Return Value

Amount of reserved margin (in deposit currency).

© 2000-2025, MetaQuotes Ltd.

FreeMargin

Gets the amount of free margin.

```
double  FreeMargin() const
```

Return Value

Amount of free margin (in deposit currency).

© 2000-2025, MetaQuotes Ltd.

MarginLevel

Gets the level of margin.

```
double  MarginLevel() const
```

Return Value

Level of margin.

© 2000-2025, MetaQuotes Ltd.

MarginCall

Gets the level of margin for a deposit.

```
double  MarginCall() const
```

Return Value

Level of margin for a deposit.

© 2000-2025, MetaQuotes Ltd.

MarginStopOut

Gets the level of margin for Stop Out.

```
double  MarginStopOut() const
```

Return Value

Level of margin for Stop Out.

© 2000-2025, MetaQuotes Ltd.

Name

Gets the client name.

```
string  Name() const
```

Return Value

Client name.

© 2000-2025, MetaQuotes Ltd.

Server

Gets the trade server name.

```
string  Server() const
```

Return Value

Trade server name.

© 2000-2025, MetaQuotes Ltd.

Currency

Gets the deposit currency name.

```
string  Currency() const
```

Return Value

Deposit currency name.

© 2000-2025, MetaQuotes Ltd.

Company

Gets the company name, that serves an account.

```
string  Company() const
```

Return Value

Company name that serves an account.

© 2000-2025, MetaQuotes Ltd.

InfoInteger

Gets the value of specified integer type property.

```
long  InfoInteger(
   ENUM_ACCOUNT_INFO_INTEGER  prop_id     // property ID
   ) const
```

Parameters

prop_id

[in] Identifier of the property. The value can be one of the values of ENUM_ACCOUNT_INFO_INTEGER enumeration.

Return Value

Value of long type.

© 2000-2025, MetaQuotes Ltd.

InfoDouble

Gets the value of specified double type property.

```
double  InfoDouble(
   ENUM_ACCOUNT_INFO_DOUBLE  prop_id     // property ID
   ) const
```

Parameters

prop_id

[in] Identifier of the property. The value can be one of the values of ENUM_ACCOUNT_INFO_DOUBLE enumeration.

Return Value

Value of double type.

© 2000-2025, MetaQuotes Ltd.

InfoString

Gets the value of specified string type property.

```
string  InfoString(
   ENUM_ACCOUNT_INFO_STRING  prop_id     // property ID
   ) const
```

Parameters

prop_id

[in] Identifier of the property. The value can be one of the values of ENUM_ACCOUNT_INFO_STRING enumeration.

Return Value

Value of string type.

© 2000-2025, MetaQuotes Ltd.

OrderProfitCheck

The function calculates the profit for the current account, based on the parameters passed. The function is used for pre-evaluation of the result of a trade operation. The value is returned in the account currency.

```
double  OrderProfitCheck(
   const string        symbol,              // symbol
   ENUM_ORDER_TYPE     trade_operation,     // order type (ORDER_TYPE_BUY or ORDER_TYP
   double              volume,              // volume
   double              price_open,          // position open price
   double              price_close          // position close price
   ) const
```

Parameters

symbol

[in] Symbol for trade operation.

trade_operation

[in] Type of trade operation from ENUM_ORDER_TYPE enumeration.

volume

[in] Volume of trade operation.

price_open

[in] Open price.

price_close

[in] Close price.

Return Value

If successful, it returns amount of profit or EMPTY_VALUE in the case of error.

© 2000-2025, MetaQuotes Ltd.

MarginCheck

Gets the amount of margin, required for trade operation.

```
double  MarginCheck(
   const string         symbol,              // symbol
   ENUM_ORDER_TYPE      trade_operation,     // order type (ORDER_TYPE_BUY or ORDER_TYI
   double               volume,              // volume
   double               price                // price
   ) const
```

Parameters

symbol

[in] Symbol for trade operation.

trade_operation

[in] Type of trade operation from ENUM_ORDER_TYPE enumeration.

volume

[in] Volume of trade operation.

price

[in] Price of trade operation.

Return Value

Amount of margin required for trade operation.

© 2000-2025, MetaQuotes Ltd.

FreeMarginCheck

Gets the amount of free margin left after trade operation.

```
double  FreeMarginCheck(
   const string         symbol,              // symbol
   ENUM_ORDER_TYPE      trade_operation,     // order type (ORDER_TYPE_BUY or ORDER_TYI
   double               volume,              // volume
   double               price                // price
   ) const
```

Parameters

symbol

[in] Symbol for trade operation.

trade_operation

[in] Type of trade operation from ENUM_ORDER_TYPE enumeration.

volume

[in] Volume of trade operation.

price

[in] Price of trade operation.

Return Value

Amount of free margin left after trade operation.

© 2000-2025, MetaQuotes Ltd.

MaxLotCheck

Gets the maximum possible volume of trade operation.

```
double  MaxLotCheck(
   const string         symbol,              // symbol
   ENUM_ORDER_TYPE      trade_operation,     // order type (ORDER_TYPE_BUY or ORDER_TYP
   double               price,               // price
   double               percent=100          // percent of available margin (default is
   ) const
```

Parameters

symbol

[in] Symbol for trade operation.

trade_operation

[in] Type of trade operation from ENUM_ORDER_TYPE enumeration.

price

[in] Price of trade operation.

percent=100

[in] Percent of available margin (in %) to be used for trade operation.

Return Value

Maximum possible volume of trade operation.

CSymbolInfo

CSymbolInfo is a class for easy access to the symbol properties.

Description

CSymbolInfo class provides access to the symbol properties.

Declaration

```
class CSymbolInfo : public CObject
```

Title

```
#include <Trade\SymbolInfo.mqh>
```

Inheritance hierarchy

CObject

CSymbolInfo

Class methods by groups

Controlling	
Refresh	Refreshes the symbol data
RefreshRates	Refreshes the symbol quotes
Properties	
Name	Gets/sets symbol name
Select	Gets/sets the "Market Watch" symbol flag
IsSynchronized	Checks the symbol synchronization with server
Volumes	
Volume	Gets the volume of last deal
VolumeHigh	Gets the maximal volume for a day
VolumeLow	Gets the minimal volume for a day
Miscellaneous	
Time	Gets the time of last quote
Spread	Gets the amount of spread (in points)
SpreadFloat	Gets the flag of floating spread
TicksBookDepth	Gets the depth of ticks saving
Levels	

© 2000-2025, MetaQuotes Ltd.

Controlling	
StopsLevel	Gets the minimal indent for orders (in points)
FreezeLevel	Gets the distance of freezing trade operations (in points)
Bid prices	
Bid	Gets the current Bid price
BidHigh	Gets the maximal Bid price for a day
BidLow	Gets the minimal Bid price for a day
Ask prices	
Ask	Gets the current Ask price
AskHigh	Gets the maximal Ask price for a day
AskLow	Gets the minimal Ask price for a day
Prices	
Last	Gets the current Last price
LastHigh	Gets the maximal Last price for a day
LastLow	Gets the minimal Last price for a day
Trade modes	
TradeCalcMode	Gets the mode of contract cost calculation
TradeCalcModeDescription	Gets the mode of contract cost calculation as a string
TradeMode	Gets the type of order execution
TradeModeDescription	Gets the type of order execution as a string
TradeExecution	Gets the trade execution mode
TradeExecutionDescription	Gets the execution mode as a string
Swaps	
SwapMode	Gets the swap calculation mode
SwapModeDescription	Gets the swap calculation mode as a string
SwapRollover3days	Gets the day of triple swap charge
SwapRollover3daysDescription	Gets the day of triple swap charge as a string
Margins and flags	
MarginInitial	Gets the value of initial margin
MarginMaintenance	Gets the value of maintenance margin
MarginLong	Gets the rate of margin charging for long positions

© 2000-2025, MetaQuotes Ltd.

Controlling	
MarginShort	Gets the rate of margin charging for short positions
MarginLimit	Gets the rate of margin charging for Limit orders
MarginStop	Gets the rate of margin charging for Stop orders
MarginStopLimit	Gets the rate of margin charging for StopLimit orders
TradeTimeFlags	Gets the flags of allowed expiration modes
TradeFillFlags	Gets the flags of allowed filling modes
Quantization	
Digits	Gets the number of digits after period
Point	Gets the value of one point
TickValue	Gets the tick value (minimal change of price)
TickValueProfit	Gets the calculated tick price for a profitable position
TickValueLoss	Gets the calculated tick price for a losing position
TickSize	Gets the minimal change of price
Contracts sizes	
ContractSize	Gets the amount of trade contract
LotsMin	Gets the minimal volume to close a deal
LotsMax	Gets the maximal volume to close a deal
LotsStep	Gets the minimal step of volume change to close a deal
LotsLimit	Gets the maximal allowed volume of opened position and pending orders (direction insensitive) for one symbol
Swaps sizes	
SwapLong	Gets the value of long position swap
SwapShort	Gets the value of short position swap
Text properties	
CurrencyBase	Gets the name of symbol base currency
CurrencyProfit	Gets the profit currency name
CurrencyMargin	Gets the margin currency name
Bank	Gets the name of current quote source
Description	Gets the string description of symbol
Path	Gets the path in symbols tree
Symbol properties	

© 2000-2025, MetaQuotes Ltd.

Controlling	
SessionDeals	Gets the number of deals in the current session
SessionBuyOrders	Gets the number of Buy orders at the moment
SessionSellOrders	Gets the number of Sell orders at the moment
SessionTurnover	Gets the summary of turnover of the current session
SessionInterest	Gets the summary of open interest of the current session
SessionBuyOrdersVolume	Gets the current volume of Buy orders
SessionSellOrdersVolume	Gets the current volume of Sell orders
SessionOpen	Gets the open price of the current session
SessionClose	Gets the close price of the current session
SessionAW	Gets the average weighted price of the current session
SessionPriceSettlement	Gets the settlement price of the current session
SessionPriceLimitMin	Gets the minimal price of the current session
SessionPriceLimitMax	Gets the maximal price of the current session
Access to MQL5 API functions	
InfoInteger	Gets the value of specified integer type property
InfoDouble	Gets the value of specified double type property
InfoString	Gets the value of specified string type property
Service functions	
NormalizePrice	Returns the value of price, normalized using the symbol properties

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

Refresh

Refreshes the symbol data.

```
void  Refresh()
```

Return Value

None.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

RefreshRates

Refreshes the symbol quotes data.

```
bool  RefreshRates()
```

Return Value

true - success, false - unable to refresh quotes.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Name

Gets symbol name.

```
string  Name() const
```

Return Value

Symbol name.

Name

Sets symbol name.

```
bool  Name(string name)
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Select

Gets the "Market Watch" symbol flag.

```
bool  Select() const
```

Return Value

"Market Watch" symbol flag.

Select

Sets the "Market Watch" symbol flag.

```
bool  Select()
```

Return Value

true - success, false - unable to change flag.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

IsSynchronized

Checks the symbol synchronization with server.

```
bool  IsSynchronized() const
```

Return Value

true - if the symbol is synchronized with server, false - if not.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Volume

Gets the volume of last deal.

```
long  Volume() const
```

Return Value

Volume of last deal.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

VolumeHigh

Gets the maximal volume of the day.

```
long  VolumeHigh() const
```

Return Value

Maximal volume of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

VolumeLow

Gets the minimal volume of the day.

```
long  VolumeLow() const
```

Return Value

Minimal volume of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Time

Gets the time of last quote.

```
datetime  Time() const
```

Return Value

Time of last quote.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Spread

Gets the amount of spread (in points).

```
int  Spread() const
```

Return Value

Gets the amount of spread (in points).

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SpreadFloat

Gets the flag of floating spread.

```
bool  SpreadFloat() const
```

Return Value

Flag of floating spread.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TicksBookDepth

Gets the depth of ticks saving.

```
int  TicksBookDepth() const
```

Return Value

Depth of ticks saving.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

StopsLevel

Gets the minimal stop level for orders (in points).

```
int  StopsLevel() const
```

Return Value

Minimal stop level for orders (in points).

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

FreezeLevel

Gets the freeze level (in points).

```
int  FreezeLevel() const
```

Return Value

Distance of freeze level (in points).

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Bid

Gets the current Bid price.

```
double  Bid() const
```

Return Value

Current Bid price.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

BidHigh

Gets the maximal Bid price of the day.

```
double  BidHigh() const
```

Return Value

Maximal Bid price of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

BidLow

Gets the minimal Bid price of the day.

```
double  BidLow() const
```

Return Value

Minimal Bid price of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Ask

Gets the current Ask price.

```
double  Ask() const
```

Return Value

Current Ask price.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

AskHigh

Gets the maximal Ask price for a day.

```
double  AskHigh() const
```

Return Value

Maximal Ask price of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

AskLow

Gets the minimal Ask price for a day.

```
double  AskLow() const
```

Return Value

Minimal Ask price of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Last

Gets the current Last price.

```
double  Last() const
```

Return Value

Current Last price.

© 2000-2025, MetaQuotes Ltd.

LastHigh

Gets the maximal Last price of the day.

```
double  LastHigh() const
```

Return Value

Maximal Last price of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

LastLow

Gets the minimal Last price of the day.

```
double  LastLow() const
```

Return Value

Minimal Last price of the day.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeCalcMode

Gets the mode of contract cost calculation.

```
ENUM_SYMBOL_CALC_MODE  TradeCalcMode() const
```

Return Value

Mode of contract cost calculation from ENUM_SYMBOL_CALC_MODE enumeration.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeCalcModeDescription

Gets the mode of contract cost calculation as a string.

```
string  TradeCalcModeDescription() const
```

Return Value

Mode of contract cost calculation as a string.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeMode

Gets the order execution type.

```
ENUM_SYMBOL_TRADE_MODE  TradeMode() const
```

Return Value

Order execution type from ENUM_SYMBOL_TRADE_MODE enumeration.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeModeDescription

Gets the trade mode as a string.

```
string  TradeModeDescription() const
```

Return Value

Trade mode as a string.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeExecution

Gets the trade execution mode.

```
ENUM_SYMBOL_TRADE_EXECUTION  TradeExecution() const
```

Return Value

Trade execution mode from ENUM_SYMBOL_TRADE_EXECUTION enumeration.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeExecutionDescription

Gets the description of trade execution mode as a string.

```
string  TradeExecutionDescription() const
```

Return Value

Trade execution mode as a string.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SwapMode

Gets the swap calculation mode.

```
ENUM_SYMBOL_SWAP_MODE  SwapMode() const
```

Return Value

Swap calculation mode from ENUM_SYMBOL_SWAP_MODE enumeration.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SwapModeDescription

Gets the swap mode description as a string.

```
string  SwapModeDescription() const
```

Return Value

Swap mode descriprion as a string.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SwapRollover3days

Gets the swap rollover day.

```
ENUM_DAY_OF_WEEK  SwapRollover3days() const
```

Return Value

Swap rollover day from ENUM_DAY_OF_WEEK enumeration.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SwapRollover3daysDescription

Gets the swap rollover day as a string.

```
string  SwapRollover3daysDescription() const
```

Return Value

Swap rollover day as a string.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

MarginInitial

Gets the value of initial margin.

```
double  MarginInitial()
```

Return Value

Value of initial margin.

Note

It returns the amount of margin (in margin currency of instrument) that is charged from one lot. Used to check client's equity, when they enter the market.

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

MarginMaintenance

Gets the value of maintenance margin.

```
double  MarginMaintenance()
```

Return Value

Value of maintenance margin.

Note

It returns the amount of margin (in margin currency of instrument) that is charged from one lot. Used to check client's equity, when the account state is changed. If the maintenance margin is equal to 0, then the initial margin is used.

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

MarginLong

Gets the rate of margin charging on long positons.

```
double  MarginLong() const
```

Return Value

Rate of margin charging on long positons.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

MarginShort

Gets the rate of margin charging on short positons.

```
double  MarginShort() const
```

Return Value

Rate of margin charging on short positons.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

MarginLimit

Gets the rate of margin charging on Limit orders.

```
double  MarginLimit() const
```

Return Value

Rate of margin charging on Limit orders.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

MarginStop

Gets the rate of margin charging on Stop orders.

```
double  MarginStop() const
```

Return Value

Rate of margin charging on Stop orders.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

MarginStopLimit

Gets the rate of margin charging on Stop Limit orders.

```
double  MarginStopLimit() const
```

Return Value

Rate of margin charging on Stop Limit orders.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeTimeFlags

Gets the flags of allowed expiration modes.

```
int  TradeTimeFlags() const
```

Return Value

Flags of allowed expiration modes.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TradeFillFlags

Gets the flags of allowed filling modes.

```
int  TradeFillFlags() const
```

Return Value

Flags of allowed filling modes.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Digits

Gets the number of digits after period.

```
int  Digits() const
```

Return Value

The number of digits after period.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Point

Gets the value of one point.

```
double  Point() const
```

Return Value

Value of one point.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TickValue

Gets the tick value (minimal change of price).

```
double  TickValue() const
```

Return Value

Tick value (minimal change of price).

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TickValueProfit

Gets the calculated tick price for a profitable position.

```
double  TickValueProfit() const
```

Return Value

The calculated tick price for a profitable position.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TickValueLoss

Gets the calculated tick price for a losing position.

```
double  TickValueLoss() const
```

Return Value

The calculated tick price for a losing position.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

TickSize

Gets the minimal change of price.

```
double  TickSize() const
```

Return Value

Minimal change of price.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

ContractSize

Gets the amount of trade contract.

```
double  ContractSize() const
```

Return Value

Amount of trade contract.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

LotsMin

Gets the minimal volume to close a deal.

```
double  LotsMin() const
```

Return Value

Minimal volume to close a deal.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

LotsMax

Gets the maximal volume to close a deal.

```
double  LotsMax() const
```

Return Value

Maximal volume to close a deal.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

LotsStep

Gets the minimal step of volume change to close a deal.

```
double  LotsStep() const
```

Return Value

Minimal step of volume change to close a deal.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

LotsLimit

Gets the maximal allowed volume of opened position and pending orders (direction insensitive) for one symbol.

```
double  LotsLimit() const
```

Return Value

The maximal allowed volume of opened position and pending orders (direction insensitive) for one symbol.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SwapLong

Gets the value of long position swap.

```
double  SwapLong() const
```

Return Value

Value of long position swap.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SwapShort

Gets the value of short position swap.

```
double  SwapShort() const
```

Return Value

Value of short position swap.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

CurrencyBase

Gets the name of symbol base currency.

```
string  CurrencyBase() const
```

Return Value

Name of symbol base currency.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

CurrencyProfit

Gets the profit currency name.

```
string  CurrencyProfit() const
```

Return Value

Profit currency name.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

CurrencyMargin

Gets the margin currency name.

```
string  CurrencyMargin() const
```

Return Value

Margin currency name.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Bank

Gets the name of current quote source.

```
string  Bank() const
```

Return Value

Name of current quote source.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Description

Gets the string description of symbol.

```
string  Description() const
```

Return Value

String description of symbol.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

Path

Gets the path in symbols tree.

```
string  Path() const
```

Return Value

Gets the path in symbols tree.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionDeals

Gets the number of deals in the current session.

```
long  SessionDeals() const
```

Return Value

Number of deals in the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionBuyOrders

Gets the number of Buy orders at the moment.

```
long  SessionBuyOrders() const
```

Return Value

Number of Buy orders at the moment.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionSellOrders

Gets then number of Sell orders at the moment.

```
long  SessionSellOrders() const
```

Return Value

Number of Sell orders at the moment.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionTurnover

Gets summary turnover of the current session.

```
double  SessionTurnover() const
```

Return Value

Summary turnover of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionInterest

Gets the summary of open interest of the current session.

```
double  SessionInterest() const
```

Return Value

Summary open interest of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionBuyOrdersVolume

Gets the current volume of Buy orders.

```
double  SessionBuyOrdersVolume() const
```

Return Value

Current volume of Buy orders.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionSellOrdersVolume

Gets the current volume of Sell orders.

```
double  SessionSellOrdersVolume() const
```

Return Value

Current volume of Sell orders.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionOpen

Gets the open price of the current session.

```
double  SessionOpen() const
```

Return Value

Open price of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionClose

Gets the close price of the current session.

```
double  SessionClose() const
```

Return Value

Close price of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionAW

Gets the average weighted price of the current session.

```
double  SessionAW() const
```

Return Value

Average weighted price of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionPriceSettlement

Gets the settlement price of the current session.

```
double  SessionPriceSettlement() const
```

Return Value

Settlement price of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionPriceLimitMin

Gets the minimal price of the current session.

```
double  SessionPriceLimitMin() const
```

Return Value

Minimal price of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

SessionPriceLimitMax

Gets the maximal price of the current session.

```
double  SessionPriceLimitMax() const
```

Return Value

Maximal price of the current session.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

InfoInteger

Gets the value of specified integer type property.

```
bool  InfoInteger(
   ENUM_SYMBOL_INFO_INTEGER  prop_id,      // property ID
   long&                     var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of integer type property from ENUM_SYMBOL_INFO_INTEGER enumeration.

var

[out] Reference to long type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

InfoDouble

Gets the value of specified double type property.

```
bool  InfoDouble(
   ENUM_SYMBOL_INFO_DOUBLE  prop_id,      // property ID
   double&                  var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of double type property from ENUM_SYMBOL_INFO_DOUBLE enumeration.

var

[out] Reference to double type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

InfoString

Gets the value of specified string type property.

```
bool  InfoString(
   ENUM_SYMBOL_INFO_STRING  prop_id,      // property ID
   string&                  var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of text property.

var

[out] Reference to string type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

NormalizePrice

Returns the value of price normalized using the symbol properties.

```
double  NormalizePrice(
   double  price   // price
   ) const
```

Parameters

price

[in] Price.

Return Value

Normalized price.

Note

The symbol should be selected by Name method.

© 2000-2025, MetaQuotes Ltd.

COrderInfo

COrderInfo is a class for easy access to the pending order properties.

Description

COrderInfo class provides access to the pending order properties.

Declaration

```
class COrderInfo : public CObject
```

Title

```
#include <Trade\OrderInfo.mqh>
```

Inheritance hierarchy

CObject

COrderInfo

Class methods by groups

Access to integer type properties	
Ticket	Gets the ticket of an order, previously selected for access
TimeSetup	Gets the time of order placement
TimeSetupMsc	Receives the time of placing an order in milliseconds since 01.01.1970
OrderType	Gets the order type
OrderTypeDescription	Gets the order type as a string
State	Gets the order state
StateDescription	Gets the order state as a string
TimeExpiration	Gets the time of order expiration
TimeDone	Gets the time of order execution or cancellation
TimeDoneMsc	Receives order execution or cancellation time in milliseconds since 01.01.1970
TypeFilling	Gets the type of order execution by remainder
TypeFillingDescription	Gets the type of order execution by remainder as a string
TypeTime	Gets the type of order at the time of the expiration
TypeTimeDescription	Gets the order type by expiration time as a string
Magic	Gets the ID of expert that placed the order

© 2000-2025, MetaQuotes Ltd.

Access to integer type properties	
PositionId	Gets the ID of position
Access to double type properties	
VolumeInitial	Gets the initial volume of order
VolumeCurrent	Gets the unfilled volume of order
PriceOpen	Gets the order price
StopLoss	Gets the order's Stop Loss
TakeProfit	Gets the order's Take Profit
PriceCurrent	Gets the current price by order symbol
PriceStopLimit	Gets the price of a Limit order
Access to text properties	
Symbol	Gets the name of order symbol
Comment	Gets the order comment
Access to MQL5 API functions	
InfoInteger	Gets the value of specified integer type property
InfoDouble	Gets the value of specified double type property
InfoString	Gets value of specified string type property
State	
StoreState	Saves the order parameters
CheckState	Checks the current parameters against the saved parameters
Selection	
Select	Selects an order by ticket for further access to its properties
SelectByIndex	Selects an order by index for further access to its properties

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

Ticket

Gets the ticket of an order.

```
ulong  Ticket() const
```

Return Value

Order ticket if successful, otherwise - ULONG_MAX.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeSetup

Gets the time of order placement.

```
datetime  TimeSetup() const
```

Return Value

Time of order placement.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeSetupMsc

Receives the time of placing an order for execution in milliseconds since 01.01.1970.

```
ulong  TimeSetupMsc() const
```

Return Value

The time of placing an order for execution in milliseconds since 01.01.1970.

Note

Order should be preliminarily selected for access using Select (by ticket) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

OrderType

Gets the order type.

```
ENUM_ORDER_TYPE  OrderType()
```

Return Value

Order type from ENUM_ORDER_TYPE enumeration.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeDescription

Gets the order type as a string.

```
string  TypeDescription() const
```

Return Value

Order type as a string.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

State

Gets the order state.

```
ENUM_ORDER_STATE  State() const
```

Return Value

Order state from ENUM_ORDER_STATE enumeration.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

StateDescription

Gets the order state as a string.

```
string  StateDescription() const
```

Return Value

Order state as a string.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeExpiration

Gets the order expiration time.

```
datetime  TimeExpiration() const
```

Return Value

Order expiration time, set on its placement.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeDone

Gets the time of order execution or cancellation.

```
datetime  TimeDone() const
```

Return Value

Time of order execution or cancellation.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeDoneMsc

Receives order execution or cancellation time in milliseconds since 01.01.1970.

```
ulong  TimeDoneMsc() const
```

Return Value

Order execution or cancellation time in milliseconds since 01.01.1970.

Note

Order should be preliminarily selected for access using Select (by ticket) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

TypeFilling

Gets the order filling type.

```
ENUM_ORDER_TYPE_FILLING  TypeFilling() const
```

Return Value

Order filling type from ENUM_ORDER_TYPE_FILLING enumeration.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeFillingDescription

Gets the order filling type as a string.

```
string  TypeFillingDescription() const
```

Return Value

Order filling type as a string.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeTime

Gets the type of order at the time of the expiration.

```
ENUM_ORDER_TYPE_TIME  TypeTime() const
```

Return Value

Type of order at the time of the expiration from ENUM_ORDER_TYPE_TIME enumeration.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeTimeDescription

Gets the order type by expiration time as a string.

```
string  TypeTimeDescription() const
```

Return Value

Order type by expiration time as a string.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Magic

Gets the ID of an Expert Advisor that placed the order.

```
long  Magic() const
```

Return Value

ID of an Expert Advisor that placed the order.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PositionId

Gets the ID of position.

```
long  PositionId() const
```

Return Value

ID of position, in which the order was involved.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

VolumeInitial

Gets the initial volume of order.

```
double  VolumeInitial() const
```

Return Value

Initial volume of order.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

VolumeCurrent

Gets the unfilled volume of order.

```
double  VolumeCurrent() const
```

Return Value

Unfilled volume of order.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceOpen

Gets the order price.

```
double  PriceOpen() const
```

Return Value

Price of order placement.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

StopLoss

Gets the order's Stop Loss.

```
double  StopLoss() const
```

Return Value

Order's Stop Loss.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TakeProfit

Gets the order's Take Profit.

```
double  TakeProfit() const
```

Return Value

Order's Take Profit.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceCurrent

Gets the current price by order symbol.

```
double  PriceCurrent() const
```

Return Value

Current price by order symbol.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceStopLimit

Gets the price of a pending order.

```
double  PriceStopLimit() const
```

Return Value

Pending order price.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Symbol

Gets the name of order symbol.

```
string  Symbol() const
```

Return Value

Name of order symbol.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Comment

Gets the order comment.

```
string  Comment() const
```

Return Value

Order comment.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoInteger

Gets the value of specified integer type property.

```
bool  InfoInteger(
   ENUM_ORDER_PROPERTY_INTEGER  prop_id,      // property ID
   long&                        var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of integer type property from ENUM_ORDER_PROPERTY_INTEGER enumeration.

var

[out] Reference to long type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoDouble

Gets the value of specified double type property.

```
bool  InfoDouble(
   ENUM_ORDER_PROPERTY_DOUBLE  prop_id,      // property ID
   double&                     var          // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of double type property from ENUM_ORDER_PROPERTY_DOUBLE enumeration.

var

[out] Reference to double type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoString

Gets the value of specified string type property.

```
bool  InfoString(
   ENUM_ORDER_PROPERTY_STRING  prop_id,      // property ID
   string&                     var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of string property from ENUM_ORDER_PROPERTY_STRING enumeration.

var

[out] Reference to string type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

StoreState

Saves the order parameters.

```
void  StoreState()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CheckState

Checks the current parameters against the saved parameters.

```
bool  CheckState()
```

Return Value

true - if the order parameters have changed since the last call of the StoreState() method, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Select

Selects an order by ticket for further access to its properties.

```
bool  Select(
   ulong  ticket   // order ticket
   )
```

Return Value

true - success, false - unable to select order.

© 2000-2025, MetaQuotes Ltd.

SelectByIndex

Selects an order by index.

```
bool  SelectByIndex(
   int  index   // order index
   )
```

Parameters

index

[in] Order index.

Return Value

true - success, false - unable to select order.

© 2000-2025, MetaQuotes Ltd.

CHistoryOrderInfo

CHistoryOrderInfo is a class for easy access to the history order properties.

Description

CHistoryOrderInfo class provides easy access to the history order properties.

Declaration

```
class CHistoryOrderInfo : public CObject
```

Title

```
#include <Trade\HistoryOrderInfo.mqh>
```

Inheritance hierarchy

CObject

CHistoryOrderInfo

Class methods by groups

Access to integer type properties	
TimeSetup	Gets the time of order placement
TimeSetupMsc	Receives the time of placing an order in milliseconds since 01.01.1970
OrderType	Gets the order type
OrderTypeDescription	Gets the order type as a string
State	Gets the order state
StateDescription	Gets the order state as a string
TimeExpiration	Gets the time of order expiration
TimeDone	Gets the time of order execution or cancellation
TimeDoneMsc	Receives order execution or cancellation time in milliseconds since 01.01.1970
TypeFilling	Gets the type of order execution by remainder
TypeFillingDescription	Gets the type of order execution by remainder as a string
TypeTime	Gets the type of order at the time of the expiration
TypeTimeDescription	Gets the order type by expiration time as a string
Magic	Gets the ID of expert that placed the order
PositionId	Gets the ID of position

Access to integer type properties	
Access to double type properties	
VolumeInitial	Gets the initial volume of order
VolumeCurrent	Gets the unfilled volume of order
PriceOpen	Gets the order price
StopLoss	Gets the order's Stop Loss
TakeProfit	Gets the order's Take Profit
PriceCurrent	Gets the current price by order symbol
PriceStopLimit	Gets the price of a Limit order
Access to text properties	
Symbol	Gets the order symbol
Comment	Gets the order comment
Access to MQL5 API functions	
InfoInteger	Gets the value of specified integer type property
InfoDouble	Gets the value of specified double type property
InfoString	Gets value of specified string type property
Selection	
Ticket	Gets the ticket/selects the order
SelectByIndex	Selects the order by index

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

TimeSetup

Gets the time of order placement.

```
datetime  TimeSetup() const
```

Return Value

Time of order placement.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeSetupMsc

Receives the time of placing an order for execution in milliseconds since 01.01.1970.

```
ulong  TimeSetupMsc() const
```

Return Value

The time of placing an order for execution in milliseconds since 01.01.1970.

Note

Historical order should be preliminarily selected for access using Ticket (by ticket) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

OrderType

Gets the order type.

```
ENUM_ORDER_TYPE  OrderType() const
```

Return Value

Order type from ENUM_ORDER_TYPE enumeration.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeDescription

Gets the order type as a string.

```
string  TypeDescription() const
```

Return Value

Order type as a string.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

State

Gets the order state.

```
ENUM_ORDER_STATE  State() const
```

Return Value

Order state from ENUM_ORDER_STATE enumeration.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

StateDescription

Gets the order state as a string.

```
string  StateDescription() const
```

Return Value

Order state as a string.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeExpiration

Gets the time of order expiration.

```
datetime  TimeExpiration() const
```

Return Value

Time of order expiration, set on its placement.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeDone

Gets the time of order execution or cancellation.

```
datetime  TimeDone() const
```

Return Value

Time of order execution or cancellation.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeDoneMsc

Receives order execution or cancellation time in milliseconds since 01.01.1970.

```
ulong  TimeDoneMsc() const
```

Return Value

Order execution or cancellation time in milliseconds since 01.01.1970.

Note

Historical order should be preliminarily selected for access using Ticket (by ticket) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

TypeFilling

Gets the type of order execution by remainder.

```
ENUM_ORDER_TYPE_FILLING  TypeFilling() const
```

Return Value

Type of order execution by remainder from ENUM_ORDER_TYPE_FILLING enumeration.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeFillingDescription

Gets the type of order execution by remainder as a string.

```
string  TypeFillingDescription() const
```

Return Value

Type order of execution by remainder as a string.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeTime

Gets the type of order at the time of the expiration.

```
ENUM_ORDER_TYPE_TIME  TypeTime() const
```

Return Value

Type of order at the time of the expiration from ENUM_ORDER_TYPE_TIME enumeration.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeTimeDescription

Gets the order type by expiration time as a string.

```
string  TypeTimeDescription() const
```

Return Value

Order type by expiration time as a string.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Magic

Gets the ID of the Expert Advisor, that placed the order.

```
long  Magic() const
```

Return Value

ID of the Expert Advisor, that placed the order.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PositionId

Gets the ID of position.

```
long  PositionId() const
```

Return Value

ID of position, in which the order was involved.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

VolumeInitial

Gets the initial volume of order.

```
double  VolumeInitial() const
```

Return Value

Initial volume of order.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

VolumeCurrent

Gets the unfilled volume of order.

```
double  VolumeCurrent() const
```

Return Value

Unfilled volume of order.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceOpen

Gets the order price.

```
double  PriceOpen() const
```

Return Value

Price of order placement.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

StopLoss

Gets the Stop Loss price of the order.

```
double  StopLoss() const
```

Return Value

Stop Loss price of the order.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TakeProfit

Gets the Take Profit price of the order.

```
double  TakeProfit() const
```

Return Value

The Take Profit price of the order.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceCurrent

Gets the current price of the order's symbol.

```
double  PriceCurrent() const
```

Return Value

The current price of order's symbol.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceStopLimit

Gets the pending order price.

```
double  PriceStopLimit() const
```

Return Value

Pending orders price.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Symbol

Gets the name of order symbol.

```
string  Symbol() const
```

Return Value

Name of order symbol.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Comment

Gets the order comment.

```
string  Comment() const
```

Return Value

Order comment.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoInteger

Gets the value of specified integer type property.

```
bool  InfoInteger(
   ENUM_ORDER_PROPERTY_INTEGER  prop_id,      // property ID
   long&                        var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of integer type property from ENUM_ORDER_PROPERTY_INTEGER enumeration.

var

[out] Reference to long type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoDouble

Gets the value of specified double type property.

```
bool  InfoDouble(
   ENUM_ORDER_PROPERTY_DOUBLE  prop_id,      // property ID
   double&                     var          // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of double type property from ENUM_ORDER_PROPERTY_DOUBLE enumeration.

var

[out] Reference to double type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoString

Gets the value of specified string type property.

```
bool  InfoString(
   ENUM_ORDER_PROPERTY_STRING  prop_id,      // property ID
   string&                     var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of text property from ENUM_ORDER_PROPERTY_STRING enumeration.

var

[out] Reference to string type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Ticket (Get method)

Gets the order ticket.

```
ulong  Ticket() const
```

Return Value

Order ticket.

Ticket (Set method)

Select the order for further work.

```
void  Ticket(
   ulong  ticket      // ticket
   )
```

Parameters

ticket

[in] Order ticket.

© 2000-2025, MetaQuotes Ltd.

SelectByIndex

Selects a historical order by index.

```
bool  SelectByIndex(
   int  index   // order index
   )
```

Parameters

index

[in] Historical order index.

Return Value

true - success, false - unable to select order.

© 2000-2025, MetaQuotes Ltd.

CPositionInfo

CPositionInfo is a class for easy access to the open position properties.

Description

CPositionInfo class provides easy access to the open position properties.

Declaration

```
class CPositionInfo : public CObject
```

Title

```
#include <Trade\PositionInfo.mqh>
```

Inheritance hierarchy

CObject

CPositionInfo

Class methods by groups

Access to integer type properties	
Time	Gets the time of position opening
TimeMsc	Receives the time of position opening in milliseconds since 01.01.1970
TimeUpdate	Receives the time of position changing in seconds since 01.01.1970
TimeUpdateMsc	Receives the time of position changing in milliseconds since 01.01.1970
PositionType	Gets the position type
TypeDescription	Gets the position type as a string
Magic	Gets the ID of expert, that opened the position
Identifier	Gets the ID of position
Access to double type properties	
Volume	Gets the volume of position
PriceOpen	Gets the price of position opening
StopLoss	Gets the price of position's Stop Loss
TakeProfit	Gets the price of position's Take Profit

© 2000-2025, MetaQuotes Ltd.

Access to integer type properties	
PriceCurrent	Gets the current price by position symbol
Commission	Gets the amount of commission by position
Swap	Gets the amount of swap by position
Profit	Gets the amount of current profit by position
Access to text properties	
Symbol	Gets the name of position symbol
Comment	Gets the comment of the position
Access to MQL5 API functions	
InfoInteger	Gets the value of specified integer type property
InfoDouble	Gets the value of specified double type property
InfoString	Gets the value of specified string type property
Selection	
Select	Selects the position
SelectByIndex	Selects the position by index
SelectByMagic	Selects a position with the specified symbol name and magic number
SelectByTicket	Selects the position by ticket
State	
StoreState	Saves the position parameters
CheckState	Checks the current parameters against the saved parameters

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

Time

Gets the time of position opening.

```
datetime  Time() const
```

Return Value

Time of position opening.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeMsc

Receives position opening time in milliseconds since 01.01.1970.

```
ulong  TimeMsc() const
```

Return Value

Position opening time in milliseconds since 01.01.1970.

Note

Position should be preliminarily selected for access using Select (by symbol) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

TimeUpdate

Receives the time of position changing in seconds since 01.01.1970.

```
datetime  TimeUpdate() const
```

Return Value

Time of position changing in seconds since 01.01.1970.

Note

Position should be preliminarily selected for access using Select (by symbol) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

TimeUpdateMsc

Receives the time of position changing in milliseconds since 01.01.1970.

```
ulong  TimeUpdateMsc() const
```

Return Value

The time of position changing in milliseconds since 01.01.1970.

Note

Position should be preliminarily selected for access using Select (by symbol) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

PositionType

Gets the position type.

```
ENUM_POSITION_TYPE  PositionType() const
```

Return Value

Position type from ENUM_POSITION_TYPE enumeration.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeDescription

Gets the position type as a string.

```
string  TypeDescription() const
```

Return Value

Position type as a string.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Magic

Gets the ID of Expert Advisor that opened the position.

```
long  Magic() const
```

Return Value

ID of the Expert Advisor that opened the position.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Identifier

Gets the ID of position.

```
long  Identifier() const
```

Return Value

ID of position.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Volume

Gets the volume of position.

```
double  Volume() const
```

Return Value

Volume of position.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceOpen

Gets the price of position opening.

```
double  PriceOpen() const
```

Return Value

Position open price.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

StopLoss

Gets the Stop Loss price of the position.

```
double  StopLoss() const
```

Return Value

The Stop Loss price of the position.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TakeProfit

Gets the Take Profit price of the position.

```
double  TakeProfit() const
```

Return Value

The Take Profit price of the position.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PriceCurrent

Gets the current price by position symbol.

```
double  PriceCurrent() const
```

Return Value

Current price by position symbol.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Commission

Gets the amount of commission of the position.

```
double  Commission() const
```

Return Value

Amount of commission of the position (in deposit currency).

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Swap

Gets the amount of swap of the position.

```
double  Swap() const
```

Return Value

Amount of swap of the position (in deposit currency).

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Profit

Gets the amount of current profit of the position.

```
double  Profit() const
```

Return Value

Amount of current profit of the position (in deposit currency).

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Symbol

Gets the name of position symbol.

```
string  Symbol() const
```

Return Value

Name of position symbol.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Comment

Gets the comment of the position.

```
string  Comment() const
```

Return Value

Comment of the position.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoInteger

Gets the value of specified integer type property.

```
bool  InfoInteger(
   ENUM_POSITION_PROPERTY_INTEGER  prop_id,      // property ID
   long&                           var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of integer type property from ENUM_POSITION_PROPERTY_INTEGER enumeration.

var

[out] Reference to long type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoDouble

Gets the value of specified double type property.

```
bool  InfoDouble(
   ENUM_POSITION_PROPERTY_DOUBLE  prop_id,      // property ID
   double&                        var          // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of double type property from ENUM_POSITION_PROPERTY_DOUBLE enumeration.

var

[in] Reference to double type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoString

Gets the value of specified string type property.

```
bool  InfoString(
   ENUM_POSITION_PROPERTY_STRING  prop_id,      // property ID
   string&                        var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of text property from ENUM_POSITION_PROPERTY_STRING enumeration.

var

[out] Reference to string type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Select

Select the position for further work.

```
bool  Select(
   const string  symbol      // symbol
   )
```

Parameters

symbol

[in] Symbol for position selection.

© 2000-2025, MetaQuotes Ltd.

SelectByIndex

Selects the position by index for further access to its properties.

```
bool  SelectByIndex(
   int  index   // position index
   );
```

Return Value

true - success, false - unable to select position.

© 2000-2025, MetaQuotes Ltd.

SelectByMagic

Select a position based on the name of a financial instrument and magic number to further work with.

```
bool  SelectByMagic(
   const string  symbol, // symbol name
   const ulong   magic   // magic number
   );
```

Parameters

symbol

[in] Symbol name.

magic

[in] Magic number of the position.

Return Value

true - successful, false - unable to select position.

© 2000-2025, MetaQuotes Ltd.

SelectByTicket

Selects position by ticket for further operation.

```
bool  SelectByTicket(
   ulong  ticket      // position ticket
   );
```

Parameters

ticket

[in] Position ticket.

Return value

true - success, false - no position selected.

© 2000-2025, MetaQuotes Ltd.

StoreState

Saves the position parameters.

```
void  StoreState()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CheckState

Checks the current parameters against the saved parameters.

```
bool  CheckState()
```

Return Value

true - the position parameters have changed since the last call of the StoreState() method, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CDealInfo

CDealInfo is a class for easy access to the deal properties.

Description

CDealInfo class provides access to the deal properties.

Declaration

```
class CDealInfo : public CObject
```

Title

```
#include <Trade\DealInfo.mqh>
```

Inheritance hierarchy

CObject

CDealInfo

Class methods by groups

Access to integer type properties	
Order	Gets the order by which the deal is executed
Time	Gets the time of deal execution
TimeMsc	Receives the time of a deal execution in milliseconds since 01.01.1970
DealType	Gets the deal type
TypeDescription	Gets the deal type as a string
Entry	Gets the deal direction
EntryDescription	Gets the deal direction as a string
Magic	Gets the ID of expert, that executed the deal
PositionId	Gets the ID of position, in which the deal was involved
Access to double type properties	
Volume	Gets the volume of deal
Price	Gets the deal price
Commision	Gets the amount of commission of the deal
Swap	Gets the amount of swap when position is closed
Profit	Gets the financial result of deal

© 2000-2025, MetaQuotes Ltd.

Access to integer type properties	
Access to text properties	
Symbol	Gets the name of deal symbol
Comment	Gets the deal comment
Access to MQL5 API functions	
InfoInteger	Gets the value of specified integer type property
InfoDouble	Gets the value of specified double type property
InfoString	Gets value of specified string type property
Selection	
Ticket	Gets ticket/selects the deal
SelectByIndex	Selects the deal by index

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

Order

Gets the order by which the deal is executed.

```
long  Order() const
```

Return Value

Order by which the deal is executed.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Time

Gets the time of deal execution.

```
datetime  Time() const
```

Return Value

Time of deal execution.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TimeMsc

Receives the time of a deal execution in milliseconds since 01.01.1970.

```
ulong  TimeMsc() const
```

Return Value

The time of a deal execution in milliseconds since 01.01.1970.

Note

Deal should be preliminarily selected for access using Ticket (by ticket) or SelectByIndex (by index) method.

© 2000-2025, MetaQuotes Ltd.

DealType

Gets the deal type.

```
ENUM_DEAL_TYPE  DealType() const
```

Return Value

Deal type from ENUM_DEAL_TYPE enumeration.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

TypeDescription

Gets the deal type as a string.

```
string  TypeDescription() const
```

Return Value

Deal type as a string.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Entry

Compares the deal direction.

```
ENUM_DEAL_ENTRY  Entry() const
```

Return Value

Deal direction (value of ENUM_DEAL_ENTRY enumeration).

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

EntryDescription

Gets the deal direction as a string.

```
string  EntryDescription() const
```

Return Value

Deal direction as a string.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Magic

Gets the ID of the Expert Advisor, that executed the deal.

```
long  Magic() const
```

Return Value

ID of the Expert Advisor, that executed the deal.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

PositionId

Gets the ID of position, in which the deal was involved.

```
long  PositionId() const
```

Return Value

ID of position, in which the deal was involved.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Volume

Gets the volume of deal.

```
double  Volume() const
```

Return Value

Volume of deal.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Price

Gets the deal price.

```
double  Price() const
```

Return Value

Deal price.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Commission

Gets the amount of commission of the deal.

```
double  Commission() const
```

Return Value

Amount of commission of the deal.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Swap

Gets the amount of swap when position is closed.

```
double  Swap() const
```

Return Value

Amount of swap when position is closed.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Profit

Gets the financial result of the deal.

```
double  Profit() const
```

Return Value

Financial result of the deal (in deposit currency).

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Symbol

Gets the name of the deal symbol.

```
string  Symbol() const
```

Return Value

Name of the deal symbol.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Comment

Gets the deal comment.

```
string  Comment() const
```

Return Value

Deal comment.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoInteger

Gets the value of specified integer type property.

```
bool  InfoInteger(
   ENUM_DEAL_PROPERTY_INTEGER  prop_id,      // property ID
   long&                       var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of integer type property from ENUM_DEAL_PROPERTY_INTEGER enumeration.

var

[out] Reference to long type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoDouble

Gets the value of specified double type property.

```
bool  InfoDouble(
   ENUM_DEAL_PROPERTY_DOUBLE  prop_id,      // property ID
   double&                    var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of double type property from ENUM_DEAL_PROPERTY_DOUBLE enumeration.

var

[out] Reference to double type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

InfoString

Gets the value of specified string type property.

```
bool  InfoString(
   ENUM_DEAL_PROPERTY_STRING  prop_id,      // property ID
   string&                    var           // reference to variable
   ) const
```

Parameters

prop_id

[in] ID of text property from ENUM_DEAL_PROPERTY_STRING enumeration.

var

[out] Reference to string type variable to place result.

Return Value

true - success, false - unable to get property value.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.

© 2000-2025, MetaQuotes Ltd.

Ticket (Get method)

Gets the deal ticket.

```
ulong  Ticket() const
```

Return Value

Deal ticket.

Ticket (Set method)

Select the position for further work.

```
void  Ticket(
   ulong  ticket      // ticket
   )
```

Parameters

ticket

[in] Deal ticket.

© 2000-2025, MetaQuotes Ltd.

SelectByIndex

Selects the deal by index for further access to its properties.

```
bool  SelectByIndex(
   int  index   // order index
   )
```

Return Value

true - success, false - unable to select the deal.

© 2000-2025, MetaQuotes Ltd.

CTrade

CTrade is a class for easy access to the trade functions.

Description

CTrade class provides easy access to the trade functions.

Declaration

```
class CTrade : public CObject
```

Title

```
#include <Trade\Trade.mqh>
```

Inheritance hierarchy

CObject

CTrade

Direct descendants

CExpertTrade

Class methods by groups

Setting parameters	
LogLevel	Sets logging level
SetExpertMagicNumber	Sets the expert ID
SetDeviationInPoints	Sets the allowed deviation
SetTypeFilling	Sets filling type of the order
SetTypeFillingBySymbol	Sets filling type of the order according to the specified symbol settings
SetAsyncMode	Sets asynchronous mode for trade operations
SetMarginMode	Sets margin calculation mode in accordance with the current account settings
Operations with orders	
OrderOpen	Places a pending order with specified parameters
OrderModify	Modifies the pending order parameters
OrderDelete	Deletes a pending order
Operations with positions	
PositionOpen	Opens a position with specified parameters

© 2000-2025, MetaQuotes Ltd.

Setting parameters	
PositionModify	Modifies position parameters by the specified symbol or position ticket
PositionClose	Closes a position for the specified symbol
PositionClosePartial	Partially closes a position on a specified symbol or having a specified ticket
PositionCloseBy	Closes a position with the specified ticket by an opposite position
Additional methods	
Buy	Opens a long position with specified parameters
Sell	Opens a short position with specified parameters
BuyLimit	Places a pending order of the Buy Limit type with specified parameters
BuyStop	Places a pending order of the Buy Stop type with specified parameters
SellLimit	Places a pending order of the Sell Limit type with specified parameters
SellStop	Places a pending order of the Sell Stop type with specified parameters
Access to the last request parameters	
Request	Gets the copy of the last request structure
RequestAction	Gets the trade operation type
RequestActionDescription	Gets the trade operation type as string
RequestMagic	Gets the magic number of the Expert Advisor
RequestOrder	Gets the order ticket used in the last request
RequestSymbol	Gets the name of the symbol used in the last request
RequestVolume	Gets the trade volume (in lots) used in the last request
RequestPrice	Gets the price used in the last request
RequestStopLimit	Gets the price of pending order of Stop Limit type used in the last request
RequestSL	Gets the Stop Loss price of the order used in the last request
RequestTP	Gets the Take Profit price of the order used in the last request
RequestDeviation	Gets the maximum allowable price deviation of the order used in the last request
RequestType	Gets the type of the order used in the last request

© 2000-2025, MetaQuotes Ltd.

Setting parameters	
RequestTypeDescription	Gets the type of the order (as string) used in the last request
RequestTypeFilling	Gets the filling type of the order used in the last request
RequestTypeFillingDescription	Gets the filling type of the order (as string) used in the last request
RequestTypeTime	Gets the validity period of the order used in the last request
RequestTypeTimeDescription	Gets the validity period of the order (as string) used in the last request
RequestExpiration	Gets the expiration time of the order used in the last request
RequestComment	Gets the comment of the order used in the last request
RequestPosition	Gets position ticket
RequestPositionBy	Gets opposite position ticket
Access to the last request checking results	
CheckResult	Gets the copy of the structure of the last request check result.
CheckResultRetcode	Gets the value of the retcode field of MqlTradeCheckResult type, filled while checking the request correctness
CheckResultRetcodeDescription	Gets the string description of the retcode field of MqlTradeCheckResult type, filled while checking the request correctness
CheckResultBalance	Gets the value of the balance field of MqlTradeCheckResult type, filled while checking the request correctness
CheckResultEquity	Gets the value of the equity field of MqlTradeCheckResult type, filled while checking the request correctness
CheckResultProfit	Gets the value of the floating profit after executing a trading operation.
CheckResultMargin	Gets the value of the margin field of MqlTradeCheckResult type, filled while checking the request correctness
CheckResultMarginFree	Gets the value of the margin_free field of MqlTradeCheckResult type, filled while checking the request correctness
CheckResultMarginLevel	Gets the value of the margin_level field of MqlTradeCheckResult type, filled while checking the request correctness
CheckResultComment	Gets the value of the comment field of MqlTradeCheckResult type, filled while checking the request correctness
Access to the last request execution results	
Result	Gets the copy of the structure of the last request result

© 2000-2025, MetaQuotes Ltd.

Setting parameters	
ResultRetcode	Gets the code of request result
ResultRetcodeDescription	Gets the code of request result as a string
ResultDeal	Gets the deal ticket
ResultOrder	Gets the order ticket
ResultVolume	Gets the volume of deal or order
ResultPrice	Gets the price, confirmed by broker
ResultBid	Gets the current bid price (the requote)
ResultAsk	Gets the current ask price (the requote)
ResultComment	Gets the broker comment
Auxiliary methods	
PrintRequest	Prints the last request parameters into journal
PrintResult	Prints the results of the last request into journal
FormatRequest	Prepares the formatted string with last request parameters
FormatRequestResult	Prepares the formatted string with results of the last request execution

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

LogLevel

Sets logging level for messages.

```
void  LogLevel(
   ENUM_LOG_LEVELS  log_level      // level
   )
```

Parameters

log_level

[in] New logging level.

Return Value

None.

Note

LOG_LEVEL_NO and less disables displaying any messages (set up automatically in the optimization mode). LOG_LEVEL_ERRORS enables displaying only error messages (value by default). LOG_LEVEL_ALL and greater enables displaying any messages (set up automatically in the test mode).

ENUM_LOG_LEVELS

Identifier	Description	Value
LOG_LEVEL_NO	Displaying messages disabled	0
LOG_LEVEL_ERRORS	Only error messages are displayed	1
LOG_LEVEL_ALL	All messages are displayed	2

© 2000-2025, MetaQuotes Ltd.

SetExpertMagicNumber

Sets the expert ID.

```
void  SetExpertMagicNumber(
   ulong  magic      // ID
   )
```

Parameters

magic

[in] New ID of the expert.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

SetDeviationInPoints

Sets the allowed deviation.

```
void  SetDeviationInPoints(
   ulong  deviation      // deviation
   )
```

Parameters

deviation

[in] Allowed deviation in points.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

SetTypeFilling

Sets filling type of the order.

```
void  SetTypeFilling(
   ENUM_ORDER_TYPE_FILLING  filling      // order filling type
   )
```

Parameters

filling

[in] Order filling type from ENUM_ORDER_TYPE_FILLING enumeration.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

SetTypeFillingBySymbol

Sets filling type of the order according to the specified symbol settings.

```
bool  SetTypeFillingBySymbol(
   const string   symbol      // symbol name
   )
```

Parameters

symbol

[in] Name of the symbol, in which SYMBOL_FILLING_MODE contains allowed order filling policies.

Return Value

true - successful execution, false - failed to define the filling policy.

Note

If SYMBOL_FILLING_FOK and SYMBOL_FILLING_IOC filling policies are allowed for a symbol simultaneously, the ORDER_FILLING_FOK value is set for the order.

© 2000-2025, MetaQuotes Ltd.

SetAsyncMode

Sets asynchronous mode for trade operations.

```
void  SetAsyncMode(
   bool  mode      // asynchronous mode flag
   )
```

Parameters

mode

[in] Asynchronous mode flag.

Return Value

None.

Note

This mode is used for asynchronous (without waiting for the trade server's response to a sent request) trade operations (see OrderSendAsync).

© 2000-2025, MetaQuotes Ltd.

SetMarginMode

Sets margin calculation mode in accordance with the current account settings.

```
void  SetMarginMode()
```

Return Value

No.

Note

The margin calculation mode is specified in ENUM_ACCOUNT_MARGIN_MODE.

© 2000-2025, MetaQuotes Ltd.

OrderOpen

Places the pending order with set parameters.

```
bool  OrderOpen(
   const string           symbol,           // symbol
   ENUM_ORDER_TYPE        order_type,       // order type
   double                 volume,           // order volume
   double                 limit_price,      // StopLimit price
   double                 price,            // execution price
   double                 sl,               // Stop Loss price
   double                 tp,               // Take Profit price
   ENUM_ORDER_TYPE_TIME   type_time,        // type by expiration
   datetime               expiration,       // expiration
   const string           comment=""        // comment
   )
```

Parameters

symbol

[in] Name of trade instrument.

order_type

[in] Type of order trade operation from ENUM_ORDER_TYPE enumeration.

volume

[in] Requested order volume.

limit_price

[in] Price at which the StopLimit order will be placed.

price

[in] Price at which the order must be executed.

sl

[in] Price at which the Stop Loss will trigger.

tp

[in] Price at which the Take Profit will trigger.

type_time

[in] Order type by execution from ENUM_ORDER_TYPE_TIME enumeration.

expiration

[in] Expiration date of pending order.

comment=""

[in] Order comment.

Return Value

true - successful check of the basic structures, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Note

Successful completion of the OrderSend(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of a trade request (trade server return code) using ResultRetcode() and value returned by ResultOrder().

© 2000-2025, MetaQuotes Ltd.

OrderModify

Modifies the pending order parameters.

```
bool  OrderModify(
   ulong                ticket,          // order ticket
   double               price,           // execution price
   double               sl,              // Stop Loss price
   double               tp,              // Take Profit price
   ENUM_ORDER_TYPE_TIME type_time,       // type by expiration
   datetime             expiration,      // expiration
   double               stoplimit        // Limit order price
   )
```

Parameters

ticket

[in] Order ticket.

price

[in] The new price by which the order must be executed (or the previous value, if the change is not necessary).

sl

[in] The new price by which the Stop Loss will trigger (or the previous value, if the change is not necessary).

tp

[in] The new price by which the Take Profit will trigger (or the previous value, if the change is not necessary).

type_time

[in] The new type of order by expiration from ENUM_ORDER_TYPE_TIME enumeration (or the previous value, if the change is not necessary).

expiration

[in] The new expiration date of pending order (or the previous value, if the change is not necessary).

stoplimit

[in] New price used for setting a Limit order when the price reaches *price* value. It is specified only for StopLimit orders.

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the OrderModify(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode().

© 2000-2025, MetaQuotes Ltd.

OrderDelete

Deletes the pending order.

```
bool  OrderDelete(
   ulong  ticket      // order ticket
   )
```

Parameters

ticket

[in] Order ticket.

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the OrderDelete(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode().

© 2000-2025, MetaQuotes Ltd.

PositionOpen

Opens a position with the specified parameters.

```
bool  PositionOpen(
   const string     symbol,          // symbol
   ENUM_ORDER_TYPE  order_type,      // order type to open position
   double           volume,          // position volume
   double           price,           // execution price
   double           sl,              // Stop Loss price
   double           tp,              // Take Profit price
   const string     comment=""       // comment
   )
```

Parameters

symbol

[in] Name of trade instrument, by which it is intended to open position.

order_type

[in] Order type (trade operation) to open position from ENUM_ORDER_TYPE enumeration.

volume

[in] Requested position volume.

price

[in] Price at which the position must be opened.

sl

[in] Price at which the Stop Loss will trigger.

tp

[in] Price at which the Take Profit will trigger.

comment=""

[in] Position comment.

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the PositionOpen(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultDeal().

© 2000-2025, MetaQuotes Ltd.

PositionModify

Modifies the position parameters by specified symbol.

```
bool  PositionModify(
   const string  symbol,      // symbol
   double        sl,          // Stop Loss price
   double        tp           // Take Profit price
   )
```

Modifies position parameters by the specified ticket.

```
bool  PositionModify(
   const ulong   ticket,      // position ticket
   double        sl,          // Stop Loss price
   double        tp           // Take Profit price
   )
```

Parameters

symbol

[in] Name of trade instrument, by which it is intended to modify position.

ticket

[in] Ticket of the position to be modified.

sl

[in] The new price by which the Stop Loss will trigger (or the previous value, if the change is not necessary).

tp

[in] The new price by which the Take Profit will trigger (or the previous value, if the change is not necessary).

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the PositionModify(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode().

For the "netting" interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol. In this case, PositionModify will modify the position with the lowest ticket.

© 2000-2025, MetaQuotes Ltd.

PositionClose

Closes a position by the specified symbol.

```
bool  PositionClose(
   const string  symbol,                  // symbol
   ulong         deviation=ULONG_MAX      // deviation
   )
```

Closes a position with the specified ticket.

```
bool  PositionClose(
   const ulong   ticket,                  // position ticket
   ulong         deviation=ULONG_MAX      // deviation
   )
```

Parameters

symbol

[in] Name of trade instrument, by which it is intended to close position.

ticket

[in] Ticket of a closed position.

deviation=ULONG_MAX

[in] Maximal deviation from the current price (in points).

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the PositionClose(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode().

For the "netting" interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol. In this case, PositionClose will close a position with the lowest ticket.

© 2000-2025, MetaQuotes Ltd.

PositionClosePartial

Partially closes a position on a specified symbol in case of a "hedging" accounting.

```
bool  PositionClosePartial(
   const string  symbol,                  // symbol
   const double  volume,                  // volume
   ulong         deviation=ULONG_MAX      // deviation
   )
```

Partially closes a position having a specified ticket in case of a "hedging" accounting.

```
bool  PositionClosePartial(
   const ulong   ticket,                  // position ticket
   const double  volume,                  // volume
   ulong         deviation=ULONG_MAX      // deviation
   )
```

Parameters

symbol

[in] Name of a trading instrument, on which a position is closed partially. If a symbol (not a ticket) is specified for a position partial closing, the first detected position having a specified MagicNumber (Expert Advisor ID) on the symbol is selected. Therefore, it is sometimes better to use PositionClosePartial() with a specified position ticket.

volume

[in] Volume, by which a position should be decreased. If the value exceeds the volume of a partially closed position, it is closed in full. No position in the opposite direction is opened.

ticket

[in] Closed position ticket.

deviation=ULONG_MAX

[in] The maximum deviation from the current price (in points).

Return Value

true if the basic check of structures is successful, otherwise false.

Note

A successful completion of the PositionClosePartial(...) method does not always mean a successful execution of a trading operation. You should call the ResultRetcode() method to check the result of a trade request (trade server return code).

In the "netting" system (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), for each symbol, at any given moment of time, only one position can be open, which is the result of one or more deals. Do not confuse the current pending orders with positions that are also displayed on the "Trade" tab of the client terminal's "Toolbox" panel.

© 2000-2025, MetaQuotes Ltd.

In case of the position representation (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be opened on each symbol simultaneously. In this case, PositionClose closes a position having a least ticket.

© 2000-2025, MetaQuotes Ltd.

PositionCloseBy

Closes a position with the specified ticket by an opposite position.

```
bool  PositionCloseBy(
   const ulong   ticket,        // position ticket
   const ulong   ticket_by      // opposite position ticket
   )
```

Parameters

ticket

[in] Ticket of the closed position.

ticket_by

[in] Ticket of the opposite position used for closing.

Returned value

true - the basic check of structures is successful, otherwise - false.

Note

A successful completion of the PositionCloseBy(...) method does not always mean a successful execution of a trading operation. You should call the ResultRetcode() method to check the result of a trade request (trade server return code).

© 2000-2025, MetaQuotes Ltd.

Buy

Opens a long position with specified parameters.

```
bool  Buy(
   double         volume,           // position volume
   const string   symbol=NULL,      // symbol
   double         price=0.0,        // execution price
   double         sl=0.0,           // stop loss price
   double         tp=0.0,           // take profit price
   const string   comment=""        // comment
   )
```

Parameters

volume

[in] Requested position volume.

symbol=NULL

[in] Position symbol. If it is not specified, the current symbol will be used.

price=0.0

[in] Price. If the price is not specified, the current market Ask price will be used.

sl=0.0

[in] Stop Loss price.

tp=0.0

[in] Take Profit price.

comment=""

[in] Comment.

Return Value

true - successful check of the structures, otherwise - false.

Note

Successful completion of the Buy(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultDeal().

© 2000-2025, MetaQuotes Ltd.

Sell

Opens a short position with specified parameters.

```
bool  Sell(
   double         volume,           // position volume
   const string   symbol=NULL,      // symbol
   double         price=0.0,        // execution price
   double         sl=0.0,           // stop loss price
   double         tp=0.0,           // take profit price
   const string   comment=""        // comment
   )
```

Parameters

volume

[in] Requested position volume.

symbol=NULL

[in] Position symbol. If the symbol is not specified, the current symbol will be used.

price=0.0

[in] Price. If the price is not specified, the current market Bid price will be used.

sl=0.0

[in] Stop Loss price.

tp=0.0

[in] Take Profit price.

comment=""

[in] Comment.

Return Value

true - successful check of the structures, otherwise - false.

Note

Successful completion of the Sell(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultDeal().

© 2000-2025, MetaQuotes Ltd.

BuyLimit

Places the pending order of Buy Limit type (buy at the price lower than current market price) with specified parameters.

```
bool  BuyLimit(
   double                volume,                    // order volume
   double                price,                     // order price
   const string          symbol=NULL,               // symbol
   double                sl=0.0,                    // stop loss price
   double                tp=0.0,                    // take profit price
   ENUM_ORDER_TYPE_TIME  type_time=ORDER_TIME_GTC,   // order lifetime
   datetime              expiration=0,              // order expiration time
   const string          comment=""                 // comment
   )
```

Parameters

volume

[in] Requested order volume.

price

[in] Order price.

symbol=NULL

[in] Order symbol. If the symbol is not specified, the current symbol will be used.

sl=0.0

[in] Stop Loss price.

tp=0.0

[in] Take Profit price.

type_time=ORDER_TIME_GTC

[in] Order lifetime from ENUM_ORDER_TYPE_TIME enumeration.

expiration=0

[in] Order expiration time (used only if type_time=ORDER_TIME_SPECIFIED).

comment=""

[in] Order comment.

Return Value

true - successful check of the structures, otherwise - false.

Note

Successful completion of the BuyLimit(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultOrder().

© 2000-2025, MetaQuotes Ltd.

BuyStop

Places the pending order of Buy Stop type (buy at the price higher than current market price) with specified parameters.

```
bool  BuyStop(
   double                volume,                    // order volume
   double                price,                     // order price
   const string          symbol=NULL,               // symbol
   double                sl=0.0,                    // stop loss price
   double                tp=0.0,                    // take profit price
   ENUM_ORDER_TYPE_TIME  type_time=ORDER_TIME_GTC,   // order lifetime
   datetime              expiration=0,              // order expiration time
   const string          comment=""                 // comment
   )
```

Parameters

volume

[in] Requested order volume.

price

[in] Order price.

symbol=NULL

[in] Order symbol. If the symbol isn't specified, the current symbol will be used.

sl=0.0

[in] Stop Loss price.

tp=0.0

[in] Take Profit price.

type_time=ORDER_TIME_GTC

[in] Order lifetime from ENUM_ORDER_TYPE_TIME enumeration.

expiration=0

[in] Order expiration time (used only if type_time=ORDER_TIME_SPECIFIED).

comment=""

[in] Order comment.

Return Value

true - successful check of the structures, otherwise - false.

Note

Successful completion of the BuyStop(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultOrder().

© 2000-2025, MetaQuotes Ltd.

SellLimit

Places the pending order of Sell Limit type (sell at the price higher than current market price) with specified parameters.

```
bool  SellLimit(
   double                volume,                    // order volume
   double                price,                     // order price
   const string          symbol=NULL,               // symbol
   double                sl=0.0,                    // stop loss price
   double                tp=0.0,                    // take profit price
   ENUM_ORDER_TYPE_TIME  type_time=ORDER_TIME_GTC,   // order lifetime
   datetime              expiration=0,              // order expiration time
   const string          comment=""                 // comment
   )
```

Parameters

volume

[in] Requested order volume.

price

[in] Order price.

symbol=NULL

[in] Order symbol. If the symbol is not specified, the current symbol will be used.

sl=0.0

[in] Stop Loss price.

tp=0.0

[in] Take Profit price.

type_time=ORDER_TIME_GTC

[in] Order lifetime from ENUM_ORDER_TYPE_TIME enumeration.

expiration=0

[in] Order expiration time (used only if type_time=ORDER_TIME_SPECIFIED).

comment=""

[in] Order comment.

Return Value

true - successful check of the structures, otherwise - false.

Note

Successful completion of the SellLimit(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultOrder().

© 2000-2025, MetaQuotes Ltd.

SellStop

Places the pending order of Sell Stop type (sell at the price lower than current market price) with specified parameters.

```
bool  SellStop(
   double                volume,                    // order volume
   double                price,                     // order price
   const string          symbol=NULL,               // symbol
   double                sl=0.0,                    // stop loss price
   double                tp=0.0,                    // take profit price
   ENUM_ORDER_TYPE_TIME  type_time=ORDER_TIME_GTC,   // order lifetime
   datetime              expiration=0,              // order expiration time
   const string          comment=""                 // comment
   )
```

Parameters

volume

[in] Requested order volume.

price

[in] Order price.

symbol=NULL

[in] Order symbol. If the symbol is not specified, the current symbol will be used.

sl=0.0

[in] Stop Loss price.

tp=0.0

[in] Take Profit price.

type_time=ORDER_TIME_GTC

[in] Order lifetime from ENUM_ORDER_TYPE_TIME enumeration.

expiration=0

[in] Order expiration time (used only if type_time=ORDER_TIME_SPECIFIED).

comment=""

[in] Order comment.

Return Value

true - successful check of the structures, otherwise - false.

Note

Successful completion of the SellStop(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultOrder().

© 2000-2025, MetaQuotes Ltd.

Request

Gets the copy of the last request structure.

```
void  Request(
   MqlTradeRequest&  request      // reference
   ) const
```

Parameters

request

[out] Reference to the copied structure.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

RequestAction

Gets the trade operation type.

```
ENUM_TRADE_REQUEST_ACTIONS  RequestAction() const
```

Return Value

Trade operation type used in the last request from ENUM_TRADE_REQUEST_ACTIONS enumeration.

© 2000-2025, MetaQuotes Ltd.

RequestActionDescription

Gets the trade operation type as string.

```
string  RequestActionDescription() const
```

Return Value

Trade operation type (as string) used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestMagic

Gets the magic number of the Expert Advisor.

```
ulong  RequestMagic() const
```

Return Value

The magic number (ID) of the Expert Advisor, used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestOrder

Gets the order ticket.

```
ulong  RequestOrder() const
```

Return Value

Order ticket of the last request.

© 2000-2025, MetaQuotes Ltd.

RequestSymbol

Gets the name of the symbol.

```
string  RequestSymbol() const
```

Return Value

The name of the symbol used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestVolume

Gets the trade volume (in lots).

```
double  RequestVolume() const
```

Return Value

The requested trade volume (in lots) used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestPrice

Gets the order execution price.

```
double  RequestPrice() const
```

Return Value

Order execution price used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestStopLimit

Gets the price of pending order of Stop Limit type.

```
double  RequestStoplimit() const
```

Return Value

The price of pending order of Stop Limit type used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestSL

Gets the Stop Loss price of an order.

```
double  RequestSL() const
```

Return Value

The Stop Loss price used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestTP

Gets the Take Profit price of the order.

```
double  RequestTP() const
```

Return Value

The Take Profit price used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestDeviation

Gets the maximum price deviation from a requested price.

```
ulong  RequestDeviation() const
```

Return Value

The maximum allowable price deviation from a requested price used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestType

Gets the type of the order.

```
ENUM_ORDER_TYPE  RequestType() const
```

Return Value

Order type used in the last request from ENUM_ORDER_TYPE enumeration.

© 2000-2025, MetaQuotes Ltd.

RequestTypeDescription

Gets the type of the order (as string).

```
string  RequestTypeDescription() const
```

Return Value

The order type (as string) used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestTypeFilling

Gets the filling type of the order.

```
ENUM_ORDER_TYPE_FILLING  RequestTypeFilling() const
```

Return Value

The filling type of the order from ENUM_ORDER_TYPE_FILLING used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestTypeFillingDescription

Gets the filling type of the order (as string).

```
string  RequestTypeFillingDescription() const
```

Return Value

The filling type (as string) of the order used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestTypeTime

Gets the validity period of the order.

```
ENUM_ORDER_TYPE_TIME  RequestTypeTime() const
```

Return Value

The validity period of the order from ENUM_ORDER_TYPE_TIME enumeration used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestTypeTimeDescription

Gets the validity period of the order (as string).

```
string  RequestTypeTimeDescription() const
```

Return Value

The validity period of the order (as string) used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestExpiration

Gets the expiration time of a pending order.

```
datetime  RequestExpiration() const
```

Return Value

The expiration time of a pending order used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestComment

Gets the comment of the order.

```
string  RequestComment() const
```

Return Value

The comment of the order used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestPosition

Gets position ticket.

```
ulong  RequestPosition() const
```

Return value

Position ticket used in the last request.

© 2000-2025, MetaQuotes Ltd.

RequestPositionBy

Gets opposite position ticket.

```
ulong  RequestPositionBy() const
```

Return value

Opposite position ticket used in the last request.

© 2000-2025, MetaQuotes Ltd.

Result

Gets the copy of the structure of the last request result.

```
void  Result(
   MqlTradeResult&  result      // reference
   ) const
```

Parameters

result

[out] Reference to the structure of MqlTradeResult type for copying.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ResultRetcode

Gets the code of request execution result.

```
uint  ResultRetcode() const
```

Return Value

The code of request result.

© 2000-2025, MetaQuotes Ltd.

ResultRetcodeDescription

Gets the code of request execution result as a string.

```
string  ResultRetcodeDescription() const
```

Return Value

Code of the last request result as a string.

© 2000-2025, MetaQuotes Ltd.

ResultDeal

Gets the deal ticket.

```
ulong  ResultDeal() const
```

Return Value

Deal ticket if the deal is executed.

© 2000-2025, MetaQuotes Ltd.

ResultOrder

Gets the order ticket.

```
ulong  ResultOrder() const
```

Return Value

Order ticket if the order is placed.

© 2000-2025, MetaQuotes Ltd.

ResultVolume

Gets the volume of deal or order.

```
double  ResultVolume() const
```

Return Value

Volume of deal or order confirmed by a broker.

© 2000-2025, MetaQuotes Ltd.

ResultPrice

Gets the price confirmed by a broker.

```
double  ResultPrice() const
```

Return Value

Price confirmed by a broker.

© 2000-2025, MetaQuotes Ltd.

ResultBid

Gets the current bid price (the requote).

```
double  ResultBid() const
```

Return Value

Current bid price (the requote).

© 2000-2025, MetaQuotes Ltd.

ResultAsk

Gets the current ask price (the requote).

```
double  ResultAsk() const
```

Return Value

Current ask price (the requote).

© 2000-2025, MetaQuotes Ltd.

ResultComment

Gets the broker comment.

```
string  ResultComment() const
```

Return Value

Broker comment to the operation.

© 2000-2025, MetaQuotes Ltd.

CheckResult

Gets the copy of the structure of the last request check result.

```
void  CheckResult(
   MqlTradeCheckResult&  check_result      // reference
   ) const
```

Parameters

check_result

[out] Reference to the target structure of the MqlTradeCheckResult type for copying.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CheckResultRetcode

Gets the value of the retcode field of MqlTradeCheckResult type, filled while checking the request correctness.

```
uint  CheckResultRetcode() const
```

Return Value

The value of the retcode field (error code) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

CheckResultRetcodeDescription

Gets the string description of the retcode field of MqlTradeCheckResult type filled while checking the request correctness.

```
string  ResultRetcodeDescription() const
```

Return Value

The string description of the retcode field (Error code) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

CheckResultBalance

Gets the value of the balance field of MqlTradeCheckResult type filled while checking the request correctness.

```
double  CheckResultBalance() const
```

Return Value

The value of the balance field (balance value that will be after the execution of the trade operation) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

CheckResultEquity

Gets the value of the equity field of MqlTradeCheckResult type filled while checking the request correctness.

```
double  CheckResultEquity() const
```

Return Value

The value of the equity field (equity value that will be after the execution of the trade operation) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

CheckResultProfit

Gets the value of a floating profit.

```
double  CheckResultProfit() const
```

Return Value

The value of a floating profit after executing a trading operation.

© 2000-2025, MetaQuotes Ltd.

CheckResultMargin

Gets the value of the margin field of MqlTradeCheckResult type filled while checking the request correctness.

```
double  CheckResultMargin() const
```

Return Value

The value of the margin field (margin required for the trade operation) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

CheckResultMarginFree

Gets the value of the margin_free field of MqlTradeCheckResult type filled while checking the request correctness.

```
double  CheckResultMarginFree() const
```

Return Value

The value of the margin_free field (free margin that will be left after the execution of the trade operation) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

CheckResultMarginLevel

Gets the value of the margin_level field of MqlTradeCheckResult type filled while checking the request correctness.

```
double  CheckResultMarginLevel() const
```

Return Value

The value of the margin_level field (margin level that will be set after the execution of the trade operation) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

CheckResultComment

The value of the comment field of MqlTradeCheckResult type filled while checking the request correctness.

```
string  CheckResultComment() const
```

Return Value

The value of the comment field (comment to the reply code, error description) of MqlTradeCheckResult type filled while checking the request correctness.

© 2000-2025, MetaQuotes Ltd.

PrintRequest

Prints the last request parameters into journal.

```
void  PrintRequest() const
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

PrintResult

Prints the results of the last request into journal.

```
void  PrintResult() const
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

FormatRequest

Prepares the formatted string with last request parameters.

```
string  FormatRequest(
   string&                 str,          // string
   const MqlTradeRequest&  request       // request
   ) const
```

Parameters

str

[in] Target string passed by reference.

request

[in] A structure of MqlTradeRequest type with parameters of the last request.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

FormatRequestResult

Prepares the formatted string with results of the last request execution.

```
string  FormatRequestResult(
   string&                 str,          // string
   const MqlTradeRequest&  request,      // request
   const MqlTradeResult&   result        // result
   ) const
```

Parameters

str

[in] Target string passed by reference.

request

[in] A structure of MqlTradeRequest type with parameters of the last request.

result

[in] A structure of MqlTradeResult type with results of the last request.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CTerminalInfo

CTerminalInfo is a class for simplified access to the properties of mql5 program environment.

Description

CTerminalInfo class provides access to the properties of mql5 program environment.

Declaration

```
class CTerminalInfo : public CObject
```

Title

```
#include <Trade\TerminalInfo.mqh>
```

Inheritance hierarchy

CObject

CTerminalInfo

Class methods by groups

Methods for access to the properties of integer type	
Build	Gets the build number of the client terminal
IsConnected	Gets the information about connection to trade server
IsDLLsAllowed	Gets the information about permission of DLL usage
IsTradeAllowed	Gets the information about permission to trade
IsEmailEnabled	Gets the information about permission to send e-mails to SMTP server and login, specified in the terminal settings
IsFtpEnabled	Gets the information about permission to send trade reports to FTP server and login, specified in the terminal settings
MaxBars	Gets the information about maximum number of bars on chart
CodePage	Gets the information about the code page of the language in the client terminal
CPUCores	Gets the information about the CPU cores
MemoryPhysical	Gets the information about the physical memory (in Mb)
MemoryTotal	Gets the information about the total memory available for the terminal/agent process (in Mb)
MemoryAvailable	Gets the information about the free memory available for the terminal/agent process (in Mb)

© 2000-2025, MetaQuotes Ltd.

Methods for access to the properties of integer type	
MemoryUsed	Gets the information about the memory used by the terminal/agent process (in Mb)
IsX64	Gets the information about the type of the client terminal
OpenCLSupport	Gets the information about the version of OpenCL supported by video card
DiskSpace	Gets the information about free disk space (in Mb)
Methods for access to the properties of string type	
Language	Gets the language of the client terminal
Name	Gets the name of the client terminal
Company	Gets the company name of the client terminal
Path	Gets the folder of the client terminal
DataPath	Gets the data folder of the client terminal
CommonDataPath	Gets the common data folder of all client terminals, installed on the computer
Access to MQL5 API functions	
InfoInteger	Gets the value of the property of integer type
InfoString	Gets the value of property of string type

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

Build

Gets the build number of the client terminal.

```
int  CBuild() const
```

Return Value

Build number of the client terminal.

Note

The terminal build number is defined by TerminalInfoInteger() function (TERMINAL_BUILD property).

© 2000-2025, MetaQuotes Ltd.

IsConnected

Gets the information about connection to trade server.

```
bool  IsConnected() const
```

Return Value

true - the terminal is connected to a trade server, otherwise - false.

Note

Connection status is defined by TerminalInfoInteger() function (TERMINAL_CONNECTED property).

© 2000-2025, MetaQuotes Ltd.

IsDLLsAllowed

Gets the information about permission of DLL usage.

```
bool  IsDLLsAllowed() const
```

Return Value

true - DLL usage is allowed, otherwise - false.

Note

Permission of DLL usage is defined by TerminalInfoInteger() function (TERMINAL_DLLS_ALLOWED property).

© 2000-2025, MetaQuotes Ltd.

IsTradeAllowed

Gets the information about permission to trade.

```
bool  IsTradeAllowed() const
```

Return Value

true - trade allowed, otherwise - false.

Note

Permission to trade is defined by TerminalInfoInteger() function (TERMINAL_TRADE_ALLOWED property).

© 2000-2025, MetaQuotes Ltd.

IsEmailEnabled

Gets the information about permission to send e-mails to SMTP server and login specified in the terminal settings.

```
bool  IsEmailEnabled() const
```

Return Value

true - sending e-mails is allowed, otherwise - false.

Note

Permission to send e-mails is defined by TerminalInfoInteger() function (TERMINAL_EMAIL_ENABLED property).

© 2000-2025, MetaQuotes Ltd.

IsFtpEnabled

Gets the information about permission to send trade reports to FTP server and login specified in the terminal settings.

```
bool  IsFtpEnabled() const
```

Return Value

true - sending trade reports to FTP server is allowed, otherwise - false.

Note

Permission to send trade reports is defined TerminalInfoInteger() function (TERMINAL_FTP_ENABLED property).

© 2000-2025, MetaQuotes Ltd.

MaxBars

Gets the maximum number of bars on chart specified in the terminal settings.

```
int  MaxBars() const
```

Return Value

Maximum number of bars on the chart.

Note

The maximum number of bars on chart is defined by TerminalInfoInteger() function (TERMINAL_MAXBARS property).

© 2000-2025, MetaQuotes Ltd.

CodePage

Gets the information about code page of the language in the terminal.

```
int  CodePage() const
```

Return Value

Code page of the language in the client terminal.

Note

Code page of the language is defined by TerminalInfoInteger() function (TERMINAL_CODEPAGE property).

© 2000-2025, MetaQuotes Ltd.

CPUCores

Gets the information about the number of CPU cores in the system.

```
int  CPUCores() const
```

Return Value

Number of CPU cores in the system.

Note

The number of CPU cores is defined by TerminalInfoInteger() function (TERMINAL_CPU_CORES property).

© 2000-2025, MetaQuotes Ltd.

MemoryPhysical

Gets the information about the physical memory (in Mb).

```
int  MemoryPhysical() const
```

Return Value

Physical memory (in Mb).

Note

The physical memory is defined by TerminalInfoInteger() function (TERMINAL_MEMORY_PHYSICAL property).

© 2000-2025, MetaQuotes Ltd.

MemoryTotal

Gets the information about the total memory available to the terminal/agent (in Mb).

```
int  MemoryTotal() const
```

Return Value

Total memory (in Mb) available to the terminal/agent.

Note

The total memory available to the terminal/agent is defined by TerminalInfoInteger() function (TERMINAL_MEMORY_TOTAL property).

© 2000-2025, MetaQuotes Ltd.

MemoryAvailable

Gets the information about the free memory available to the client terminal/agent (in Mb).

```
int  MemoryTotal() const
```

Return Value

Free memory (in Mb) available to the terminal/agent.

Note

The free memory available to the client terminal/agent is defined by TerminalInfoInteger() function (TERMINAL_MEMORY_TOTAL property).

© 2000-2025, MetaQuotes Ltd.

MemoryUsed

Gets the information about the memory used by the client terminal/agent (in Mb).

```
int  MemoryUsed() const
```

Return Value

The memory used by the client terminal/agent (in Mb).

Note

The memory used by the client terminal/agent is defined by TerminalInfoInteger() function (TERMINAL_MEMORY_USED property).

© 2000-2025, MetaQuotes Ltd.

IsX64

Gets the information about the type of the client terminal.

```
bool  IsX64() const
```

Return Value

true - 64-bit version is used, otherwise - false.

Note

The type of the terminal is defined by TerminalInfoInteger() function (TERMINAL_X64 property).

© 2000-2025, MetaQuotes Ltd.

OpenCLSupport

Gets the information about the version of OpenCL supported by video card.

```
int  OpenCLSupport() const
```

Return Value

OpenCL version having the following form: 0x00010002 = "1.2". 0 means that OpenCL is not supported.

Note

OpenCL version is defined by TerminalInfoInteger() function (TERMINAL_OPENCL_SUPPORT property).

© 2000-2025, MetaQuotes Ltd.

DiskSpace

Gets the information about free disk space available for MQL5\Files folder of the terminal/agent (in Mb).

```
int  MDiskSpace() const
```

Return Value

Free disk space.

Note

Free disk space is defined by TerminalInfoInteger() function (TERMINAL_DISK_SPACE property).

© 2000-2025, MetaQuotes Ltd.

Language

Gets the information about the language of the client terminal.

```
string  Language() const
```

Return Value

Language used in the client terminal.

Note

The terminal language is defined by TerminalInfoString() function (TERMINAL_LANGUAGE property).

© 2000-2025, MetaQuotes Ltd.

Name

Gets the information on the name of the client terminal.

```
string  Name() const
```

Return Value

Name of the client terminal.

Note

The name of the terminal is defined by TerminalInfoString() function (TERMINAL_NAME property).

© 2000-2025, MetaQuotes Ltd.

Company

Gets the information about the name of the comopany.

```
string  Company() const
```

Return Value

The name of the company.

Note

The company name is defined by TerminalInfoString() function (TERMINAL_COMPANY property).

© 2000-2025, MetaQuotes Ltd.

Path

Gets the client terminal folder.

```
string  Path() const
```

Return Value

The client terminal folder.

Note

The client terminal folder is used by TerminalInfoString() function (TERMINAL_PATH property).

© 2000-2025, MetaQuotes Ltd.

DataPath

Gets the information about the terminal data folder.

```
string  DataPath() const
```

Return Value

Data folder of the client terminal.

Note

Client terminal data folder is defined by TerminalInfoString() function (TERMINAL_DATA_PATH property).

© 2000-2025, MetaQuotes Ltd.

CommonDataPath

Gets the common data folder of all client terminals installed on the computer.

```
string  CommonDataPath() const
```

Return Value

Common data folder of all installed terminals.

Note

The common data folder of all installed terminals is defined by TerminalInfoString() function (COMMON_DATA_PATH property).

© 2000-2025, MetaQuotes Ltd.

InfoInteger

Returns the value of a corresponding integer property of the mql5 program environment.

```
int  TerminalInfoInteger(
   int  property_id      // identifier of a property
   );
```

Parameters

property_id

[in] Identifier of a property. It can be one of the values of the enumeration ENUM_TERMINAL_INFO_INTEGER.

Return Value

Value of int type.

Note

The property value is defined by TerminalInfoInteger() function.

© 2000-2025, MetaQuotes Ltd.

InfoString

The function returns the value of a corresponding property of the mql5 program environment. The property must be of string type.

```
string  TerminalInfoString(
   int  property_id      // property ID
   );
```

Parameters

property_id

[in] Identifier of a property. It can be one the values of the enumeration ENUM_TERMINAL_INFO_STRING.

Return Value

Value of string type.

Note

The property value is defined by TerminalInfoString() function.

© 2000-2025, MetaQuotes Ltd.

Classes for Creating and Testing Trading Strategies

This section contains technical details of working with classes for creation and testing of trading strategies and description of the relevant components of the MQL5 standard library.

The use of these classes will save time when creating (and especially testing) trading strategies.

MQL5 Standard Library (in terms of trading strategies) is placed in the terminal directory, in the Include\Expert folder.

Base classes	Description
CExpertBase	Base class for all trading strategy classes
CExpert	Base class for Expert Advisor
CExpertSignal	Base class for Trading Signal classes
CExpertTrailing	Base class for Trailing Stop classes
CExpertMoney	Base class for Money Management classes

Trading signal classes	Description
CSignalAC	The module of signals based on market models of the indicator Accelerator Oscillator.
CSignalAMA	The module of signals based on market models of the indicator Adaptive Moving Average.
CSignalAO	The module of signals based on market models of the indicator Awesome Oscillator.
CSignalBearsPower	The module of signals based on market models of the oscillator Bears Power.
CSignalBullsPower	The module of signals based on market models of the oscillator Bulls Power.
CSignalCCI	The module of signals based on market models of the oscillator Commodity Channel Index.
CSignalDeM	The module of signals based on market models of the oscillator DeMarker.
CSignalDEMA	The module of signals based on market models of the indicator Double Exponential Moving Average.
CSignalEnvelopes	The module of signals based on market models of the indicator Envelopes.
CSignalFrAMA	The module of signals based on market models of the indicator Fractal Adaptive Moving Average.
CSignalITF	The module of filtration of signals by time.

© 2000-2025, MetaQuotes Ltd.

Trading signal classes	Description
CSignalMACD	The module of signals based on market models of the oscillator MACD.
CSignalMA	The module of signals based on market models of the indicator Moving Average.
CSignalSAR	The module of signals based on market models of the indicator Parabolic SAR.
CSignalRSI	The module of signals based on market models of the oscillator Relative Strength Index.
CSignalRVI	The module of signals based on market models of the oscillator Relative Vigor Index.
CSignalStoch	The module of signals based on market models of the oscillator Stochastic.
CSignalTRIX	The module of signals based on market models of the oscillator Triple Exponential Average.
CSignalTEMA	The module of signals based on market models of the indicator Triple Exponential Moving Average.
CSignalWPR	The module of signals based on market models of the oscillator Williams Percent Range.

Trailing Stop classes	Description
CTrailingFixedPips	This class implements Trailing Stop algorithm based on fixed points
CTrailingMA	This class implements Trailing Stop algorithm based on the values of Moving Average indicator
CTrailingNone	A stub class, it does not use any Trailing Stop algorithm
CTrailingPSAR	This class implements Trailing Stop algorithm based on the values of Parabolic SAR indicator

Money Management classes	Description
CMoneyFixedLot	A class with an algorithm based on trading with predefined fixed lot size.
CMoneyFixedMargin	A class with an algorithm based on trading with predefined fixed margin.
CMoneyFixedRisk	A class with an algorithm based on trading with predefined risk.
CMoneyNone	A class with an algorithm based on trading with minimal allowed lot size.
CMoneySizeOptimized	A class with an algorithm based on trading with variable lot size, depending on the results of the previous deals.

© 2000-2025, MetaQuotes Ltd.

© 2000-2025, MetaQuotes Ltd.

Base classes for Expert Advisors

This section contains technical details of working with classes for creation and testing of trading strategies and description of the relevant components of the MQL5 standard library.

The use of these classes will save time when creating (and especially testing) trading strategies.

MQL5 Standard Library (in terms of trading strategies classes) is placed in the terminal directory, in the Include\Expert folder.

Class	Description
CExpertBase	Base class for all trading strategy classes
CExpert	Base class for Expert Advisor
CExpertSignal	Base class for Trading Signal classes
CExpertTrailing	Base class for Trailing Stop classes
CExpertMoney	Base class for Money Management classes

© 2000-2025, MetaQuotes Ltd.

CExpertBase

CExpertBase is a base class for the CExpert class and all auxiliary trading strategy classes.

Description

CExpertBase provides the data and methods, which are common to all objects of the Expert Advisor.

Declaration

```
class CExpertBase : public CObject
```

Title

```
#include <Expert\ExpertBase.mqh>
```

Inheritance hierarchy

CObject

CExpertBase

Direct descendants

CExpert, CExpertMoney, CExpertSignal, CExpertTrailing

Class Methods by Groups

Public Methods:

Initialization	
virtual Init	Initializes the object
virtual ValidationSettings	Checks the settings
Parameters	
Symbol	Sets the symbol
Period	Sets the timeframe
Magic	Sets the Expert Advisor ID
Indicators and Timeseries	
virtual SetPriceSeries	Sets pointers to external timeseries (price series)
virtual SetOtherSeries	Sets pointers to external timeseries (non-price series)
virtual InitIndicators	Initializes the indicators and timeseries
Access to Protected Data	
InitPhase	Gets the current phase of object initialization
TrendType	Sets trend type

© 2000-2025, MetaQuotes Ltd.

Initialization	
UsedSeries	Gets bitmask of timeseries used
EveryTick	Sets the "Every tick" flag
Access to Timeseries	
Open	Gets the element of the Open timeseries by index
High	Gets the element of the High timeseries by index
Low	Gets the element of the Low timeseries by index
Close	Gets the element of the Close timeseries by index
Spread	Gets the element of the Spread timeseries by index
Time	Gets the element of the Time timeseries by index
TickVolume	Gets the element of the TickVolume timeseries by index
RealVolume	Gets the element of the RealVolume timeseries by index

Protected Methods:

Initialization of Timeseries	
InitOpen	Open timeseries initialization method
InitHigh	High timeseries initialization method
InitLow	Low timeseries initialization method
InitClose	Close timeseries initialization method
InitSpread	Spread timeseries initialization method
InitTime	Time timeseries initialization method
InitTickVolume	TickVolume timeseries initialization method
InitRealVolume	RealVolume timeseries initialization method
Service Methods	
virtual PriceLevelUnit	Gets the price level unit
virtual StartIndex	Gets the index of starting bar to analyze
virtual CompareMagic	Compares the Expert Advisor ID with the specified value

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

InitPhase

Gets the current phase of the object initialization.

```
ENUM_INIT_PHASE  InitPhase()
```

Return Value

Current phase of the object initialization.

Note

The object initialization consist of several phases:

1. Start initialization.

- start - after finish of the constructor
- finish - after successful completion of the Init(...) method.
- allowed - call of the Init(...) method
- not allowed - call of the ValidationSettings() method and other initialization methods

2. Parameters setting phase. In this phase you need to set all the object parameters, used for creation of indicators.

- start - after successful completion of the Init(...) method
- finish - after successful completion of the ValidationSettings() method
- allowed - call of Symbol(...) and Period(...) methods
- not allowed - call of the Init(...), SetPriceSeries(...), SetOtherSeries(...) and InitIndicators(...) methods

3. Checking of parameters.

- start - after successful completion of the ValidationSettings() method
- finish - after successful completion of the InitIndicators(...) method
- allowed - call of the Symbol(...), Period(...) and InitIndicators(...) methods
- not allowed - call of any other initialization methods

4. Finish of initialization.

- start - after successful completion of the InitIndicators(...) method
- not allowed - call of initialization methods

© 2000-2025, MetaQuotes Ltd.

TrendType

Sets trend type.

```
void  TrendType(
   M_TYPE_TREND    value          // value
   )
```

Parameters

value

[in] New value of trend type.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

UsedSeries

Gets the bitmask of timeseries used.

```
int  UsedSeries()
```

Return Value

The list of used timeseries as bitmask.

Note

If the bit is set, the corresponding timeseries is used, if it is not set, the timeseries is not used.

The bit-timeseries correspondence:

bit 0 - Open timeseries,
bit 1 - High timeseries,
bit 2 - Low timeseries,
bit 3 - Close timeseries,
bit 4 - Spread timeseries,
bit 5 - Time timeseries,
bit 6 - TickVolume timeseries,
bit 7 - RealVolume timeseries.

© 2000-2025, MetaQuotes Ltd.

EveryTick

Sets the "Every tick" flag.

```
void  EveryTick(
   bool     value          // flag
   )
```

Parameters

value

[in] New value of a flag.

Return Value

None.

Note

If the flag is set, each price (tick) change at a working symbol is processed.

If the flag is not set, the processing method is called only at a new bar on the working timeframe and symbol.

© 2000-2025, MetaQuotes Ltd.

Open

Gets the element of the Open timeseries by index.

```
double  Open(
   int     ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the Open timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

High

Gets the element of the High timeseries by index.

```
double  High(
   int     ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the High timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

Low

Gets the element of the Low timeseries by index.

```
double  Low(
   int     ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the Low timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

Close

Gets the element of the Close timeseries by index.

```
double  Close(
   int    ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the Close timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

Spread

Gets the element of the Spread timeseries by index.

```
double  Spread(
   int    ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the Spread timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

Time

Gets the element of the Time timeseries by index.

```
datetime  Time(
   int    ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the Time timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

TickVolume

Gets the element of the TickVolume timeseries by index.

```
long  TickVolume(
   int     ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the TickVolume timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

RealVolume

Gets the element of the RealVolume timeseries by index.

```
long  RealVolume(
   int    ind          // index
   )
```

Parameters

ind

[in] Element index.

Return Value

If successful, it returns the numerical value of the RealVolume timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.

© 2000-2025, MetaQuotes Ltd.

Init

Initializes the object.

```
bool  Init(
   CSymbolInfo       symbol,    // symbol
   ENUM_TIMEFRAMES   period,    // timeframe
   double            point      // point
   )
```

Parameters

symbol

[in] Pointer to the object of CSymbolInfo type for access to symbol information.

period

[in] Timeframe (ENUM_TIMEFRAMES enumeration).

point

[in] The "weight" of 2/4-digit point.

Return Value

true - successful completion, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Symbol

Sets the object symbol.

```
bool  Symbol(
   string    name     // symbol
   )
```

Parameters

name

[in] Symbol.

Return Value

true - successful, otherwise - false.

Note

The setting of working symbol is necessary if the object uses the symbol different from symbol defined at the first initialization.

© 2000-2025, MetaQuotes Ltd.

Period

Sets the object timeframe.

```
bool  Period(
   ENUM_TIMEFRAMES  value     // timeframe
   )
```

Parameters

value

[in] Timeframe.

Return Value

true - successful, otherwise - false.

Note

The setting of working timeframe is necessary if the object uses the timeframe different from timeframe defined at the initialization.

© 2000-2025, MetaQuotes Ltd.

Magic

Sets the Expert Advisor ID.

```
void  Magic(
   ulong  value     // magic
   )
```

Parameters

value

[in] Expert Advisor ID.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

SetPriceSeries

Sets pointers to external price series.

```
virtual bool  SetPriceSeries(
   CiOpen*    open,         // pointer
   CiHigh*    high,         // pointer
   CiLow*     low,          // pointer
   CiClose*   close         // pointer
   )
```

Parameters

open

[in] Pointer to Open timeseries.

high

[in] Pointer to High timeseries.

low

[in] Pointer to Low timeseries.

close

[in] Pointer to Close timeseries.

Return Value

true - successful, otherwise - false.

Note

The setting of pointers to external timeseries (price series) is necessary if the object uses the symbol and timeframe (set during the first initialization) and price timeseries necessary for further work.

© 2000-2025, MetaQuotes Ltd.

SetOtherSeries

Sets pointers to external non-price series.

```
virtual bool  SetOtherSeries(
   CiSpread*       spread,        // pointer
   CiTime*         time,          // pointer
   CiTickVolume*   tick_volume,   // pointer
   CiRealVolume*   real_volume    // pointer
   )
```

Parameters

spread

[in] Pointer to Spread timeseries.

time

[in] Pointer to Time timeseries.

tick_volume

[in] Pointer to TickVolume timeseries.

real_volume

[in] Pointer to RealVolume timeseries.

Return Value

true - successful, otherwise - false.

Note

The setting of pointers to external timeseries (price series) is necessary if the object uses the symbol and timeframe (set during the first initialization) and price timeseries necessary for further work.

© 2000-2025, MetaQuotes Ltd.

InitIndicators

Initializes all indicators and time series.

```
virtual bool  InitIndicators(
   CIndicators*  indicators=NULL    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The timeseries are initialized only if the object uses the symbol or timeframe different from the symbol or timeframe defined at initialization.

© 2000-2025, MetaQuotes Ltd.

InitOpen

Initalizes the Open timeseries.

```
bool  InitOpen(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The Open timeseries is initialized only if the object uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

InitHigh

Initalizes the High timeseries.

```
bool  InitHigh(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The High timeseries is initialized only if the object uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

InitLow

Initalizes the Low timeseries.

```
bool  InitLow(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The Low timeseries is initialized only if the object uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

InitClose

Initalizes the Close timeseries.

```
bool  InitClose(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The Close timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

InitSpread

Initalizes the Spread timeseries.

```
bool  InitSpread(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The Spread timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

InitTime

Initalizes the Time timeseries.

```
bool  InitTime(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The Time timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

InitTickVolume

Initalizes the TickVolume timeseries.

```
bool  InitTickVolume(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The TickVolume timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

InitRealVolume

Initalizes the RealVolume timeseries.

```
bool  InitRealVolume(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The RealVolume timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).

© 2000-2025, MetaQuotes Ltd.

PriceLevelUnit

Gets the price level unit.

```
virtual double  PriceLevelUnit()
```

Return Value

The value of price level unit.

Note

The method of a base class returns the "weight" of the 2/4 digits point.

© 2000-2025, MetaQuotes Ltd.

StartIndex

Gets the index of starting bar to analyze.

```
virtual int  StartIndex()
```

Return Value

The index of starting bar to analyze.

Note

The method returns 0 if the flag to analyze current bar is set to true (analysis from the current bar). If the flag is not set, it returns 1 (analysis from the last completed bar).

© 2000-2025, MetaQuotes Ltd.

CompareMagic

Compares the Expert Advisor ID (magic) with the specified value.

```
virtual bool  CompareMagic(
   ulong  magic    // identifier
   )
```

Parameters

magic

[in] Identifier value to compare.

Return Value

true - identifier matches the specified one, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CExpert

CExpert is a base class for trading strategies.

It already has some elementary trading "skills". It has built-in algorithms for working with time series and indicators and a set of virtual methods for trading strategy.

How to use it:

1. Prepare an algorithm of the strategy;
2. Create your own class, inherited from CExpert class;
3. Override the virtual methods in your class with your own algorithms.

Description

The CExpert class is a set of virtual methods for implementation of trading strategies.

Note

A position is recognized as belonging to an Expert Advisor and managed by it based on the pair of properties m_symbol and m_magic. In the "hedging" mode, multiple positions can be opened for the same symbol, therefore the m_magic value is important.

Declaration

```
class CExpert : public CExpertBase
```

Title

```
#include <Expert\Expert.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpert

Class Methods by Groups

Initialization	
Init	Class instance initialization method
virtual InitSignal	Initializes Trading Signal object
virtual InitTrailing	Initializes Trailing Stop object
virtual InitMoney	Initializes Money Management object
virtual InitTrade	Initializes Trade object
virtual ValidationSettings	Checks the settings
virtual InitIndicators	Initializes indicators and timeseries

© 2000-2025, MetaQuotes Ltd.

Initialization	
virtual InitParameters	Expert Advisor parameters initialization method
virtual Deinit	Class instance deinitialization method
virtual DeinitSignal	Deinitializes Trading Signal object
virtual DeinitTrailing	Deinitializes Trailing Stop object
virtual DeinitMoney	Deinitializes Money Management object
virtual DeinitTrade	Deinitializes Trade object
virtual DeinitIndicators	Deinitializes indicators and timeseries
Parameters	
Magic	Sets the Expert Advisor ID
MaxOrders	Gets/sets the maximum amount of allowed orders
OnTickProcess	Sets a flag to proceed the "OnTick" event
OnTradeProcess	Sets a flag to proceed the "OnTrade" event
OnTimerProcess	Sets a flag to proceed the "OnTimer" event
OnChartEventProcess	Sets a flag to proceed the "OnChartEvent" event
OnBookEventProcess	Sets a flag to proceed the "OnBookEvent" event
Event Processing Methods	
OnTick	OnTick event handler
OnTrade	OnTrade event handler
OnTimer	OnTimer event handler
OnChartEvent	OnChartEvent event handler
OnBookEvent	OnBookEvent event handler
Update Methods	
Refresh	Updates all data
Processing	
Processing	Main processing algorithm
Market Entry Methods	
CheckOpen	Checks position opening conditions
CheckOpenLong	Checks conditions to open long position
CheckOpenShort	Checks conditions to open short position
OpenLong	Opens a long position

© 2000-2025, MetaQuotes Ltd.

Initialization	
OpenShort	Opens a short position
Market Exit Methods	
CheckClose	Checks conditions to close current position
CheckCloseLong	Checks conditions to close long position
CheckCloseShort	Checks conditions to close short position
CloseAll	Closes the opened position and deletes all orders
Close	Closes the opened position
CloseLong	Closes the long position
CloseShort	Closes the short position
Position Reverse Methods	
CheckReverse	Checks conditions to reverse opened position
CheckReverseLong	Checks conditions to reverse long position
CheckReverseShort	Checks conditions to reverse short position
ReverseLong	Performs reverse operation of long position
ReverseShort	Performs reverse operation of short position
Position/Order Trailing Methods	
CheckTrailingStop	Checks conditions to modify position parameters
CheckTrailingStopLong	Checks Trailing Stop conditions of long position
CheckTrailingStopShort	Checks Trailing Stop conditions of short position
TrailingStopLong	Performs Trailing Stop for long position
TrailingStopShort	Performs Trailing Stop for short position
CheckTrailingOrderLong	Checks Trailing Stop conditions of Buy Limit/Stop order
CheckTrailingOrderShort	Checks Trailing Stop conditions of Sell Limit/Stop order
TrailingOrderLong	Performs Trailing Stop for Buy Limit/Stop order
TrailingOrderShort	Performs Trailing Stop for Sell Limit/Stop order
Order Delete Methods	
CheckDeleteOrderLong	Checks conditions to delete Buy order
CheckDeleteOrderShort	Checks conditions to delete Sell order
DeleteOrders	Deletes all orders
DeleteOrder	Deletes Stop/Limit order

© 2000-2025, MetaQuotes Ltd.

Initialization	
DeleteOrderLong	Deletes Buy Limit/Stop order
DeleteOrderShort	Deletes Sell Limit/Stop order
Trade Volume Methods	
LotOpenLong	Gets trade volume for buy operation
LotOpenShort	Gets trade volume for sell operation
LotReverse	Gets trade volume for position reverse operation
Trade History Methods	
PrepareHistoryDate	Sets starting date for trade history tracking
HistoryPoint	Creates a checkpoint of trade history (saves number of positions, orders, deals and historical orders)
CheckTradeState	Compares the current state with the saved one and calls the corresponding event handler
Event flags	
WaitEvent	Sets the trading event waiting flag
NoWaitEvent	Resets the trading event waiting flag
Trade Event Processing Methods	
TradeEventPositionStopTake	Event handler of the "Position Stop Loss/Take Profit triggered" event
TradeEventOrderTriggered	Event handler of the "Pending Order Triggered" event
TradeEventPositionOpened	Event handler of the "Position Opened" event
TradeEventPositionVolumeChanged	Event handler of the "Position Volume Changed" event
TradeEventPositionModified	Event handler of the "Position Modified" event
TradeEventPositionClosed	Event handler of the "Position Closed" event
TradeEventOrderPlaced	Event handler of the "Pending Order Placed" event
TradeEventOrderModified	Event handler of the "Pending Order Modified" event
TradeEventOrderDeleted	Event handler of the "Pending Order Deleted" event
TradeEventNotIdentified	Event handler of the non-identified event
Service methods	
TimeframeAdd	Adds a timeframe to track
TimeframesFlags	Forms timeframe flags
SelectPosition	Selects a position to work with

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries

© 2000-2025, MetaQuotes Ltd.

Init

Class instance initialization method.

```
bool  Init(
   string              symbol,         // symbol
   ENUM_TIMEFRAMES     period,         // timeframe
   bool                every_tick,     // flag
   ulong               magic           // Expert Advisor identifier
   )
```

Parameters

symbol

[in] Symbol.

period

[in] Timeframe from ENUM_TIMEFRAMES enumeration.

every_tick

[in] Flag.

magic

[in] Expert Advisor ID (Magic number).

Return Value

None.

Note

If every_tick is set to true, the Processing() method is called at each tick of the working symbol. otherwise, the Processing() is called only when a new bar is formed on the working timeframe of the EA's working symbol.

© 2000-2025, MetaQuotes Ltd.

Magic

Sets the Expert Advisor ID (magic).

```
void  Magic(
   ulong  value     // new value
   )
```

Parameters

value

[in] New value of Expert Advisor ID.

Return Value

None.

Note

If EA's identifier is changed, the same identifier is assigned to all auxiliary objects.

Implementation

```
//+------------------------------------------------------------------+
//| Sets magic number for object and its dependent objects           |
//| INPUT:  value - new value of magic number.                       |
//| OUTPUT: no.                                                      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
void CExpert::Magic(ulong value)
  {
   if(m_trade!=NULL)     m_trade.SetExpertMagicNumber(value);
   if(m_signal!=NULL)    m_signal.Magic(value);
   if(m_money!=NULL)     m_money.Magic(value);
   if(m_trailing!=NULL) m_trailing.Magic(value);
//---
   CExpertBase::Magic(value);
  }
```

© 2000-2025, MetaQuotes Ltd.

InitSignal

Initializes trading signal object.

```
virtual bool  InitSignal(
   CExpertSignal*     signal=NULL,        // pointer
   )
```

Parameters

signal

[in] Pointer to CExpertSignal class object (or its descendant).

Return Value

true - successful, otherwise - false.

Note

If signal is NULL, the CExpertSignal class will be used for initialization (it does nothing).

© 2000-2025, MetaQuotes Ltd.

InitTrailing

Initializes trailing stop object.

```
virtual bool  InitTrailing(
   CExpertTrailing*     trailing=NULL,        // pointer
   )
```

Parameters

trailing

[in] Pointer to CExpertTrailing class object (or its descendant).

Return Value

true - successful, otherwise - false.

Note

If trailing is NULL, the ExpertTrailing class will be used for initialization (it does nothing).

© 2000-2025, MetaQuotes Ltd.

InitMoney

Initializes the money management object.

```
virtual bool  InitMoney(
   CExpertMoney*     money=NULL,         // pointer
   )
```

Parameters

money

[in] Pointer to CExpertMoney class object (or its descendant).

Return Value

true - successful, otherwise - false.

Note

If money is NULL, the CExpertMoney class will be used for initialization (it uses the minimum lot).

© 2000-2025, MetaQuotes Ltd.

InitTrade

Initializes the trade object.

```
virtual bool  InitTrade(
   ulong            magic,       // identifier
   CExpertTrade*    trade=NULL   // pointer
   )
```

Parameters

magic

[in] Expert Advisor ID (will be used in trade requests).

trade

[in] Pointer to trade object.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Deinit

Class instance deinitialization method.

```
virtual void Deinit()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnTickProcess

Sets the OnTick event handling flag.

```
void  OnTickOProcess(
   bool     value        // flag
   )
```

Parameters

value

[in] OnTick event handling flag.

Return Value

None.

Note

If the flag is true, the OnTick event is handled. By default, the flag is set to true.

© 2000-2025, MetaQuotes Ltd.

OnTradeProcess

Sets the OnTrade event handling flag.

```
void  OnTradeProcess(
   bool     value        // flag
   )
```

Parameters

value

[in] OnTrade event handling flag.

Return Value

None.

Note

If the flag is true, the OnTrade event is handled. By default, the flag is set to false.

© 2000-2025, MetaQuotes Ltd.

OnTimerProcess

Sets the OnTimer event handling flag.

```
void  OnTimerProcess(
   bool     value        // flag
   )
```

Parameters

value

[in] OnTimer event handling flag.

Return Value

None.

Note

If the flag is true, the OnTimer event is handled. By default, the flag is set to false.

© 2000-2025, MetaQuotes Ltd.

OnChartEventProcess

Sets a flag to handle the OnChartEvent event.

```
void  OnChartEventProcess(
   bool     value        // flag
   )
```

Parameters

value

[in] Flag to handle the OnChartEvent event.

Return Value

None.

Note

If the flag is true, the OnChartEvent event is handled. By default, the flag is set to false.

© 2000-2025, MetaQuotes Ltd.

OnBookEventProcess

Sets a flag to handle the OnBookEvent event.

```
void  OnChartEventProcess(
   bool     value        // flag
   )
```

Parameters

value

[in] Flag to handle the OnBookEvent event.

Return Value

None.

Note

If the flag is true, the OnBookEvent event is handled. By default, the flag is set to false.

© 2000-2025, MetaQuotes Ltd.

MaxOrders (Get Method)

Gets the maximum amount of allowed orders.

```
int  MaxOrders()
```

Return Value

Maximum amount of allowed orders.

MaxOrders (Set Method)

Sets the maximum amount of allowed orders.

```
void  MaxOrders(
   int     max_orders        // amount of orders
   )
```

Parameters

max_orders

[in] New value of maximum amount of allowed orders.

Return Value

None.

Note

By default, the maximum amount of allowed orders is equal to 1.

© 2000-2025, MetaQuotes Ltd.

Signal

Gets the pointer to the trade signal object.

```
CExpertSignal*  Signal() const
```

Return Value

Pointer to the trade signal object.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

It also checks the settings of all the Expert Advisor objects.

© 2000-2025, MetaQuotes Ltd.

InitIndicators

Initializes necessary indicators and timeseries.

```
virtual bool  InitIndicators(
   CIndicators*  indicators=NULL    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful completion, otherwise - false.

Note

The timeseries are initialized if the object uses a symbol or timeframe other than the one defined in the initialization.

Indicators and timeseries of all auxiliary EA objects are initialized.

© 2000-2025, MetaQuotes Ltd.

OnTick

OnTick event handler.

```
virtual void  OnTick()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnTrade

OnTrade event handler.

```
virtual void  OnTrade()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnTimer

OnTimer event handler.

```
virtual void  OnTimer()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnChartEvent

OnChartEvent event handler.

```
virtual void  OnChartEvent(
   const int     id,       // event id
   const long&   lparam,   // long type event parameter
   const double  dparam,   // double type event parameter
   const string  sparam    // string type event parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type.

dparam

[in] Event parameter of double type.

sparam

[in] Event parameter of string type.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnBookEvent

OnBookEvent event handler.

```
virtual void  OnBookEvent(
   const string&      symbol        // symbol
)
```

Parameters

symbol

[in] Symbol of OnBookEvent event.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

InitParameters

Initializes parameters of Expert Advisor.

```
virtual bool  InitParameters()
```

Return Value

true - successful, otherwise - false.

Note

The InitParameters() function of CExpert base class does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

DeinitTrade

Deinitializes trade object.

```
virtual void  DeinitTrade()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

DeinitSignal

Deinitializes trade signal object.

```
virtual void  DeinitSignal()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

DeinitTrailing

Deinitializes trailing object.

```
virtual void  DeinitTrailing()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

DeinitMoney

Deinitializes money management object.

```
virtual void  DeinitMoney()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

DeinitIndicators

Deinitializes indicators and timeseries.

```
virtual void  DeinitIndicators()
```

Return Value

None.

Note

Indicators and timeseries of all auxiliary EA objects are deinitialized.

© 2000-2025, MetaQuotes Ltd.

Refresh

Updates all necessary data.

```
virtual bool  Refresh()
```

Return Value

true - further tick processing is needed, otherwise - false.

Note

It allows to determine the need of tick processing. If it is needed, it updates all quotes and timeseries and indicators data and returns true.

Implementation

```
//+------------------------------------------------------------------+
//| Refreshing data for processing                                   |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if successful, false otherwise.                     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::Refresh()
  {
   MqlDateTime time;
//--- refresh rates
   if(!m_symbol.RefreshRates()) return(false);
//--- check need processing
   TimeToStruct(m_symbol.Time(),time);
   if(m_period_flags!=WRONG_VALUE && m_period_flags!=0)
      if((m_period_flags & TimeframesFlags(time))==0) return(false);
   m_last_tick_time=time;
//--- refresh indicators
   m_indicators.Refresh();
//--- ok
   return(true);
  }
```

© 2000-2025, MetaQuotes Ltd.

Processing

Main processing algorithm.

```
virtual bool  Processing()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It does the following steps:

1. Checks the presence of the opened position on the symbol. If there is no opened position, skip steps 2, 3, and 4.
2. Checks conditions to reverse opened position (CheckReverse() method). If position has been "reversed", exit.
3. Checks conditions to close position (CheckClose() method). If position has been closed, skip step 4.
4. Checks conditions to modify position parameters (CheckTrailingStop() method). If position parameters have been modified, exit.
5. Check the presence of pending orders on the symbol. If there is no any pending order, go to step 9.
6. Checks condition to delete order (CheckDeleteOrderLong() for buy pending orders or CheckDeleteOrderShort() for sell pending orders). If the order has been deleted, go to step 9.
7. Check conditions to modify pending order parameters (CheckTrailingOrderLong() for buy orders or CheckTrailingOrderShort() for sell orders). If the order parameters have been modified, exit.
8. Exit.
9. Checks conditions to open position (CheckOpen() method).

If you want to implement your own algorithm, you need to override the Processing() method of the descendant class.

Implementation

© 2000-2025, MetaQuotes Ltd.

```
//+------------------------------------------------------------------+

SelectPosition

Selects a position to work with.

```
void  SelectPosition()
```

Return Value

No.

Implementation

```
//+------------------------------------------------------------------+
//| Position select                                                  |
//| INPUT:  no.                                                      |
//| OUTPUT: no.                                                      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::SelectPosition(void)
  {
   bool res=false;
//---
   if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
      res=m_position.SelectByMagic(m_symbol.Name(),m_magic);
   else
      res=m_position.Select(m_symbol.Name());
//---
   return(res);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckOpen

Checks conditions to open a position.

```
virtual bool  CheckOpen()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to open long (CheckOpenLong()) and short (CheckOpenShort()) positions.

Implementation

```
//+------------------------------------------------------------------+
//| Check for position open or limit/stop order set                  |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckOpen()
  {
   if(CheckOpenLong())  return(true);
   if(CheckOpenShort()) return(true);
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckOpenLong

Checks necessity and conditions to open long position.

```
virtual bool  CheckOpenLong()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to open a long position (CheckOpenLong() method of Signal object) and does that with the parameters set by Signal object (OpenLong() method) if the conditions are met.

Implementation

```
//+------------------------------------------------------------------+
//| Check for long position open or limit/stop order set             |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckOpenLong()
  {
   double   price=EMPTY_VALUE;
   double   sl=0.0;
   double   tp=0.0;
   datetime expiration=TimeCurrent();
//--- check signal for long enter operations
   if(m_signal.CheckOpenLong(price,sl,tp,expiration))
     {
      if(!m_trade.SetOrderExpiration(expiration))
        {
         m_expiration=expiration;
        }
      return(OpenLong(price,sl,tp));
     }
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Checks necessity and conditions to open a short position.

```
virtual bool  CheckOpenShort()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to open a short position (CheckOpenShort() method of Signal object) and does that with the parameters set by Signal object (OpenShort() method) if the conditions are met.

Implementation

```
//+------------------------------------------------------------------+
//| Check for short position open or limit/stop order set            |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckOpenShort()
  {
   double   price=EMPTY_VALUE;
   double   sl=0.0;
   double   tp=0.0;
   datetime expiration=TimeCurrent();
//--- check signal for short enter operations
   if(m_signal.CheckOpenShort(price,sl,tp,expiration))
     {
      if(!m_trade.SetOrderExpiration(expiration))
        {
         m_expiration=expiration;
        }
      return(OpenShort(price,sl,tp));
     }
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

OpenLong

Opens a long position.

```
virtual bool  OpenLong(
   double    price,    // price
   double    sl,       // Stop Loss
   double    tp        // Take Profit
   )
```

Parameters

price

[in] Market entry price.

sl

[in] Stop Loss price.

tp

[in] Take Profit price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

It gets trading volume (LotOpenLong(...) method) and opens a long position (Buy() method of Trade object) if trading volume is not equal to 0.

Implementation

```
//+------------------------------------------------------------------+
//| Long position open or limit/stop order set                       |
//| INPUT:  price - price,                                           |
//|         sl    - stop loss,                                       |
//|         tp    - take profit.                                     |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::OpenLong(double price,double sl,double tp)
  {
   if(price==EMPTY_VALUE) return(false);
//--- get lot for open
   double lot=LotOpenLong(price,sl);
//--- check lot for open
   if(lot==0.0) return(false);
//---
   return(m_trade.Buy(lot,price,sl,tp));
  }
```

© 2000-2025, MetaQuotes Ltd.

OpenShort

Opens a short position.

```
virtual bool  OpenShort(
   double    price,    // price
   double    sl,       // Stop Loss
   double    tp        // Take Profit
   )
```

Parameters

price

[in] Market entry price.

sl

[in] Stop Loss price.

tp

[in] Take Profit price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

It gets trading volume (LotOpenShort() method) and opens a short position (by calling Sell method of Trade object) if trading volume is not equal to 0.

Implementation

```
//+------------------------------------------------------------------+
//| Short position open or limit/stop order set                      |
//| INPUT:  price - price,                                           |
//|         sl    - stop loss,                                       |
//|         tp    - take profit.                                     |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::OpenShort(double price,double sl,double tp)
  {
   if(price==EMPTY_VALUE) return(false);
//--- get lot for open
   double lot=LotOpenShort(price,sl);
//--- check lot for open
   if(lot==0.0) return(false);
//---
   return(m_trade.Sell(lot,price,sl,tp));
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckReverse

Checks necessity and conditions to reverse an open position.

```
virtual bool  CheckReverse()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to reverse long (CheckReverseLong()) and short (CheckReverseShort()) positions.

Implementation

```
//+------------------------------------------------------------------+
//| Check for position reverse                                       |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckReverse()
  {
   if(m_position.PositionType()==POSITION_TYPE_BUY)
     {
      //--- check the possibility of reverse the long position
      if(CheckReverseLong())  return(true);
     }
   else
      //--- check the possibility of reverse the short position
      if(CheckReverseShort()) return(true);
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckReverseLong

Checks necessity and conditions to reverse a long position.

```
virtual bool  CheckReverseLong()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to reverse a long position (CheckReverseLong() method of Signal object) and perform reverse operation of the current long position with the parameters set by Signal object (ReverseLong(...) method) if the conditions are met.

Implementation

```
//+------------------------------------------------------------------+
//| Check for long position reverse                                  |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckReverseLong()
  {
   double   price=EMPTY_VALUE;
   double   sl=0.0;
   double   tp=0.0;
   datetime expiration=TimeCurrent();
//--- check signal for long reverse operations
   if(m_signal.CheckReverseLong(price,sl,tp,expiration)) return(ReverseLong(price,sl,t
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckReverseShort

Checks necessity and conditions to reverse a short position.

```
virtual bool  CheckReverseLong()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to reverse a short position (CheckReverseShort() method of Signal object) and perform reverse operation of the current short position with the parameters set by Signal object (ReverseShort() method) if the conditions are met.

Implementation

```
//+------------------------------------------------------------------+
//| Check for short position reverse                                 |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckReverseShort()
  {
   double   price=EMPTY_VALUE;
   double   sl=0.0;
   double   tp=0.0;
   datetime expiration=TimeCurrent();
//--- check signal for short reverse operations
   if(m_signal.CheckReverseShort(price,sl,tp,expiration)) return(ReverseShort(price,sl
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

ReverseLong

Performs reverse operation of a long position.

```
virtual bool  ReverseLong(
   double    price,     // price
   double    sl,        // Stop Loss
   double    tp         // Take Profit
   )
```

Parameters

price

[in] Market entry price.

sl

[in] Stop Loss price.

tp

[in] Take Profit price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

It gets the position reverse volume (LotReverse() method) and reverses a long position (Sell() method of Trade object) if trading volume is not equal to 0.

In the "hedging" mode of position accounting, position reversal is performed as the closure of the existing position and opening of a new opposite one with the remaining volume.

Implementation

© 2000-2025, MetaQuotes Ltd.

```
//+------------------------------------------------------------------+
//| Long position reverse                                            |
//| INPUT:  price - price,                                           |
//|         sl    - stop loss,                                       |
//|         tp    - take profit.                                     |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::ReverseLong(double price,double sl,double tp)
  {
   if(price==EMPTY_VALUE)
      return(false);
//--- get lot for reverse
   double lot=LotReverse(sl);
//--- check lot
   if(lot==0.0)
      return(false);
//---
   bool result=true;
   if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
     {
      //--- first close existing position
      lot-=m_position.Volume();
      result=m_trade.PositionCloseByTicket(m_position.Identifier());
     }
   if(result)
      result=m_trade.Sell(lot,price,sl,tp);
//---
   return(result);
  }
```

© 2000-2025, MetaQuotes Ltd.

ReverseShort

Performs reverse operation of a short position.

```
virtual bool  ReverseShort(
   double    price,     // price
   double    sl,        // Stop Loss
   double    tp         // Take Profit
   )
```

Parameters

price

[in] Market entry price.

sl

[in] Stop Loss price.

tp

[in] Take Profit price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

It gets position reverse volume (LotReverse(...) method) and perform trade operation of the short position reverse (Buy() method of Trade object) if trading volume is not equal to 0.

In the "hedging" mode of position accounting, position reversal is performed as the closure of the existing position and opening of a new opposite one with the remaining volume.

Implementation

© 2000-2025, MetaQuotes Ltd.

```
//+------------------------------------------------------------------+
//| Short position reverse                                           |
//| INPUT:  price - price,                                           |
//|         sl    - stop loss,                                       |
//|         tp    - take profit.                                     |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::ReverseLong(double price,double sl,double tp)
  {
   if(price==EMPTY_VALUE)
      return(false);
//--- get lot for reverse
   double lot=LotReverse(sl);
//--- check lot
   if(lot==0.0)
      return(false);
//---
   bool result=true;
   if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
     {
      //--- first close existing position
      lot-=m_position.Volume();
      result=m_trade.PositionCloseByTicket(m_position.Identifier());
     }
   if(result)
      result=m_trade.Sell(lot,price,sl,tp);
//---
   return(result);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckClose

Checks conditions to close position.

```
virtual bool  CheckClose()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

1. It checks Expert Advisor Stop Out conditions (CheckClose() method of money management object). If condition is satisfied, it closes the position, deletes all orders (CloseAll()), and exits.
2. It checks conditions to close long or short position (CheckCloseLong() or CheckCloseShort() methods) and if position is closed, it deletes all orders (DeleteOrders() method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for position close or limit/stop order delete              |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckClose()
  {
   double lot;
//--- position must be selected before call
   if((lot=m_money.CheckClose(GetPointer(m_position)))!=0.0)
      return(CloseAll(lot));
//--- check for position type
   if(m_position.PositionType()==POSITION_TYPE_BUY)
     {
      //--- check the possibility of closing the long position / delete pending orders
      if(CheckCloseLong())
        {
         DeleteOrders();
         return(true);
        }
     }
   else
     {
      //--- check the possibility of closing the short position / delete pending orde
      if(CheckCloseShort())
        {
         DeleteOrders();
         return(true);
        }
     }
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckCloseLong

Checks conditions to close a long position.

```
virtual bool  CheckCloseLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks conditions to close a long position (CheckCloseLong() method of Signal object) and if they are satisfied, it closes the open position (CloseLong(...) method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for long position close or limit/stop order delete         |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckCloseLong()
  {
   double price=EMPTY_VALUE;
//--- check for long close operations
   if(m_signal.CheckCloseLong(price))
      return(CloseLong(price));
//--- return without operations
   return(false);
  }
```

CheckCloseShort

Checks conditions to close a short position.

```
virtual bool  CheckCloseShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks conditions to close a short position (CheckCloseShort() method of Signal object) and if they are satisfied, it closes the position (CloseShort() method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for short position close or limit/stop order delete        |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckCloseShort()
  {
   double price=EMPTY_VALUE;
//--- check for short close operations
   if(m_signal.CheckCloseShort(price))
      return(CloseShort(price));
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CloseAll

It performs partial of full position closing.

```
virtual bool  CloseAll(
   double    lot    // lot
   )
```

Parameters

lot

[in] Number of lots to reduce the position.

Return Value

true - trade operation has been executed, otherwise - false.

Note

In the "netting" mode, a position is closed using the CExpertTrade::Buy or CExpertTrade::Sell methods. In the "hedging" mode, the CTrade::PositionClose method is used, which can also be used on accounts with the netting mode. The DeleteOrders() method is used to delete orders.

Implementation

```
//+------------------------------------------------------------------+
//| Position close and orders delete                                 |
//| INPUT:  lot - volume for close.                                  |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CloseAll(double lot)
  {
   bool result=false;
//--- check for close operations
   if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
      result=m_trade.PositionCloseByTicket(m_position.Identifier());
   else
     {
      if(m_position.PositionType()==POSITION_TYPE_BUY)
         result=m_trade.Sell(lot,0,0,0);
      else
         result=m_trade.Buy(lot,0,0,0);
     }
   result|=DeleteOrders();
//---
   return(result);
  }
```

© 2000-2025, MetaQuotes Ltd.

Close

Closes the opened position.

```
virtual bool  Close()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

Closes the position (PositionClose() method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Position close                                                   |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::Close()
  {
   return(m_trade.PositionClose(m_symbol.Name()));
  }
```

© 2000-2025, MetaQuotes Ltd.

CloseLong

Closes the long position.

```
virtual bool  CloseLong(
   double    price    // price
   )
```

Parameters

price

[in] Market entry price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

In the "netting" mode, a position is closed using the CExpertTrade::Buy or CExpertTrade::Sell methods. In the "hedging" mode, the CTrade::PositionCloseByTicket method is used.

Implementation

```
//+------------------------------------------------------------------+
//| Long position close                                              |
//| INPUT:  price - price for close.                                 |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CloseLong(double price)
  {
   bool result=false;
//---
   if(price==EMPTY_VALUE)
      return(false);
   if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
      result=m_trade.PositionCloseByTicket(m_position.Identifier());
   else
      result=m_trade.Sell(m_position.Volume(),price,0,0);
//---
   return(result);
  }
```

© 2000-2025, MetaQuotes Ltd.

CloseShort

Closes the short position.

```
virtual bool  CloseShort(
   double    price    // price
   )
```

Parameters

price

[in] Market entry price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

In the "netting" mode, a position is closed using the CExpertTrade::Buy or CExpertTrade::Sell methods. In the "hedging" mode, the CTrade::PositionCloseByTicket method is used.

Implementation

```
//+------------------------------------------------------------------+
//| Short position close                                             |
//| INPUT:  price - price for close.                                 |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CloseShort(double price)
  {
   bool result=false;
//---
   if(price==EMPTY_VALUE)
      return(false);
   if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
      result=m_trade.PositionCloseByTicket(m_position.Identifier());
   else
      result=m_trade.Buy(m_position.Volume(),price,0,0);
//---
   return(result);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStop

It checks Trailing Stop conditions of the opened position.

```
virtual bool  CheckTrailingStop()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions of the opened position (CheckTrailingStopLong() or CheckTrailingStopShort() for long and short positions).

Implementation

```
//+------------------------------------------------------------------+
//| Check for trailing stop/profit position                          |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckTrailingStop()
  {
//--- position must be selected before call
   if(m_position.PositionType()==POSITION_TYPE_BUY)
     {
      //--- check the possibility of modifying the long position
      if(CheckTrailingStopLong()) return(true);
     }
   else
     {
      //--- check the possibility of modifying the short position
      if(CheckTrailingStopShort()) return(true);
     }
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopLong

It checks Trailing Stop conditions of the opened long position.

```
virtual bool  CheckTrailingStopLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions of the opened long position (CheckTrailingStopLong(...) method of Expert Trailing object). If conditions are satisfied, it modifies the position parameters (TrailingStopLong(...) method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for trailing stop/profit long position                     |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckTrailingStopLong()
  {
   double sl=EMPTY_VALUE;
   double tp=EMPTY_VALUE;
//--- check for long trailing stop operations
   if(m_trailing.CheckTrailingStopLong(GetPointer(m_position),sl,tp))
     {
      if(sl==EMPTY_VALUE) sl=m_position.StopLoss();
      if(tp==EMPTY_VALUE) tp=m_position.TakeProfit();
      //--- long trailing stop operations
      return(TrailingStopLong(sl,tp));
     }
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopShort

It checks Trailing Stop conditions of the opened short position.

```
virtual bool  CheckTrailingStopShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions of the opened short position (CheckTrailingStopShort(...) method of Expert Trailing object). If conditions are satisfied, it modifies the position parameters (TrailingStopShort(...) method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for trailing stop/profit short position                    |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckTrailingStopShort()
  {
   double sl=EMPTY_VALUE;
   double tp=EMPTY_VALUE;
//--- check for short trailing stop operations
   if(m_trailing.CheckTrailingStopShort(GetPointer(m_position),sl,tp))
     {
      if(sl==EMPTY_VALUE) sl=m_position.StopLoss();
      if(tp==EMPTY_VALUE) tp=m_position.TakeProfit();
      //--- short trailing stop operations
      return(TrailingStopShort(sl,tp));
     }
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

TrailingStopLong

It modifies parameters of the opened long position.

```
virtual bool  TrailingStopLong(
   double    sl,    // Stop Loss
   double    tp,    // Take Profit
   )
```

Parameters

sl

[in] Stop Loss price.

tp

[in] Take Profit price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

The function modifies parameters of the opened long position (PositionModify(...) method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Trailing stop/profit long position                               |
//| INPUT:  sl - new stop loss,                                      |
//|         tp - new take profit.                                    |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::TrailingStopLong(double sl,double tp)
  {
   return(m_trade.PositionModify(m_symbol.Name(),sl,tp));
  }
```

© 2000-2025, MetaQuotes Ltd.

TrailingStopShort

It modifies parameters of the opened short position.

```
virtual bool  TrailingStopLong(
   double    sl,    // Stop Loss
   double    tp,    // Take Profit
   )
```

Parameters

sl

[in] Stop Loss price.

tp

[in] Take Profit price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

The function modifies parameters of the opened short position (PositionModify(...) method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Trailing stop/profit short position                              |
//| INPUT:  sl - new stop loss,                                      |
//|         tp - new take profit.                                    |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::TrailingStopShort(double sl,double tp)
  {
   return(m_trade.PositionModify(m_symbol.Name(),sl,tp));
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckTrailingOrderLong

Checks Trailing Stop conditions of Buy Limit/Stop trailing order.

```
virtual bool  CheckTrailingOrderLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions for buy limit/stop trailing order (CheckTrailingOrderLong() method of Trade Signals object) and modifies the order parameters if necessary (TrailingOrderLong(...) method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for trailing long limit/stop order                         |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckTrailingOrderLong()
  {
   double price;
//--- check the possibility of modifying the long order
   if(m_signal.CheckTrailingOrderLong(GetPointer(m_order),price))
      return(TrailingOrderLong(m_order.PriceOpen()-price));
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckTrailingOrderShort

It checks Trailing Stop conditions of Sell Limit/Stop trailing order.

```
virtual bool  CheckTrailingOrderShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions for sell limit/stop trailing order (CheckTrailingOrderShort() method of Trade Signals object) and modifies the order parameters if necessary (TrailingOrderShort() method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for trailing short limit/stop order                        |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckTrailingOrderShort()
  {
   double price;
//--- check the possibility of modifying the short order
   if(m_signal.CheckTrailingOrderShort(GetPointer(m_order),price))
      return(TrailingOrderShort(m_order.PriceOpen()-price));
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

TrailingOrderLong

It modifies parameters of Buy Limit/Stop trailing order.

```
virtual bool  TrailingOrderLong(
   double    delta    // delta
   )
```

Parameters

delta

[in] Price delta.

Return Value

true - trade operation has been executed, otherwise - false.

Note

It modifies parameters of Buy Limit/Stop trailing order (OrderModify(...) method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Trailing long limit/stop order                                   |
//| INPUT:  delta - price change.                                    |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::TrailingOrderLong(double delta)
  {
   ulong  ticket=m_order.Ticket();
   double price =m_order.PriceOpen()-delta;
   double sl    =m_order.StopLoss()-delta;
   double tp    =m_order.TakeProfit()-delta;
//--- modifying the long order
   return(m_trade.OrderModify(ticket,price,sl,tp,m_order.TypeTime(),m_order.TimeExpira
  }
```

© 2000-2025, MetaQuotes Ltd.

TrailingOrderShort

It modifies parameters of Sell Limit/Stop trailing order.

```
virtual bool  TrailingOrderShort(
   double    delta    // delta
   )
```

Parameters

delta

[in] Price delta.

Return Value

true - trade operation has been executed, otherwise - false.

Note

It modifies parameters of Sell Limit/Stop trailing order (OrderModify(...) method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Trailing short limit/stop order                                  |
//| INPUT:  delta - price change.                                    |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::TrailingOrderShort(double delta)
  {
   ulong  ticket=m_order.Ticket();
   double price =m_order.PriceOpen()-delta;
   double sl    =m_order.StopLoss()-delta;
   double tp    =m_order.TakeProfit()-delta;
//--- modifying the short order
   return(m_trade.OrderModify(ticket,price,sl,tp,m_order.TypeTime(),m_order.TimeExpira
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckDeleteOrderLong

It checks conditions to delete Buy Limit/Stop order.

```
virtual bool  CheckDeleteOrderLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks the order expiration time. It checks conditions to delete the Buy Limit/Stop order (CheckCloseLong(...) method of Signal class object) and deletes the order if condition is satisfied (DeleteOrderLong() method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for delete long limit/stop order                           |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckDeleteOrderLong()
  {
   double price;
//--- check the possibility of deleting the long order
   if(m_expiration!=0 && TimeCurrent()>m_expiration)
     {
      m_expiration=0;
      return(DeleteOrderLong());
     }
   if(m_signal.CheckCloseLong(price))
      return(DeleteOrderLong());
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

CheckDeleteOrderShort

It checks conditions to delete Sell Limit/Stop order.

```
virtual bool  CheckDeleteOrderShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

1. It checks the order expiration time.

2. It checks conditions to delete the Sell Limit/Stop order (CheckCloseShort(...) method of Signal class object) and deletes the order if one of the conditions is satisfied (DeleteOrderShort() method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for delete short limit/stop order                          |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckDeleteOrderShort()
  {
   double price;
//--- check the possibility of deleting the short order
   if(m_expiration!=0 && TimeCurrent()>m_expiration)
     {
      m_expiration=0;
      return(DeleteOrderShort());
     }
   if(m_signal.CheckCloseShort(price))
      return(DeleteOrderShort());
//--- return without operations
   return(false);
  }
```

© 2000-2025, MetaQuotes Ltd.

DeleteOrders

Deletes all orders.

```
virtual bool  DeleteOrders()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It deletes all orders (DeleteOrder() for all orders).

Implementation

```
//+------------------------------------------------------------------+
//| Delete all limit/stop orders                                     |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::DeleteOrders()
  {
   bool result=false;
   int  total=OrdersTotal();
//---
   for(int i=total-1;i>=0;i--)
     {
      if(m_order.Select(OrderGetTicket(i)))
        {
         if(m_order.Symbol()!=m_symbol.Name()) continue;
         result|=DeleteOrder();
        }
     }
//---
   return(result);
  }
```

© 2000-2025, MetaQuotes Ltd.

DeleteOrder

Deletes the Limit/Stop order.

```
virtual bool  DeleteOrder()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It deletes the Limit/Stop order (OrderDelete(...) method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Delete limit/stop order                                          |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::DeleteOrder()
  {
   return(m_trade.OrderDelete(m_order.Ticket()));
  }
```

© 2000-2025, MetaQuotes Ltd.

DeleteOrderLong

Deletes the Buy Limit/Stop order.

```
virtual bool  DeleteOrderLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It deletes Buy Limit/Stop order (OrderDelete(...) method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Delete long limit/stop order                                     |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::DeleteOrderLong()
  {
   return(m_trade.OrderDelete(m_order.Ticket()));
  }
```

© 2000-2025, MetaQuotes Ltd.

DeleteOrderShort

Deletes the Sell Limit/Stop order.

```
virtual bool  DeleteOrderShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It deletes the Sell Limit/Stop order (OrderDelete(...) method of CTrade class object).

Implementation

```
//+------------------------------------------------------------------+
//| Delete short limit/stop order                                    |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::DeleteOrderShort()
  {
   return(m_trade.OrderDelete(m_order.Ticket()));
  }
```

© 2000-2025, MetaQuotes Ltd.

LotOpenLong

Gets trade volume for buy operation.

```
double  LotOpenLong(
   double    price,    // price
   double    sl        // Stop Loss
   )
```

Parameters

price

[in] Market entry price.

sl

[in] Stop Loss price.

Return Value

Trade volume (in lots) for buy operation.

Note

It gets trade volume for buy operation (CheckOpenLong(...) method of money management object).

Implementation

```
//+------------------------------------------------------------------+
//| Method of getting the lot for open long position.                |
//| INPUT:  price - price,                                           |
//|         sl    - stop loss.                                       |
//| OUTPUT: lot for open.                                            |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
double CExpert::LotOpenLong(double price,double sl)
  {
   return(m_money.CheckOpenLong(price,sl));
  }
```

© 2000-2025, MetaQuotes Ltd.

LotOpenShort

Gets trade volume for sell operation.

```
double  LotOpenShort(
   double    price,   // price
   double    sl       // Stop Loss
   )
```

Parameters

price

[in] Market entry price.

sl

[in] Stop Loss price.

Return Value

Trade volume (in lots) for sell operation.

Note

It gets trade volume for sell operation (CheckOpenShort(...) method of money management object).

Implementation

```
//+------------------------------------------------------------------+
//| Method of getting the lot for open short position.               |
//| INPUT:  price - price,                                           |
//|         sl    - stop loss.                                       |
//| OUTPUT: lot for open.                                            |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
double CExpert::LotOpenShort(double price,double sl)
  {
   return(m_money.CheckOpenShort(price,sl));
  }
```

© 2000-2025, MetaQuotes Ltd.

LotReverse

Gets trade volume for position reverse.

```
double  LotReverse(
   double    sl       // Stop Loss
   )
```

Parameters

sl

[in] Stop Loss price.

Return Value

Trade volume (in lots) for position reverse operation.

Note

It gets trade volume for position reverse operation (CheckReverse(...) method of money management object).

Implementation

```
//+------------------------------------------------------------------+
//| Method of getting the lot for reverse position.                  |
//| INPUT:  sl - stop loss.                                          |
//| OUTPUT: lot for open.                                            |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
double CExpert::LotReverse(double sl)
  {
   return(m_money.CheckReverse(GetPointer(m_position),sl));
  }
```

© 2000-2025, MetaQuotes Ltd.

PrepareHistoryDate

Sets starting date for tracking of trade history.

```
void  PrepareHistoryDate()
```

Note

The trade history tracking period is set from the beginning of the month (but not less than one day).

© 2000-2025, MetaQuotes Ltd.

HistoryPoint

Creates a checkpoint of trade history.

```
void  HistoryPoint(
   bool   from_check_trade=false   // flag
   )
```

Parameters

from_check_trade=false

[in] Flag to avoid recursion.

Note

It saves the amount of positions, orders, deals, and historical orders.

© 2000-2025, MetaQuotes Ltd.

CheckTradeState

Compares the current state with the saved one and calls the corresponding event handler.

```
bool  CheckTradeState()
```

Return Value

true - event has been handled, otherwise - false.

Note

It checks the number of positions, orders, deals, and historical orders by comparing with the values saved by HistoryPoint() method. If trade history has changed, it calls the corresponding virtual event handler.

© 2000-2025, MetaQuotes Ltd.

WaitEvent

Sets the event waiting flag.

```
void  WaitEvent(
   ENUM_TRADE_EVENTS    event          // flag
   )
```

Parameters

event

[in] Flag of waiting for an event (from ENUM_TRADE_EVENTS enumeration) to set.

Return Value

None.

Event flags

```
//--- flags of expected events
enum ENUM_TRADE_EVENTS
  {
   TRADE_EVENT_NO_EVENT               =0,         // no expected events
   TRADE_EVENT_POSITION_OPEN          =0x1,       // flag of expecting the "opening of
   TRADE_EVENT_POSITION_VOLUME_CHANGE=0x2,        // flag of expecting of the "modifica
   TRADE_EVENT_POSITION_MODIFY        =0x4,       // flag of expecting of the "modifica
   TRADE_EVENT_POSITION_CLOSE         =0x8,       // flag of expecting of the "closing
   TRADE_EVENT_POSITION_STOP_TAKE     =0x10,      // flag of expecting of the "trigger
   TRADE_EVENT_ORDER_PLACE            =0x20,      // flag of expecting of the "placing
   TRADE_EVENT_ORDER_MODIFY           =0x40,      // flag of expecting of the "modifica
   TRADE_EVENT_ORDER_DELETE           =0x80,      // flag of expecting of the "deletion
   TRADE_EVENT_ORDER_TRIGGER          =0x100      // flag of expecting of the "trigger
  };
```

© 2000-2025, MetaQuotes Ltd.

NoWaitEvent

Resets the event waiting flag.

```
void  NoWaitEvent(
   ENUM_TRADE_EVENTS    event          // flag
   )
```

Parameters

event

[in] Flag with events (from ENUM_TRADE_EVENTS enumeration) to reset.

Return Value

None.

Event flags

```
//--- flags of expected events
enum ENUM_TRADE_EVENTS
  {
   TRADE_EVENT_NO_EVENT               =0,         // no expected events
   TRADE_EVENT_POSITION_OPEN          =0x1,       // flag of expecting the "opening of
   TRADE_EVENT_POSITION_VOLUME_CHANGE=0x2,        // flag of expecting of the "modifica
   TRADE_EVENT_POSITION_MODIFY        =0x4,       // flag of expecting of the "modifica
   TRADE_EVENT_POSITION_CLOSE         =0x8,       // flag of expecting of the "closing
   TRADE_EVENT_POSITION_STOP_TAKE     =0x10,      // flag of expecting of the "trigger
   TRADE_EVENT_ORDER_PLACE            =0x20,      // flag of expecting of the "placing
   TRADE_EVENT_ORDER_MODIFY           =0x40,      // flag of expecting of the "modifica
   TRADE_EVENT_ORDER_DELETE           =0x80,      // flag of expecting of the "deletion
   TRADE_EVENT_ORDER_TRIGGER          =0x100      // flag of expecting of the "trigger
  };
```

© 2000-2025, MetaQuotes Ltd.

TradeEventPositionStopTake

Event handler of the "Position Stop Loss/Take Profit triggered" event.

```
virtual bool  TradeEventPositionStopTake()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventOrderTriggered

Event handler of the "Pending Order triggered" event.

```
virtual bool  TradeEventOrderTriggered()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventPositionOpened

Event handler of the "Position opened" event.

```
virtual bool  TradeEventPositionOpened()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventPositionVolumeChanged

Event handler of the "Position volume changed" event.

```
virtual bool  TradeEventPositionVolumeChanged()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventPositionModified

Event handler of the "Position modified" event.

```
virtual bool  TradeEventPositionModified()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventPositionClosed

Event handler of the "Position closed" event.

```
virtual bool  TradeEventPositionClosed()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventOrderPlaced

Event handler of the "Pending order placed" event.

```
virtual bool  TradeEventOrderPlaced()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventOrderModified

Event handler of the "Pending order modified" event.

```
virtual bool  TradeEventOrderModified()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventOrderDeleted

Event handler of the "Pending order deleted" event.

```
virtual bool  TradeEventOrderDeleted()
```

Return Value

The CExpert class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

TradeEventNotIdentified

Event handler of the non-identified event.

```
virtual bool  TradeEventNotIdentified()
```

Return Value

The CExpert class method does nothing and always returns true.

Note

Note that several trade events can arrive, in such cases it is difficult to identify them.

© 2000-2025, MetaQuotes Ltd.

TimeframeAdd

Add a timeframe for tracking.

```
void  TimeframeAdd(
   ENUM_TIMEFRAMES    period         // timeframe
   )
```

Parameters

period

[in] Timeframe (from ENUM_TIMEFRAMES enumeration) to be tracked.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

TimeframesFlags

Forms the timeframe flags.

```
int  TimeframesFlags(
   MqlDateTime&    time         // reference
   )
```

Parameters

time

[in] Reference to MqlDateTime type structure containing a new time.

Return Value

It returns the flag that indicates timeframes with a new bar.

© 2000-2025, MetaQuotes Ltd.

CExpertSignal

CExpertSignal is a base class for trading signals, it does nothing (except CheckReverseLong() and CheckReverseShort() methods) but provides the interfaces.

How to use it:

1. Prepare an algorithm for trading signals;
2. Create your own trading signal class, inherited from CExpertSignal class;
3. Override the virtual methods in your class with your own algorithms.

You can find an examples of trading signal classes in the Expert\Signal\ folder.

Description

CExpertSignal is a base class for implementation of trading signal algorithms.

Declaration

```
class CExpertSignal : public CExpertBase
```

Title

```
#include <Expert\ExpertSignal.mqh>
```

Inheritance hierarchy

CObject

CExpertBase

CExpertSignal

Direct descendants

CSignalAC, CSignalAMA, CSignalAO, CSignalBearsPower, CSignalBullsPower, CSignalCCI, CSignalDeM, CSignalDEMA, CSignalEnvelopes, CSignalFrAMA, CSignalRSI, CSignalRVI, CSignalSAR, CSignalStoch, CSignalTEMA, CSignalTriX, CSignalWPR

Class Methods by Groups

Initialization	
virtual InitIndicators	Initializes indicators and timeseries
virtual ValidationSettings	Checks the object settings
virtual AddFilter	Adds a filter to combined signal
Access to Protected Data	
BasePrice	Sets base price level
UsedSeries	Gets the flags of timeseries used
Parameters Setting	

© 2000-2025, MetaQuotes Ltd.

Initialization	
Weight	Sets the value of "Weight" parameter
PatternsUsage	Sets the value of "PatternsUsage" parameter
General	Sets the value of "General" parameter
Ignore	Sets the value of "Ignore" parameter
Invert	Sets the value of "Invert" parameter
ThresholdOpen	Sets the value of "ThresholdOpen" parameter
ThresholdClose	Sets the value of "ThresholdClose" parameter
PriceLevel	Sets the value of "PriceLevel" parameter
StopLevel	Sets the value of "StopLevel" parameter
TakeLevel	Sets the value of "TakeLevel" parameter
Expiration	Sets the value of "Expiration" parameter
Magic	Sets the value of "Magic" parameter
Checking Trading Conditions	
virtual CheckOpenLong	Checks conditions to open long position
virtual CheckCloseLong	Checks conditions to close long position
virtual CheckOpenShort	Checks conditions to open short position
virtual CheckCloseShort	Checks conditions to close short position
virtual CheckReverseLong	Checks conditions of long position reversal
virtual CheckReverseShort	Checks conditions of short position reversal
Trade Parameters Setting	
virtual OpenLongParams	Sets parameters for long position opening
virtual OpenShortParams	Sets parameters for short position opening
virtual CloseLongParams	Sets parameters for long position closing
virtual CloseShortParams	Sets parameters for short position closing
Checking of Order Trailing Conditions	
virtual CheckTrailingOrderLong	Checks conditions to modify parameters of Buy Pending order
virtual CheckTrailingOrderShort	Checks conditions to modify parameters of Sell Pending order

© 2000-2025, MetaQuotes Ltd.

Initialization	
Methods to Check Formation of Market Orders	
virtual LongCondition	Gets the result of checking buy conditions
virtual ShortCondition	Gets the result of checking sell conditions
virtual Direction	Gets the "weighted" direction of price

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries

© 2000-2025, MetaQuotes Ltd.

BasePrice

Sets base price level.

```
void  BasePrice(
   double    value          // value
   )
```

Parameters

value

[in] New value of the parameter.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

UsedSeries

Gets the flags of the timeseries used.

```
int  UsedSeries()
```

Return Value

Flags of the used timeseries (if the symbol/timeframe corresponds to the working symbol/timeframe), otherwise 0.

© 2000-2025, MetaQuotes Ltd.

Weight

Sets new value of "Weight" parameter.

```
void  Weight(
   double    value          // value
   )
```

Parameters

value

[in] "Weight" parameter.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

PatternUsage

Sets new value of "PatternsUsage" parameter.

```
void  PatternUsage(
   double    value          // value
   )
```

Parameters

value

[in] New value of "PatternsUsage".

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

General

Sets new value of "General" parameter.

```
void  General(
   int     value          // value
   )
```

Parameters

value

[in] New value of "General".

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Ignore

Sets new value of "Ignore" parameter.

```
void  Ignore(
   long     value          // value
   )
```

Parameters

value

[in] New value of "Ignore".

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Invert

Sets new value of "Invert" parameter.

```
void  Invert(
   long     value          // value
   )
```

Parameters

value

[in] New value of "Invert".

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ThresholdOpen

Sets new value of "ThresholdOpen" parameter.

```
void  ThresholdOpen(
   long     value          // value
   )
```

Parameters

value

[in] New value of "ThresholdOpen".

Return Value

None.

Note

The range of "ThresholdOpen" parameter is from 0 to 100. Used when "voting" to open position.

© 2000-2025, MetaQuotes Ltd.

ThresholdClose

Sets new value of "ThresholdClose" parameter.

```
void  ThresholdOpen(
   long     value          // value
   )
```

Parameters

value

[in] New value of "ThresholdClose".

Return Value

None.

Note

The range of "ThresholdClose" parameter is from 0 to 100. Used when "voting" to close position.

© 2000-2025, MetaQuotes Ltd.

PriceLevel

Sets new value of "PriceLevel" parameter.

```
void  PriceLevel(
   double    value          // value
   )
```

Parameters

value

[in] New value of "PriceLevel".

Return Value

None.

Note

The value of "PriceLevel" is defined in price level units. The numerical values of price level unit is returned by PriceLevelUnit() method. The "PriceLevel" is used to define the open price relative to the base price.

© 2000-2025, MetaQuotes Ltd.

StopLevel

Sets new value of "StopLevel" parameter.

```
void  StopLevel(
   double    value          // value
   )
```

Parameters

value

[in] New value of "StopLevel".

Return Value

None.

Note

The value of "StopLevel" is defined in price level units. The numerical values of price level unit is returned by PriceLevelUnit() method. The "StopLevel" is used to define the Stop Loss price relative to the open price.

© 2000-2025, MetaQuotes Ltd.

TakeLevel

Sets new value of "TakeLevel" parameter.

```
void  TakeLevel(
   double    value          // value
   )
```

Parameters

value

[in] New value of "TakeLevel".

Return Value

None.

Note

The value of "TakeLevel" is defined in price level units. The numerical values of price level unit is returned by PriceLevelUnit() method. The "TakeLevel" is used to define the Take Profit price relative to the open price.

© 2000-2025, MetaQuotes Ltd.

Expiration

Sets the value of "Expiration" parameter.

```
void  Expiration(
   int     value          // value
   )
```

Parameters

value

[in] New value of "Expiration".

Return Value

None.

Note

The value of "Expiration" parameter is defined in bars. It is used as Expiration time for Pending Orders (when trading using pending orders).

© 2000-2025, MetaQuotes Ltd.

Magic

Sets the value of "Magic" parameter.

```
void  Magic(
   int     value          // value
   )
```

Parameters

value

[in] New value of "Magic" (Expert Advisor ID).

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the object settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - object settings are correct, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

InitIndicators

Initializes all necessary indicators and timeseries.

```
virtual bool  InitIndicators(
   CIndicators*  indicators    // pointer
   )
```

Parameters

indicators

[in] Pointer to collection of indicators and timeseries.

Return Value

true - successful completion, otherwise - false.

Note

The necessary timeseries are initialized only if the object uses the symbol or timeframe different from the one defined at initialization.

© 2000-2025, MetaQuotes Ltd.

AddFilter

Adds a filter to the composite signal.

```
virtual bool  AddFilter(
   CExpertSignal*  filter    // pointer
   )
```

Parameters

indicators

[in] Pointer to filter object.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckOpenLong

Checks conditions to open a long position.

```
virtual bool  CheckOpenLong(
   double&    price,          // price
   double&    sl,             // Stop Loss
   double&    tp,             // Take Profit
   datetime&  expiration      // expiration
   )
```

Parameters

price

[in][out] Variable for open price, passed by reference.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

expiration

[in][out] Variable for expiration time, passed by reference (if necessary).

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Checks conditions to open a short position.

```
virtual bool  CheckOpenShort(
   double&    price,          // price
   double&    sl,             // Stop Loss
   double&    tp,             // Take Profit
   datetime&  expiration      // expiration
   )
```

Parameters

price

[in][out] Variable for open price, passed by reference.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

expiration

[in][out] Variable for expiration time, passed by reference (if necessary).

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OpenLongParams

Sets parameters to open a long position.

```
virtual bool  OpenLongParams(
   double&    price,          // price
   double&    sl,             // Stop Loss
   double&    tp,             // Take Profit
   datetime&  expiration      // expiration
   )
```

Parameters

price

[in][out] Variable for open price, passed by reference.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

expiration

[in][out] Variable for expiration time, passed by reference (if necessary).

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OpenShortParams

Sets parameters to open a short position.

```
virtual bool  OpenShortParams(
   double&    price,          // price
   double&    sl,             // Stop Loss
   double&    tp,             // Take Profit
   datetime&  expiration      // expiration
   )
```

Parameters

price

[in][out] Variable for price, passed by reference.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

expiration

[in][out] Variable for expiration time, passed by reference (if necessary).

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckCloseLong

Checks conditions to close a long position.

```
virtual bool  CheckCloseLong(
   double&  price      // price
   )
```

Parameters

price

[in][out] Variable for close price, passed by reference.

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckCloseShort

Checks conditions to close a short position.

```
virtual bool  CheckCloseShort(
   double&  price      // price
   )
```

Parameters

price

[in][out] Variable for close price, passed by reference.

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CloseLongParams

Sets parameters to close a long position.

```
virtual bool  CloseLongParams(
   double&    price          // price
   )
```

Parameters

price

[in][out] Variable for close price, passed by reference.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CloseShortParams

Sets parameters to close a short position.

```
virtual bool  CloseShortParams(
   double&    price          // price
   )
```

Parameters

price

[in][out] Variable for close price, passed by reference.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckReverseLong

Checks conditions of a long position reversal.

```
virtual bool  CheckReverseLong(
   double&    price,          // price
   double&    sl,             // Stop Loss
   double&    tp,             // Take Profit
   datetime&  expiration      // expiration
   )
```

Parameters

price

[in][out] Variable for price, passed by reference.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

expiration

[in][out] Variable for expiration time, passed by reference (if necessary).

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckReverseShort

Checks conditions of a short position reversal.

```
virtual bool  CheckReverseShort(
   double&    price,          // price
   double&    sl,             // Stop Loss
   double&    tp,             // Take Profit
   datetime&  expiration      // expiration
   )
```

Parameters

price

[in][out] Variable for reversal price, passed by reference.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

expiration

[in][out] Variable for expiration time, passed by reference (if necessary).

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingOrderLong

Checks conditions to modify parameters of Buy Pending order.

```
virtual bool  CheckTrailingOrderLong(
   COrderInfo*     order,          // order
   double&         price           // price
   )
```

Parameters

order

[in] Pointer to COrderInfo class object.

price

[in][out] Variable for Stop Loss price.

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingOrderShort

Checks conditions to modify parameters of Sell Pending order.

```
virtual bool  CheckTrailingOrderShort(
   COrderInfo*     order,          // order
   double&         price           // price
   )
```

Parameters

order

[in] Pointer to COrderInfo class object.

price

[in][out] Variable for Stop Loss price.

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

LongCondition

Checks conditions to open a long position.

```
virtual int  LongCondition()
```

Return Value

If the conditions are satisfied, it returns the value from 1 to 100 (depending on "strength" of a signal). If there is no signal to open a long position, it returns 0.

Note

The base class has no implementation of checking conditions to open a long position and always returns 0.

© 2000-2025, MetaQuotes Ltd.

ShortCondition

Checks conditions to open a short position.

```
virtual int  ShortCondition()
```

Return Value

If the conditions are satisfied, it returns the value from 1 to 100 (depending on "strength" of a signal). If there isn't a signal to open short position, it returns 0.

Note

The base class has no implementation of checking conditions to open a short position and always returns 0.

© 2000-2025, MetaQuotes Ltd.

Direction

Returns the value of "weighted" price direction.

```
virtual double  Direction()
```

Return Value

It returns the value>0 when upward direction is most probable and <0 in case of a downward direction. The absolute value depends on the "strength" of a signal.

Note

If the built-in filters are used, their results are considered when defining the general direction.

CExpertTrailing

CExpertTrailing is a base class for trailing algorithms, it does nothing but provides the interfaces.

How to use it:

1. Prepare an algorithm for trailing;
2. Create your own trailing class inherited from CExpertTrailing class;
3. Override the virtual methods in your class with your own algorithms.

You can find an examples of trailing classes in the Expert\Trailing\ folder.

Description

CExpertTrailing is a base class for implementation of trailing stop algorithms.

Declaration

```
class CExpertTrailing : public CExpertBase
```

Title

```
#include <Expert\ExpertTrailing.mqh>
```

Inheritance hierarchy

CObject

CExpertBase

CExpertTrailing

Direct descendants

CTrailingFixedPips, CTrailingMA, CTrailingNone, CTrailingPSAR

Class Methods by Groups

Checking of Trailing Stop Conditions	
virtual CheckTrailingStopLong	Checks conditions to modify parameters of the long position
virtual CheckTrailingStopShort	Checks conditions to modify parameters of the short position

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, ValidationSettings, SetPriceSeries, SetOtherSeries, InitIndicators

CheckTrailingStopLong

Checks conditions to modify parameters of a long position.

```
virtual bool  CheckTrailingStopLong(
   CPositionInfo*  position,     // pointer
   double&         sl,           // Stop Loss
   double&         tp            // Take Profit
   )
```

Parameters

position

[in] Pointer to CPositionInfo class object.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

Return Value

true - condition is satisfied, otherwise - false.

Note

Base class method always returns false.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopShort

Checks conditions to modify parameters of a short position.

```
virtual bool  CheckTrailingStopShort(
   CPositionInfo*  position,     // pointer
   double&         sl,           // Stop Loss
   double&         tp            // Take Profit
   )
```

Parameters

position

[in] Pointer to CPositionInfo class object.

sl

[in][out] Variable for Stop Loss price, passed by reference.

tp

[in][out] Variable for Take Profit price, passed by reference.

Return Value

true - condition is satisfied, otherwise - false.

Note

Base class method always returns false.

Percent

Sets the value of "Risk percent" parameter.

```
void  Percent(
   double  percent      // risk percent
   )
```

Parameters

percent

[in] Risk percent.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

Base class method always returns true.

© 2000-2025, MetaQuotes Ltd.

CheckOpenLong

Gets the volume for a long position.

```
virtual double  CheckOpenLong(
   double  price,     // price
   double  sl         // Stop Loss
   )
```

Parameters

price

[in] Opening price of a long position.

sl

[in] Stop Loss price of a long position.

Return Value

Trade volume for a long position.

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Gets the volume for a short position.

```
virtual double  CheckOpenShort(
   double  price,     // price
   double  sl         // Stop Loss
   )
```

Parameters

price

[in] Opening price for a short position.

sl

[in] Stop Loss price of a short position.

Return Value

Trade volume for a short position.

© 2000-2025, MetaQuotes Ltd.

CheckReverse

Gets the volume for reverse of the position.

```
virtual double  CheckReverse(
   CPositionInfo*  position,     // pointer
   double          sl            // Stop Loss
   )
```

Parameters

position

[in] Pointer to CPositionInfo class object.

sl

[in] Stop Loss price.

Return Value

Volume for reverse of the position.

© 2000-2025, MetaQuotes Ltd.

CheckClose

Checks conditions to close the opened position.

```
virtual double  CheckClose()
```

Return Value

true - condition is satisfied, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Modules of Trade Signals

The standard delivery of the client terminal includes a set of ready-made modules of trade signals for "MQL5 Wizard". When creating an Expert Advisor in MQL5 Wizard, you can use any combination of the modules of trade signals (up to 64). The final decision on a trade operation is made on the basis of complex analysis of signals obtained from all included modules. The detailed description of the mechanism of making trade decisions is given below.

The standard delivery includes the following modules of signals:

- Signals of the Indicator Accelerator Oscillator
- Signals of the Indicator Adaptive Moving Average
- Signals of the Indicator Awesome Oscillator
- Signals of the Oscillator Bears Power
- Signals of the Oscillator Bulls Power
- Signals of the Oscillator Commodity Channel Index
- Signals of the Oscillator DeMarker
- Signals of the Indicator Double Exponential Moving Average
- Signals of the Indicator Envelopes
- Signals of the Indicator Fractal Adaptive Moving Average
- Signals of the Intraday Time Filter
- Signals of the Oscillator MACD
- Signals of the Indicator Moving Average
- Signals of the Indicator Parabolic SAR
- Signals of the Oscillator Relative Strength Index
- Signals of the Oscillator Relative Vigor Index
- Signals of the Oscillator Stochastic
- Signals of the Oscillator Triple Exponential Average
- Signals of the Indicator Triple Exponential Moving Average
- Signals of the Oscillator Williams Percent Range

The Mechanism of Making Trade Decisions on the Basis of Signal Modules

The mechanism of making trade decisions can be represented as the following list of basic principles:

- Each of the modules of signals has its set of market modules (certain combination of prices and values of an indicator).
- Each market model has a significance that may vary with the range of 1 to 100. The higher is the significance, the stronger the model is.
- Each of the models generates a forecast of direction of the price movement.
- A forecast of a module is the result of search for embedded models, and it is outputted as a number within the range of -100 to 100. The sign determines the direction of forecast movement (negative

© 2000-2025, MetaQuotes Ltd.

sign means the price will fall, positive sign means the price will rise). The absolute value corresponds to the strength of the best found model.

- The forecast of each module is sent to the final "voting" with a weight coefficient of 0 to 1 specified in its settings ("Weight").
- The result of voting is a number within the range of -100 to 100, where the sign determines direction of the forecast movement, and the absolute value characterizes the strength of the signal. It is calculated as the Arithmetic mean of weighted forecasts of all the modules of signals. The absolute value is used by an Expert Advisor to make trade decisions.

Each generated Expert Advisor has two adjustable settings — threshold levels of opening and closing a position (ThresholdOpen and ThresholdClose) that can be equal to a value in the range of 0 to 100. If the strength of final signal exceeds a threshold level, a trade operation that corresponds to the sign of the signal is performed.

Examples

Consider an Expert Advisor with the following threshold levels: ThresholdOpen=20 and ThresholdClose=90. Two modules of signals participate in making decisions on trade operations: the MA module with weight 0.4 and the Stochastic module with weight 0.8. Let's analyze two variants of obtained trade signals:

Variant 1

The price crossed the rising MA upwards. This case corresponds to one of the market models implemented in the MA module. This model implies a rise of price. Its significance is equal to 100. At the same time, the Stochastic oscillator turned down and formed a divergence with price. This case corresponds to one of the models implemented in the Stochastic module. This model implies a fall of price. The weight of this model is 80.

Let's calculate the result of final "voting". The rate obtained from the MA module is calculated as 0.4 * 100 = 40. The value from the Stochastic module is calculated as 0.8 * (-80) = -64. The final value is calculated as the Arithmetic mean of these two rates: (40 - 64)/2 = -12. The result of voting is the signal for selling with relative strength equal to 12. The threshold level that is equal to 20 is not reached. Thus a trade operation is not performed.

Variant 2

The price crossed the rising MA downwards. This case corresponds to one of the models implemented in the MA module.This model implies a rise of price. Its significance is equal to 10. At the same time, the Stochastic oscillator turned down and formed a divergence with price. This case corresponds to one of the models implemented in the Stochastic module. This model implies a fall of price. The weight of this model is 80.

Let's calculate the result of final "voting". The rate obtained from the MA module is calculated as 0.4 * 10 = 4. The value from the Stochastic module is calculated as 0.8 * (-80) = -64. The final value is calculated as the Arithmetic mean of these two rates: (4 - 64)/2 = -30. The result of voting is the signal for selling with relative strength equal to 30. The threshold level that is equal to 20 is reached. Thus the result is the signal for opening a short position.

© 2000-2025, MetaQuotes Ltd.

a) Divergence of the price and the Stochastic oscillator (variants 1 and 2).

b) The price crossed the MA indicator upwards (variant 1).

c) The price crossed the MA indicator downwards (variant 2).

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Accelerator Oscillator

This module is based on the market models of the indicator Accelerator Oscillator. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• The indicator value is above 0 and it rises at the analyzed and at the previous bars.  • The indicator value is below 0 and it rises at the analyzed and at the previous bars. For selling	• The indicator value is below 0 and it falls at the analyzed and at the previous bars.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • The indicator value is above 0 and it falls at the analyzed and at the two previous bars. No objections to buying	The indicator value grows at the analyzed bar.
No objections to selling	The indicator value falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only"), an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Adaptive Moving Average

This module is based on the market models of the indicator Adaptive Moving Average. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Failed breakout.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) but the indicator rises (weak indicator line roll-back signal).  • **Moving Average crossover.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator rises (strong signal). 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• **True breakout.** The lower shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar is above the indicator, and the Low price is below the indicator) and the indicator rises (indicator line roll-back signal). For selling	• **Failed breakout.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) but the indicator falls (weak indicator line roll-back signal).  • **Moving Average crossover.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator falls (strong signal).

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **True breakout.** The upper shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are below the indicator, and the High price is above the indicator) and the indicator falls (indicator line roll-back signal). No objections to buying	The price is above the indicator.
No objections to selling	The price is below the indicator.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only"), an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodMA	Period of averaging of the indicator.
Shift	Shift of the indicator along the time axis (in bars).
Method	Method of averaging.
Applied	A price series used for calculation of the indicator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Awesome Oscillator

This module of signals is based on the market models of the indicator Awesome Oscillator. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Saucer** — value of the indicator at the analyzed bar rises, and it fell at the previous bars; at that, both values are above 0.  • **Crossing the zero line** — value of the indicator is above 0 at the analyzed bar, and it is below 0 at the previous bar.  • **Divergence** — the first analyzed bottom of the indicator is shallower than the previous one, and the corresponding price bottom is deeper

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	than the previous one. In addition, the indicator must not rise above the zero level. For selling	• **Saucer** — value of the indicator at the analyzed bar falls, and it rose at the previous bars; at that, both values are below 0.  • **Crossing the zero line** — value of the indicator is below 0 at the analyzed bar, and it is above 0 at the previous bar.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Divergence** — the first analyzed peak of the indicator is lower than the previous one, and the corresponding price peak is higher than the previous one. In addition, the indicator must not falls below the zero level. No objections to buying	The indicator value grows at the analyzed bar.
No objections to selling	The indicator value falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Bears Power

This module of signals is based on the market models of the oscillator Bears Power. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Reverse** — the oscillator turned upwards and its value at the analyzed bar is below 0.  • **Divergence** — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one. In addition, the oscillator must not rise above the zero level. For selling	No signals for selling.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
No objections to buying	Value of the oscillator is less than 0.
No objections to selling	No signals.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodBears	Period of calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Bulls Power

This module of signals is based on the market models of the oscillator Bulls Power. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	No signals for buying.
For selling	• **Reverse** — the oscillator turned downwards and its value at the analyzed bar is above 0.  • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak. In addition, the oscillator must not fall below the zero level. 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
No objections to buying	No signals.
No objections to selling	Value of the oscillator is greater than 0.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodBulls	Period of calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Commodity Channel Index

This module of signals is based on the market models of the oscillator Commodity Channel Index. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Reverse behind the oversold level** — the oscillator turned upwards and its value at the analyzed bar is behind the level of oversold level (default value is -100).  • **Divergence** — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one. 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• **Double divergence** — the oscillator formed three consequent bottoms, each of them is higher than the previous one; and the price formed three corresponding bottoms, and each of them is lower than the previous one. For selling	• **Reverse behind the overbought level** — the oscillator turned downwards and its value at the analyzed bar is behind the overbought level (default value is 100).  • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Double divergence** — the oscillator formed three consequent peaks, each of them is lower than the previous one; and the price formed three corresponding peaks, each of them is higher than the previous one. No objections to buying	Value of the oscillator grows at the analyzed bar.
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodCCI	Period of calculation of the oscillator.
Applied	A price series used for calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator DeMarker

This module of signals is based on the market models of the oscillator DeMarker. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Reverse behind the oversold level** — the oscillator turned upwards and its value at the analyzed bar is behind the oversold level (default value is 0.3).  • **Divergence** — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one.  • **Double divergence** — the oscillator form three consequent bottoms, each of them is higher than the previous one; and the price formed

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	three corresponding bottoms, and each of them is lower than the previous one. For selling	• **Reverse behind the overbought level** — the oscillator turned downwards and its value at the analyzed bar is behind the overbought level (default value is 0.7).  • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Double divergence** — the oscillator formed three consequent peaks, each of them is lower than the previous one; and the price formed three corresponding peaks, each of them is higher than the previous one. No objections to buying	Value of the oscillator grows at the analyzed bar.
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodDeM	Period of calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Double Exponential Moving Average

This module is based on the market models of the indicator Double Exponential Moving Average. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Failed breakout.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator rises (weak signal for a roll-back from the indicator line).  • **Moving Average crossover.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator rises (strong signal). 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• **Formed breakout.** The lower shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are above the indicator, and the Low price is below the indicator) and the indicator rises (signal for a roll-back from the indicator line). For selling	• **Failed breakout.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator falls (weak signal for a roll-back from the indicator line).  • **Moving Average crossover.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator falls (strong signal).

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Formed breakout.** The upper shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are below the indicator, and the High price is above the indicator) and the indicator falls (weak signal for a roll-back from the indicator line). No objections to buying	The price is above the indicator.
No objections to selling	The price is below the indicator.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodMA	Period of averaging of the indicator.
Shift	Shift of the indicator along the time axis (in bars).
Method	Method of averaging.
Applied	A price series used for calculation of the indicator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Envelopes

This module of signals is based on the market models of the indicator Envelopes. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• The price is near the lower line of the indicator at the analyzed bar. • The price crossed the upper line of the indicator at the analyzed bar. For selling	• The price is near the upper line of the indicator at the analyzed bar.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • The price crossed the lower line of the indicator at the analyzed bar. No objections to buying	No signals.
No objections to selling	No signals.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodMA	Period of calculation of the indicator.
Shift	Shift of the indicator along the time axis (in bars).
Method	Method of averaging.
Applied	A price series used for calculation of the indicator.
Deviation	Deviation of the envelope borders from the center line (MA) in percentage terms.

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Fractal Adaptive Moving Average

This module of signals is based on the market models of the indicator Fractal Adaptive Moving Average. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Failed breakout.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator rises (weak signal for a roll-back from the indicator line).  • **Moving Average crossover.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator rises (strong signal). 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• **Formed breakout.** The lower shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar is above the indicator, and the Low price is below the indicator) and the indicator rises (signal for a roll-back from the indicator line). For selling	• **Failed breakout.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator falls (weak signal for a roll-back from the indicator line).  • **Moving Average crossover.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator falls (strong signal).

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Formed breakout.** The upper shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are below the indicator, and the High price is above the indicator) and the indicator falls (weak signal for a roll-back from the indicator line). No objections to buying	The price is above the indicator.
No objections to selling	The price is below the indicator.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodMA	Period of averaging of the indicator.
Shift	Shift of the indicator along the time axis (in bars).
Method	Method of averaging.
Applied	A price series used for calculation of the indicator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Intraday Time Filter

This module is based on the assumption that the efficiency of market models changes in time. Using this module, you can filter signals received from the other modules by hour and days of week. It allows increasing the quality of generated signals due to cutting off the unfavorable time periods. The mechanism of making trade decisions on the basis of signals of the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	No signals.
For selling	No signals.
No objections to buying	The current date and time meet the specified parameters.
No objections to selling	The current date and time meet the specified parameters.

Adjustable Parameters

This module has the following adjustable parameters:

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
GoodHourOfDay	Number of the only hour of day (from 0 to 23) when trade signals will be enabled. If the value is -1, the signals will be enabled through the whole day.
BadHoursOfDay	The bit field. Each bit of this field corresponds to an hour of day (0 bit - 0 hour, ..., 23 bit - 23-rd hour). If the value of a bit is equal to 0, trade signals will be enabled during the corresponding hour. If the value of a bit is equal to 1, trade signals will be disabled during the corresponding hour. A specified number is represented as a binary number and is used as bit mask. Disabled hours have higher priority than the enabled ones.
GoodDayOfWeek	Number of the only day of week (from 0 to 6, where 0 is Sunday), when trade signals will be enabled. If the value is -1, the signals will be enabled on any day.
BadDaysOfWeek	The bit field. Each bit of this field corresponds to a day of week (0 bit - Sunday, ..., 6 bit - Saturday). If the value of a bit is equal to 0, trade signals will be enabled during the corresponding day. If the value of a bit is equal to 1, trade signals will be disabled during the corresponding day. A specified number is represented as a binary number and is used as bit mask. Disabled days have higher priority than the enabled ones.

Signals of the Oscillator MACD

This module of signals is based on the market models of the oscillator MACD. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

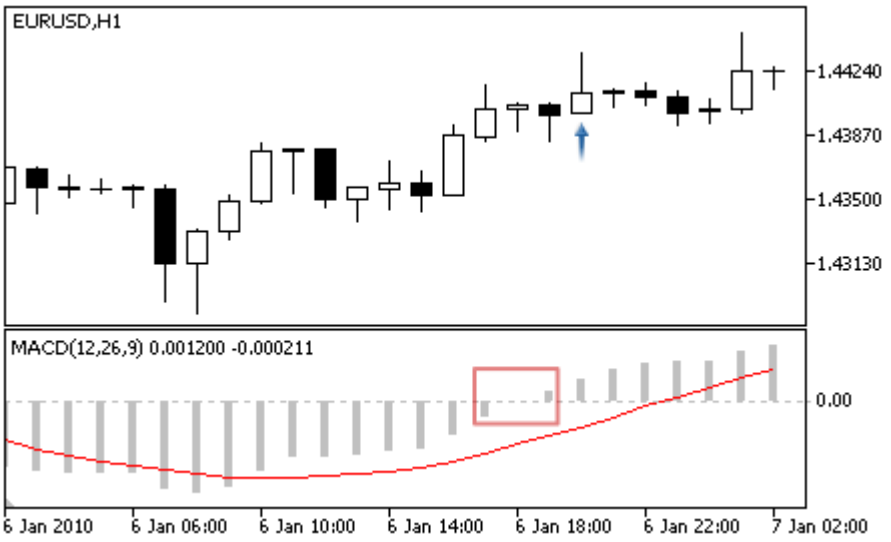
Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

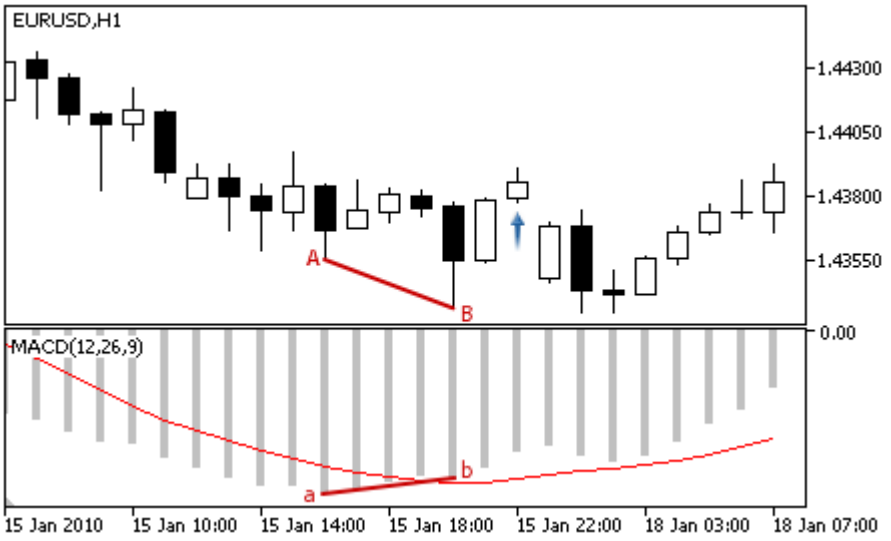
Signal Type	Description of Conditions
For buying	• **Reverse** — the oscillator turned upwards (the oscillator rises at the analyzed bar and falls at the previous one). • **Crossover of the main and signal line** — the main line is above the signal line at the analyzed bar and below the signal line at the previous one.  • **Crossing the zero level** — the main line is above the zero level at the analyzed bar and below the zero level at the previous one.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions



- **Divergence** — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one.



- **Double divergence** — the oscillator forms three consequent bottoms, each of them is higher than the previous one; and the price formed three corresponding bottoms, and each of them is lower than the previous one.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	For selling	• **Reverse** — the oscillator turned downwards (the oscillator falls at the analyzed bar and rises at the previous one).  • **Crossover of the main and signal line** — the main line is below the signal line at the analyzed bar and above the signal line at the previous one.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Crossing the zero level** — the main line is below the zero level at the analyzed bar and above the zero level at the previous one.  • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Double divergence** — the oscillator formed three consequent peaks, each of them is lower than the previous one; and the price formed three corresponding peaks, each of them is higher than the previous one. No objections to buying	Value of the oscillator grows at the analyzed bar.
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodFast	Period of calculation of the fast EMA.
PeriodSlow	Period of calculation of the slow EMA.
PeriodSignal	Period of smoothing.
Applied	A price series used for calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Moving Average

This module of signals is based on the market models of the indicator Moving Average. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Failed breakout.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator rises (weak signal for a roll-back from the indicator line).  • **Moving Average crossover.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator rises (strong signal). 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• **Formed breakout.** The lower shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are above the indicator, and the Low price is below the indicator) and the indicator rises (weak signal for a roll-back from the indicator line). For selling	• **Failed breakout.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator falls (weak signal).  • **Moving Average crossover.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator falls (strong signal).

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Formed breakout.** The upper shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are below the indicator, and the High price is above the indicator) and the indicator falls (weak signal for a roll-back from the indicator line). No objections to buying	The price is above the indicator.
No objections to selling	The price is below the indicator.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodMA	Period of averaging of the indicator.
Shift	Shift of the indicator along the time axis (in bars).
Method	Method of averaging.
Applied	A price series used for calculation of the indicator.

© 2000-2025, MetaQuotes Ltd.

Signals of the indicator Parabolic SAR

This module of signals is based on the market models of the indicator Parabolic SAR. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	**Reverse** — the indicator is below the price at the analyzed bar and above the price at the previous one. For selling	**Reverse** — the indicator is above the price at the analyzed bar and below the price at the previous one. No objections to buying	The price is above the indicator.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
No objections to selling	The price is below the indicator.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
Step	The step of price increment.
Maximum	Maximum rate of the speed of convergence of the indicator with the price.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Relative Strength Index

This module of signals is based on the market models of the oscillator Relative Strength Index. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Reverse behind the oversold level** — the oscillator turned upwards and its value at the analyzed bar is behind the oversold level (default value is 30).  • **Failed swing** — the oscillator rises higher than the previous peak at the analyzed bar. 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• **Divergence** — the first analyzed bottom of the oscillator is lower than the previous one, and the corresponding price bottom is lower than the previous one.  • **Double divergence** — the oscillator form three consequent bottoms, each of them is higher than the previous one; and the price formed three corresponding bottoms, and each of them is lower than the previous one.  • **Head/Shoulders** — the oscillator formed three consequent bottoms, and the mid one is lower than the others.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	For selling	• **Reverse behind the overbought level** — the oscillator turned downwards and its value at the analyzed bar is behind the overbought level (default value is 70).  • **Failed swing** — the oscillator falls lower than the previous bottom at the analyzed bar.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak.  • **Double divergence** — the oscillator formed three consequent peaks, each of them is lower than the previous one; and the price formed three corresponding peaks, each of them is higher than the previous one.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Head/Shoulders** — the oscillator formed three consequent peaks, and the mid one is higher than the others. No objections to buying	Value of the oscillator grows at the analyzed bar.
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodRSI	Period of calculation of the oscillator.
Applied	A price series used for calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Relative Vigor Index

This module of signals is based on the market models of the oscillator Relative Vigor Index. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	**Crossing of the main and signal line** — the main line is above the signal line at the analyzed bar and below the signal line at the previous one. For selling	**Crossing of the main and signal line** — the main line is below the signal line at the analyzed bar and above the signal line at the previous one. No objections to buying	Value of the oscillator grows at the analyzed bar.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodRVI	Period of calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Stochastic

This module of signals is based on the market models of the oscillator Stochastic. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Reverse** — the oscillator turned upwards (the oscillator rises at the analyzed bar and falls at the previous one).  • **Crossing of the main and signal line** — the main line is above the signal line at the analyzed bar and below the signal line at the previous one.  • **Divergence** — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Double divergence** — the oscillator form three consequent bottoms, each of them is higher than the previous one; and the price formed three corresponding bottoms, and each of them is lower than the previous one. For selling	• **Reverse** — the oscillator turned downwards (the oscillator falls at the analyzed bar and rises at the previous one).

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Crossing of the main and signal line** — the main line is below the signal line at the analyzed bar and above the signal line at the previous one.  • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Double divergence** — the oscillator formed three consequent peaks, each of them is lower than the previous one; and the price formed three corresponding peaks, each of them is higher than the previous one. No objections to buying	Value of the oscillator grows at the analyzed bar.
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodK	Period of calculation of the main line of the oscillator.
PeriodD	Period of averaging of the main line of the oscillator.
PeriodSlow	Period of slowing.
Applied	A price series used for calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Triple Exponential Average

This module of signals is based on the market models of the oscillator Triple Exponential Average. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Reverse** — the oscillator turned upwards (the oscillator rises at the analyzed bar and falls at the previous one).  • **Crossing the zero level** — the main line is above the zero level at the analyzed bar and below the zero level at the previous one. 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• **Divergence** — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one. For selling	• **Reverse** — the oscillator turned downwards (the oscillator falls at the analyzed bar and rises at the previous one).  • **Crossing the zero level** — the main line is below the zero level at the analyzed bar and above the zero level at the previous one.

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak. No objections to buying	Value of the oscillator grows at the analyzed bar.
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodTriX	Period of calculation of the oscillator.
Applied	A price series used for calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Indicator Triple Exponential Moving Average

This module of signals is based on the market models of the indicator Triple Exponential Moving Average. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator rises (weak signal of a roll-back from the indicator line).  • **Moving Average crossover.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator rises (strong signal). 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	• Formed breakout. The lower shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are above the indicator, and the Low price is below the indicator) and the indicator rises (weak signal of a roll-back from the indicator line). For selling	• **Failed breakout.** The price has crossed the indicator upwards (the Open price of the analyzed bar is below the indicator and the Close price is above the indicator) and the indicator falls (weak signal of a roll-back from the indicator line).  • **Moving Average crossover.** The price has crossed the indicator downwards (the Open price of the analyzed bar is above the indicator and the Close price is below the indicator) and the indicator falls (strong signal).

© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
	 • **Formed breakout.** The upper shadow of the bar has crossed the indicator (the Open and Close prices of the analyzed bar are below the indicator, and the High price is above the indicator) and the indicator falls (weak signal of a roll-back from the indicator line). No objections to buying	The price is above the indicator.
No objections to selling	The price is below the indicator.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

Adjustable Parameters

This module has the following adjustable parameters:

© 2000-2025, MetaQuotes Ltd.

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodMA	Period of averaging of the indicator.
Shift	Shift of the indicator along the time axis (in bars).
Method	Method of averaging.
Applied	A price series used for calculation of the indicator.

© 2000-2025, MetaQuotes Ltd.

Signals of the Oscillator Williams Percent Range

This module of signals is based on the market models of the oscillator Williams Percent Range. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signal Type	Description of Conditions
For buying	• **Reverse behind the oversold level** — the oscillator turned upwards and its value at the analyzed bar is behind the oversold level (default value is -80).  • **Divergence** — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one. 
© 2000-2025, MetaQuotes Ltd.

Signal Type	Description of Conditions
For selling	• **Reverse behind the overbought level** — the oscillator turned downwards and its value at the analyzed bar is behind the overbought level (default value is -20).  • **Divergence** — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak. No objections to buying	Value of the oscillator grows at the analyzed bar.
No objections to selling	Value of the oscillator falls at the analyzed bar.

Note

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).

© 2000-2025, MetaQuotes Ltd.

Remember that the oscillator Williams Percent Range has a reversed scale. Its maximum value is -100, and minimum is 0.

Adjustable Parameters

This module has the following adjustable parameters:

Parameter	Description
Weight	Weight of signal of the module in the interval 0 to 1.
PeriodWPR	Period of calculation of the oscillator.

© 2000-2025, MetaQuotes Ltd.

Trailing Stop classes

This section contains technical details of working with trailing stop classes and description of the relevant components of the MQL5 standard library.

The use of these classes will save time when creating (and testing) trading strategies.

MQL5 Standard Library (in terms of trading strategies) is placed in the terminal directory, in the Include\Expert\Trailing folder.

Class	Description
CTrailingFixedPips	This class implements Trailing Stop algorithm based on fixed points
CTrailingMA	This class implements Trailing Stop algorithm based on the values of Moving Average indicator
CTrailingNone	A stub class, it does not uses any Trailing Stop algorithm
CTrailingPSAR	This class implements Trailing Stop algorithm based on the values of Parabolic SAR indicator

© 2000-2025, MetaQuotes Ltd.

CTrailingFixedPips

CTrailingFixedPips is a class with implementation of Trailing Stop algorithm based on fixed points trailing.

CTrailingFixedPips class implements the following algorithm of trailing open positions: If Stop Loss level is equal to zero, Stop Loss order modification condition is considered unfulfilled, therefore there is no suggestion to change a position's Stop Loss. Otherwise, the check of whether the price has moved in favorable direction is performed.

If a position has a Stop Loss order, it checks the minimal allowed Stop Loss distance to the current price. If the position has no Stop Loss level, the distance between the current and open prices is checked. If the distance exceeds Stop Loss level, the system suggests to set a new Stop Loss price.

If Stop Loss modification condition is fulfilled and Take Profit is not equal to zero, the system suggests setting a new Take Profit price.

If Expert Advisor class has been initialized with the flag every_tick=false, it will perform all operations (trading, trailing, etc) only at the new bar on a working symbol and timeframe. In this case, setting Take Profit order allows you to close position when the price moves in the position direction before a new bar appears.

Description

CTrailingFixedPips implements the Trailing Stop algorithm at a specified "distance" from the current price (in points).

Declaration

```
class CTrailingFixedPips: public CExpertTrailing
```

Title

```

StopLevel

Sets the value of Stop Loss level.

```
void  StopLevel(
   int  stop_level      // level
   )
```

Parameters

stop_loss

[in] The value of Stop Loss level (in conventional 2/4-digit points).

Note

If Stop Loss level is equal to 0, the Trailing Stop is not used.

© 2000-2025, MetaQuotes Ltd.

ProfitLevel

Sets the value of Take Profit level.

```
void  ProfitLevel(
   int  profit_level      // level
   )
```

Parameters

profit_level

[in] The value of Take Profit level (in conventional 2/4-digit points).

Note

If profit level is equal to 0, the Trailing Stop is not used.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

The function checks Take Profit and Stop Loss levels. The correct values are 0 and values greater than the minimal indention in points from the current close price to place Stop orders.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```
virtual bool  CheckTrailingStopLong(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference to Stop Loss
   double&         tp            // reference to Take Profit
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

If Stop Loss level is equal to 0, the condition is not fulfilled (exit). If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the current Bid price is higher than base price+stop loss level, it suggests to set new Stop Loss price. In this case, If position already has Take Profit price, it suggests to set new Take Profit price equal to Bid price+take profit level.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```
virtual bool  CheckTrailingStopShort(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference to Stop Loss
   double&         tp            // reference to Take Profit
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

If Stop Loss level is equal to 0, the condition is not fulfilled (exit). If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the current Ask price is lower than base price - stop loss level, it suggests to set new Stop Loss price. In this case, If position already has Take Profit price, it suggests to set new Take Profit price equal to Ask price - take profit level.

CTrailingMA

CTrailingMA is a class with implementation of Trailing Stop algorithm based on the values of moving average indicator.

Description

CTrailingMA class implements Trailing Stop algorithm based on the values of moving average indicator of the previous (completed) bar.

Declaration

```
class CTrailingMA: public CExpertTrailing
```

Title

```
   #include <Expert\Trailing\TrailingMA.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertTrailing
      CTrailingMA

Class Methods by Groups

Initialization	
Period	Sets period of moving average
Shift	Sets shift of moving average
Method	Sets smoothing method of moving average
Applied	Sets applied price of moving average
virtual InitIndicators	Initializes indicators and timeseries
virtual ValidationSettings	Checks the settings
Check Trailing Methods	
virtual CheckTrailingStopLong	Check Trailing Stop conditions of a long position
virtual CheckTrailingStopShort	Check Trailing Stop conditions of a short position

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

© 2000-2025, MetaQuotes Ltd.

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries

© 2000-2025, MetaQuotes Ltd.

Period

Sets period of a moving average.

```
void  Period(
   int  period      // period
   )
```

Parameters

period

[in] Period of a moving average.

© 2000-2025, MetaQuotes Ltd.

Shift

Sets shift of a moving average.

```
void  Shift(
   int  shift      // parameter
   )
```

Parameters

shift

[in] Shift of a moving average.

© 2000-2025, MetaQuotes Ltd.

Method

Sets smoothing method of a moving average.

```
void  Method(
   ENUM_MA_METHOD  method      // parameter
   )
```

Parameters

method

[in] Smoothing method (from ENUM_MA_METHOD enumeration) of a moving average.

© 2000-2025, MetaQuotes Ltd.

Applied

Sets applied price of a moving average.

```
void  Applied(
   ENUM_APPLIED_PRICE  applied      // parameter
   )
```

Parameters

applied

[in] Applied price (from ENUM_APPLIED_PRICE enumeration) of a moving average.

© 2000-2025, MetaQuotes Ltd.

InitIndicators

Initializes indicators and timeseries.

```
virtual bool  InitIndicators(
   CIndicators*  indicators      // pointer
   )
```

Parameters

indicators

[in] Pointer to indicators and timeseries collection (CExpert class member).

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

The function checks the period of moving average, the correct values are positive.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```
virtual bool  CheckTrailingStopLong(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference
   double&         tp            // reference
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

First it calculates the maximal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of moving average indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the base price is the open price of the position. If the calculated Stop Loss price is higher than base price and lower than maximal allowed Stop Loss price, it suggests to set new Stop Loss price.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```
virtual bool  CheckTrailingStopShort(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference
   double&         tp            // reference
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

First it calculates the minimal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of moving average indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the base price is the open price of the position. If the calculated Stop Loss price is lower than base price and higher than minimal allowed Stop Loss price, it suggests to set new Stop Loss price.

© 2000-2025, MetaQuotes Ltd.

CTrailingNone

CTrailingNone is a stub class. This class should be used at initialization of trailing object in CExpert class if your strategy does not use Trailing Stop.

Description

CTrailingNone class does not implement any Trailing Stop algorithm. The methods of checking Trailing Stop conditions always return false.

Declaration

```
class CTrailingNone: public CExpertTrailing
```

Title

```
   #include <Expert\Trailing\TrailingNone.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertTrailing
      CTrailingNone

Class Methods by Groups

Check Trailing Methods	
virtual CheckTrailingStopLong	A stub method for checking Trailing Stop conditions of a long position
virtual CheckTrailingStopShort	A stub method for checking Trailing Stop conditions of a short position

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, ValidationSettings, SetPriceSeries, SetOtherSeries, InitIndicators

CheckTrailingStopLong, CheckTrailingStopShort

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```
virtual bool  CheckTrailingStopLong(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference
   double&         tp            // reference
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

The function always returns false.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```
virtual bool  CheckTrailingStopShort(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference
   double&         tp            // reference
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

The function always returns false.

CTrailingPSAR

CTrailingPSAR is a class with implementation of Trailing Stop algorithm based on the values of Parabolic SAR indicator.

Description

CTrailingPSAR class implements the Trailing Stop algorithm based on the values of Parabolic SAR indicator of the previous (completed) bar.

Declaration

```
class CTrailingPSAR: public CExpertTrailing
```

Title

```
   #include <Expert\Trailing\TrailingParabolicSAR.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertTrailing
      CTrailingPSAR

Class Methods by Groups

Initialization	
Step	Sets the value of step of Parabolic SAR indicator
Maximum	Sets the value of maximum of Parabolic SAR indicator
virtual InitIndicators	Initializes indicators and timeseries
Check Trailing Methods	
virtual CheckTrailingStopLong	Check conditions of trailing stop of a long position
virtual CheckTrailingStopShort	Check conditions of trailing stop of a short position

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, ValidationSettings, SetPriceSeries, SetOtherSeries

© 2000-2025, MetaQuotes Ltd.

© 2000-2025, MetaQuotes Ltd.

Step

Sets the value of step of Parabolic SAR indicator.

```
void  Step(
   double  step      // parameter
   )
```

Parameters

step

[in] The value of step of Parabolic SAR indicator.

© 2000-2025, MetaQuotes Ltd.

Maximum

Sets the value of maximum of Parabolic SAR indicator.

```
void  Maximum(
   double  maximum      // parameter
   )
```

Parameters

maximum

[in] The value of maximum of Parabolic SAR indicator.

© 2000-2025, MetaQuotes Ltd.

InitIndicators

Initializes indicators and timeseries.

```
virtual bool  InitIndicators(
   CIndicators*  indicators      // pointer
   )
```

Parameters

indicators

[in] Pointer to indicators and timeseries collection (CExpert class member).

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```
virtual bool  CheckTrailingStopLong(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference
   double&         tp            // reference
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

First it calculates the maximal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of Parabolic SAR indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the calculated Stop Loss price is higher than base price and lower than maximal allowed Stop Loss price, it suggests to set new Stop Loss price.

© 2000-2025, MetaQuotes Ltd.

CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```
virtual bool  CheckTrailingStopShort(
   CPositionInfo*  position,     // pointer
   double&         sl,           // reference
   double&         tp            // reference
   )
```

Parameters

position

[in] Pointer to CPositionInfo object.

sl

[in][out] Reference to variable for Stop Loss price.

tp

[in][out] Reference to variable for Take Profit price.

Return Value

true - conditions are satisfied, otherwise - false.

Note

First it calculates the minimal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of Parabolic SAR indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the calculated Stop Loss price is lower than base price and higher than minimal allowed Stop Loss price, it suggests to set new Stop Loss price.

Money Management classes

This section contains technical details of working with money and risk management classes and description of the relevant components of the MQL5 standard library.

The use of these classes will save time when creating (and testing) trading strategies.

MQL5 Standard Library (in terms of money and risk management classes) is placed in the terminal directory, in the Include\Expert\Money\ folder.

Class	Description
CMoneyFixedLot	This class implements money management algorithm based on trading with predefined fixed lot size.
CMoneyFixedMargin	This class implements money management algorithm based on trading with predefined fixed margin.
CMoneyFixedRisk	This class implements money management algorithm based on trading with predefined risk.
CMoneyNone	This class implements money management algorithm based on trading with minimal allowed lot size.
CMoneySizeOptimized	This class implements money management algorithm based on trading with variable lot size, depending on results of the previous deals.

© 2000-2025, MetaQuotes Ltd.

CMoneyFixedLot

CMoneyFixedLot is the class designed to implement money management algorithm based on trading with predefined fixed lot size.

Description

CMoneyFixedLot implements money management algorithm based on trading with predefined fixed lot size.

Declaration

```
class CMoneyFixedLot: public CExpertMoney
```

Title

```
#include <Expert\Money\MoneyFixedLot.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertMoney
      CMoneyFixedLot

Class Methods by Groups

Initialization	
Lots	Sets trading volume
virtual ValidationSettings	Checks the settings
Money and Risk Management Methods	
virtual CheckOpenLong	Gets trade volume for a long position
virtual CheckOpenShort	Gets trade volume for a short position

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries, InitIndicators

Methods inherited from class CExpertMoney

Percent, CheckReverse, CheckClose

© 2000-2025, MetaQuotes Ltd.

© 2000-2025, MetaQuotes Ltd.

Lots

Sets trading volume (in lots).

```
void  Lots(
   double  lots      // number of lots
   )
```

Parameters

lots

[in] Trading volume.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

Checks if the predefined fixed lot falls within the range of allowed values and is multiple of change step.

© 2000-2025, MetaQuotes Ltd.

CheckOpenLong

Gets trade volume for a long position.

```
virtual double  CheckOpenLong(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss order price.

Return Value

Trade volume for a long position.

Note

The function always returns the predefined fixed trade volume.

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Gets trade volume for a short position.

```
virtual double  CheckOpenShort(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss order price.

Return Value

Trade volume for a short position.

Note

The function always returns the predefined fixed trade volume.

© 2000-2025, MetaQuotes Ltd.

CMoneyFixedMargin

CMoneyFixedMargin is the class designed to implement money management algorithm based on trading with predefined fixed margin.

Description

CMoneyFixedMargin implements money management algorithm based on trading with predefined fixed margin.

Declaration

```
class CMoneyFixedMargin: public CExpertMoney
```

Title

```
#include <Expert\Money\MoneyFixedMargin.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertMoney
      CMoneyFixedMargin

Class Methods by Groups

CheckOpenLong

Gets trade volume for a long position.

```
virtual double  CheckOpenLong(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for a long position.

Note

The function returns trade volume for a long position with a fixed predefined margin. The margin is defined by Percent parameter of CExpertMoney base class.

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Gets trade volume for a short position.

```
virtual double  CheckOpenShort(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for a short position.

Note

The function returns trade volume for a short position with a predefined fixed margin. The margin is defined by Percent parameter of CExpertMoney base class.

© 2000-2025, MetaQuotes Ltd.

CMoneyFixedRisk

CMoneyFixedRisk is a class with implementation of money management algorithm with fixed predefined risk.

Description

CMoneyFixedRisk class implements the money management algorithm with fixed predefined risk.

Declaration

```
class CMoneyFixedRisk: public CExpertMoney
```

Title

```
#include <Expert\Money\MoneyFixedRisk.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertMoney
      CMoneyFixedRisk

CheckOpenLong

Gets trade volume for a long position.

```
virtual double  CheckOpenLong(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for a long position.

Note

The function returns trade volume for a long position with a fixed predefined risk level. The risk is defined by Percent parameter of CExpertMoney base class.

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Gets trade volume for a short position.

```
virtual double  CheckOpenShort(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for a short position.

Note

The function returns trade volume for a short position with a fixed predefined risk level. The risk is defined by Percent parameter of CExpertMoney base class.

© 2000-2025, MetaQuotes Ltd.

CMoneyNone

CMoneyNone is a class with implementation of the "absence" of money and risk management.

Description

CMoneyNone class implements trading with minimal allowed lot.

Declaration

```
class CMoneyNone: public CExpertMoney
```

Title

```
#include <Expert\Money\MoneyNone.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertMoney
      CMoneyNone

Class Methods by Groups

Initialization	
virtual ValidationSettings	Checks the settings
Money and Risk Management Methods	
virtual CheckOpenLong	Gets trade volume for a long position
virtual CheckOpenShort	Gets trade volume for a short position

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

The function always returns true.

© 2000-2025, MetaQuotes Ltd.

CheckOpenLong

Gets trade volume for a long position.

```
virtual double  CheckOpenLong(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for a long position.

Note

The function always returns the minimal lot size.

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Gets trade volume for a short position.

```
virtual double  CheckOpenShort(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for a short position.

Note

The function always returns the minimal lot size.

© 2000-2025, MetaQuotes Ltd.

CMoneySizeOptimized

CMoneySizeOptimized is a class with implementation of money and risk management algorithm depending on results of the previous deals.

Description

CMoneySizeOptimized implements the market entry algorithm with the lot size depending on results of the previous deals.

Declaration

```
class CMoneySizeOptimized: public CExpertMoney
```

Title

```
#include <Expert\Money\MoneySizeOptimized.mqh>
```

Inheritance hierarchy

CObject
  CExpertBase
    CExpertMoney
      CMoneySizeOptimized

Class Methods by Groups

Initialization	
DecreaseFactor	Sets the parameter value
virtual ValidationSettings	Checks the settings
Money and Risk Management Methods	
virtual CheckOpenLong	Gets trade volume for a long position
virtual CheckOpenShort	Gets trade volume for a short position

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries, InitIndicators

Methods inherited from class CExpertMoney

Percent, CheckReverse, CheckClose

© 2000-2025, MetaQuotes Ltd.

© 2000-2025, MetaQuotes Ltd.

DecreaseFactor

Sets the value of decrease factor.

```
void  DecreaseFactor(
   double  decrease_factor      // decrease factor
   )
```

Parameters

decrease_factor

[in] Decrease factor.

Note

The DecreaseFactor defines the open position volume decreasing coefficient (compared with the volume of a previous position) for the case of consecutive loss trades.

© 2000-2025, MetaQuotes Ltd.

ValidationSettings

Checks the settings.

```
virtual bool  ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

If the value of decrease factor is negative, it returns false, otherwise it returns true.

© 2000-2025, MetaQuotes Ltd.

CheckOpenLong

Gets trade volume for a long position.

```
virtual double  CheckOpenLong(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for long position.

Note

The function returns trade volume for a long position considering results of previous deals.

© 2000-2025, MetaQuotes Ltd.

CheckOpenShort

Gets trade volume for a short position.

```
virtual double  CheckOpenShort(
   double  price,     // price
   double  sl         // Stop Loss price
   )
```

Parameters

price

[in] Estimated open price.

sl

[in] Estimated Stop Loss price.

Return Value

Trade volume for a long position.

Note

The function returns trade volume for a short position considering results of previous deals.

Classes for Creating Control Panels and Dialogs

This section contains technical details of working with classes for creation of controls panels and dialogs, as well as description of the relevant components of the MQL5 standard library.

The use of these classes will save time when developing custom interactive MQL5 applications, including Expert Advisors and indicators.

MQL5 Standard Library (in terms of classes for creation of control panels and dialogs) is placed in the terminal data folder, in the MQL5\Include\Controls.

Find the examples of working with classes in the following articles:

- How to create a graphical panel of any complexity level
- Improving Panels: Adding transparency, changing background color and inheriting from CAppDialog/CWndClient
- Adding a control panel to an indicator or an Expert Advisor in no time
- Create your own graphical panels in MQL5
- Creating active control panels in MQL5 for trading

The sample Expert Advisor, which illustrates the operation of these classes, can be found in MQL5\Expert\Examples\Controls.

Auxiliary structures	Description
CRect	Structure of the rectangular area
CDateTime	Structure for working with date and time

Base classes	Description
CWnd	Base class for all controls
CWndObj	Base class for controls and dialogs
CWndContainer	Base class for complex controls

Simple controls	Description
CLabel	Control, based on "Text label" graphic object
CBmpButton	Control, based on "Bitmap label" graphic object
CButton	Control, based on "Button" graphic object
CEdit	Control, based on "Edit field" graphic object
CPanel	Control, based on "Rectangle label"
CPicture	Control, based on "Bitmap label"

© 2000-2025, MetaQuotes Ltd.

Complex controls	Description
CScroll	Base class of the scroll bar
CScrollV	Vertical scroll bar
CScrollH	Horizontal scroll bar
CWndClient	Base class of the client area with scroll bars
CListView	List view
CComboBox	Combo box
CCheckBox	Check box
CCheckGroup	Check group
CRadioButton	Radio button
CRadioGroup	Radio group
CSpinEdit	Increment/decrement field
CDialog	Dialog
CAppDialog	Main dialog of MQL5 application

© 2000-2025, MetaQuotes Ltd.

CRect

CRect is a class of the rectangular area of the chart.

Description

CRect is a class of the area, it is defined by both coordinates of the upper-left and lower-right corners of a rectangle in Cartesian coordinates.

Declaration

```
class CRect
```

Title

```
#include <Controls\Rect.mqh>
```

Class Methods by Groups

Properties	
Left	Gets/sets the X coordinate of the upper-left corner
Top	Gets/sets the Y coordinate of the upper-left corner
Right	Gets/sets the X coordinate of the lower-right corner
Bottom	Gets/sets the Y coordinate of the lower-right corner
Width	Gets/sets the width
Height	Gets/sets the height
SetBound	Sets new coordinates of the area
Move	Performs the absolute displacement of the area coordinates
Shift	Performs the relative displacement (shift) of the area coordinates
Contains	Checks if the point is inside the area
Additional methods	
Format	Gets the area coordinates as a string

© 2000-2025, MetaQuotes Ltd.

Left (Get Method)

Gets the X coordinate of the upper-left corner.

```
int  Left()
```

Return Value

X coordinate of the upper-left corner.

Left (Set Method)

Sets the X coordinate of the upper-left corner.

```
void  Left(
   const int  x      // x coordinate
   )
```

Parameters

x

[in] New X coordinate of the upper-left corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Top (Get Method)

Gets the Y coordinate of the upper-left corner.

```
int  Top()
```

Return Value

Y coordinate of the upper-left corner.

Top (Set Method)

Sets the Y coordinate of the upper-left corner.

```
void  Top(
   const int  y      // y coordinate
   )
```

Parameters

y

[in] New Y coordinate of the upper-left corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Right (Get Method)

Gets the X coordinate of the lower-right corner.

```
int  Right()
```

Return Value

X coordinate of the lower-right corner.

Right (Set Method)

Sets the X coordinate of the lower-right corner.

```
void  Right(
   const int  x      // x coordinate
   )
```

Parameters

x

[in] New X coordinate of the lower-right corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Bottom (Get Method)

Gets the Y coordinate of the lower-right corner.

```
int  Bottom()
```

Return Value

Y coordinate of the lower-right corner.

Bottom (Set Method)

Sets the Y coordinate of the lower-right corner.

```
void  Bottom(
   const int  y      // y coordinate
   )
```

Parameters

y

[in] New Y coordinate of the lower-right corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Width (Get Method)

Gets the width of the area.

```
int  Width()
```

Return Value

Width of the area.

Width (Set Method)

Sets new width of the area.

```
virtual bool  Width(
   const int  w      // width
   )
```

Parameters

w

[in] New width.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Height (Get Method)

Gets the height of the area.

```
int  Height()
```

Return Value

Height of the area.

Height (Set Method)

Sets new height of the area.

```
virtual bool  Height(
   const int  h      // height
   )
```

Parameters

h

[in] New height.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

SetBound

Sets new coordinates of the area using CRect class coordinates.

```
void  SetBound(
   const & CRect  rect      // CRect class
   )
```

Return Value

None.

SetBound

Sets new coordinates of the area.

```
void  SetBound(
   const int  l      // left
   const int  t      // top
   const int  r      // right
   const int  b      // bottom
   )
```

Parameters

l

[in] X coordinate of the upper-left corner.

t

[in] Y coordinate of the upper-left corner.

r

[in] X coordinate of the lower-right corner.

b

[in] Y coordinate of the lower-right corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Move

Performs the absolute displacement of the area coordinates.

```
void  Move(
   const int  x,      // X coordinate
   const int  y       // Y coordinate
   )
```

Parameters

x

[in] New X coordinate.

y

[in] New Y coordinate.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Shift

Performs the relative displacement (shift) of the area coordinates.

```
void  Shift(
   const int  dx,      // delta X
   const int  dy       // delta Y
   )
```

Parameters

dx

[in] Delta X.

dy

[in] Delta Y.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Contains

Checks if the point is inside the CRect class area.

```
bool  Contains(
   const int  x,      // X coordinate
   const int  y       // Y coordinate
   )
```

Parameters

x

[in] X coordinate.

y

[in] Y coordinate.

Return Value

true - the point is inside the area (including borders), otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Format

Gets the area coordinates as a string.

```
string  Format(
   string &  fmt,     // format
   ) const
```

Parameters

fmt

[in] String with format.

Return Value

String with the area coordinates.

© 2000-2025, MetaQuotes Ltd.

CDateTime

CDateTime is a structure for working with date and time.

Description

CDateTime is a structure derived from MqlDateTime, it used for operation with date and time in controls.

Declaration

```
struct CDateTime
```

Title

```
#include <Tools\DateTime.mqh>
```

Methods

Properties	
MonthName	Gets month name
ShortMonthName	Gets short name of the month
DayName	Gets full name of the day in a week
ShortDayName	Gets short name of the day in a week
DaysInMonth	Gets number of days in month
Get/Set methods	
DateTime	Gets/sets date and time
Date	Sets date
Time	Sets time
Sec	Sets seconds
Min	Sets minutes
Hour	Sets hour
Day	Sets day of the month
Mon	Sets month
Year	Sets year
Additional methods	
SecDec	Subtracts specified number of seconds
SecInc	Adds specified number of seconds
MinDec	Subtracts specified number of minutes

© 2000-2025, MetaQuotes Ltd.

Properties	
MinInc	Adds specified number of minutes
HourDec	Subtracts specified number of hours
HourInc	Adds specified number of hours
DayDec	Subtracts specified number of days
DayInc	Adds specified number of days
MonDec	Subtracts specified number of months
MonInc	Adds specified number of months
YearDec	Subtracts specified number of years
YearInc	Adds specified number of years

© 2000-2025, MetaQuotes Ltd.

MonthName

Gets month name.

```
string  MonthName()  const
```

Gets month name by index.

```
string  MonthName(
   const int       num          // month index
   )  const
```

Parameters

num

[in] Month index (1-12).

Return Value

Full month name.

© 2000-2025, MetaQuotes Ltd.

ShortMonthName

Gets short month name.

```
string  ShortMonthName()  const
```

Gets short month name by index.

```
string  ShortMonthName(
   const int       num          // month index
   )  const
```

Parameters

num

[in] Month index (1-12).

Return Value

Short month name.

© 2000-2025, MetaQuotes Ltd.

DayName

Gets full name of the day in a week.

```
string  DayName()  const
```

Gets full name of the day in a week by index.

```
string  DayName(
   const int       num          // day index
   )  const
```

Parameters

num

[in] Day index (0-6).

Return Value

Full name of the day.

© 2000-2025, MetaQuotes Ltd.

ShortDayName

Gets short name of the day in a week.

```
string  ShortDayName()  const
```

Gets short name of the day in a week by index.

```
string  ShortDayName(
   const int       num          // day index
   )  const
```

Parameters

num

[in] Day index (0-6).

Return Value

Short name of the day.

© 2000-2025, MetaQuotes Ltd.

DaysInMonth

Gets number of days in month.

```
int  DaysInMonth()  const
```

Return Value

Number of days in month.

© 2000-2025, MetaQuotes Ltd.

DateTime (Get Method)

Gets date and time.

```
datetime  DateTime()
```

Return Value

Value of datetime type.

DateTime (Set Method datetime)

Sets date and time with datetime type.

```
void  DateTime(
   const datetime      value          // date and time
   )
```

Parameters

value

[in] Value of datetime type.

Return Value

None.

DateTime (Set Method MqlDateTime)

Sets date and time with MqlDateTime type.

```
void  DateTime(
   const MqlDateTime   &value         // date and time
   )
```

Parameters

value

[in] Value of MqlDateTime type.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Date (Set Method datetime)

Sets date with datetime type.

```
void  Date(
   const datetime      value          // date
   )
```

Parameters

value

[in] Value of datetime type.

Return Value

None.

Date (Set Method MqlDateTime)

Sets date with MqlDateTime type.

```
void  Date(
   const MqlDateTime   &value         // date
   )
```

Parameters

value

[in] Value of MqlDateTime type.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Time (Set Method datetime)

Sets time with datetime type.

```
void  Time(
   const datetime      value          // time
   )
```

Parameters

value

[in] Value of datetime type.

Return Value

None.

Time (Set Method MqlDateTime)

Sets time with MqlDateTime type.

```
void  Time(
   const MqlDateTime   &value         // time
   )
```

Parameters

value

[in] Value of MqlDateTime type.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Sec

Sets seconds.

```
void  Sec(
   const int   value        // seconds
   )
```

Parameters

value

[in] Seconds.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Min

Sets minutes.

```
void  Min(
   const int   value        // minutes
   )
```

Parameters

value

[in] Minutes.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Hour

Sets hour.

```
void  Hour(
   const int   value        // hour
   )
```

Parameters

value

[in] Hour.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Day

Sets day of the month.

```
void  Day(
   const int   value        // day of month
   )
```

Parameters

value

[in] Day of month.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Mon

Sets month.

```
void  Mon(
   const int    value        // month
   )
```

Parameters

value

[in] Month.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Year

Sets year.

```
void  Year(
   const int   value        // year
   )
```

Parameters

value

[in] Year.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

SecDec

Subtracts specified number of seconds.

```
void  SecDec(
   int   delta=1        // seconds
   )
```

Parameters

delta

[in] Seconds to subtract.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

SecInc

Adds specified number of seconds.

```
void  SecInc(
   int   delta=1        // seconds
   )
```

Parameters

delta

[in] Seconds to add.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

MinDec

Subtracts specified number of minutes.

```
void  MinDec(
   int   delta=1        // minutes
   )
```

Parameters

delta

[in] Minutes to subtract.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

MinInc

Adds specified number of minutes.

```
void  MinInc(
   int   delta=1        // minutes
   )
```

Parameters

delta

[in] Minutes to add.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

HourDec

Subtracts specified number of hours.

```
void  HourDec(
   int   delta=1        // hours
   )
```

Parameters

delta

[in] Hours to subtract.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

HourInc

Adds specified number of hours.

```
void  HourInc(
   int   delta=1        // hours
   )
```

Parameters

delta

[in] Hours to add.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

DayDec

Subtracts specified number of days.

```
void  DayDec(
   int   delta=1        // days
   )
```

Parameters

delta

[in] Days to subtract.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

DayInc

Adds specified number of days.

```
void  DayInc(
   int   delta=1        // days
   )
```

Parameters

delta

[in] Days to add.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

MonDec

Subtracts specified number of months.

```
void  MonDec(
   int   delta=1        // months
   )
```

Parameters

delta

[in] Months to subtract.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

MonInc

Adds specified number of months.

```
void  MonInc(
   int   delta=1        // months
   )
```

Parameters

delta

[in] Months to add.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

YearDec

Subtracts specified number of years.

```
void  YearDec(
   int   delta=1        // years
   )
```

Parameters

delta

[in] Years to subtract.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

YearInc

Adds specified number of years.

```
void  YearInc(
   int   delta=1        // years
   )
```

Parameters

delta

[in] Years to add.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CWnd

CWnd is a base class for all Standard Library controls.

Description

CWnd class is the implementation of the base control class.

Declaration

```
class CWnd : public CObject
```

Title

```
#include <Controls\Wnd.mqh>
```

Inheritance hierarchy

CObject

CWnd

Direct descendants

CDragWnd, CWndContainer, CWndObj

Class Methods by Groups

Create and destroy	
Create	Creates control
Destroy	Destroys control
Chart event handlers	
OnEvent	Event handler of all chart events
OnMouseEvent	Event handler for the CHARTEVENT_MOUSE_MOVE event
Name	
Name	Gets control name
Access to container	
ControlsTotal	Gets the number of controls in the container
Control	Gets the control by index
ControlFind	Gets the control by ID
Geometry	
Rect	Gets the control coordinates
Left	Gets/sets the X coordinate of the upper-left corner

© 2000-2025, MetaQuotes Ltd.

Create and destroy	
Top	Gets/sets the Y coordinate of the upper-left corner
Right	Gets/sets the X coordinate of the lower-right corner
Bottom	Gets/sets the Y coordinate of the lower-right corner
Width	Gets/sets the control width
Height	Gets/sets the control height
Move	Control absolute displacement
Shift	Control relative displacement
Resize	Changes control size
Contains	Checks if the point/control is inside the control area
Align	
Alignment	Sets alignment properties of the control
Align	Performs control alignment in the specified chart area
Identification	
Id	Gets/sets the control ID
State	
IsEnabled	Checks the control ability to respond to user's actions
Enable	Enables the control ability to respond to user's actions
Disable	Disables the control ability to respond to user's actions
IsVisible	Checks the visibility flag
Visible	Sets the visibility flag
Show	Shows the control
Hide	Hides the control
IsActive	Checks the control activity
Activate	Activates the control
Deactivate	Deactivates the control
State flags	
StateFlags	Gets/sets the control state flags
StateFlagsSet	Sets the control state flags
StateFlagsReset	Resets the control state flags
Properties flags	

© 2000-2025, MetaQuotes Ltd.

Create and destroy	
PropFlags	Gets/sets the control properties flags
PropFlagsSet	Sets the control properties flags
PropFlagsReset	Resets the control properties flags
Mouse operations	
MouseX	Gets/saves the mouse X coordinate
MouseY	Gets/saves the mouse Y coordinate
MouseFlags	Gets/saves the mouse buttons state
MouseFocusKill	Kills mouse focus
Internal event handlers	
OnCreate	"Create" event handler
OnDestroy	"Destroy" event handler
OnMove	"Move" event handler
OnResize	"Resize" event handler
OnEnable	"Enable" event handler
OnDisable	"Disable" event handler
OnShow	"Show" event handler
OnHide	"Hide" event handler
OnActivate	"Activate" event handler
OnDeactivate	"Deactivate" event handler
OnClick	"Click" event handler
OnChange	"Change" event handler
Mouse event handlers	
OnMouseDown	"MouseDown" event handler
OnMouseUp	"MouseUp" event handler
Drag event handlers	
OnDragStart	"DragStart" event handler
OnDragProcess	"DragProcess" event handler
OnDragEnd	"DragEnd" event handler
Drag object	
DragObjectCreate	Creates drag object

© 2000-2025, MetaQuotes Ltd.

Create and destroy	
DragObjectDestroy	Destroys drag object

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

© 2000-2025, MetaQuotes Ltd.

Create

Creates a control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // x1 coordinate
   const int      y1,          // y1 coordinate
   const int      x2,          // x2 coordinate
   const int      y2           // y2 coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Chart subwindow, at which the control is created.

x1

[in] X coordinate of the upper-left corner.

y1

[in] Y coordinate of the upper-left corner.

x2

[in] X coordinate of the lower-right corner.

y2

[in] Y coordinate of the lower-right corner.

Return Value

true - successful, otherwise - false.

Note

Base class method only saves the creation parameters and always returns true.

© 2000-2025, MetaQuotes Ltd.

Destroy

Destroys a control.

```
virtual bool  Destroy()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // event parameter
   const double&  dparam,      // event parameter
   const string&  sparam       // event parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type, passed by reference.

dparam

[in] Event parameter of double type, passed by reference.

sparam

[in] Event parameter of string type, passed by reference.

Return Value

true - event has been processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMouseEvent

Mouse event handler (the CHARTEVENT_MOUSE_MOVE chart event).

```
virtual bool  OnMouseEvent(
   const int  x,          // x coordinate
   const int  y,          // y coordinate
   const int  flags       // flags
   )
```

Parameters

x

[in] X coordinate of the mouse cursor relative to the upper-left corner of the chart.

y

[in] Y coordinate of the mouse cursor relative to the upper-left corner of the chart.

flags

[in] Flag of mouse buttons states.

Return Value

true - event has been processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Name

Gets control name.

```
string  Name()  const
```

Return Value

Control name.

© 2000-2025, MetaQuotes Ltd.

ControlsTotal

Gets the number of controls in the container.

```
int  ControlsTotal()  const
```

Return Value

Number of controls in container.

Note

The base class method does not have the container, it provides the access to container for its heirs and always returns 0.

© 2000-2025, MetaQuotes Ltd.

Control

Gets the control from the container by index.

```
CWnd*  Control(
   const int  ind      // index
   )  const
```

Parameters

ind

[in] Control index.

Return Value

A pointer to the control.

Note

The base class method does not have the container, it provides the access to container for its heirs and always returns NULL.

© 2000-2025, MetaQuotes Ltd.

ControlFind

Gets the control from container by specified ID.

```
virtual CWnd*  ControlFind(
   const long  id      // ID
   )
```

Parameters

id

[in] Identifier of the control to find.

Return Value

Pointer to the control from the container.

Note

The base class method does not have the container, it provides the access to container for its heirs. If the specified ID matches the container's one, it returns a pointer to itself (this).

© 2000-2025, MetaQuotes Ltd.

Rect

Gets the pointer to the CRect class object.

```
const CRect*  Rect()  const
```

Return Value

Pointer to the CRect class object.

© 2000-2025, MetaQuotes Ltd.

Left (Get Method)

Gets the X coordinate of the upper-left corner of the control.

```
int  Left()
```

Return Value

X coordinate of the upper-left corner of the control.

Left (Set Method)

Sets the X coordinate of the upper-left corner of the control.

```
void  Left(
   const int  x      // coordinate
   )
```

Parameters

x

[in] New X coordinate of the upper-left corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Top (Get Method)

Gets the Y coordinate of the upper-left corner of the control.

```
int  Top()
```

Return Value

Y coordinate of the upper-left corner of the control.

Top (Set Method)

Sets the Y coordinate of the upper-left corner of the control.

```
void  Top(
   const int  y      // y coordinate
   )
```

Parameters

y

[in] New Y coordinate of the upper-left corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Right (Get Method)

Gets the X coordinate of the lower-right corner of the control.

```
int  Right()
```

Return Value

X coordinate of the lower-right corner.

Right (Set Method)

Sets the X coordinate of the lower-right corner of the control.

```
void  Right(
   const int  x      // x coordinate
   )
```

Parameters

x

[in] New X coordinate of the lower-right corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Bottom (Get Method)

Gets the Y coordinate of the lower-right corner of the control.

```
int  Bottom()
```

Return Value

Y coordinate of the lower-right corner of the control.

Bottom (Set Method)

Sets the Y coordinate of the lower-right corner of the control.

```
void  Bottom(
   const int  y      // y coordinate
   )
```

Parameters

y

[in] New Y coordinate of the lower-right corner.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Width (Get Method)

Gets the control width.

```
int  Width()
```

Return Value

Width of the control.

Width (Set Method)

Sets the width of the control.

```
virtual bool  Width(
   const int  w      // width
   )
```

Parameters

w

[in] New width.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Height (Get Method)

Gets the control height.

```
int  Height()
```

Return Value

Height of the control.

Height (Set Method)

Sets new height of the control.

```
virtual bool  Height(
   const int  h      // height
   )
```

Parameters

h

[in] New height.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Move

Performs absolute displacement of a control.

```
void  Move(
   const int  x,      // x coordinate
   const int  y       // y coordinate
   )
```

Parameters

x

[in] New X coordinate of the upper-left point.

y

[in] New Y coordinate of the upper-left point.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Shift

Performs the relative shift of a control.

```
void  Shift(
   const int  dx,      // delta X
   const int  dy       // delta Y
   )
```

Parameters

dx

[in] Delta X.

dy

[in] Delta Y.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Resize

Sets a size of the control.

```
virtual bool  Resize(
   const int  w,
   const int  h
   )
```

Parameters

w

[in] New width.

h

[in] New height.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Contains

Checks if the point is inside the control area of the chart.

```
bool  Contains(
   const int  x,      // X coordinate
   const int  y       // Y coordinate
   )
```

Parameters

x

[in] X coordinate.

y

[in] Y coordinate.

Return Value

true - the point is inside the area (including borders), otherwise - false.

Contains

Checks if the specified control is inside the control area of the chart.

```
bool  Contains(
   const CWnd*  control      // pointer
   )  const
```

Parameters

control

[in] Object pointer.

Return Value

true - the specified control is inside the area (including borders), otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Alignment

Sets alignment parameters of the control.

```
void  Alignment(
   const int  flags,       // flags
   const int  left,        // offset
   const int  top,         // offset
   const int  right,       // offset
   const int  bottom       // offset
   )
```

Parameters

flags

[in] Alignment flags.

left

[in] Fixed offset from the left border.

top

[in] Fixed offset from the top border.

right

[in] Fixed offset from the right border.

bottom

[in] Fixed offset from the bottom border.

Return Value

None.

Note

Alignement flags:

```
enum WND_ALIGN_FLAGS
{
   WND_ALIGN_NONE=0,                                  // no align
   WND_ALIGN_LEFT=1,                                  // align left
   WND_ALIGN_TOP=2,                                   // align top
   WND_ALIGN_RIGHT=4,                                 // align right
   WND_ALIGN_BOTTOM=8,                                // align bottom
   WND_ALIGN_WIDTH = WND_ALIGN_LEFT|WND_ALIGN_RIGHT,  // align width
   WND_ALIGN_HEIGHT=WND_ALIGN_TOP|WND_ALIGN_BOTTOM,   // align height
   WND_ALIGN_CLIENT=WND_ALIGN_WIDTH|WND_ALIGN_HEIGHT, // align height and width
   }
```

© 2000-2025, MetaQuotes Ltd.

Align

Performs control alignment in the specified chart area.

```
virtual bool  Align(
   const CRect*  rect      // pointer
   )
```

Parameters

rect

[in] Pointer to the object with chart area coordinates.

Return Value

true - successful, otherwise - false.

Note

The alignment parameters must be specified (no alignment by default).

© 2000-2025, MetaQuotes Ltd.

Id (Get Method)

Gets the control ID.

```
long  Id()  const
```

Return Value

The control identifier.

Id (Set Method)

Sets the value of the control ID.

```
virtual long  Id(
   const long  id      // identifier
   )
```

Parameters

id

[in] New value of the control identifier.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

IsEnabled

Checks the control ability to respond to user's actions.

```
bool  IsEnabled()  const
```

Return Value

true - control is enabled, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Enable

Enables the control ability to respond to user's actions.

```
virtual bool  Enable()
```

Return Value

true - successful, otherwise - false.

Note

If the control is enabled, it is able to process the external events.

© 2000-2025, MetaQuotes Ltd.

Disable

Disables the control ability to respond to user's actions.

```
virtual bool  Disable()
```

Return Value

true - successful, otherwise - false.

Note

The disabled control is not able to process the external events.

© 2000-2025, MetaQuotes Ltd.

IsVisible

Checks whether the control is visible.

```
bool  IsVisible()  const
```

Return Value

true - control is shown on the chart, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Visible

Sets the visibility flag.

```
virtual bool  Visible(
   const bool  flag      // flag
   )
```

Parameters

flag

[in] New flag.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Show

Shows the control.

```
virtual bool  Show()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Hide

Hides the control.

```
virtual bool  Hide()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

IsActive

Gets a value indicating whether the control is active.

```
bool  IsActive()  const
```

Return Value

true - control is active, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Activate

Activates the control.

```
virtual bool  Activate()
```

Return Value

true - successful, otherwise - false.

Note

The control becomes active when the mouse cursor is hovering over it.

© 2000-2025, MetaQuotes Ltd.

Deactivate

Deactivates the control.

```
virtual bool  Deactivate()
```

Return Value

true - successful, otherwise - false.

Note

The control becomes inactive when the mouse cursor is out off the control.

© 2000-2025, MetaQuotes Ltd.

StateFlags (Get Method)

Gets the control state flags.

```
int  StateFlags()
```

Return Value

The control state flags.

StateFlags (Set Method)

Sets the control state flags.

```
virtual void  StateFlags(
   const int  flags      // flags
   )
```

Parameters

flags

[in] New control state flags.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

StateFlagsSet

Sets the control state flags.

```
virtual void  StateFlagsSet(
   const int  flags      // flags
   )
```

Parameters

flags

[in] Flags to set.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

StateFlagsReset

Resets the control state flags.

```
virtual void  StateFlagsReset(
   const int  flags      // flags
   )
```

Parameters

flags

[in] Flags to reset.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

PropFlags (Get Method)

Gets the control properties flags.

```
void  PropFlags(
   const int  flags      // flags
   )
```

Return Value

The control properties flags.

PropFlags (Set Method)

Sets the control properties flags.

```
virtual void  PropFlags(
   const int  flags      // flags
   )
```

Parameters

flags

[in] New flags.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

PropFlagsSet

Sets the control properties flags.

```
virtual void  PropFlagsSet(
   const int  flags      // flags
   )
```

Parameters

flags

[in] Flags to set.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

PropFlagsReset

Resets the control properties flags.

```
virtual void  PropFlagsReset(
   const int  flags      // flags
   )
```

Parameters

flags

[in] Flags to reset.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

MouseX (Set Method)

Saves the mouse X coordinate.

```
void  MouseX(
   const int  value      // coordinate
   )
```

Parameters

value

[in] The X coordinate of the mouse.

Return Value

None.

MouseX (Get Method)

Gets the saved X coordinate of the mouse.

```
int  MouseX()
```

Return Value

The X coordinate of the mouse.

© 2000-2025, MetaQuotes Ltd.

MouseY (Set Method)

Saves the mouse Y coordinate.

```
void  MouseY(
   const int  value      // coordinate
   )
```

Parameters

value

[in] The Y coordinate of the mouse.

Return Value

None.

MouseY (Get Method)

Gets the saved Y coordinate of the mouse.

```
int  MouseY()
```

Return Value

The Y coordinate of the mouse.

© 2000-2025, MetaQuotes Ltd.

MouseFlags (Set Method)

Saves the state of mouse buttons.

```
virtual void  MouseFlags(
   const int  value      // state
   )
```

Parameters

value

[in] State of mouse buttons.

Return Value

None.

MouseFlags (Get Method)

Gets the saved state of mouse buttons.

```
int  MouseFlags()
```

Return Value

State of mouse buttons.

© 2000-2025, MetaQuotes Ltd.

MouseFocusKill

Clears the saved state of mouse buttons and deactivates the control.

```
bool  MouseFocusKill(
   const long  id=CONTROLS_INVALID_ID      // id
   )
```

Parameters

id=CONTROLS_INVALID_ID

[in] Identifier of the control, that received mouse focus.

Return Value

The control deactivation result.

© 2000-2025, MetaQuotes Ltd.

OnCreate

The virtual handler of the internal "Create" event.

```
virtual bool  OnCreate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnDestroy

The virtual handler of the internal "Destroy" event.

```
virtual bool  OnDestroy()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnMove

The virtual handler of the internal "Move" event.

```
virtual bool  OnMove()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of the internal "Resize" event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnEnable

The virtual handler of the internal "Enable" event (if enabled, it can respond to user interaction).

```
virtual bool  OnEnable()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnDisable

The virtual handler of the internal "Disable" event (if disabled, it cannot respond to user interaction).

```
virtual bool  OnDisable()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of the internal "Show" event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of the internal "Hide" event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnActivate

The virtual handler of the internal "Activate" event.

```
virtual bool  OnActivate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnDeactivate

The virtual handler of the internal "Deactivate" event.

```
virtual bool  OnDeactivate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnClick

The virtual handler of the internal "Click" event (mouse click).

```
virtual bool  OnClick()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChange

The virtual handler of the internal "Change" event.

```
virtual bool  OnChange()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnMouseDown

The virtual handler of the "MouseDown" (mouse click) event.

```
virtual bool  OnMouseDown()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseDown" event occurs when left mouse button is pressed on the control.

© 2000-2025, MetaQuotes Ltd.

OnMouseUp

The virtual handler of the "MouseUp" (mouse button release) event.

```
virtual bool  OnMouseUp()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseUp" event occurs when left mouse button is released on the control.

© 2000-2025, MetaQuotes Ltd.

OnDragStart

The virtual handler of the "DragStart" (start dragging) event.

```
virtual bool  OnDragStart()
```

Return Value

true - event processed, otherwise - false.

Note

The "DragStart" event occurs at the start of control dragging operation.

© 2000-2025, MetaQuotes Ltd.

OnDragProcess

The virtual handler of the "DragProcess" (dragging) event.

```
virtual bool  OnDragProcess(
   const int  x,      // x coordinate
   const int  y       // y coordinate
   )
```

Parameters

x

[in] Current X coordinate of mouse cursor.

y

[in] Current Y coordinate of mouse cursor.

Return Value

true - event processed, otherwise - false.

Note

The "DragProcess" event occurs when the control is dragged.

© 2000-2025, MetaQuotes Ltd.

OnDragEnd

The virtual handler of the "DragEnd" event.

```
virtual bool  OnDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "DragEnd" event occurs when control drag process is finished.

© 2000-2025, MetaQuotes Ltd.

DragObjectCreate

Creates drag object.

```
virtual bool  DragObjectCreate()
```

Return Value

true - successful, otherwise - false.

Note

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

DragObjectDestroy

Destroys drag object.

```
virtual bool  DragObjectDestroy()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CWndObj

CWndObj is a base class for simple controls (based on chart objects) of the Standard Library.

Description

CWndObj class implements base methods of the simple control.

Declaration

```
class CWndObj : public CWnd
```

Title

```
#include <Controls\WndObj.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndObj

Direct descendants

CBmpButton, CButton, CEdit, CLabel, CPanel, CPicture

Class Methods by Groups

Chart events processing	
OnEvent	Event handler of all chart events
Properties	
Text	Gets/sets the OBJPROP_TEXT property of the chart object
Color	Gets/sets the OBJPROP_COLOR property of the chart object
ColorBackground	Gets/sets the OBJPROP_BGCOLOR property of the chart object
ColorBorder	Gets/sets the OBJPROP_BORDER_COLOR property of the chart object
Font	Gets/sets the OBJPROP_FONT property of the chart object
FontSize	Gets/sets the OBJPROP_FONTSIZE property of the chart object
ZOrder	Gets/sets the OBJPROP_ZORDER property of the chart object
Chart objects event handlers	
OnObjectCreate	CHARTEVENT_OBJECT_CREATE event handler
OnObjectChange	CHARTEVENT_OBJECT_CHANGE event handler
OnObjectDelete	CHARTEVENT_OBJECT_DELETE event handler

© 2000-2025, MetaQuotes Ltd.

Chart events processing	
OnObjectDrag	CHARTEVENT_OBJECT_DRAG event handler
Properties change event handlers	
OnSetText	"SetText" event handler
OnSetColor	"SetColor" event handler
OnSetColorBackground	"SetColorBackground" event handler
OnSetFont	"SetFont" event handler
OnSetFontSize	"SetFontSize" event handler
OnSetZOrder	"SetZOrder" event handler
Internal event handlers	
OnDestroy	"Destroy" internal event handler
OnChange	"Change" internal event handler

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CWnd

Create, Destroy, OnMouseEvent, Name, ControlsTotal, Control, ControlFind, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Move, Move, Shift, Contains, Contains, Alignment, Align, Id, Id, IsEnabled, Enable, Disable, IsVisible, Visible, Show, Hide, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type, passed by reference.

dparam

[in] Event parameter of double type, passed by reference.

sparam

[in] Event parameter of string type, passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Text (Get method)

Gets the OBJPROP_TEXT (text) property of the chart object.

```
string  Text()
```

Return Value

The value of the OBJPROP_TEXT property.

Text (Set method)

Sets the OBJPROP_TEXT (text) property of the chart object.

```
bool  Text(
   const string  value      // value
   )
```

Parameters

value

[in] New value of the OBJPROP_TEXT property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Color (Get method)

Gets the OBJPROP_COLOR (color) property of the chart object.

```
color  Color()
```

Return Value

The value of the OBJPROP_COLOR property.

Color (Set method)

Sets the OBJPROP_COLOR (color) propery of the chart object.

```
bool  Color(
   const color  value      // value
   )
```

Parameters

value

[in] New value of the OBJPROP_COLOR property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ColorBackground (Get method)

Gets the OBJPROP_BGCOLOR (background color) of the chart object.

```
color  ColorBackground()
```

Return Value

The value of the OBJPROP_BGCOLOR property.

ColorBackground (Set method)

Sets the OBJPROP_BGCOLOR (background color) property of the chart object.

```
bool  ColorBackground(
   const color  value      // value
   )
```

Parameters

value

[in] New value of the OBJPROP_BGCOLOR property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ColorBorder (Get method)

Gets the OBJPROP_BORDER_COLOR (border color) property of the chart object.

```
color  ColorBorder()
```

Return Value

The value of the OBJPROP_BORDER_COLOR property.

ColorBorder (Set method)

Sets the OBJPROP_BORDER_COLOR (border color) property of the chart object.

```
bool  ColorBorder(
   const color  value      // value
   )
```

Parameters

value

[in] New value of the OBJPROP_BORDER_COLOR property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Font (Get method)

Gets the OBJPROP_FONT (font) property of the chart object.

```
string  Font()
```

Return Value

The value of the OBJPROP_FONT property.

Font (Set method)

Sets the OBJPROP_FONT (font) property of the chart object.

```
bool  Font(
   const string  value      // value
   )
```

Parameters

value

[in] New value of the OBJPROP_FONT property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

FontSize (Get method)

Gets the OBJPROP_FONTSIZE (font size) property of the chart object.

```
int  FontSize()
```

Return Value

The value of the OBJPROP_FONTSIZE property.

FontSize (Set method)

Sets the OBJPROP_FONTSIZE (font size) property of the chart object.

```
bool  FontSize(
   const int  value      // value
   )
```

Parameters

value

[in] New value of the OBJPROP_FONTSIZE property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ZOrder (Get method)

Gets the OBJPROP_ZORDER property of the chart object.

```
long  ZOrder()
```

Return Value

The value of the OBJPROP_ZORDER property.

ZOrder (Set method)

Sets the OBJPROP_ZORDER property of the chart object.

```
bool  ZOrder(
   const long  value      // value
   )
```

Parameters

value

[in] New value of the OBJPROP_ZORDER property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnObjectCreate

The virtual handler of chart object CHARTEVENT_OBJECT_CREATE event.

```
virtual bool  OnObjectCreate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnObjectChange

The virtual handler of chart object CHARTEVENT_OBJECT_CHANGE event.

```
virtual bool  OnObjectChange()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnObjectDelete

The virtual handler of chart object CHARTEVENT_OBJECT_DELETE event.

```
virtual bool  OnObjectDelete()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnObjectDrag

The virtual handler of chart object CHARTEVENT_OBJECT_DRAG event.

```
virtual bool  OnObjectDrag()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```
virtual bool  OnSetText()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```
virtual bool  OnSetColor()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnSetColorBackground

The virtual handler of control "SetColorBackground" (change of the OBJPROP_BGCOLOR property) event.

```
virtual bool  OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnSetFont

The virtual handler of "SetFont" (change of the OBJPROP_FONT property) event.

```
virtual bool  OnSetFont()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnSetFontSize

The virtual handler of "SetFontSize" (change of the OBJPROP_FONTSIZE property) event.

```
virtual bool  OnSetFontSize()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnSetZOrder

The virtual handler of "SetZOrder" (change of the OBJPROP_ZORDER property) event.

```
virtual bool  OnSetZOrder()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnDestroy

The virtual handler of control "Destroy" internal event.

```
virtual bool  OnDestroy()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChange

The virtual handler of control "Change" internal event.

```
virtual bool  OnChange()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CWndContainer

CWndContainer is a base class for a complex control (containing dependent controls) of the Standard library.

Description

CWndContainer class implements base methods of the complex control.

Declaration

```
class CWndContainer : public CWnd
```

Title

```
#include <Controls\WndContainer.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer

Direct descendants

CCheckBox, CComboBox, CDateDropList, CDatePicker, CDialog, CRadioButton, CScroll, CSpinEdit, CWndClient

Class Methods by Groups

Destroy	
Destroy	Destroys all the container controls
Chart event handlers	
OnEvent	Event handler of all chart events
OnMouseEvent	The CHARTEVENT_MOUSE_MOVE event handler
Access to container	
ControlsTotal	Gets the number of controls in the container
Control	Gets control by index
ControlFind	Gets control by ID
Add/Delete	
Add	Adds control to a group (container)
Delete	Deletes control from a group (container)
Geometry	

© 2000-2025, MetaQuotes Ltd.

Destroy	
Move	Performs a absolute displacement of an element group
Shift	Performs a relative displacement of an element group
Identification	
Id	Sets the ID for all controls of the container
State	
Enable	Enables all controls of the container
Disable	Disables all controls of the container
Show	Shows all controls of the container
Hide	Hides all controls of the container
Mouse operations	
MouseFocusKill	Kills mouse focus
File operations	
Save	Saves container information to file
Load	Loads container information from file
Internal event handlers	
OnResize	"Resize" event handler
OnActivate	"Activate" event handler
OnDeactivate	"Deactivate" event handler

Methods inherited from class CObject

Prev, Prev, Next, Next, Type, Compare

Methods inherited from class CWnd

Create, Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

© 2000-2025, MetaQuotes Ltd.

Destroy

Destroys all the container controls.

```
virtual bool  Destroy()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type, passed by reference.

dparam

[in] Event parameter of double type, passed by reference.

sparam

[in] Event parameter of string type, passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMouseEvent

Mouse event handler.

```
virtual bool  OnMouseEvent(
   const int  x,          // x coordinate
   const int  y,          // y coordinate
   const int  flags       // flags
   )
```

Parameters

x

[in] X coordinate of the mouse cursor relative to the upper-left corner of the chart.

y

[in] Y coordinate of the mouse cursor relative to the upper-left corner of the chart.

flags

[in] Flag of mouse buttons states.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ControlsTotal

Gets the number of controls in the container.

```
int  ControlsTotal()  const
```

Return Value

Number of controls in the contrainer.

© 2000-2025, MetaQuotes Ltd.

Control

Gets control from the container by index.

```
CWnd*  Control(
   const int  ind      // index
   )  const
```

Parameters

ind

[in] Index of the control needed.

Return Value

Pointer to the control, otherwise NULL if the control is not found.

© 2000-2025, MetaQuotes Ltd.

ControlFind

Gets control from the container by identifier.

```
virtual CWnd*  ControlFind(
   const long  id      // id
   )
```

Parameters

id

[in] Control ID.

Return Value

Pointer to the control, otherwise NULL if the control is not found.

© 2000-2025, MetaQuotes Ltd.

Add

Adds a control to a group (container).

```
bool  Add(
   CWnd&  control      // reference
   )
```

Parameters

control

[in] Control to add, passed by reference.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Delete

Deletes control from a group (container).

```
bool  Delete(
   CWnd&  control      // reference
   )
```

Parameters

control

[in] Control to delete, passed by reference.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Move

Performs an absolute displacement of all controls of the container.

```
virtual bool  Move(
   const int  x,      // X coordinate
   const int  y       // Y coordinate
   )
```

Parameters

x

[in] New X coordinate of the upper-left corner.

y

[in] New Y coordinate of the upper-left corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Shift

Performs the relative shift of the coordinates for all controls of the container.

```
virtual bool  Shift(
   const int  dx,      // delta X
   const int  dy       // delta Y
   )
```

Parameters

dx

[in] Delta X.

dy

[in] Delta Y.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Id

Sets the ID for all controls of the container.

```
virtual long  Id(
   const long  id      // identifier
   )
```

Parameters

id

[in] Base group identifier.

Return Value

Number of identifiers used by container controls.

© 2000-2025, MetaQuotes Ltd.

Enable

Enables all the controls of the container.

```
virtual bool  Enable()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Disable

Disables all controls of the container.

```
virtual bool  Disable()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Show

Shows all controls of the container.

```
virtual bool  Show()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Hide

Hides all controls of the container.

```
virtual bool  Hide()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

MouseFocusKill

Clears the saved state of mouse buttons and deactivates all controls in the container.

```
bool  MouseFocusKill(
   const long  id=CONTROLS_INVALID_ID      // id
   )
```

Parameters

id=CONTROLS_INVALID_ID

[in] Identifier of the control, that received mouse focus.

Return Value

The controls deactivation result.

© 2000-2025, MetaQuotes Ltd.

Save

Saves container information to file.

```
virtual bool  Save(
   const int  file_handle      // handle
   )
```

Parameters

file_handle

[in] Handle of the binary file previously opened for writing.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Load

Loads container information from file

```
virtual bool  Load(
   const int  file_handle      // handle
   )
```

Parameters

file_handle

[in] Handle of the binary file previously opened for reading.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnActivate

The virtual handler of control "Activate" internal event.

```
virtual bool  OnActivate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnDeactivate

The virtual handler of control "Deactivate" internal event.

```
virtual bool  OnDeactivate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

CLabel

CLabel is class of the simple control based on "Text label" chart object.

Description

CLabel is intended for creation of simple non-editable text labels.

Declaration

```
class CLabel : public CWndObj
```

Title

```
#include <Controls\Label.mqh>
```

Inheritance hierarchy

CObject
CWnd
CWndObj
CLabel

Create

Creates new CLabel control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // x1 coordinate
   const int      y1,          // y1 coordinate
   const int      x2,          // x2 coordinate
   const int      y2           // y2 coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```
virtual bool  OnSetText()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```
virtual bool  OnSetColor()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetFont

The virtual handler of control "SetFont" (change of the OBJPROP_FONT property) event.

```
virtual bool  OnSetFont()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetFontSize

The virtual handler of control "SetFontSize" (change of the OBJPROP_FONTSIZE property) event.

```
virtual bool  OnSetFontSize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnCreate

The virtual handler of control "Create" internal event.

```
virtual bool  OnCreate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of control "Show" internal event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMove

The virtual handler of control "Move" internal event.

```
virtual bool  OnMove()
```

Return Value

true - event processed, otherwise - false.

Create

Creates new CBmpButton control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // x1 coordinate
   const int      y1,          // y1 coordinate
   const int      x2,          // x2 coordinate
   const int      y2           // y2 coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Border (Get method)

Gets the "Border" (border width) property of the control.

```
int  Border()  const
```

Return Value

The "Border" property.

Border (Set method)

Sets the "Border" (border width) property of the control.

```
bool  Border(
   const int  value      // value
   )
```

Parameters

value

[in] New value of the "Border" property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BmpNames

Sets the name of bmp files of the control

```
bool  BmpNames(
   const string  off="",      // file name
   const string  on=""        // file name
   )
```

Parameters

off=""

[in] Name of bmp file for OFF state.

on=""

[in] Name of bmp file for ON state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BmpOffName (Get method)

Gets the name of bmp file for OFF state.

```
string  BmpOffName()  const
```

Return Value

Name of bmp file for OFF state.

BmpOffName (Set method)

Sets the name of bmp file for OFF state.

```
bool  BmpOffName(
   const string  name      // file name
   )
```

Parameters

name

[in] Name of bmp file for OFF state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BmpOnName (Get method)

Gets the name of bmp file for ON state.

```
string  BmpOnName()  const
```

Return Value

Name of bmp file for ON state.

BmpOnName (Set method)

Sets the name of bmp file for ON state.

```
bool  BmpOnName(
   const string  name      // file name
   )
```

Parameters

name

[in] Name of bmp file for ON state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BmpPassiveName (Get method)

Gets the name of bmp file for the control passive state.

```
string  BmpPassiveName()  const
```

Return Value

Name of bmp file for the control passive state.

BmpPassiveName (Set method)

Sets the name of bmp file for the passive state.

```
bool  BmpPassiveName(
   const string  name      // file name
   )
```

Parameters

name

[in] Name of bmp file for the control passive state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BmpActiveName (Get method)

Gets the name of bmp file for the active state.

```
string  BmpActiveName()  const
```

Return Value

Name of bmp file for the active state.

Note

The control becomes active when the mouse cursor is hovering over it.

BmpActiveName (Set method)

Sets the name of bmp file for the active state.

```
bool  BmpActiveName(
   const string  name      // file name
   )
```

Parameters

name

[in] Name of bmp file for the active state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Pressed (Get method)

Gets the state ("Pressed" property) of the control.

```
bool  Pressed()  const
```

Return Value

Control state.

Pressed (Set method)

Sets the state ("Pressed" property) of the control.

```
bool  Pressed(
   const bool  pressed      // state
   )
```

Parameters

pressed

[in] New control state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Locking (Get method)

Gets the "Locking" property of the control.

```
bool  Locking()  const
```

Return Value

The value of "Locking" property.

Locking (Set method)

Sets new value of the "Locking" property of the control.

```
void  Locking(
   const bool  locking      // value
   )
```

Parameters

locking

[in] New value of "Locking" property.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnSetZOrder

The virtual handler of control "SetZOrder" (change of the OBJPROP_ZORDER property) event.

```
virtual bool  OnSetZOrder()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnCreate

The virtual handler of control "Create" internal event.

```
virtual bool  OnCreate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of control "Show" internal event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMove

The virtual handler of control "Move" internal event.

```
virtual bool  OnMove()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChange

The virtual handler of control "Change" internal event.

```
virtual bool  OnChange()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnActivate

The virtual handler of control "Activate" internal event.

```
virtual bool  OnActivate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnDeactivate

The virtual handler of control "Deactivate" internal event.

```
virtual bool  OnDeactivate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMouseDown

The virtual handler of control "MouseDown" event.

```
virtual bool  OnMouseDown()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMouseUp

The virtual handler of control "MouseUp" (mouse button release) event.

```
virtual bool  OnMouseUp()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CButton

CButton is a class of a simple control based on "Button" chart object.

Description

CButton class is intended for creation of simple buttons.

Declaration

```
class CButton : public CWndObj
```

Title

```
#include <Controls\Button.mqh>
```

Inheritance hierarchy

CObject
CWnd
CWndObj
CButton

Result of the code provided below:

Class Methods by Groups

Create	
Create	Creates control

© 2000-2025, MetaQuotes Ltd.

Create	
State	
Pressed	Gets/sets the "Pressed" property
Locking	Gets/sets the "Locking" property
Properties change event handlers	
OnSetText	"SetText" event handler
OnSetColor	"SetColor" event handler
OnSetColorBackground	"SetColorBackground" event handler
OnSetColorBorder	"SetColorBorder" event handler
OnSetFont	"SetFont" event handler
OnSetFontSize	"SetFontSize" event handler
Internal event handlers	
OnCreate	"Create" internal event handler
OnShow	"Show" internal event handler
OnHide	"Hide" internal event handler
OnMove	"Move" internal event handler
OnResize	"Resize" internal event handler
OnMouseDown	"MouseDown" internal event handler
OnOnMouseUp	"MouseUp" internal event handler

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CWnd

Destroy, OnMouseEvent, Name, ControlsTotal, Control, ControlFind, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Move, Move, Shift, Contains, Contains, Alignment, Align, Id, Id, IsEnabled, Enable, Disable, IsVisible, Visible, Show, Hide, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndObj

OnEvent, Text, Text, Color, Color, ColorBackground, ColorBackground, ColorBorder, ColorBorder, Font, Font, FontSize, FontSize, ZOrder, ZOrder

Example of creating a panel with button:

```
//+------------------------------------------------------------------+
```

Create

Creates new CButton control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Pressed (Get method)

Gets the state ("Pressed" property) of the control.

```
bool  Pressed()  const
```

Return Value

"Pressed" property of the control.

Pressed (Set method)

Sets the state ("Pressed" property) of the control.

```
bool  Pressed(
   const bool  pressed      // state
   )
```

Parameters

pressed

[in] New control state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Locking (Get method)

Gets the "Locking" property of the control.

```
bool  Locking()  const
```

Return Value

The value of "Locking" property.

Locking (Set method)

Sets the value of "Locking" property of the control.

```
void  Locking(
   const bool  locking      // value
   )
```

Parameters

locking

[in] New value of "Locking" property of the control.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```
virtual bool  OnSetText()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```
virtual bool  OnSetColor()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColorBackground

The virtual handler of control "SetColorBackground" (change of the OBJPROP_BGCOLOR property) event.

```
virtual bool  OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColorBorder

The virtual handler of control "SetColorBorder" (change of the OBJPROP_BORDER_COLOR property) event.

```
virtual bool  OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetFont

The virtual handler of control "SetFont" (change of the OBJPROP_FONT property) event.

```
virtual bool  OnSetFont()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetFontSize

The virtual handler of control "SetFontSize" (change of the OBJPROP_FONTSIZE property) event.

```
virtual bool  OnSetFontSize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnCreate

The virtual handler of control "Create" internal event.

```
virtual bool  OnCreate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of control "Show" internal event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMove

The virtual handler of control "Move" internal event.

```
virtual bool  OnMove()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMouseDown

The virtual handler of control "MouseDown" event handler.

```
virtual bool  OnMouseDown()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseDown" event occurs when left mouse button is pressed on the control.

© 2000-2025, MetaQuotes Ltd.

OnMouseUp

The virtual handler of control "MouseUp" (left mouse button release) event.

```
virtual bool  OnMouseUp()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseUp" event occurs when left mouse button is released on the control.

CEdit

CEdit is class of the simple control based on "Edit" chart object.

Description

CEdit class in intended for creation of controls, in which the user can enter text.

Declaration

```
class CEdit : public CWndObj
```

Title

```
#include <Controls\Edit.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndObj
      CEdit

Result of the code provided below:

Class Methods by Groups

Create	
Create	Creates control

© 2000-2025, MetaQuotes Ltd.

Create	
Properties	
ReadOnly	Gets/sets the "ReadOnly" property
TextAlign	Gets/sets the "TextAlign" property
Chart object event handlers	
OnObjectEndEdit	The CHARTEVENT_OBJECT_ENDEDIT event handler (virtual)
Properties change event handlers	
OnSetText	"SetText" event handler
OnSetColor	"SetColor" event handler
OnSetColorBackground	"SetColorBackground" event handler
OnSetColorBorder	"SetColorBorder" event handler
OnSetFont	"SetFont" event handler
OnSetFontSize	"SetFontSize" event handler
OnSetZOrder	"SetZOrder" event handler
Internal event handlers	
OnCreate	"Create" internal event handler
OnShow	"Show" internal event handler
OnHide	"Hide" internal event handler
OnMove	"Move" internal event handler
OnResize	"Resize" internal event handler
OnChange	"Change" internal event handler
OnClick	"Click" internal event handler

Create

Creates CEdit control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ReadOnly (Get Method)

Gets the "ReadOnly" property of the control.

```
bool  ReadOnly()
```

Return Value

The value of "ReadOnly" property.

ReadOnly (Set Method)

Sets the value of "ReadOnly" property of the control.

```
bool  ReadOnly(
   const bool  flag      // value
   )
```

Parameters

flag

[in] New value of "ReadOnly" property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

TextAlign (Get method)

Gets the value of "TextAlign" property (text alignment mode) of the control.

```
ENUM_ALIGN_MODE  TextAlign() const
```

Return Value

Value of "TextAlign" property of the control.

TextAlign (Set method)

Sets new value of "TextAlign" property (text aligment mode) of the control.

```
bool  TextAlign(
   ENUM_ALIGN_MODE  align      // property value
   )
```

Parameters

align

[in] New value of "TextAlign" property.

Return Value

true - successful, false - cannot change the property.

© 2000-2025, MetaQuotes Ltd.

OnObjectEndEdit

The virtual handler of CHARTEVENT_OBJECT_ENDEDIT chart object event.

```
virtual bool  OnObjectEndEdit()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```
virtual bool  OnSetText()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```
virtual bool  OnSetColor()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColorBackground

The virtual handler of control "SetColorBackground" (change of the OBJPROP_BGCOLOR property) event.

```
virtual bool  OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColorBorder

The virtual handler of control "SetColorBorder" (change of the OBJPROP_BORDER_COLOR property) event.

```
virtual bool  OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetFont

The virtual handler of control "SetFont" (change of the OBJPROP_FONT property) event.

```
virtual bool  OnSetFont()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetFontSize

The virtual handler of control "SetFontSize" (change of the OBJPROP_FONTSIZE property) event.

```
virtual bool  OnSetFontSize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetZOrder

The virtual handler of control "SetZOrder" (change of the OBJPROP_ZORDER property) event.

```
virtual bool  OnSetZOrder()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnCreate

The virtual handler of control "Create" internal event.

```
virtual bool  OnCreate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of control "Show" internal event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMove

The virtual handler of control "Move" internal event.

```
virtual bool  OnMove()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChange

The virtual handler of control "Change" internal event.

```
virtual bool  OnChange()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClick

The virtual handler of control "Click" (mouse button click) internal event.

```
virtual bool  OnClick()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CPanel

CPanel is a class of the simple control based on "Rectangle label" chart object.

Description

CPanel class is intended to combine the controls with similar functions in the group.

Declaration

```
class CPanel : public CWndObj
```

Title

```
#include <Controls\Panel.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndObj
      CPanel

Result of the code provided below:

Class Methods by Groups

Create	
Create	Creates control

© 2000-2025, MetaQuotes Ltd.

Create	
Chart object properties	
BorderType	Gets the "BorderType" property of the chart object
Chart object event handlers	
OnSetText	"SetText" event handler
OnSetColorBackground	"SetColorBackground" event handler
OnSetColorBorder	"SetColorBorder" event handler
Internal event handlers	
OnCreate	"Create" internal event handler
OnShow	"Show" internal event handler
OnHide	"Hide" internal event handler
OnMove	"Move" internal event handler
OnResize	"Resize" internal event handler
OnChange	"Change" internal event handler

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CWnd

Destroy, OnMouseEvent, Name, ControlsTotal, Control, ControlFind, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Move, Move, Shift, Contains, Contains, Alignment, Align, Id, Id, IsEnabled, Enable, Disable, IsVisible, Visible, Show, Hide, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndObj

OnEvent, Text, Text, Color, Color, ColorBackground, ColorBackground, ColorBorder, ColorBorder, Font, Font, FontSize, FontSize, ZOrder, ZOrder

Example of creating a panel with Rectangle label:

```
//+------------------------------------------------------------------+

Create

Creates new CPanel control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BorderType (Get method)

Gets the "BorderType" property of the chart object.

```
ENUM_BORDER_TYPE  BorderType()
```

Return Value

The value of "BorderType" property.

BorderType (Set method)

Sets new value of "BorderType" property of the chart object.

```
bool  BorderType(
   const ENUM_BORDER_TYPE  type      // value
   )
```

Parameters

type

[in] New value of "BorderType" property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```
virtual bool  OnSetText()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColorBackground

The virtual handler of control "SetColorBackground" (change of the OBJPROP_BGCOLOR property) event.

```
virtual bool  OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnSetColorBorder

The virtual handler of control "SetColorBorder" (change of the OBJPROP_BORDER_COLOR property) event.

```
virtual bool  OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnCreate

The virtual handler of control "Create" internal event.

```
virtual bool  OnCreate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of control "Show" internal event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMove

The virtual handler of control "Move" internal event.

```
virtual bool  OnMove()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChange

The virtual handler of control "Change" internal event.

```
virtual bool  OnChange()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CPicture

CPicture is a class of the simple control based on "Bitmap Label" object.

Description

CPicture class is intended for creation of simple graphic images.

Create

Creates new CPicture control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Border (Get method)

Gets the "Border" (border width) property of the control.

```
int  Border()  const
```

Return Value

The "Border" property.

Border (Set method)

Sets the "Border" (border width) property of the control.

```
bool  Border(
   const int  value      // value
   )
```

Parameters

value

[in] New value of the "Border" property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BmpName (Get method)

Gets the name of bmp file of the control.

```
string  BmpName()  const
```

Return Value

Name of bmp file of the control.

BmpName (Set method)

Sets the name of bmp file of the control.

```
bool  BmpName(
   const string  name      // file name
   )
```

Parameters

name

[in] Name of bmp file of the control.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnCreate

The virtual handler of control "Create" internal event.

```
virtual bool  OnCreate()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of control "Show" internal event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnMove

The virtual handler of control "Move" internal event.

```
virtual bool  OnMove()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChange

The virtual handler of control "Change" internal event.

```
virtual bool  OnChange()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CScroll

CScroll is a base class for creation of scroll bars.

Description

CScroll is a complex control (with dependent controls), it contains the base functionality for creation of scroll bars. The base class itself is not used as a separate control, two of its heirs (CScrollV and CScrollH classes) are used as controls.

Declaration

```
class CScroll : public CWndContainer
```

Title

```
#include <Controls\Scrolls.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CScroll

Direct descendants

CScrollH, CScrollV

Class Methods by Groups

Create	
Create	Creates control
Chart object event handlers	
OnEvent	Event handler of all chart events
Properties	
MinPos	Gets/sets the minimal position
MaxPos	Gets/sets the maximal position
CurrPos	Gets/sets the current position
Dependent controls creation	
CreateBack	Creates background button
CreateInc	Creates increment button of the scroll bar
CreateDec	Creates decrement button of the scroll bar
CreateThumb	Creates thumb button (can be dragged) of the scroll bar

© 2000-2025, MetaQuotes Ltd.

Create	
Dependent controls event handlers	
OnClickInc	Event handler used for handling increment button events
OnClickDec	Event handler used for handling decrement button events
Internal event handlers	
OnShow	"Create" internal event handler
OnHide	"Hide" internal event handler
OnChangePos	"ChangePosition" internal event handler
Object drag handlers	
OnThumbDragStart	"ThumbDragStart" event handler
OnThumbDragProcess	"ThumbDragProcess" event handler
OnThumbDragEnd	"ThumbDragEnd" event handler
Position	
CalcPos	Gets scroll bar position by coordinate

Create

Creates new CScroll control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

MinPos (Get method)

Gets the value of "MinPos" (minimal position) of the CScroll control.

```
int  MinPos()  const
```

Return Value

New value of "MinPos" property.

MinPos (Set method)

Sets the value of "MinPos" (minimal position) of the CScroll control.

```
void  MinPos(
   const int  value      // value
   )
```

Parameters

value

[in] New value of "MinPos" property.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

MaxPos (Get method)

Gets the value of "MaxPos" (maximal position) of the CScroll control.

```
int  MaxPos()  const
```

Return Value

New value of "MaxPos" property.

MaxPos (Set method)

Sets the value of "MaxPos" (maximal position) of the CScroll control.

```
void  MaxPos(
   const int  value      // value
   )
```

Parameters

value

[in] New value of "MaxPos" property.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CurrPos (Get method)

Gets the value of "CurrPos" (current position) of the CScroll control.

```
int  CurrPos()  const
```

Return Value

New value of "CurrPos" property.

CurrPos (Set method)

Sets the value of "CurrPos" (current position) of the CScroll control.

```
void  CurrPos(
   const int  value      // value
   )
```

Parameters

value

[in] New value of "CurrPos" property.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CreateBack

Creates background button of the CScroll control.

```
virtual bool  CreateBack()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateInc

Creates increment button of CScroll control.

```
virtual bool  CreateInc()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateDec

Creates decrement button of CScroll control.

```
virtual bool  CreateDec()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateThumb

Creates thumb button (can be dragged) of CScroll control.

```
virtual bool  CreateThumb()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickInc

The virtual handler of the control "ClickInc" (left mouse button click on the increment button) internal event.

```
virtual bool  OnClickInc()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickDec

The virtual handler of the control "ClickDec" (left mouse button click on the decrement button) internal event.

```
virtual bool  OnClickDec()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnShow

The virtual handler of the control "Show" event.

```
virtual bool  OnShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnHide

The virtual handler of the control "Hide" internal event.

```
virtual bool  OnHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChangePos

The virtual handler of the control "ChangePos" (position change) internal event.

```
virtual bool  OnChangePos()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragStart

The virtual handler of the control "ThumbDragStart" (drag start) event.

```
virtual bool  OnThumbDragStart()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragStart" event occurs at start of the drag operation.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragProcess

The virtual handler of the control "ThumbDragProcess" event.

```
virtual bool  OnThumbDragProcess(
   const int  x,      // x coordinate
   const int  y       // y coordinate
   )
```

Parameters

x

[in] Current X coordinate of mouse cursor.

y

[in] Current Y coordinate of mouse cursor.

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragProcess" occurs when the scroll bar control (thumb button) is moved.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragEnd

The virtual handler of the control "ThumbDragEnd" (drag process finished) event.

```
virtual bool  OnThumbDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragEnd" occurs when the drag operation of the scroll bar control (thumb button) is finished.

© 2000-2025, MetaQuotes Ltd.

CalcPos

Gets the control scroll bar position by coordinate.

```
virtual int  CalcPos(
   const int      coord      // coordinate
   )
```

Parameters

coord

[in] Scroll bar coordinate.

Return Value

Scroll bar position.

© 2000-2025, MetaQuotes Ltd.

CScrollV

CScrollV is a class of the "Vertical scroll bar" complex control.

Description

CScrollV class is intended for creation of vertical scroll bars.

Declaration

```
class CScrollV : public CScroll
```

Title

```
#include <Controls\Scrolls.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CScroll
        CScrollV

}
```

© 2000-2025, MetaQuotes Ltd.

CreateInc

Creates increment button of the control.

```
virtual bool  CreateInc()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateDec

Creates decrement button of the control.

```
virtual bool  CreateDec()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateThumb

Creates thumb button (can be dragged) of the control.

```
virtual bool  CreateThumb()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of the control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChangePos

The virtual handler of the control "ChangePos" (position change) internal event.

```
virtual bool  OnChangePos()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragStart

The virtual handler of the control "ThumbDragStart" (drag start) event.

```
virtual bool  OnThumbDragStart()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragStart" event occurs at start of the drag operation.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragProcess

The virtual handler of the control "ThumbDragProcess" event.

```
virtual bool  OnThumbDragProcess(
   const int  x,      // x coordinate
   const int  y       // y coordinate
   )
```

Parameters

x

[in] Current X coordinate of mouse cursor.

y

[in] Current Y coordinate of mouse cursor.

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragProcess" occurs when the scroll bar control (thumb button) is moved.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragEnd

The virtual handler of the control "ThumbDragEnd" (drag process finished) event.

```
virtual bool  OnThumbDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragEnd" occurs when the drag operation of the scroll bar control (thumb button) is finished.

© 2000-2025, MetaQuotes Ltd.

CalcPos

Gets the control scroll bar position by coordinate.

```
virtual int  CalcPos(
   const int      coord      // coordinate
   )
```

Parameters

coord

[in] Scroll bar coordinate.

Return Value

Scroll bar position.

© 2000-2025, MetaQuotes Ltd.

CScrollH

CScrollH is a class of the "Horizontal scroll bar" complex control.

Description

CScrollH is intended for creation of horizontal scroll bars.

Declaration

```
class CScrollH : public CScroll
```

Title

```
#include <Controls\Scrolls.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CScroll
        CScrollH

Result of the code provided below:

Class Methods by Groups

© 2000-2025, MetaQuotes Ltd.

Dependent controls	
CreateInc	Creates scroll bar increment button
CreateDec	Creates scroll bar decrement button
CreateThumb	Creates scroll bar thumb button (can be dragged)
Internal event handlers	
OnResize	"Resize" internal event handler
OnChangePos	"ChangePosition" internal event handler
Drag event handlers	
OnThumbDragStart	"ThumbDragStart" event handler
OnThumbDragProcess	"ThumbDragProcess" event handler
OnThumbDragEnd	"ThumbDragEnd" event handler
Position	
CalcPos	Gets scroll bar position by coordinate

Methods inherited from class CObject

Prev, Prev, Next, Next, Type, Compare

Methods inherited from class CWnd

Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndContainer

Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide, Save, Load

Methods inherited from class CScroll

Create, OnEvent, MinPos, MinPos, MaxPos, MaxPos, CurrPos, CurrPos

Example of creating a panel with horizontal scrollbar:

```

}
```

© 2000-2025, MetaQuotes Ltd.

CreateInc

Creates increment button of the control.

```
virtual bool  CreateInc()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateDec

Creates decrement button of the control.

```
virtual bool  CreateDec()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateThumb

Creates thumb button (can be dragged) of the control.

```
virtual bool  CreateThumb()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of the control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChangePos

The virtual handler of the control "ChangePos" (position change) internal event.

```
virtual bool  OnChangePos()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragStart

The virtual handler of the control "ThumbDragStart" (drag start) event.

```
virtual bool  OnThumbDragStart()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragStart" event occurs at start of the drag operation.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragProcess

The virtual handler of the control "ThumbDragProcess" event.

```
virtual bool  OnThumbDragProcess(
   const int  x,      // x coordinate
   const int  y       // y coordinate
   )
```

Parameters

x

[in] Current X coordinate of mouse cursor.

y

[in] Current Y coordinate of mouse cursor.

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragProcess" occurs when the scroll bar control (thumb button) is moved.

© 2000-2025, MetaQuotes Ltd.

OnThumbDragEnd

The virtual handler of the control "ThumbDragEnd" (drag process finished) event.

```
virtual bool  OnThumbDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragEnd" occurs when the drag operation of the scroll bar control (thumb button) is finished.

© 2000-2025, MetaQuotes Ltd.

CalcPos

Gets the control scroll bar position by coordinate.

```
virtual int  CalcPos(
   const int      coord      // coordinate
   )
```

Parameters

coord

[in] Scroll bar coordinate.

Return Value

Scroll bar position.

© 2000-2025, MetaQuotes Ltd.

CWndClient

CWndClient is a class of the "Client area" complex control (with dependent controls). It is a base class for creation of scroll bars area.

Description

CWndClient implements the functionality for creation of client area with scroll bars.

Declaration

```
class CWndClient : public CWndContainer
```

Title

```
#include <Controls\WndClient.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CWndClient

Direct descendants

CCheckGroup, CListView, CRadioGroup

Create

Creates new CWndClient control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ColorBackground

Sets background color of the control.

```
bool  ColorBackground(
   const color  value      // background color
   )
```

Parameters

value

[in] Background color of the control.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ColorBorder

Set border color of the control.

```
bool  ColorBorder(
   const color  value      // color
   )
```

Parameters

value

[in] Border color of the control.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

BorderType

Sets border type of the control.

```
bool  BorderType(
   const ENUM_BORDER_TYPE  type      // value
   )
```

Parameters

type

[in] Border type of the control.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

VScrolled (Get method)

Gets the flag indicating that vertical scroll bar is used.

```
bool  VScrolled()
```

Return Value

true - vertical scroll bar is used, otherwise - false.

VScrolled (Set method)

Sets the flag indicating that vertical scroll bar is used.

```
bool  VScrolled(
   const bool  flag      // flag
   )
```

Parameters

flag

[in] Flag.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

HScrolled (Get method)

Gets the flag indicating that horizontal scroll bar is used.

```
bool  HScrolled()
```

Return Value

true - horizontal scroll bar is used, otherwise - false.

HScrolled (Set method)

Sets the flag indicating that horizontal scroll bar is used.

```
bool  HScrolled(
   const bool  flag      // flag
   )
```

Parameters

flag

[in] Flag.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateBack

Creates background button of the control.

```
virtual bool  CreateBack()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateScrollV

Creates vertical scroll bar.

```
virtual bool  CreateScrollV()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateScrollH

Creates horizontal scroll bar.

```
virtual bool  CreateScrollH()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of the control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnVScrollShow

The virtual handler of the VScroll (vertical scroll) dependent control "Show" (vertical scroll bar show) internal event.

```
virtual bool  OnVScrollShow()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnVScrollHide

The virtual handler of the VScroll (vertical scroll) dependent control "Hide" (vertical scroll bar hide) internal event.

```
virtual bool  OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnHScrollShow

The virtual handler of the HScroll (horizontal scroll) dependent control "Show" (horizontal scroll bar show) internal event.

```
virtual bool  OnHScrollShow()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnHScrollHide

The virtual handler of the HScroll (horizontal scroll) dependent control "Hide" (horizontal scroll bar hide) internal event.

```
virtual bool  OnHScrollHide()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineDown

The virtual handler of the VScroll (vertical scroll) dependent control "ScrollLineDown" (vertical scroll line down) internal event.

```
virtual bool  OnScrollLineDown()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineUp

The virtual handler of the VScroll (vertical scroll) dependent control "ScrollLineUp" (vertical scroll line up) internal event.

```
virtual bool  OnScrollLineUp()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineLeft

The virtual handler of the HScroll (horizontal scroll) dependent control "ScrollLineLeft" (horizontal scroll line left) internal event.

```
virtual bool  OnScrollLineLeft()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineRight

The virtual handler of the HScroll (horizontal scroll) dependent control "ScrollLineRight" (horizontal scroll line right) internal event.

```
virtual bool  OnScrollLineRight()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.

© 2000-2025, MetaQuotes Ltd.

ReBound

Sets new parameters of the control using CRect class coordinates.

```
void  ReBound(
   const & CRect  rect      // CRect class
   )
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CListView

CListView is a class of the ListView complex control (with dependent controls).

Description

CListView class encapsulates list-control functionality.

Declaration

```
class CListView : public CWndClient
```

Title

```
#include <Controls\ListView.mqh>
```

Inheritance hierarchy

CObject
CWnd
CWndContainer
CWndClient
CListView

Class Methods by Groups

© 2000-2025, MetaQuotes Ltd.

Create	
Create	Creates control
Chart event handlers	
OnEvent	Event handler of all chart events
Settings	
TotalView	Sets the number of items shown on the control
Add/Delete	
AddItem	Adds an item to control list
Data	
Select	Selects current list element by index
SelectByText	Selects current list element by text
SelectByValue	Selects current list element by value
Read-only data	
Value	Gets the value of the current list element
Dependent controls	
CreateRow	Creates a row of the ListView
Internal event handlers	
OnResize	"Resize" internal event handler (virtual)
Dependent controls event handlers	
OnVScrollShow	"Show" internal event handler (virtual) of VScroll dependent control
OnVScrollHide	"Hide" internal event handler (virtual) of VScroll dependent control
OnScrollLineDown	"ScrollLineDown" internal event handler (virtual) of VScroll dependent control
OnScrollLineUp	"ScrollLineUp" internal event handler (virtual) of VScroll dependent control
OnItemClick	"ItemClick" internal event handler (virtual)
Redraw	
Redraw	Redraws the control
RowState	Sets the state of the specified row
CheckView	Checks the "visibility" of the specified row

Create

Creates CListView control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

TotalView

Sets the number of items shown on the control.

```
bool  TotalView(
   const int  value      // number of items shown
   )
```

Parameters

value

[in] The number of items shown on the control.

Return Value

true - successful, otherwise - false.

Note

The number of shown items can be specified only at once.

© 2000-2025, MetaQuotes Ltd.

AddItem

Adds an item to the control list.

```
bool  AddItem(
   const string  item,      // text
   const long    value      // value
   )
```

Parameters

item

[in] Text.

value

[in] Value.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Select

Selects current list element by index.

```
bool  Select(
   const int  index     // index
   )
```

Parameters

index

[in] Item index.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

SelectByText

Selects the current list element by text.

```
bool  SelectByText(
   const string  text     // text
   )
```

Parameters

text

[in] Element text.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

SelectByValue

Selects the current list element by value.

```
bool  SelectByValue(
   const long  value     // value
   )
```

Parameters

value

[in] Value.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Value

Gets the value of the current list element.

```
long  Value()
```

Return Value

The value of the current list element.

© 2000-2025, MetaQuotes Ltd.

CreateRow

Creates a row of the CListView control.

```
bool  CreateRow(
   const int  index     // index
   )
```

Parameters

index

[in] Item index.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnResize

The virtual handler of the control "Resize" internal event.

```
virtual bool  OnResize()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnVScrollShow

The virtual handler of the VScroll (vertical scroll) dependent control "VScrollShow" (vertical scroll bar show) internal event.

```
virtual bool  OnVScrollShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnVScrollHide

The virtual handler of the VScroll (vertical scroll) dependent control "VScrollHide" (vertical scroll bar hide) internal event.

```
virtual bool  OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineDown

The virtual handler of the VScroll (vertical scroll) dependent control "ScrollLineDown" (vertical scroll line down) internal event.

```
virtual bool  OnScrollLineDown()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineUp

The virtual handler of the VScroll (vertical scroll) dependent control "ScrollLineUp" (vertical scroll line up) internal event.

```
virtual bool  OnScrollLineUp()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnItemClick

The virtual handler of "ItemClick" (mouse button click) internal event on a specified row of CListView control.

```
virtual bool  OnItemClick()
   const int    index     // index
   )
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Redraw

Redraws the control.

```
bool  Redraw()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

RowState

Changes the state of the specified row of the CListView control.

```
bool  RowState(
   const int   index      // index
   const bool  select     // state
   )
```

Parameters

index

[in] Row index.

select

[in] Row state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CheckView

Checks the "visibility" of the specified row of the CListView control.

```
bool  CheckView()
```

Return Value

true - selected row is visible, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CComboBox

CComboBox is a class of the ComboBox complex control (with dependent controls).

Description

ComboBox consists of a list box, combined with a static control, intended for selection. The list-box portion of the control may be dropped down when a user selects the drop-down arrow next to the control

Declaration

```
class CComboBox : public CWndContainer
```

Title

```
#include <Controls\ComboBox.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CComboBox

Result of the code provided below:

Class Methods by Groups

© 2000-2025, MetaQuotes Ltd.

Create	
Create	Creates control
Chart event handlers	
OnEvent	Event handler of all chart events
Add	
AddItem	Adds an item to control
Settings	
ListViewItems	Sets the number of items shown on the control
Data	
Select	Selects the current list element by index
SelectByText	Selects the current list element by text
SelectByValue	Selects the current list element by value
Read-only data	
Value	Gets the value of the current list element
Dependent controls	
CreateEdit	Creates dependent control (edit)
CreateButton	Creates dependent control (button)
CreateList	Creates dependent control (list view)
Dependent controls event handlers	
OnClickEdit	"ClickEdit" internal event handler (virtual)
OnClickButton	"ClickButton" internal event handler (virtual)
OnChangeList	"ChangeList" internal event handler (virtual)
Show/Hide the drop-down list	
ListShow	Shows the items list
ListHide	Hides the items list

Create

Creates CComboBox control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chat, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

AddItem

Adds an item to the control.

```
bool  AddItem(
   const string  item,      // text
   const long    value      // value
   )
```

Parameters

item

[in] Text.

value=0

[in] Value.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ListViewItems

Sets the number of list elements of the CComboBox control.

```
void  ListViewItems(
   const int    value     // number of elements
   )
```

Parameters

value

[in] Number of the drop-down list elements.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Select

Selects the current list element by index.

```
bool  Select(
   const int  index     // index
   )
```

Parameters

index

[in] Item index.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

SelectByText

Selects the current list element by a specified text.

```
bool  SelectByText(
   const string  text     // text
   )
```

Parameters

text

[in] Text of the item.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

SelectByValue

Selects the current list element by a specified value.

```
bool  SelectByValue(
   const long  value     // value
   )
```

Parameters

value

[in] Value.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Value

Gets the value of the current list element.

```
long  Value()
```

Return Value

The value of the current list element.

© 2000-2025, MetaQuotes Ltd.

CreateEdit

Creates dependent control (edit) of the control.

```
virtual bool  CreateEdit()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateButton

Creates dependent control (button).

```
virtual bool  CreateButton()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateList

Creates dependent control (list view).

```
virtual bool  CreateList()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickEdit

The virtual handler of the control "ClickEdit" (mouse click on the edit) internal event.

```
virtual bool  OnClickEdit()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickButton

The virtual handler of the "ClickButton" (mouse click on the button) internal event.

```
virtual bool  OnClickButton()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChangeList

The virtual handler of the "ChangeList" (change of the list) internal event.

```
virtual bool  OnChangeList()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ListShow

Shows the drop-down list of the control.

```
virtual bool  ListShow()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ListHide

Hides the drop-down list of the control.

```
virtual bool  ListHide()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CCheckBox

CCheckBox is class of the CheckBox complex control.

Description

CCheckBox control displays a check box that allows a user to select a true or false condition at a mouse click.

Declaration

```
class CCheckBox : public CWndContainer
```

Title

```
#include <Controls\CheckBox.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CCheckBox

Result of the code provided below:

Class Methods by Groups

Create	
Create	Creates control

© 2000-2025, MetaQuotes Ltd.

Create	
Chart event handlers	
OnEvent	Event handler of all chart events
Properties	
Text	Gets/sets text label associated with the control
Color	Gets/sets color of text label associated with the control
State	
Checked	Gets/sets a value indicating whether the control is checked
Data	
Value	Gets/sets the value associated with the control
Dependent controls	
CreateButton	Creates dependent control (button)
CreateLabel	Creates dependent control (label)
Dependent controls event handlers	
ClickButton	"ClickButton" internal event handler (virtual)
ClickLabel	"ClickLabel" internal event handler (virtual)

Methods inherited from class CObject

Prev, Prev, Next, Next, Type, Compare

Methods inherited from class CWnd

Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndContainer

Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide

Example of creating a panel with Checkbox control:

```
//+------------------------------------------------------------------+
//|                                                ControlsCheckBox.mq5 |

Create

Creates CCheckBox control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Text (Get method)

Gets text of the label associated with the control.

```
string  Text()
```

Return Value

Text of the label.

Text (Set method)

Sets text of the label associated with the control.

```
bool  Text(
   const string  value      // text
   )
```

Parameters

value

[in] New text of the label.

Return Value

true - successful, otherwise - false.

Note

Label text is specified by setting OBJPROP_TEXT (text) of a chart object.

© 2000-2025, MetaQuotes Ltd.

Color (Get method)

Gets color of the label associated with the control.

```
color  Color()  const
```

Return Value

Label color.

Color (Set method)

Sets color of the label associated with the control.

```
bool  Color(
   const color  value      // color
   )
```

Parameters

value

[in] New label color.

Return Value

true - successful, otherwise - false.

Note

Label color is specified by setting OBJPROP_COLOR (color) of a chart object.

© 2000-2025, MetaQuotes Ltd.

Checked (Get method)

Gets state of the control.

```
bool  Checked()  const
```

Return Value

State of the control.

Checked (Set method)

Sets state of the control.

```
bool  Checked(
   const bool  flag      // state
   )
```

Parameters

flag

[in] New state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Value (Get method)

Gets the value associated with the control.

```
int  Value()  const
```

Return Value

The value associated with the control.

Value (Set method)

Sets the value associated with the control.

```
void  Value(
   const int  value      // value
   )
```

Parameters

value

[in] New value.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CreateButton

Creates dependent control (button).

```
virtual bool  CreateButton()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateLabel

Creates dependent control (label).

```
virtual bool  CreateLabel()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickButton

The virtual handler of the control "ClickButton" (mouse click on the button) internal event.

```
virtual bool  OnClickButton()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickLabel

The virtual handler of the control "ClickLabel" (mouse click on the label) internal event.

```
virtual bool  OnClickLabel()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CCheckGroup

CCheckGroup is a class of the CheckGroup complex control (with dependent controls).

Description

CCheckGroup provides the possibility for creation of controls, which allow to display and edit flags.

Declaration

```
class CCheckGroup : public CWndClient
```

Title

```
#include <Controls\CheckGroup.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CWndClient
        CCheckGroup

Result of the code provided below:

Class Methods by Groups

© 2000-2025, MetaQuotes Ltd.

Create	
Create	Creates control
Chart event handlers	
OnEvent	Event handler for all chart events
Add	
AddItem	Adds new item
Read-only data	
Value	Gets the value associated with the control
Dependent controls	
CreateButton	Creates new CCheckBox item at a specified index
Dependent controls event handlers	
OnVScrollShow	"Show" internal event handler (virtual) of VScroll dependent control
OnVScrollHide	"Hide" internal event handler (virtual) of VScroll dependent control
OnScrollLineDown	"ScrollLineUp" internal event handler (virtual) of VScroll dependent control
OnScrollLineUp	"ScrollLineDown" internal event handler (virtual) of VScroll dependent control
OnChangeItem	"ChangeItem" internal event handler (virtual) of VScroll dependent control
Redraw	
Redraw	Redraws the group
RowState	Sets the state of the specified item of the group

Create

Creates new CCheckGroup control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

AddItem

Adds an item (row) to the control.

```
bool  AddItem(
   const string  item,      // text
   const long    value      // value
   )
```

Parameters

item

[in] Added control label text.

value=0

[in] Value associated with the added control.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Value

Gets the value associated with the control.

```
long  Value()
```

Return Value

The value associated with the control.

Note

The value depends on state of all items of the CCheckGroup.

© 2000-2025, MetaQuotes Ltd.

CreateButton

Creates new CCheckBox class instance at a specified index.

```
bool  CreateButton(
   int  index      // index
   )
```

Parameters

index

[in] Index of the new item in the CCheckGroup.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnVScrollShow

The virtual handler of the dependent VScroll (vertical scroll) control "Show" internal event.

```
virtual bool  OnVScrollShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnVScrollHide

The virtual handler of the dependent VScroll (vertical scroll) control "Hide" internal event.

```
virtual bool  OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineDown

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineDown" internal event.

```
virtual bool  OnScrollLineDown()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineUp

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineUp" internal event.

```
virtual bool  OnScrollLineUp()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChangeItem

The virtual handler of the control "ChangeItem" (item change) internal event.

```
virtual bool  OnChangeItem(
   const int  index      // index
   )
```

Parameters

index

[in] Index of the changed item.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Redraw

Redraws the control.

```
bool  Redraw()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

RowState

Sets the state of the specified item.

```
bool  RowState(
   const int   index,      // item index
   const bool  select      // state
   )
```

Parameters

index

[in] Item index to change.

select

[in] New state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CRadioButton

CRadioButton is a class of RadioButton complex control.

Description

CRadioButton itself is not used, it used for creation of CRadioGroup items.

Declaration

```
class CRadioButton : public CWndContainer
```

Title

```
#include <Controls\RadioButton.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CRadioButton

Class Methods by Groups

Create	
Create	Creates control
Chart event handlers	
OnEvent	Event handler for all chart events
Properties	
Text	Gets/sets the text label associated with the control
Color	Gets/sets the color of text label associated with the control
State	
State	Gets/sets the state
Dependent controls	
CreateButton	Creates button
CreateLabel	Creates label
Dependent controls event handlers	
OnClickButton	"ClickButton" internal event handler (virtual)
OnClickLabel	"ClickLabel" internal event handler (virtual)

Create

Creates new CRadioButton control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Text (Get method)

Gets text of the label associated with the control.

```
string  Text()
```

Return Value

Text of the label.

Text (Set method)

Sets text of the label.

```
bool  Text(
   const string  value      // text
   )
```

Parameters

value

[in] New text of the label.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Color (Get method)

Gets color of the label associated with the control.

```
color  Color()  const
```

Return Value

Label color.

Color (Set method)

Sets color of the label associated with the control.

```
bool  Color(
   const color  value      // color
   )
```

Parameters

value

[in] New label color.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

State (Get method)

Gets the button state.

```
bool  State()  const
```

Return Value

Button state.

State (Set method)

Sets the button state.

```
bool  State(
   const bool  flag      // flag
   )
```

Parameters

flag

[in] New button state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateButton

Creates button.

```
virtual bool  CreateButton()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateLabel

Creates label.

```
virtual bool  CreateLabel()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickButton

The virtual handler of the control "ClickButton" (button click) internal event.

```
virtual bool  OnClickButton()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickLabel

The virtual handler of the control "ClickLabel" (click on the label) internal event.

```
virtual bool  OnClickLabel()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CRadioGroup

CRadioGroup is a class of RadioGroup complex control (with dependent controls).

Description

CRadioGroup enables creation of a control allowing the display and editing the enumerable type field.

Declaration

```
class CRadioGroup : public CWndClient
```

Title

```
#include <Controls\RadioGroup.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CWndClient
        CRadioGroup

Create

Creates new CRadioGroup control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

AddItem

Adds an item to the control.

```
bool  AddItem(
   const string  item,      // text
   const long    value=0    // value
   )
```

Parameters

item

[in] Added control label text.

value=0

[in] Value associated with the added control.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Value

Gets the value associated with the control.

```
long  Value()
```

Return Value

The value associated with the control.

Note

The value depends on state of all CRadioButton items of the CRadioGroup control.

© 2000-2025, MetaQuotes Ltd.

CreateButton

Creates new CRadioButton class instance at a specified index.

```
bool  CreateButton(
   const int  index      // index
   )
```

Parameters

index

[in] Index of the new item in the CRadioGroup.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnVScrollShow

The virtual handler of the dependent VScroll (vertical scroll) control "Show" internal event.

```
virtual bool  OnVScrollShow()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnVScrollHide

The virtual handler of the dependent VScroll (vertical scroll) control "Hide" internal event.

```
virtual bool  OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineDown

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineDown" internal event.

```
virtual bool  OnScrollLineDown()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnScrollLineUp

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineUp" internal event.

```
virtual bool  OnScrollLineUp()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChangeItem

The virtual handler of the control "ChangeItem" (item change) event.

```
virtual bool  OnChangeItem(
   const int  index      // index
   )
```

Parameters

index

[in] Index of the changed item.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Redraw

Redraws the control.

```
bool  Redraw()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

RowState

Changes the state of an item.

```
bool  RowState(
   const int   index,      // index
   const bool  select      // state
   )
```

Parameters

index

[in] Item index to change.

select

[in] New state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Select

Selects the current item.

```
void  Select(
   const int  index      // index
   )
```

Parameters

index

[in] Item index to select.

Return Value

None.

CSpinEdit

CSpinEdit is a class of SpinEdit complex control (with dependent controls).

Description

CSpinEdit class is intended for creation of a control, which allows editing a value of integer type with a specified step and within specified limitations.

Declaration

```
class CSpinEdit : public CWndContainer
```

Title

```
#include <Controls\SpinEdit.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CSpinEdit

Result of the code provided below:

Class Methods by Groups

Create	
Create	Creates control

© 2000-2025, MetaQuotes Ltd.

Create	
Chart event handlers	
OnEvent	Event handler of all chart events
Properties	
MinValue	Gets/sets the minimal allowed value
MaxValue	Gets/sets the maximal allowed value
State	
Value	Gets/sets the current value
Dependent controls	
CreateEdit	Creates dependent control (edit)
CreateInc	Creates dependent control (increment button)
CreateDec	Creates dependent control (decrement button)
Dependent controls event handlers	
OnClickInc	"ClickInc" internal event handler (virtual)
OnClickDec	"ClickDec" internal event handler (virtual)
Internal event handlers	
OnChangeValue	"ChangeValue" internal event handler (virtual)

Methods inherited from class CObject

Prev, Prev, Next, Next, Type, Compare

Methods inherited from class CWnd

Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndContainer

Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide

Example of creating a panel with spin edit control:

```
//+------------------------------------------------------------------+
//|                                              ControlsSpinEdit.mq5 |

Create

Creates new CSpinEdit control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

MinValue (Get method)

Gets the value of "MinValue" property (minimal value) of the control.

```
int  MinValue()  const
```

Return Value

The value of "MinValue" property.

MinValue (Set method)

Sets the value of "MinValue" property (minimal value) of the control.

```
void  MinValue(
   const int  value      // value
   )
```

Parameters

value

[in] New value of "MinValue" property.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

MaxValue (Get method)

Gets the value of "MaxValue" property (maximal value) of the control.

```
int  MaxValue()  const
```

Return Value

The value of "MaxValue" property.

MaxValue (Set method)

Sets the value of "MaxValue" property (maximal value) of the control.

```
void  MaxValue(
   const int  value      // value
   )
```

Parameters

value

[in] New value of "MaxValue" property.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Value (Get method)

Gets the "Value" property (current value) of the control.

```
int  Value()  const
```

Return Value

The "Value" property.

Value (Set method)

Sets the "Value" property (current value) of the control.

```
void  Value(
   const int  value      // value
   )
```

Parameters

value

[in] New "Value" property.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

CreateEdit

Creates dependent control (CEdit).

```
virtual bool  CreateEdit()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateInc

Creates dependent control (increment button).

```
virtual bool  CreateInc()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateDec

Creates dependent control (decrement button).

```
virtual bool  CreateDec()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickInc

The virtual handler of the control "ClickInc" (mouse click on the increment button) internal event.

```
virtual bool  OnClickInc()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickDec

The virtual handler of the control "ClickDec" (mouse click on the decrement button) internal event.

```
virtual bool  OnClickDec()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnChangeValue

The virtual handler of the control "ChangeValue" (changing the current value) internal event.

```
virtual bool  OnChangeValue()
```

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CDialog

CDialog is class of the Dialog complex control.

Description

CDialog class is intended to combine the controls with different functions in the group.

Declaration

```
class CDialog : public CWndContainer
```

Title

```
#include <Controls\Dialog.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CDialog

Direct descendants

CAppDialog

Class Methods by Groups

Create	
Create	Creates control
Chart event handlers	
OnEvent	Event handler of all chart events
Properties	
Caption	Gets/sets the value of the "Caption" property
Add	
Add	Adds control to the client area
Dependent controls	
CreateWhiteBorder	Creates dependent control (white border)
CreateBackground	Creates dependent control (background)
CreateCaption	Creates dependent control (caption)
CreateButtonClose	Creates dependent control (close button)
CreateClientArea	Creates dependent control (client area)

© 2000-2025, MetaQuotes Ltd.

Create	
Dependent controls event handlers	
OnClickCaption	"ClickCaption" internal event handler
OnClickButtonClose	"ClickButtonClose" internal event handler
Access to client area properties	
ClientAreaVisible	Sets a value indicating whether the client area is visible
ClientAreaLeft	Gets X coordinate of the upper-left corner of the control client area
ClientAreaTop	Gets Y coordinate of the upper-left corner of the control client area
ClientAreaRight	Gets X coordinate of the lower-right corner of the control client area
ClientAreaBottom	Gets Y coordinate of the lower-right corner of the control client area
ClientAreaWidth	Gets the client area width
ClientAreaHeight	Gets the client area height
Drag event handlers	
OnDialogDragStart	"DialogDragStart" event handler (virtual)
OnDialogDragProcess	"DialogDragProcess" event handler (virtual)
OnDialogDragEnd	"DialogDragEnd" event handler (virtual)

Methods inherited from class CObject

Methods inherited from class CWnd

Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndContainer

Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide

© 2000-2025, MetaQuotes Ltd.

Create

Creates new CDialog control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Caption (Get method)

Gets the "Caption" property of the CDialog control.

```
string  MinValue()  const
```

Return Value

The "Caption" property.

Caption (Set method)

Sets the "Caption" property of the CDialog control.

```
bool  Caption(
   const string  text      // text
   )
```

Parameters

text

[in] New value of "Caption" property.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Add

Adds control to the client area by pointer.

```
bool  Add(
   CWnd   *control,         // pointer
   )
```

Parameters

control

[in] Pointer to control.

Return Value

true - successful, otherwise - false.

Add

Adds control to the client area by reference.

```
bool  Add(
   CWnd   &control,         // reference
   )
```

Parameters

control

[in] Reference to control.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateWhiteBorder

Creates dependent control (white border).

```
virtual bool  CreateWhiteBorder()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateBackground

Creates dependent control (background).

```
virtual bool  CreateBackground()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateCaption

Creates dependent control (caption).

```
virtual bool  CreateCaption()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateButtonClose

Creates dependent control (close button)

```
virtual bool  CreateButtonClose()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateClientArea

Creates dependent control (client area).

```
virtual bool  CreateClientArea()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickCaption

The virtual handler of the control "ClickCaption" internal event.

```
virtual bool  OnClickCaption()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

OnClickButtonClose

The virtual handler of the control "ClickButtonClose" internal event.

```
virtual bool  OnClickButtonClose()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ClientAreaVisible

Sets a flag indicating whether the client area is visible.

```
bool  ClientAreaVisible(
   const bool  visible      // visibility flag
   )
```

Parameters

visible

[in] Visibility flag.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ClientAreaLeft

Gets X coordinate of the upper-left corner of the control client area.

```
int  ClientAreaLeft()
```

Return Value

The X coordinate of the upper-left corner of the control client area.

© 2000-2025, MetaQuotes Ltd.

ClientAreaTop

Gets Y coordinate of the upper-left corner of the control client area.

```
int  ClientAreaTop()
```

Return Value

The Y coordinate of the upper-left corner of the control client area.

© 2000-2025, MetaQuotes Ltd.

ClientAreaRight

Gets X coordinate of the lower-right corner of the control client area.

```
int  ClientAreaTop()
```

Return Value

The X coordinate of the lower-right corner of the control client area.

© 2000-2025, MetaQuotes Ltd.

ClientAreaBottom

Gets Y coordinate of the lower-right corner of the control client area.

```
int  ClientAreaBottom()
```

Return Value

The Y coordinate of the lower-right corner of the control client area.

© 2000-2025, MetaQuotes Ltd.

ClientAreaWidth

Gets the width of the control client area.

```
int  ClientAreaWidth()
```

Return Value

The width of the client area.

© 2000-2025, MetaQuotes Ltd.

ClientAreaHeight

Gets the height of the control client area.

```
int  ClientAreaHeight()
```

Return Value

The height of the control client area.

© 2000-2025, MetaQuotes Ltd.

OnDialogDragStart

The virtual handler of the control "DialogDragStart" event.

```
virtual bool  OnDialogDragStart()
```

Return Value

true - event processed, otherwise - false.

Note

The "DialogDragStart" event occurs at start of the drag of the control.

© 2000-2025, MetaQuotes Ltd.

OnDialogDragProcess

The virtual handler of the control "DialogDragProcess" event.

```
virtual bool  OnDialogDragProcess()
```

Return Value

true - event processed, otherwise - false.

Note

The "DialogDragProcess" event occurs when the control is dragged.

© 2000-2025, MetaQuotes Ltd.

OnDialogDragEnd

The virtual handler of the control "DialogDragEnd" event.

```
virtual bool  OnDialogDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "DialogDragEnd" event occurs at the end of the drag of the control.

© 2000-2025, MetaQuotes Ltd.

CAppDialog

CAppDialog is a class of Application Dialog complex control (with dependent controls).

Description

CAppDialog class is intended to combine the controls with different functions in the group inside the MQL5 program.

Declaration

```
class CAppDialog : public CDialog
```

Title

```
#include <Controls\Dialog.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CDialog
        CAppDialog

Class Methods by Groups

Create and destroy	
Create	Creates control
Destroy	Destroys control
Events processing	
OnEvent	Event handler of all chart events
Run	
Run	Runs control
Chart events processing	
ChartEvent	Event handler of all chart events
Settings	
Minimized	Sets a value indicating whether the control is minimized
Save/Load	
IniFileSave	Saves the control state to file
IniFileLoad	Loads the control state from file
IniFileName	Sets the file name for loading/saving the control state

© 2000-2025, MetaQuotes Ltd.

Create and destroy	
IniFileExt	Sets the file extension for loading/saving the control state
Initialization	
CreateCommon	Common initialization method
CreateExpert	Initialization method for working in Expert Advisors
CreateIndicator	Initialization method for working in indicators
Dependent controls	
CreateButtonMinMax	Creates dependent controls (minimize/maximize buttons)
Dependent controls event handlers	
OnClickButtonClose	"ClickButtonClose" internal event handler (virtual)
OnClickButtonMinMax	"ClickButtonMinMax" internal event handler (virtual)
External events	
OnAnotherApplicationClose	Event handler of external events (virtual)
Methods	
Rebound	Sets new coordinates of the control using CRect class coordinates
Minimize	Shows the control in the minimized state
Maximize	Shows the control in the maximized (restored) state
CreateInstanceId	Creates a unique Id for the names of the control objects
ProgramName	Gets the name of MQL5 program, at which the control is used
SubwinOff	Get the Y offset of the control subwindow

Create

Creates new CAppDialog control.

```
virtual bool  Create(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

chart

[in] ID of the chart, at which the ontrol is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the ontrol is created.

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Destroy

CAppDialog control deinitialization method.

```
virtual void  Destroy(
   const int  reason=REASON_PROGRAM    // reason code
)
```

Parameters

reason

[in] Deinitialization reason code. REASON_PROGRAM is set by default.

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnEvent

Chart event handler.

```
virtual bool  OnEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Run

Runs control.

```
bool  Run()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

ChartEvent

Virtual handler of the control events.

```
virtual bool  ChartEvent(
   const int      id,          // ID
   const long&    lparam,      // parameter
   const double&  dparam,      // parameter
   const string&  sparam       // parameter
   )
```

Parameters

id

[in] Event ID.

lparam

[in] Event parameter of long type passed by reference.

dparam

[in] Event parameter of double type passed by reference.

sparam

[in] Event parameter of string type passed by reference.

Return Value

true - event processed, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Minimized

Sets the value of "Minimized" (window state) property of the control.

```
bool  Minimized(
   const bool  flag      // state
   )
```

Parameters

flag

[in] New state.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

IniFileSave

Saves the control state to file.

```
void  IniFileSave()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

IniFileLoad

Loads the control state from file.

```
void  IniFileLoad()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

IniFileName

Sets the file name for loading/saving the control state.

```
virtual string  IniFileName()  const
```

Return Value

File name for loading/saving of the control state.

Note

The file name includes the name of the Expert Advisor/indicator and working symbol, on which MQL5 program is launched.

© 2000-2025, MetaQuotes Ltd.

IniFileExt

Sets the file extension for loading/saving the control state.

```
virtual string  IniFileExt()  const
```

Return Value

File extension used for loading/saving of the control state.

© 2000-2025, MetaQuotes Ltd.

CreateCommon

Common initialization method.

```
bool  CreateCommon(
   const long     chart,       // chart ID
   const string   name,        // name
   const int      subwin,      // chart subwindow
   )
```

Parameters

chart

[in] ID of the chart, at which the control is created.

name

[in] Unique name of the control.

subwin

[in] Subwindow of the chart, at which the control is created.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateExpert

Initialization method for working in Expert Advisors.

```
bool  CreateExpert(
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateIndicator

Initialization method for working in indicators.

```
bool  CreateIndicator(
   const int      x1,          // coordinate
   const int      y1,          // coordinate
   const int      x2,          // coordinate
   const int      y2           // coordinate
   )
```

Parameters

x1

[in] X coordinate of the upper left corner.

y1

[in] Y coordinate of the upper left corner.

x2

[in] X coordinate of the lower right corner.

y2

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateButtonMinMax

Creates dependent controls (minimize/maximize buttons).

```
virtual void  CreateButtonMinMax()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnClickButtonClose

The virtual handler of the control "ClickButtonClose" (mouse click on close button) internal event.

```
virtual void  OnClickButtonClose()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnClickButtonMinMax

The virtual handler of the control "ClickButtonMinMax" (mouse click on minimize/maximize button) internal event.

```
virtual void  OnClickButtonClose()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

OnAnotherApplicationClose

The virtual handler of the control external events.

```
virtual void  OnAnotherApplicationClose()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Rebound

Sets new coordinates of the control using CRect class coordinates.

```
bool  Rebound(
   const & CRect  rect      // CRect class
   )
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Minimize

Shows the control window in the minimized state.

```
virtual void  Minimize()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

Maximize

Shows the control window in the maximized (restored) state.

```
virtual void  Maximize()
```

Return Value

true - successful, otherwise - false.

© 2000-2025, MetaQuotes Ltd.

CreateInstanceId

Creates a unique prefix for the names of the control objects.

```
string  CreateInstanceId()
```

Return Value

Prefix for the object names.

© 2000-2025, MetaQuotes Ltd.

ProgramName

Gets the name of the MQL5 program, at which the control is used.

```
string  ProgramName()
```

Return Value

Name of the MQL5 program.

© 2000-2025, MetaQuotes Ltd.

SubwinOff

Gets the Y offset of the control subwindow.

```
void  SubwinOff()
```

Return Value

None.

© 2000-2025, MetaQuotes Ltd.

Moving from MQL4 to MQL5

MQL5 is the evolution of its predecessor - the MQL4 programming language, in which numerous indicators, scripts, and Expert Advisors were written. Despite the fact that the new programming language is maximally compatible with the previous-generation language, there are still some differences between these languages. And when transferring programs these differences should be noted.

This section contains information intended to facilitate the adaptation of codes to the new MQL5 language for programmers who know MQL4.

First it should be noted:

- The new language does not contain functions start(), init() and deinit().
- No limit for the number of indicator buffers.
- DLLs are loaded immediately after loading an Expert Advisor (or any other mql5 program).
- Check of logical conditions is shortened.
- When limits of an array are exceeded, the current performance is terminated (critically - with the output of an errors).
- Precedence of operators like in C + +.
- The language offers the implicit type cast (even from string to a number).
- Local variables are not initialized automatically (except for strings).
- Common local arrays are automatically deleted.

Special Functions init, start and deinit

The MQL4 language contained only three predefined functions that could be used in the indicator, script or Expert Advisor (not taking into account the include files *.mqh and library files). In MQL5 there are no such functions, but there are their analogues. The table shows the approximate correspondence of functions.

MQL4	MQL5
init	OnInit
start	OnStart
deinit	OnDeinit

Functions OnInit and OnDeinit perform the same role as init and deinit in MQL4 - they are designed to locate the code, which must be performed during initialization and deinitialization of mql5 programs. You can either just rename these functions accordingly, or leave them as they are, but add calls of these functions in corresponding places.

Example:

```
void OnInit()
  {
//--- Call function upon initialization
   init();
```

© 2000-2025, MetaQuotes Ltd.

```
  }
void OnDeinit(const int reason)
  {
//--- Call function upon deinitialization
   deinit();
//---
  }
```

The start function is replaced by OnStart only in scripts. In Expert Advisors and indicators it should be renamed to OnTick and OnCalculate, respectively. The code that is to be executed during a mql5 program operation should be located in these three functions:

mql5-program	main function
script	OnStart
indicator	OnCalculate
Expert Advisor	OnTick

If the indicator or script code does not contain the main function, or the function name differs from the required one, the call of this function is not performed. It means, if the source code of a script doesn't contain OnStart, such a code will be compiled as an Expert Advisor.

If an indicator code doesn't contain the OnCalculate function, the compilation of such an indicator is impossible.

Predefined Variables

In MQL5 there are no such predefined variables as Ask, Bid, Bars. Variables Point and Digits have a slightly different spelling:

MQL4	MQL5
Digits	_Digits

Access to Timeseries

In MQL5 there are no such predefined timeseries as Open[], High[], Low[], Close[], Volume[] and Time[]. The necessary depth of a timeseries can now be set using corresponding functions to access timeseries.

© 2000-2025, MetaQuotes Ltd.

Expert Advisors

Expert Advisors in MQL5 do not require the obligatory presence of functions that handle the events of a new tick receipt - OnTick, as it was in MQL4 (the start function in MQL4 is executed when a new tick is received). In MQL5 Expert Advisors can contain pre-defined handler functions of several types of events:

- OnTick – receipt of a new tick;
- OnTimer – timer event;
- OnTrade - trade event;
- OnChartEvent – events of input from the keyboard and mouse, events of a graphic object moving, event of a text editing completion in the entry field of the LabelEdit object;
- OnBookEvent – event of Depth of Market status change.

Custom Indicators

In MQL4, the number of indicator buffers is limited and can't exceed 8. In MQL5 there are no such limitations, but it should be remembered that each indicator buffer requires allocation of a certain part of memory for its location in the terminal, so the new possibility should not be abused.

MQL4 offered only 6 types of custom indicator plotting; while MQL5 now offers 18 drawing styles. The names of drawing types haven't changed, but the ideology of the graphical representation of indicators has changed significantly.

The direction of indexing in indicator buffers also differs. By default, in MQL5 all the indicator buffers have the behavior of common arrays, i.e. 0 indexed element is the oldest one in the history, and as the index increases, we move from the oldest data to the most recent ones.

The only function for working with custom indicators that was preserved from MQL4 is SetIndexBuffer. But its call has changed; now you should specify type of data to be stored in an array, linked to the indicator buffer.

Properties of custom indicators also have changed and expanded. New functions for accessing timeseries have been added, so the total calculation algorithm must be reconsidered.

Graphical Objects

The number of graphical objects in MQL5 has been significantly increased. Besides, graphical objects can now be positioned in time with the accuracy of a second in a chart of any timeframe - now object anchor points are not rounded off to the bar opening time in the current price chart.

For the Arrow, Text and Label objects now you can specify binding methods, and for the Label, Button, Chart, Bitmap Label and Edit objects you can set chart corner to which an object is attached.

List of MQL5 Functions

All MQL5 functions in alphabetical order.

Function	Action	Section
AccountInfoDouble	Returns a value of double type of the corresponding account property	Account Information
AccountInfoInteger	Returns a value of integer type (bool, int or long) of the corresponding account property	Account Information
AccountInfoString	Returns a value string type corresponding account property	Account Information
acos	Returns the arc cosine of x in radians	Math Functions
Alert	Displays a message in a separate window	Common Functions
ArrayBsearch	Searches for a specified value in a multidimensional numeric array sorted ascending	Array Functions
ArrayCompare	Returns the result of comparing two arrays of simple types or custom structures without complex objects	Array Functions
ArrayCopy	Copies one array into another	Array Functions
ArrayFill	Fills an array with the specified value	Array Functions
ArrayFree	Frees up buffer of any dynamic array and sets the size of the zero dimension in 0.	Array Functions
ArrayGetAsSeries	Checks direction of array indexing	Array Functions
ArrayInitialize	Sets all elements of a numeric array into a single value	Array Functions
ArrayIsDynamic	Checks whether an array is dynamic	Array Functions
ArrayIsSeries	Checks whether an array is a timeseries	Array Functions
ArrayMaximum	Searches for the largest element in the first dimension of a multidimensional numeric array	Array Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
ArrayMinimum	Searches for the lowest element in the first dimension of a multidimensional numeric array	Array Functions
ArrayRange	Returns the number of elements in the specified dimension of the array	Array Functions
ArrayResize	Sets the new size in the first dimension of the array	Array Functions
ArraySetAsSeries	Sets the direction of array indexing	Array Functions
ArraySize	Returns the number of elements in the array	Array Functions
ArraySort	Sorting of numeric arrays by the first dimension	Array Functions
ArrayPrint	Prints an array of a simple type or a simple structure into journal	Array Functions
ArrayInsert	Inserts the specified number of elements from a source array to a receiving one starting from a specified index	Array Functions
ArrayRemove	Removes the specified number of elements from the array starting with a specified index	Array Functions
ArrayReverse	Reverses the specified number of elements in the array starting with a specified index	Array Functions
ArraySwap	Swaps the contents of two dynamic arrays of the same type	Array Functions
asin	Returns the arc sine of x in radians	Math Functions
atan	Returns the arc tangent of x in radians	Math Functions
Bars	Returns the number of bars the history for a specified symbol and period	Timeseries and Indicators Access
BarsCalculated	Returns the number of calculated data in an indicator buffer or -1 in the case of error (data hasn't been calculated yet)	Timeseries and Indicators Access

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
CalendarCountryById	Get a country description by its ID	Economic Calendar
CalendarEventById	Get an event description by its ID	Economic Calendar
CalendarValueById	Get an event value description by its ID	Economic Calendar
CalendarCountries	Get the array of country names available in the calendar	Economic Calendar
CalendarEventByCountry	Get the array of descriptions of all events available in the calendar by a specified country code	Economic Calendar
CalendarEventByCurrency	Get the array of descriptions of all events available in the calendar by a specified currency	Economic Calendar
CalendarValueHistoryByEvent	Get the array of values for all events in a specified time range by an event ID	Economic Calendar
CalendarValueHistory	Get the array of values for all events in a specified time range with the ability to sort by country and/or currency	Economic Calendar
CalendarValueLastByEvent	Get the array of event values by its ID since the calendar database status with a specified change_id	Economic Calendar
CalendarValueLast	Get the array of values for all events with the ability to sort by country and/or currency since the calendar database status with a specified change_id	Economic Calendar
ceil	Returns integer numeric value closest from above	Math Functions
CharArrayToString	Converting symbol code (ansi) into one-symbol array	Conversion Functions
ChartApplyTemplate	Applies a specific template from a specified file to the chart	Chart Operations
ChartClose	Closes the specified chart	Chart Operations
ChartFirst	Returns the ID of the first chart of the client terminal	Chart Operations

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
ChartGetDouble	Returns the double value property of the specified chart	Chart Operations
ChartGetInteger	Returns the integer value property of the specified chart	Chart Operations
ChartGetString	Returns the string value property of the specified chart	Chart Operations
ChartID	Returns the ID of the current chart	Chart Operations
ChartIndicatorAdd	Adds an indicator with the specified handle into a specified chart window	Chart Operations
ChartIndicatorDelete	Removes an indicator with a specified name from the specified chart window	Chart Operations
ChartIndicatorGet	Returns the handle of the indicator with the specified short name in the specified chart window	Chart Operations
ChartIndicatorName	Returns the short name of the indicator by the number in the indicators list on the specified chart window	Chart Operations
ChartIndicatorsTotal	Returns the number of all indicators applied to the specified chart window.	Chart Operations
ChartNavigate	Performs shift of the specified chart by the specified number of bars relative to the specified position in the chart	Chart Operations
ChartNext	Returns the chart ID of the chart next to the specified one	Chart Operations
ChartOpen	Opens a new chart with the specified symbol and period	Chart Operations
CharToString	Converting a symbol code into a one-character string	Conversion Functions
ChartPeriod	Returns the period value of the specified chart	Chart Operations
ChartPriceOnDropped	Returns the price coordinate of the chart point, the Expert	Chart Operations

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
	Advisor or script has been dropped to	
ChartRedraw	Calls a forced redrawing of a specified chart	Chart Operations
ChartSaveTemplate	Saves current chart settings in a template with a specified name	Chart Operations
ChartScreenShot	Provides a screenshot of the chart of its current state in a GIF, PNG or BMP format depending on specified extension	Chart Operations
ChartSetDouble	Sets the double value for a corresponding property of the specified chart	Chart Operations
ChartSetInteger	Sets the integer value (datetime, int, color, bool or char) for a corresponding property of the specified chart	Chart Operations
ChartSetString	Sets the string value for a corresponding property of the specified chart	Chart Operations
ChartSetSymbolPeriod	Changes the symbol value and a period of the specified chart	Chart Operations
ChartSymbol	Returns the symbol name of the specified chart	Chart Operations
ChartTimeOnDropped	Returns the time coordinate of the chart point, the Expert Advisor or script has been dropped to	Chart Operations
ChartTimePriceToXY	Converts the coordinates of a chart from the time/price representation to the X and Y coordinates	Chart Operations
ChartWindowFind	Returns the number of a subwindow where an indicator is drawn	Chart Operations
ChartWindowOnDropped	Returns the number (index) of the chart subwindow, the Expert Advisor or script has been dropped to	Chart Operations

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
ChartXOnDropped	Returns the X coordinate of the chart point, the Expert Advisor or script has been dropped to	Chart Operations
ChartXYToTimePrice	Converts the X and Y coordinates on a chart to the time and price values	Chart Operations
ChartYOnDropped	Returns the Y coordinate of the chart point, the Expert Advisor or script has been dropped to	Chart Operations
CheckPointer	Returns the type of the object pointer	Common Functions
CLBufferCreate	Creates an OpenCL buffer	Working with OpenCL
CLBufferFree	Deletes an OpenCL buffer	Working with OpenCL
CLBufferRead	Reads an OpenCL buffer into an array	Working with OpenCL
CLBufferWrite	Writes an array into an OpenCL buffer	Working with OpenCL
CLContextCreate	Creates an OpenCL context	Working with OpenCL
CLContextFree	Removes an OpenCL context	Working with OpenCL
CLExecute	Runs an OpenCL program	Working with OpenCL
CLGetDeviceInfo	Receives device property from OpenCL driver	Working with OpenCL
CLGetInfoInteger	Returns the value of an integer property for an OpenCL object or device	Working with OpenCL
CLHandleType	Returns the type of an OpenCL handle as a value of the ENUM_OPENCL_HANDLE_TYPE enumeration	Working with OpenCL
CLKernelCreate	Creates an OpenCL start function	Working with OpenCL
CLKernelFree	Removes an OpenCL start function	Working with OpenCL
CLProgramCreate	Creates an OpenCL program from a source code	Working with OpenCL
CLProgramFree	Removes an OpenCL program	Working with OpenCL
CLSetKernelArg	Sets a parameter for the OpenCL function	Working with OpenCL

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
CLSetKernelArgMem	Sets an OpenCL buffer as a parameter of the OpenCL function	Working with OpenCL
ColorToARGB	Converting color type to uint type to receive ARGB representation of the color.	Conversion Functions
ColorToString	Converting color value into string as "R,G,B"	Conversion Functions
Comment	Outputs a comment in the left top corner of the chart	Common Functions
CopyBuffer	Gets data of a specified buffer from a specified indicator into an array	Timeseries and Indicators Access
CopyClose	Gets history data on bar closing price for a specified symbol and period into an array	Timeseries and Indicators Access
CopyHigh	Gets history data on maximal bar price for a specified symbol and period into an array	Timeseries and Indicators Access
CopyLow	Gets history data on minimal bar price for a specified symbol and period into an array	Timeseries and Indicators Access
CopyOpen	Gets history data on bar opening price for a specified symbol and period into an array	Timeseries and Indicators Access
CopyRates	Gets history data of the Rates structure for a specified symbol and period into an array	Timeseries and Indicators Access
CopyRealVolume	Gets history data on trade volumes for a specified symbol and period into an array	Timeseries and Indicators Access
CopySpread	Gets history data on spreads for a specified symbol and period into an array	Timeseries and Indicators Access
CopyTicks	Gets ticks accumulated by the terminal for the current working session into an array	Timeseries and Indicators Access
CopyTickVolume	Gets history data on tick volumes for a specified symbol and period into an array	Timeseries and Indicators Access

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
CopyTime	Gets history data on bar opening time for a specified symbol and period into an array	Timeseries and Indicators Access
cos	Returns the cosine of a number	Math Functions
CryptDecode	Performs the inverse transformation of the data from array	Common Functions
CryptEncode	Transforms the data from array with the specified method	Common Functions
CustomSymbolCreate	Create a custom symbol with the specified name in the specified group	Custom Symbols
CustomSymbolDelete	Delete a custom symbol with the specified name	Custom Symbols
CustomSymbolSetInteger	Set the integer type property value for a custom symbol	Custom Symbols
CustomSymbolSetDouble	Set the real type property value for a custom symbol	Custom Symbols
CustomSymbolSetString	Set the string type property value for a custom symbol	Custom Symbols
CustomSymbolSetMarginRate	Set the margin rates depending on the order type and direction for a custom symbol	Custom Symbols
CustomSymbolSetSessionQuote	Set the start and end time of the specified quotation session for the specified symbol and week day	Custom Symbols
CustomSymbolSetSessionTrade	Set the start and end time of the specified trading session for the specified symbol and week day	Custom Symbols
CustomRatesDelete	Delete all bars from the price history of the custom symbol in the specified time interval	Custom Symbols
CustomRatesReplace	Fully replace the price history of the custom symbol within the specified time interval with the data from the MqlRates type array	Custom Symbols

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
CustomRatesUpdate	Add missing bars to the custom symbol history and replace existing data with the ones from the MqlRates type array	Custom Symbols
CustomTicksAdd	Adds data from an array of the MqlTick type to the price history of a custom symbol. The custom symbol must be selected in the Market Watch window	Custom Symbols
CustomTicksDelete	Delete all ticks from the price history of the custom symbol in the specified time interval	Custom Symbols
CustomTicksReplace	Fully replace the price history of the custom symbol within the specified time interval with the data from the MqlTick type array	Custom Symbols
CustomBookAdd	Passes the status of the Depth of Market for a custom symbol	Custom Symbols
DatabaseOpen	Opens or creates a database in a specified file	Working with databases
DatabaseClose	Closes a database	Working with databases
DatabaseImport	Imports data from a file into a table	Working with databases
DatabaseExport	Exports a table or an SQL request execution result to a CSV file	Working with databases
DatabasePrint	Prints a table or an SQL request execution result in the Experts journal	Working with databases
DatabaseTableExists	Checks the presence of the table in a database	Working with databases
DatabaseExecute	Executes a request to a specified database	Working with databases
DatabasePrepare	Creates a handle of a request, which can then be executed using DatabaseRead()	Working with databases
DatabaseReset	Resets a request, like after calling DatabasePrepare()	Working with databases

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
DatabaseBind	Sets a parameter value in a request	Working with databases
DatabaseBindArray	Sets an array as a parameter value	Working with databases
DatabaseRead	Moves to the next entry as a result of a request	Working with databases
DatabaseReadBind	Moves to the next record and reads data into the structure from it	Working with databases
DatabaseFinalize	Removes a request created in DatabasePrepare()	Working with databases
DatabaseTransactionBegin	Starts transaction execution	Working with databases
DatabaseTransactionCommit	Completes transaction execution	Working with databases
DatabaseTransactionRollback	Rolls back transactions	Working with databases
DatabaseColumnsCount	Gets the number of fields in a request	Working with databases
DatabaseColumnName	Gets a field name by index	Working with databases
DatabaseColumnType	Gets a field type by index	Working with databases
DatabaseColumnSize	Gets a field size in bytes	Working with databases
DatabaseColumnText	Gets a field value as a string from the current record	Working with databases
DatabaseColumnInteger	Gets the int type value from the current record	Working with databases
DatabaseColumnLong	Gets the long type value from the current record	Working with databases
DatabaseColumnDouble	Gets the double type value from the current record	Working with databases
DatabaseColumnBlob	Gets a field value as an array from the current record	Working with databases
DebugBreak	Program breakpoint in debugging	Common Functions
Digits	Returns the number of decimal digits determining the accuracy of the price value of the current chart symbol	Checkup
DoubleToString	Converting a numeric value to a text line with a specified	Conversion Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
	accuracy	
DXContextCreate	Creates a graphic context for rendering frames of a specified size	Working with DirectX
DXContextSetSize	Changes a frame size of a graphic context created in DXContextCreate()	Working with DirectX
DXContextSetSize	Gets a frame size of a graphic context created in DXContextCreate()	Working with DirectX
DXContextClearColors	Sets a specified color to all pixels for the rendering buffer	Working with DirectX
DXContextClearDepth	Clears the depth buffer	Working with DirectX
DXContextGetColors	Gets an image of a specified size and offset from a graphic context	Working with DirectX
DXContextGetDepth	Gets the depth buffer of a rendered frame	Working with DirectX
DXBufferCreate	Creates a buffer of a specified type based on a data array	Working with DirectX
DXTextureCreate	Creates a 2D texture out of a rectangle of a specified size cut from a passed image	Working with DirectX
DXInputCreate	Creates shader inputs	Working with DirectX
DXInputSet	Sets shader inputs	Working with DirectX
DXShaderCreate	Creates a shader of a specified type	Working with DirectX
DXShaderSetLayout	Sets vertex layout for the vertex shader	Working with DirectX
DXShaderInputsSet	Sets shader inputs	Working with DirectX
DXShaderTexturesSet	Sets shader textures	Working with DirectX
DXDraw	Renders the vertices of the vertex buffer set in DXBufferSet()	Working with DirectX
DXDrawIndexed	Renders graphic primitives described by the index buffer from DXBufferSet()	Working with DirectX

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
DXPrimiveTopologySet	Sets the type of primitives for rendering using DXDrawIndexed()	Working with DirectX
DXBufferSet	Sets a buffer for the current rendering	Working with DirectX
DXShaderSet	Sets a shader for rendering	Working with DirectX
DXHandleType	Returns a handle type	Working with DirectX
DXRelease	Releases a handle	Working with DirectX
EnumToString	Converting an enumeration value of any type to string	Conversion Functions
EventChartCustom	Generates a custom event for the specified chart	Working with Events
EventKillTimer	Stops the generation of events by the timer in the current chart	Working with Events
EventSetMillisecondTimer	Launches event generator of the high-resolution timer with a period less than 1 second for the current chart	Working with Events
EventSetTimer	Starts the timer event generator with the specified periodicity for the current chart	Working with Events
exp	Returns exponent of a number	Math Functions
ExpertRemove	Stops Expert Advisor and unloads it from the chart	Common Functions
fabs	Returns absolute value (modulus) of the specified numeric value	Math Functions
FileClose	Closes a previously opened file	File Functions
FileCopy	Copies the original file from a local or shared folder to another file	File Functions
FileDelete	Deletes a specified file	File Functions
FileFindClose	Closes search handle	File Functions
FileFindFirst	Starts the search of files in a directory in accordance with the specified filter	File Functions
FileFindNext	Continues the search started by the FileFindFirst() function	File Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
FileFlush	Writes to a disk all data remaining in the input/output file buffer	File Functions
FileGetInteger	Gets an integer property of a file	File Functions
FileIsEnding	Defines the end of a file in the process of reading	File Functions
FileIsExist	Checks the existence of a file	File Functions
FileIsLineEnding	Defines the end of a line in a text file in the process of reading	File Functions
FileMove	Moves or renames a file	File Functions
FileOpen	Opens a file with a specified name and flag	File Functions
FileReadArray	Reads arrays of any type except for string from the file of the BIN type	File Functions
FileReadBool	Reads from the file of the CSV type a string from the current position till a delimiter (or till the end of a text line) and converts the read string to a value of bool type	File Functions
FileReadDatetime	Reads from the file of the CSV type a string of one of the formats: "YYYY.MM.DD HH:MM:SS", "YYYY.MM.DD" or "HH:MM:SS" - and converts it into a datetime value	File Functions
FileReadDouble	Reads a double value from the current position of the file pointer	File Functions
FileReadFloat	Reads a float value from the current position of the file pointer	File Functions
FileReadInteger	Reads int, short or char value from the current position of the file pointer	File Functions
FileReadLong	Reads a long type value from the current position of the file pointer	File Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
FileReadNumber	Reads from the file of the CSV type a string from the current position till a delimiter (or til the end of a text line) and converts the read string into double value	File Functions
FileReadString	Reads a string from the current position of a file pointer from a file	File Functions
FileReadStruct	Reads the contents from a binary file into a structure passed as a parameter, from the current position of the file pointer	File Functions
FileSeek	Moves the position of the file pointer by a specified number of bytes relative to the specified position	File Functions
FileSize	Returns the size of a corresponding open file	File Functions
FileTell	Returns the current position of the file pointer of a corresponding open file	File Functions
FileWrite	Writes data to a file of CSV or TXT type	File Functions
FileWriteArray	Writes arrays of any type except for string into a file of BIN type	File Functions
FileWriteDouble	Writes value of the double type from the current position of a file pointer into a binary file	File Functions
FileWriteFloat	Writes value of the float type from the current position of a file pointer into a binary file	File Functions
FileWriteInteger	Writes value of the int type from the current position of a file pointer into a binary file	File Functions
FileWriteLong	Writes value of the long type from the current position of a file pointer into a binary file	File Functions
FileWriteString	Writes the value of a string parameter into a BIN or TXT file	File Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
	starting from the current position of the file pointer	
FileWriteStruct	Writes the contents of a structure passed as a parameter into a binary file, starting from the current position of the file pointer	File Functions
floor	Returns integer numeric value closest from below	Math Functions
fmax	Returns the maximal value of the two numeric values	Math Functions
fmin	Returns the minimal value of the two numeric values	Math Functions
fmod	Returns the real remainder after the division of two numbers	Math Functions
FolderClean	Deletes all files in the specified folder	File Functions
FolderCreate	Creates a folder in the Files directory	File Functions
FolderDelete	Removes a selected directory. If the folder is not empty, then it can't be removed	File Functions
FrameAdd	Adds a frame with data	Working with Optimization Results
FrameFilter	Sets the frame reading filter and moves the pointer to the beginning	Working with Optimization Results
FrameFirst	Moves a pointer of frame reading to the beginning and resets the previously set filter	Working with Optimization Results
FrameInputs	Receives input parameters, on which the frame is formed	Working with Optimization Results
FrameNext	Reads a frame and moves the pointer to the next one	Working with Optimization Results
GetLastError	Returns the last error	Checkup
GetPointer	Returns the object pointer	Common Functions
GetTickCount	Returns the number of milliseconds that have elapsed since the system was started	Common Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
GlobalVariableCheck	Checks the existence of a global variable with the specified name	Global Variables of the Terminal
GlobalVariableDel	Deletes a global variable	Global Variables of the Terminal
GlobalVariableGet	Returns the value of a global variable	Global Variables of the Terminal
GlobalVariableName	Returns the name of a global variable by its ordinal number in the list of global variables	Global Variables of the Terminal
GlobalVariablesDeleteAll	Deletes global variables with the specified prefix in their names	Global Variables of the Terminal
GlobalVariableSet	Sets the new value to a global variable	Global Variables of the Terminal
GlobalVariableSetOnCondition	Sets the new value of the existing global variable by condition	Global Variables of the Terminal
GlobalVariablesFlush	Forcibly saves contents of all global variables to a disk	Global Variables of the Terminal
GlobalVariablesTotal	Returns the total number of global variables	Global Variables of the Terminal
GlobalVariableTemp	Sets the new value to a global variable, that exists only in the current session of the terminal	Global Variables of the Terminal
GlobalVariableTime	Returns time of the last accessing the global variable	Global Variables of the Terminal
HistoryDealGetDouble	Returns the requested property of a deal in the history (double)	Trade Functions
HistoryDealGetInteger	Returns the requested property of a deal in the history (datetime or int)	Trade Functions
HistoryDealGetString	Returns the requested property of a deal in the history (string)	Trade Functions
HistoryDealGetTicket	Returns a ticket of a corresponding deal in the history	Trade Functions
HistoryDealSelect	Selects a deal in the history for further calling it through appropriate functions	Trade Functions
HistoryDealsTotal	Returns the number of deals in the history	Trade Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
HistoryOrderGetDouble	Returns the requested property of an order in the history (double)	Trade Functions
HistoryOrderGetInteger	Returns the requested property of an order in the history (datetime or int)	Trade Functions
HistoryOrderGetString	Returns the requested property of an order in the history (string)	Trade Functions
HistoryOrderGetTicket	Return order ticket of a corresponding order in the history	Trade Functions
HistoryOrderSelect	Selects an order in the history for further working with it	Trade Functions
HistoryOrdersTotal	Returns the number of orders in the history	Trade Functions
HistorySelect	Retrieves the history of transactions and orders for the specified period of the server time	Trade Functions
HistorySelectByPosition	Requests the history of deals with a specified position identifier.	Trade Functions
iBars	Returns the number of bars of a corresponding symbol and period, available in history	Timeseries and Indicators Access
iBarShift	Returns the index of the bar corresponding to the specified time	Timeseries and Indicators Access
iClose	Returns the Close price of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iHigh	Returns the High price of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iHighest	Returns the index of the highest value found on the corresponding chart (shift relative to the current bar)	Timeseries and Indicators Access

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
iLow	Returns the Low price of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iLowest	Returns the index of the smallest value found on the corresponding chart (shift relative to the current bar)	Timeseries and Indicators Access
iOpen	Returns the Open price of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iTime	Returns the opening time of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iTickVolume	Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iRealVolume	Returns the real volume of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iVolume	Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iSpread	Returns the spread value of the bar (indicated by the 'shift' parameter) on the corresponding chart	Timeseries and Indicators Access
iAD	Accumulation/Distribution	Technical Indicators
iADX	Average Directional Index	Technical Indicators
iADXWilder	Average Directional Index by Welles Wilder	Technical Indicators
iAlligator	Alligator	Technical Indicators
iAMA	Adaptive Moving Average	Technical Indicators
iAO	Awesome Oscillator	Technical Indicators
iATR	Average True Range	Technical Indicators

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
iBands	Bollinger Bands®	Technical Indicators
iBearsPower	Bears Power	Technical Indicators
iBullsPower	Bulls Power	Technical Indicators
iBWMFI	Market Facilitation Index by Bill Williams	Technical Indicators
iCCI	Commodity Channel Index	Technical Indicators
iChaikin	Chaikin Oscillator	Technical Indicators
iCustom	Custom indicator	Technical Indicators
iDEMA	Double Exponential Moving Average	Technical Indicators
iDeMarker	DeMarker	Technical Indicators
iEnvelopes	Envelopes	Technical Indicators
iForce	Force Index	Technical Indicators
iFractals	Fractals	Technical Indicators
iFrAMA	Fractal Adaptive Moving Average	Technical Indicators
iGator	Gator Oscillator	Technical Indicators
iIchimoku	Ichimoku Kinko Hyo	Technical Indicators
iMA	Moving Average	Technical Indicators
iMACD	Moving Averages Convergence-Divergence	Technical Indicators
iMFI	Money Flow Index	Technical Indicators
iMomentum	Momentum	Technical Indicators
IndicatorCreate	Returns the handle to the specified technical indicator created by an array of MqlParam type parameters	Timeseries and Indicators Access
IndicatorParameters	Based on the specified handle, returns the number of input parameters of the indicator, as well as the values and types of the parameters	Timeseries and Indicators Access
IndicatorRelease	Removes an indicator handle and releases the calculation block of the indicator, if it's not used by anyone else	Timeseries and Indicators Access

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
IndicatorSetDouble	Sets the value of an indicator property of the double type	Custom Indicators
IndicatorSetInteger	Sets the value of an indicator property of the int type	Custom Indicators
IndicatorSetString	Sets the value of an indicator property of the string type	Custom Indicators
IntegerToString	Converting int into a string of preset length	Conversion Functions
iOBV	On Balance Volume	Technical Indicators
iOsMA	Moving Average of Oscillator (MACD histogram)	Technical Indicators
iRSI	Relative Strength Index	Technical Indicators
iRVI	Relative Vigor Index	Technical Indicators
iSAR	Parabolic Stop And Reverse System	Technical Indicators
IsStopped	Returns true, if an mql5 program has been commanded to stop its operation	Checkup
iStdDev	Standard Deviation	Technical Indicators
iStochastic	Stochastic Oscillator	Technical Indicators
iTEMA	Triple Exponential Moving Average	Technical Indicators
iTriX	Triple Exponential Moving Averages Oscillator	Technical Indicators
iVIDyA	Variable Index Dynamic Average	Technical Indicators
iVolumes	Volumes	Technical Indicators
iWPR	Williams' Percent Range	Technical Indicators
log	Returns natural logarithm	Math Functions
log10	Returns the logarithm of a number by base 10	Math Functions
MarketBookAdd	Provides opening of Depth of Market for a selected symbol, and subscribes for receiving notifications of the DOM changes	Market Info

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
MarketBookGet	Returns a structure array MqlBookInfo containing records of the Depth of Market of a specified symbol	Market Info
MarketBookRelease	Provides closing of Depth of Market for a selected symbol, and cancels the subscription for receiving notifications of the DOM changes	Market Info
MathAbs	Returns absolute value (modulus) of the specified numeric value	Math Functions
MathArccos	Returns the arc cosine of x in radians	Math Functions
MathArcsin	Returns the arc sine of x in radians	Math Functions
MathArctan	Returns the arc tangent of x in radians	Math Functions
MathCeil	Returns integer numeric value closest from above	Math Functions
MathCos	Returns the cosine of a number	Math Functions
MathExp	Returns exponent of a number	Math Functions
MathFloor	Returns integer numeric value closest from below	Math Functions
MathIsValidNumber	Checks the correctness of a real number	Math Functions
MathLog	Returns natural logarithm	Math Functions
MathLog10	Returns the logarithm of a number by base 10	Math Functions
MathMax	Returns the maximal value of the two numeric values	Math Functions
MathMin	Returns the minimal value of the two numeric values	Math Functions
MathMod	Returns the real remainder after the division of two numbers	Math Functions
MathPow	Raises the base to the specified power	Math Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
MathRand	Returns a pseudorandom value within the range of 0 to 32767	Math Functions
MathRound	Rounds of a value to the nearest integer	Math Functions
MathSin	Returns the sine of a number	Math Functions
MathSqrt	Returns a square root	Math Functions
MathSrand	Sets the starting point for generating a series of pseudorandom integers	Math Functions
MathTan	Returns the tangent of a number	Math Functions
MessageBox	Creates, displays a message box and manages it	Common Functions
MQLInfoInteger	Returns an integer value of a corresponding property of a running mql5 program	Checkup
MQLInfoString	Returns a string value of a corresponding property of a running mql5 program	Checkup
MT5Initialize	Establish a connection with the MetaTrader 5 terminal	MetaTrader for Python
MT5Shutdown	Close the previously established connection to the MetaTrader 5 terminal	MetaTrader for Python
MT5TerminalInfo	Get status and parameters of the connected MetaTrader 5 terminal	MetaTrader for Python
MT5Version	Return the MetaTrader 5 terminal version	MetaTrader for Python
MT5CopyRatesFrom	Get bars from the MetaTrader 5 terminal starting from the specified date	MetaTrader for Python
MT5CopyRatesFromPos	Get bars from the MetaTrader 5 terminal starting from the specified index	MetaTrader for Python
MT5CopyRatesRange	Get bars in the specified date range from the MetaTrader 5 terminal	MetaTrader for Python
MT5CopyTicksFrom	Get ticks from the MetaTrader 5 terminal starting from the	MetaTrader for Python

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
	specified date	
MT5CopyTicksRange	Get ticks for the specified date range from the MetaTrader 5 terminal	MetaTrader for Python
NormalizeDouble	Rounding of a floating point number to a specified accuracy	Conversion Functions
ObjectCreate	Creates an object of the specified type in a specified chart	Object Functions
ObjectDelete	Removes the object with the specified name from the specified chart (from the specified chart subwindow)	Object Functions
ObjectFind	Searches for an object with the specified ID by the name	Object Functions
ObjectGetDouble	Returns the double value of the corresponding object property	Object Functions
ObjectGetInteger	Returns the integer value of the corresponding object property	Object Functions
ObjectGetString	Returns the string value of the corresponding object property	Object Functions
ObjectGetTimeByValue	Returns the time value for the specified object price value	Object Functions
ObjectGetValueByTime	Returns the price value of an object for the specified time	Object Functions
ObjectMove	Changes the coordinates of the specified object anchor point	Object Functions
ObjectName	Returns the name of an object of the corresponding type in the specified chart (specified chart subwindow)	Object Functions
ObjectsDeleteAll	Removes all objects of the specified type from the specified chart (from the specified chart subwindow)	Object Functions
ObjectSetDouble	Sets the value of the corresponding object property	Object Functions
ObjectSetInteger	Sets the value of the corresponding object property	Object Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
ObjectSetString	Sets the value of the corresponding object property	Object Functions
ObjectsTotal	Returns the number of objects of the specified type in the specified chart (specified chart subwindow)	Object Functions
OnStart	The function is called when the Start event occurs to perform actions set in the script	Event Handling
OnInit	The function is called in indicators and EAs when the Init event occurs to initialize a launched MQL5 program	Event Handling
OnDeinit	The function is called in indicators and EAs when the Deinit event occurs to de-initialize a launched MQL5 program	Event Handling
OnTick	The function is called in EAs when the NewTick event occurs to handle a new quote	Event Handling
OnCalculate	The function is called in indicators when the Calculate event occurs to handle price data changes	Event Handling
OnTimer	The function is called in indicators and EAs during the Timer periodic event generated by the terminal at fixed time intervals	Event Handling
OnTrade	The function is called in EAs during the Trade event generated at the end of a trading operation on a trade server	Event Handling
OnTradeTransaction	The function is called in EAs when the TradeTransaction event occurs to process a trade request execution results	Event Handling
OnBookEvent	The function is called in EAs when the BookEvent event	Event Handling

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
	occurs to process changes in the market depth	
OnChartEvent	The function is called in indicators and EAs when the ChartEvent event occurs to process chart changes made by a user or an MQL5 program	Event Handling
OnTester	The function is called in EAs when the Tester event occurs to perform necessary actions after testing an EA on history data	Event Handling
OnTesterInit	The function is called in EAs when the TesterInit event occurs to perform necessary actions before optimization in the strategy tester	Event Handling
OnTesterDeinit	The function is called in EAs when the TesterDeinit event occurs after EA optimization in the strategy tester	Event Handling
OnTesterPass	The function is called in EAs when the TesterPass even occurs to handle an arrival of a new data frame during EA optimization in the strategy tester	Event Handling
OrderCalcMargin	Calculates the margin required for the specified order type, in the deposit currency	Trade Functions
OrderCalcProfit	Calculates the profit based on the parameters passed, in the deposit currency	Trade Functions
OrderCheck	Checks if there are enough funds to execute the required trade operation.	Trade Functions
OrderGetDouble	Returns the requested property of the order (double)	Trade Functions
OrderGetInteger	Returns the requested property of the order (datetime or int)	Trade Functions
OrderGetString	Returns the requested property of the order (string)	Trade Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
OrderGetTicket	Return the ticket of a corresponding order	Trade Functions
OrderSelect	Selects a order for further working with it	Trade Functions
OrderSend	Sends trade requests to a server	Trade Functions
OrderSendAsync	Asynchronously sends trade requests without waiting for the trade response of the trade server	Trade Functions
OrdersTotal	Returns the number of orders	Trade Functions
ParameterGetRange	Receives data on the values range and the change step for an input variable when optimizing an Expert Advisor in the Strategy Tester	Working with Optimization Results
ParameterSetRange	Specifies the use of input variable when optimizing an Expert Advisor in the Strategy Tester: value, change step, initial and final values	Working with Optimization Results
Period	Returns the current chart timeframe	Checkup
PeriodSeconds	Returns the number of seconds in the period	Common Functions
PlaySound	Plays a sound file	Common Functions
PlotIndexGetInteger	Returns the value of an indicator line property of the integer type	Custom Indicators
PlotIndexSetDouble	Sets the value of an indicator line property of the type double	Custom Indicators
PlotIndexSetInteger	Sets the value of an indicator line property of the int type	Custom Indicators
PlotIndexSetString	Sets the value of an indicator line property of the string type	Custom Indicators
Point	Returns the point size of the current symbol in the quote currency	Checkup
PositionGetDouble	Returns the requested property of an open position (double)	Trade Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
PositionGetInteger	Returns the requested property of an open position (datetime or int)	Trade Functions
PositionGetString	Returns the requested property of an open position (string)	Trade Functions
PositionGetSymbol	Returns the symbol corresponding to the open position	Trade Functions
PositionGetTicket	Returns the ticket of the position with the specified index in the list of open positions	Trade Functions
PositionSelect	Chooses an open position for further working with it	Trade Functions
PositionSelectByTicket	Selects a position to work with by the ticket number specified in it	Trade Functions
PositionsTotal	Returns the number of open positions	Trade Functions
pow	Raises the base to the specified power	Math Functions
Print	Displays a message in the log	Common Functions
PrintFormat	Formats and prints the sets of symbols and values in a log file in accordance with a preset format	Common Functions
rand	Returns a pseudorandom value within the range of 0 to 32767	Math Functions
ResetLastError	Sets the value of a predetermined variable _LastError to zero	Common Functions
ResourceCreate	Creates an image resource based on a data set	Common Functions
ResourceFree	Deletes dynamically created resource (freeing the memory allocated for it)	Common Functions
ResourceReadImage	Reads data from the graphical resource created by ResourceCreate() function or saved in EX5 file during compilation	Common Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
ResourceSave	Saves a resource into the specified file	Common Functions
round	Rounds of a value to the nearest integer	Math Functions
SendFTP	Sends a file at the address specified in the settings window of the "FTP" tab	Common Functions
SendMail	Sends an email at the address specified in the settings window of the "Email" tab	Common Functions
SendNotification	Sends push notifications to mobile terminals, whose MetaQuotes ID are specified in the "Notifications" tab	Common Functions
SeriesInfoInteger	Returns information about the state of historical data	Timeseries and Indicators Access
SetIndexBuffer	Binds the specified indicator buffer with one-dimensional dynamic array of the double type	Custom Indicators
ShortArrayToString	Copying array part into a string	Conversion Functions
ShortToString	Converting symbol code (unicode) into one-symbol string	Conversion Functions
SignalBaseGetDouble	Returns the value of double type property for selected signal	Trade Signals
SignalBaseGetInteger	Returns the value of integer type property for selected signal	Trade Signals
SignalBaseGetString	Returns the value of string type property for selected signal	Trade Signals
SignalBaseSelect	Selects a signal from signals, available in terminal for further working with it	Trade Signals
SignalBaseTotal	Returns the total amount of signals, available in terminal	Trade Signals
SignalInfoGetDouble	Returns the value of double type property of signal copy settings	Trade Signals
SignalInfoGetInteger	Returns the value of integer type property of signal copy settings	Trade Signals

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
SignalInfoGetString	Returns the value of string type property of signal copy settings	Trade Signals
SignalInfoSetDouble	Sets the value of double type property of signal copy settings	Trade Signals
SignalInfoSetInteger	Sets the value of integer type property of signal copy settings	Trade Signals
SignalSubscribe	Subscribes to the trading signal	Trade Signals
SignalUnsubscribe	Cancels subscription	Trade Signals
sin	Returns the sine of a number	Math Functions
Sleep	Suspends execution of the current Expert Advisor or script within a specified interval	Common Functions
SocketCreate	Create a socket with specified flags and return its handle	Network Functions
SocketClose	Close a socket	Network Functions
SocketConnect	Connect to the server with timeout control	Network Functions
SocketIsConnected	Checks if the socket is currently connected	Network Functions
SocketIsReadable	Get a number of bytes that can be read from a socket	Network Functions
SocketIsWritable	Check whether data can be written to a socket at the current time	Network Functions
SocketTimeouts	Set timeouts for receiving and sending data for a socket system object	Network Functions
SocketRead	Read data from a socket	Network Functions
SocketSend	Write data to a socket	Network Functions
SocketTlsHandshake	Initiate secure TLS (SSL) connection to a specified host via TLS Handshake protocol	Network Functions
SocketTlsCertificate	Get data on the certificate used to secure network connection	Network Functions
SocketTlsRead	Read data from secure TLS connection	Network Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
SocketTlsReadAvailable	Read all available data from secure TLS connection	Network Functions
SocketTlsSend	Send data via secure TLS connection	Network Functions
sqrt	Returns a square root	Math Functions
srand	Sets the starting point for generating a series of pseudorandom integers	Math Functions
StringAdd	Adds a string to the end of another string	String Functions
StringBufferLen	Returns the size of buffer allocated for the string	String Functions
StringCompare	Compares two strings and returns 1 if the first string is greater than the second; 0 - if the strings are equal; -1 (minus 1) - if the first string is less than the second one	String Functions
StringConcatenate	Forms a string of parameters passed	String Functions
StringFill	Fills out a specified string by selected symbols	String Functions
StringFind	Search for a substring in a string	String Functions
StringFormat	Converting number into string according to preset format	Conversion Functions
StringGetCharacter	Returns the value of a number located in the specified string position	String Functions
StringInit	Initializes string by specified symbols and provides the specified string length	String Functions
StringLen	Returns the number of symbols in a string	String Functions
StringReplace	Replaces all the found substrings of a string by a set sequence of symbols	String Functions
StringSetCharacter	Returns a copy of a string with a changed value of a symbol in a	String Functions

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
	specified position	
StringSplit	Gets substrings by a specified separator from the specified string, returns the number of substrings obtained	String Functions
StringSubstr	Extracts a substring from a text string starting from a specified position	String Functions
StringToCharArray	Symbol-wise copying a string converted from Unicode to ANSI, to a selected place of array of uchar type	Conversion Functions
StringToColor	Converting "R,G,B" string or string with color name into color type value	Conversion Functions
StringToDouble	Converting a string containing a symbol representation of number into number of double type	Conversion Functions
StringToInteger	Converting a string containing a symbol representation of number into number of int type	Conversion Functions
StringToLower	Transforms all symbols of a selected string to lowercase	String Functions
StringToShortArray	Symbol-wise copying a string to a selected part of array of ushort type	Conversion Functions
StringToTime	Converting a string containing time or date in "yyyy.mm.dd [hh:mi]" format into datetime type	Conversion Functions
StringToUpper	Transforms all symbols of a selected string into capitals	String Functions
StringTrimLeft	Cuts line feed characters, spaces and tabs in the left part of the string	String Functions
StringTrimRight	Cuts line feed characters, spaces and tabs in the right part of the string	String Functions
StructToTime	Converts a variable of MqlDateTime structure type into	Date and Time

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
	a datetime value	
Symbol	Returns the name of a symbol of the current chart	Checkup
SymbolInfoDouble	Returns the double value of the symbol for the corresponding property	Market Info
SymbolInfoInteger	Returns a value of an integer type (long, datetime, int or bool) of a specified symbol for the corresponding property	Market Info
SymbolInfoMarginRate	Returns the margin rates depending on the order type and direction	Market Info
SymbolInfoSessionQuote	Allows receiving time of beginning and end of the specified quoting sessions for a specified symbol and day of week.	Market Info
SymbolInfoSessionTrade	Allows receiving time of beginning and end of the specified trading sessions for a specified symbol and day of week.	Market Info
SymbolInfoString	Returns a value of the string type of a specified symbol for the corresponding property	Market Info
SymbolInfoTick	Returns the current prices for the specified symbol in a variable of the MqlTick type	Market Info
SymbolIsSynchronized	Checks whether data of a selected symbol in the terminal are synchronized with data on the trade server	Market Info
SymbolName	Returns the name of a specified symbol	Market Info
SymbolSelect	Selects a symbol in the Market Watch window or removes a symbol from the window	Market Info
SymbolsTotal	Returns the number of available (selected in Market Watch or all) symbols	Market Info

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
tan	Returns the tangent of a number	Math Functions
TerminalClose	Commands the terminal to complete operation	Common Functions
TerminalInfoDouble	Returns an double value of a corresponding property of the mql5 program environment	Checkup
TerminalInfoInteger	Returns an integer value of a corresponding property of the mql5 program environment	Checkup
TerminalInfoString	Returns a string value of a corresponding property of the mql5 program environment	Checkup
TesterStatistics	It returns the value of a specified statistic calculated based on testing results	Common Functions
TextGetSize	Returns the string's width and height at the current font settings	Object Functions
TextOut	Transfers the text to the custom array (buffer) designed for creation of a graphical resource	Object Functions
TextSetFont	Sets the font for displaying the text using drawing methods (Arial 20 used by default)	Object Functions
TimeCurrent	Returns the last known server time (time of the last quote receipt) in the datetime format	Date and Time
TimeDaylightSavings	Returns the sign of Daylight Saving Time switch	Date and Time
TimeGMT	Returns GMT in datetime format with the Daylight Saving Time by local time of the computer, where the client terminal is running	Date and Time
TimeGMTOffset	Returns the current difference between GMT time and the local computer time in seconds, taking into account DST switch	Date and Time
TimeLocal	Returns the local computer time in datetime format	Date and Time

© 2000-2025, MetaQuotes Ltd.

Function	Action	Section
TimeToString	Converting a value containing time in seconds elapsed since 01.01.1970 into a string of "yyyy.mm.dd hh:mi" format	Conversion Functions
TimeToStruct	Converts a datetime value into a variable of MqlDateTime structure type	Date and Time
TimeTradeServer	Returns the current calculation time of the trade server	Date and Time
UninitializeReason	Returns the code of the reason for deinitialization	Checkup
WebRequest	Sends HTTP request to the specified server	Common Functions
ZeroMemory	Resets a variable passed to it by reference. The variable can be of any type, except for classes and structures that have constructors.	Common Functions

© 2000-2025, MetaQuotes Ltd.

List of MQL5 Constants

All MQL5 constants in alphabetical order.

Constant	Description	Usage
__DATE__	File compilation date without time (hours, minutes and seconds are equal to 0)	Print
__DATETIME__	File compilation date and time	Print
__FILE__	Name of the currently compiled file	Print
__FUNCSIG__	Signature of the function in whose body the macro is located. Loggi	Print

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ng of the full description of functions can be useful in the identification of overloaded functions	
__FUNCTION__	Name of the function, in whose body the macro is located	Print
__LINE__	Line number in the source code, in which the macro is located	Print
__MQLBUILD__, __MQL5BUILD__	Compiler	Print

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	build number	
__PATH__	An absolute path to the file that is currently being compiled	Print
ACCOUNT_ASSETS	The current assets of an account	AccountInfoDouble
ACCOUNT_BALANCE	Account balance in the deposit currency	AccountInfoDouble
ACCOUNT_COMMISSION_BLOCKED	The current blocked commission amount on an account	AccountInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ACCOUNT_COMPANY	Name of a company that serves the account	AccountInfoString
ACCOUNT_CREDIT	Account credit in the deposit currency	AccountInfoDouble
ACCOUNT_CURRENCY	Account currency	AccountInfoString
ACCOUNT_EQUITY	Account equity in the deposit currency	AccountInfoDouble
ACCOUNT_LEVERAGE	Account leverage	AccountInfoInteger
ACCOUNT_LIABILITIES	The current liabilities on an account	AccountInfoDouble
ACCOUNT_LIMIT_ORDERS	Maximum allowe	AccountInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	d number of active pending orders	
ACCOUNT_LOGIN	Account number	AccountInfoInteger
ACCOUNT_MARGIN	Account margin used in the deposit currency	AccountInfoDouble
ACCOUNT_MARGIN_FREE	Free margin of an account in the deposit currency	AccountInfoDouble
ACCOUNT_MARGIN_INITIAL	Initial margin. The amount reserved on an account to cover the margin	AccountInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	of all pending orders	
ACCOUNT_MARGIN_LEVEL	Account margin level in percents	AccountInfoDouble
ACCOUNT_MARGIN_MAINTENANCE	Maintenance margin. The minimum equity reserved on an account to cover the minimum amount of all open positions	AccountInfoDouble
ACCOUNT_MARGIN_SO_CALL	Margin call level. Depending on the set ACCOUNT_MARGIN_SO_MODE is	AccountInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	expressed in percents or in the deposit currency	
ACCOUNT_MARGIN_SO_MODE	Mode for setting the minimal allowed margin	AccountInfoInteger
ACCOUNT_MARGIN_SO_SO	Margin stop out level. Depending on the set ACCOUNT_MARGIN_SO_MODE is expressed in percents or in the deposit currency	AccountInfoDouble
ACCOUNT_NAME	Client name	AccountInfoString

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ACCOUNT_PROFIT	Current profit of an account in the deposit currency	AccountInfoDouble
ACCOUNT_SERVER	Trade server name	AccountInfoString
ACCOUNT_STOPOUT_MODE_MONEY	Account stop out mode in money	AccountInfoInteger
ACCOUNT_STOPOUT_MODE_PERCENT	Account stop out mode in percents	AccountInfoInteger
ACCOUNT_TRADE_ALLOWED	Allowed trade for the current account	AccountInfoInteger
ACCOUNT_TRADE_EXPERT	Allowed trade for an Expert	AccountInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	Advisor	
ACCOUNT_TRADE_MODE	Account trade mode	AccountInfoInteger
ACCOUNT_TRADE_MODE_CONTEST	Contest account	AccountInfoInteger
ACCOUNT_TRADE_MODE_DEMO	Demo account	AccountInfoInteger
ACCOUNT_TRADE_MODE_REAL	Real account	AccountInfoInteger
ALIGN_CENTER	Centered (only for the Edit object)	ObjectSetInteger, ObjectGetInteger, ChartScreenShot
ALIGN_LEFT	Left alignment	ObjectSetInteger, ObjectGetInteger, ChartScreenShot
ALIGN_RIGHT	Right alignment	ObjectSetInteger, ObjectGetInteger, ChartScreenShot
ANCHOR_CENTER	Anchor point strictly in the center of the object	ObjectSetInteger, ObjectGetInteger
ANCHOR_LEFT	Anchor point	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	to the left in the center	
ANCHOR_LEFT_LOWER	Anchor point at the lower left corner	ObjectSetInteger, ObjectGetInteger
ANCHOR_LEFT_UPPER	Anchor point at the upper left corner	ObjectSetInteger, ObjectGetInteger
ANCHOR_LOWER	Anchor point below in the center	ObjectSetInteger, ObjectGetInteger
ANCHOR_RIGHT	Anchor point to the right in the center	ObjectSetInteger, ObjectGetInteger
ANCHOR_RIGHT_LOWER	Anchor point at the lower right corner	ObjectSetInteger, ObjectGetInteger
ANCHOR_RIGHT_UPPER	Anchor point at the upper	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	right corner	
ANCHOR_UPPER	Anchor point above in the center	ObjectSetInteger, ObjectGetInteger
BASE_LINE	Main line	Indicators Lines
BOOK_TYPE_BUY	Buy order (Bid)	MqlBookInfo
BOOK_TYPE_BUY_MARKET	Buy order by Market	MqlBookInfo
BOOK_TYPE_SELL	Sell order (Offer)	MqlBookInfo
BOOK_TYPE_SELL_MARKET	Sell order by Market	MqlBookInfo
BORDER_FLAT	Flat form	ObjectSetInteger, ObjectGetInteger
BORDER_RAISED	Prominent form	ObjectSetInteger, ObjectGetInteger
BORDER_SUNKEN	Concave form	ObjectSetInteger, ObjectGetInteger
CHAR_MAX	Maximal value, which can be	Numerical Type Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	represented by char type	
CHAR_MIN	Minimal value, which can be represented by char type	Numerical Type Constants
CHART_AUTOSCROLL	Mode of automatic moving to the right border of the chart	ChartSetInteger, ChartGetInteger
CHART_BARS	Display as a sequence of bars	ChartSetInteger
CHART_BEGIN	Chart beginning (the oldest prices)	ChartNavigate
CHART_BRING_TO_TOP	Show chart on top of	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	other charts	
CHART_CANDLES	Display as Japanese candlesticks	ChartSetInteger
CHART_COLOR_ASK	Ask price level color	ChartSetInteger, ChartGetInteger
CHART_COLOR_BACKGROUND	Chart background color	ChartSetInteger, ChartGetInteger
CHART_COLOR_BID	Bid price level color	ChartSetInteger, ChartGetInteger
CHART_COLOR_CANDLE_BEAR	Body color of a bear candlestick	ChartSetInteger, ChartGetInteger
CHART_COLOR_CANDLE_BULL	Body color of a bull candlestick	ChartSetInteger, ChartGetInteger
CHART_COLOR_CHART_DOWN	Color for the down bar, shadows and body borders of	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	bear candlesticks	
CHART_COLOR_CHART_LINE	Line chart color and color of "Doji" Japanese candlesticks	ChartSetInteger, ChartGetInteger
CHART_COLOR_CHART_UP	Color for the up bar, shadows and body borders of bull candlesticks	ChartSetInteger, ChartGetInteger
CHART_COLOR_FOREGROUND	Color of axes, scales and OHLC line	ChartSetInteger, ChartGetInteger
CHART_COLOR_GRID	Grid color	ChartSetInteger, ChartGetInteger
CHART_COLOR_LAST	Line color of the last executed deal price (Last)	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
CHART_COLOR_STOP_LEVEL	Color of stop order levels (Stop Loss and Take Profit)	ChartSetInteger, ChartGetInteger
CHART_COLOR_VOLUME	Color of volumes and position opening levels	ChartSetInteger, ChartGetInteger
CHART_COMMENT	Text of a comment in a chart	ChartSetString, ChartGetString
CHART_CURRENT_POS	Current position	ChartNavigate
CHART_DRAG_TRADE_LEVELS	Permission to drag trading levels on a chart with a mouse. The drag	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	mode is enabled by default (true value)	
CHART_EVENT_MOUSE_MOVE	Send notifications of mouse move and mouse click events (CHARTEVENT_MOUSE_MOVE) to all mql5 programs on a chart	ChartSetInteger, ChartGetInteger
CHART_EVENT_OBJECT_CREATE	Send a notification of an event of new object creation (CHARTEVENT_O	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	BJECT_CREATE) to all mql5-programs on a chart	
CHART_EVENT_OBJECT_DELETE	Send a notification of an event of object deletion (CHARTEVENT_OBJECT_DELETE) to all mql5-programs on a chart	ChartSetInteger, ChartGetInteger
CHART_FIRST_VISIBLE_BAR	Number of the first visible bar in the chart. Indexing of bars is the same as for	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	timeseries.	
CHART_FIXED_MAX	Fixed chart maximum	ChartSetDouble, ChartGetDouble
CHART_FIXED_MIN	Fixed chart minimum	ChartSetDouble, ChartGetDouble
CHART_FIXED_POSITION	Chart fixed position from the left border in percent value. Chart fixed position is marked by a small gray triangle on the horizontal time axis. It is displayed only if the automatic chart scrolli	ChartSetDouble, ChartGetDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ng to the right on tick incoming is disabled (see CHART_AUTOSCROLL property). The bar on a fixed position remains in the same place when zooming in and out.	
CHART_FOREGROUND	Price chart in the foreground	ChartSetInteger, ChartGetInteger
CHART_HEIGHT_IN_PIXELS	Chart height in pixels	ChartSetInteger, ChartGetInteger
CHART_IS_OBJECT	Identifying "Chart" (OBJ_CHA	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	RT) object - returns true for a graphical object. Returns false for a real chart	
CHART_LINE	Display as a line drawn by Close prices	ChartSetInteger
CHART_MODE	Chart type (candlesticks, bars or line)	ChartSetInteger, ChartGetInteger
CHART_MOUSE_SCROLL	Scrolling the chart horizontally using the left mouse button. Vertical scrolli	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ng is also available if the value of any following properties is set to true: CHART_SCALEFIX, CHART_SCALEFIX_11 or CHART_SCALE_PT_PER_BAR	
CHART_POINTS_PER_BAR	Scale in points per bar	ChartSetDouble, ChartGetDouble
CHART_PRICE_MAX	Chart maximum	ChartSetDouble, ChartGetDouble
CHART_PRICE_MIN	Chart minimum	ChartSetDouble, ChartGetDouble
CHART_SCALE	Scale	ChartSetInteger, ChartGetInteger
CHART_SCALE_PT_PER_BAR	Scale to be specified in points	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	per bar	
CHART_SCALEFIX	Fixed scale mode	ChartSetInteger, ChartGetInteger
CHART_SCALEFIX_11	Scale 1:1 mode	ChartSetInteger, ChartGetInteger
CHART_SHIFT	Mode of price chart indent from the right border	ChartSetInteger, ChartGetInteger
CHART_SHIFT_SIZE	The size of the zero bar indent from the right border in percents	ChartSetDouble, ChartGetDouble
CHART_SHOW_ASK_LINE	Display Ask values as a horizontal line in a chart	ChartSetInteger, ChartGetInteger
CHART_SHOW_BID_LINE	Display Bid values as a	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	horizontal line in a chart	
CHART_SHOW_DATE_SCALE	Showing the time scale on a chart	ChartSetInteger, ChartGetInteger
CHART_SHOW_GRID	Display grid in the chart	ChartSetInteger, ChartGetInteger
CHART_SHOW_LAST_LINE	Display Last values as a horizontal line in a chart	ChartSetInteger, ChartGetInteger
CHART_SHOW_OBJECT_DESCR	Pop-up descriptions of graphical objects	ChartSetInteger, ChartGetInteger
CHART_SHOW_OHLC	Show OHLC values in the upper left corner	ChartSetInteger, ChartGetInteger
CHART_SHOW_ONE_CLICK	Showing the "One click	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	trading" panel on a chart	
CHART_SHOW_PERIOD_SEP	Display vertical separators between adjacent periods	ChartSetInteger, ChartGetInteger
CHART_SHOW_PRICE_SCALE	Showing the price scale on a chart	ChartSetInteger, ChartGetInteger
CHART_SHOW_TRADE_LEVELS	Displaying trade levels in the chart (levels of open positions, Stop Loss, Take Profit and pending orders)	ChartSetInteger, ChartGetInteger
CHART_SHOW_VOLUMES	Display	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	volume in the chart	
CHART_VISIBLE_BARS	The number of bars on the chart that can be displayed	ChartSetInteger, ChartGetInteger
CHART_VOLUME_HIDE	Volumes are not shown	ChartSetInteger
CHART_VOLUME_REAL	Trade volumes	ChartSetInteger
CHART_VOLUME_TICK	Tick volumes	ChartSetInteger
CHART_WIDTH_IN_BARS	Chart width in bars	ChartSetInteger, ChartGetInteger
CHART_WIDTH_IN_PIXELS	Chart width in pixels	ChartSetInteger, ChartGetInteger
CHART_WINDOW_HANDLE	Chart window handle (HWND)	ChartSetInteger, ChartGetInteger
CHART_WINDOW_IS_VISIBLE	Visibility of	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	subwindows	
CHART_WINDOW_YDISTANCE	The distance between the upper frame of the indicator subwindow and the upper frame of the main chart window, along the vertical Y axis, in pixels. In case of a mouse event, the cursor coordinates are passed in terms of the coordinates	ChartSetInteger, ChartGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	of the main chart window, while the coordinates of graphical objects in an indicator subwindow are set relative to the upper left corner of the subwindow. The value is required for converting the absolute coordinates of the main chart to the local

Constant	Description	Usage
	coordinates of a subwindow for correct work with the graphical objects, whose coordinates are set relative to the upper left corner of the subwindow frame.	
CHART_WINDOWS_TOTAL	The total number of chart windows, including indicator subwindows	ChartSetInteger, ChartGetInteger
CHARTEVENT_CHART_CHANGE	Change of the	OnChartEvent

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	chart size or modification of chart properties through the Properties dialog	
CHARTEVENT_CLICK	Clicking on a chart	OnChartEvent
CHARTEVENT_CUSTOM	Initial number of an event from a range of custom events	OnChartEvent
CHARTEVENT_CUSTOM_LAST	The final number of an event from a range of custom events	OnChartEvent

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
CHARTEVENT_KEYDOWN	Keystrokes	OnChartEvent
CHARTEVENT_MOUSE_MOVE	Mouse move, mouse clicks (if CHART_EVENT_MOUSE_MOVE=true is set for the chart)	OnChartEvent
CHARTEVENT_OBJECT_CHANGE	Graphical object property changed via the properties dialog	OnChartEvent
CHARTEVENT_OBJECT_CLICK	Clicking on a graphical object	OnChartEvent
CHARTEVENT_OBJECT_CREATE	Graphical object created (if CHART_EVENT_OBJECT	OnChartEvent

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	_CREATE=true is set for the chart)	
CHARTEVENT_OBJECT_DELETE	Graphical object deleted (if CHART_EVENT_OBJECT_DELETE=true is set for the chart)	OnChartEvent
CHARTEVENT_OBJECT_DRAG	Drag and drop of a graphical object	OnChartEvent
CHARTEVENT_OBJECT_ENDEDIT	End of text editing in the graphical object Edit	OnChartEvent
CHARTS_MAX	The maximum possible numb	Other Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	er of simultaneously open charts in the terminal	
CHIKOUSPAN_LINE	Chiku Span line	Indicators Lines
clrAliceBlue	Alice Blue	Web Colors
clrAntiqueWhite	Antique White	Web Colors
clrAqua	Aqua	Web Colors
clrAquamarine	Aquamarine	Web Colors
clrBeige	Beige	Web Colors
clrBisque	Bisque	Web Colors

CORNER_LEFT_LOWER	Center of coordinates is in the lower left corner of the chart	ObjectSetInteger, ObjectGetInteger
CORNER_LEFT_UPPER	Center of coordinates is in the upper left corner of the chart	ObjectSetInteger, ObjectGetInteger
CORNER_RIGHT_LOWER	Center of coordinates is in the lower right corner of the chart	ObjectSetInteger, ObjectGetInteger
CORNER_RIGHT_UPPER	Center of coordinates is in the upper right corner	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	of the chart	
CP_ACP	The current Windows ANSI code page.	CharArrayToString, StringToCharArray, FileOpen
CP_MACCP	The current system Macintosh code page. Note: This value is mostly used in earlier created program codes and is of no use now, since modern Macintosh computers use Unico	CharArrayToString, StringToCharArray, FileOpen

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	de for encoding.	
CP_OEMCP	The current system OEM code page.	CharArrayToString, StringToCharArray, FileOpen
CP_SYMBOL	Symbol code page	CharArrayToString, StringToCharArray, FileOpen
CP_THREAD_ACP	The Windows ANSI code page for the current thread.	CharArrayToString, StringToCharArray, FileOpen
CP_UTF7	UTF-7 code page.	CharArrayToString, StringToCharArray, FileOpen
CP_UTF8	UTF-8 code page.	CharArrayToString, StringToCharArray, FileOpen
CRYPT_AES128	AES encryption with 128 bit key (16 bytes)	CryptEncode, CryptDecode

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
CRYPT_AES256	AES encryption with 256 bit key (32 bytes)	CryptEncode, CryptDecode
CRYPT_ARCH_ZIP	ZIP archives	CryptEncode, CryptDecode
CRYPT_BASE64	BASE64	CryptEncode, CryptDecode
CRYPT_DES	DES encryption with 56 bit key (7 bytes)	CryptEncode, CryptDecode
CRYPT_HASH_MD5	MD5 HASH calculation	CryptEncode, CryptDecode
CRYPT_HASH_SHA1	SHA1 HASH calculation	CryptEncode, CryptDecode
CRYPT_HASH_SHA256	SHA256 HASH calculation	CryptEncode, CryptDecode
DBL_DIG	Number of significant decimal digits for	Numerical Type Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	double type	
DBL_EPSILON	Minimal value, which satisfies the condition: 1.0+DBL_EPSILON != 1.0 (for double type)	Numerical Type Constants
DBL_MANT_DIG	Bits count in a mantissa for double type	Numerical Type Constants
DBL_MAX	Maximal value, which can be represented by double type	Numerical Type Constants
DBL_MAX_10_EXP	Maximal decimal value of exponent	Numerical Type Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	degree for double type	
DBL_MAX_EXP	Maximal binary value of exponent degree for double type	Numerical Type Constants
DBL_MIN	Minimal positive value, which can be represented by double type	Numerical Type Constants
DBL_MIN_10_EXP	Minimal decimal value of exponent degree for double type	Numerical Type Constants
DBL_MIN_EXP	Minimal binary value of	Numerical Type Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	exponent degree for double type	
DEAL_COMMENT	Deal comment	HistoryDealGetString
DEAL_COMMISSION	Deal commission	HistoryDealGetDouble
DEAL_ENTRY	Deal entry - entry in, entry out, reverse	HistoryDealGetInteger
DEAL_ENTRY_IN	Entry in	HistoryDealGetInteger
DEAL_ENTRY_INOUT	Reverse	HistoryDealGetInteger
DEAL_ENTRY_OUT	Entry out	HistoryDealGetInteger
DEAL_MAGIC	Deal magic number (see ORDER_MAGIC)	HistoryDealGetInteger
DEAL_ORDER	Deal order number	HistoryDealGetInteger
DEAL_POSITION_ID	Identifier of a	HistoryDealGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	position, in the opening, modification or change of which this deal took part. Each position has a unique identifier that is assigned to all deals executed for the symbol during the entire lifetime of the position.	
DEAL_PRICE	Deal price	HistoryDealGetDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
DEAL_PROFIT	Deal profit	HistoryDealGetDouble
DEAL_SWAP	Cumulative swap on close	HistoryDealGetDouble
DEAL_SYMBOL	Deal symbol	HistoryDealGetString
DEAL_TIME	Deal time	HistoryDealGetInteger
DEAL_TIME_MSC	The time of a deal execution in milliseconds since 01.01.1970	HistoryDealGetInteger
DEAL_TYPE	Deal type	HistoryDealGetInteger
DEAL_TYPE_BALANCE	Balance	HistoryDealGetInteger
DEAL_TYPE_BONUS	Bonus	HistoryDealGetInteger
DEAL_TYPE_BUY	Buy	HistoryDealGetInteger
DEAL_TYPE_BUY_CANCELED	Canceled buy deal. There can be a situation when a	HistoryDealGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	previously executed buy deal is canceled. In this case, the type of the previously executed deal (DEAL_TYPE_BUY) is changed to DEAL_TYPE_BUY_CANCELED, and its profit/loss is zeroized. Previously obtained profit/loss is charged/withdrawn	

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	using a separated balance operation	
DEAL_TYPE_CHARGE	Additional charge	HistoryDealGetInteger
DEAL_TYPE_COMMISSION	Additional commission	HistoryDealGetInteger
DEAL_TYPE_COMMISSION_AGENT_DAILY	Daily agent commission	HistoryDealGetInteger
DEAL_TYPE_COMMISSION_AGENT_MONTHLY	Monthly agent commission	HistoryDealGetInteger
DEAL_TYPE_COMMISSION_DAILY	Daily commission	HistoryDealGetInteger
DEAL_TYPE_COMMISSION_MONTHLY	Monthly commission	HistoryDealGetInteger
DEAL_TYPE_CORRECTION	Correction	HistoryDealGetInteger
DEAL_TYPE_CREDIT	Credit	HistoryDealGetInteger
DEAL_TYPE_INTEREST	Interest rate	HistoryDealGetInteger
DEAL_TYPE_SELL	Sell	HistoryDealGetInteger
DEAL_TYPE_SELL_CANCELED	Canceled	HistoryDealGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	sell deal. There can be a situation when a previously executed sell deal is canceled. In this case, the type of the previously executed deal (DEAL_TYPE_SELL) is changed to DEAL_TYPE_SELL_CANCELED, and its profit/loss is zeroized. Previously	

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	obtained profit/loss is charged/withdrawn using a separated balance operation	
DEAL_VOLUME	Deal volume	HistoryDealGetDouble
DRAW_ARROW	Drawing arrows	Drawing Styles
DRAW_BARS	Display as a sequence of bars	Drawing Styles
DRAW_CANDLES	Display as a sequence of candlesticks	Drawing Styles
DRAW_COLOR_ARROW	Drawing multicolored arrows	Drawing Styles
DRAW_COLOR_BARS	Multicolored bars	Drawing Styles

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
DRAW_COLOR_CANDLES	Multicolored candlesticks	Drawing Styles
DRAW_COLOR_HISTOGRAM	Multicolored histogram from the zero line	Drawing Styles
DRAW_COLOR_HISTOGRAM2	Multicolored histogram of the two indicator buffers	Drawing Styles
DRAW_COLOR_LINE	Multicolored line	Drawing Styles
DRAW_COLOR_SECTION	Multicolored section	Drawing Styles
DRAW_COLOR_ZIGZAG	Multicolored ZigZag	Drawing Styles
DRAW_FILLING	Color fill between the two levels	Drawing Styles
DRAW_HISTOGRAM	Histogram from the	Drawing Styles

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	zero line	
DRAW_HISTOGRAM2	Histogram of the two indicator buffers	Drawing Styles
DRAW_LINE	Line	Drawing Styles
DRAW_NONE	Not drawn	Drawing Styles
DRAW_SECTION	Section	Drawing Styles
DRAW_ZIGZAG	Style Zigzag allows vertical section on the bar	Drawing Styles
ELLIOTT_CYCLE	Cycle	ObjectSetInteger, ObjectGetInteger
ELLIOTT_GRAND_SUPERCYCLE	Grand Supercycle	ObjectSetInteger, ObjectGetInteger
ELLIOTT_INTERMEDIATE	Intermediate	ObjectSetInteger, ObjectGetInteger
ELLIOTT_MINOR	Minor	ObjectSetInteger, ObjectGetInteger
ELLIOTT_MINUETTE	Minuette	ObjectSetInteger, ObjectGetInteger
ELLIOTT_MINUTE	Minute	ObjectSetInteger, ObjectGetInteger
ELLIOTT_PRIMARY	Primary	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ELLIOTT_SUBMINUETTE	Subminuette	ObjectSetInteger, ObjectGetInteger
ELLIOTT_SUPERCYCLE	Supercycle	ObjectSetInteger, ObjectGetInteger
EMPTY_VALUE	Empty value in an indicator buffer	Other Constants
ERR_ACCOUNT_WRONG_PROPERTY	Wrong account property ID	GetLastError
ERR_ARRAY_BAD_SIZE	Requested array size exceeds 2 GB	GetLastError
ERR_ARRAY_RESIZE_ERROR	Not enough memory for the relocation of an array, or an attempt to change the size of a static array	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_BOOKS_CANNOT_ADD	Depth Of Market can not be added	GetLastError
ERR_BOOKS_CANNOT_DELETE	Depth Of Market can not be removed	GetLastError
ERR_BOOKS_CANNOT_GET	The data from Depth Of Market can not be obtained	GetLastError
ERR_BOOKS_CANNOT_SUBSCRIBE	Error in subscribing to receive new data from Depth Of Market	GetLastError
ERR_BUFFERS_NO_MEMORY	Not enough memory for the distribution of	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	indicator buffers	
ERR_BUFFERS_WRONG_INDEX	Wrong indicator buffer index	GetLastError
ERR_CANNOT_CLEAN_DIRECTORY	Failed to clear the directory (probably one or more files are blocked and removal operation failed)	GetLastError
ERR_CANNOT_DELETE_DIRECTORY	The directory cannot be removed	GetLastError
ERR_CANNOT_DELETE_FILE	File deleting error	GetLastError
ERR_CANNOT_OPEN_FILE	File opening error	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_CHAR_ARRAY_ONLY	Must be an array of type char	GetLastError
ERR_CHART_CANNOT_CHANGE	Failed to change chart symbol and period	GetLastError
ERR_CHART_CANNOT_CREATE_TIMER	Failed to create timer	GetLastError
ERR_CHART_CANNOT_OPEN	Chart opening error	GetLastError
ERR_CHART_INDICATOR_CANNOT_ADD	Error adding an indicator to chart	GetLastError
ERR_CHART_INDICATOR_CANNOT_DEL	Error deleting an indicator from the chart	GetLastError
ERR_CHART_INDICATOR_NOT_FOUND	Indicator not found on the specified chart	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_CHART_NAVIGATE_FAILED	Error navigating through chart	GetLastError
ERR_CHART_NO_EXPERT	No Expert Advisor in the chart that could handle the event	GetLastError
ERR_CHART_NO_REPLY	Chart does not respond	GetLastError
ERR_CHART_NOT_FOUND	Chart not found	GetLastError
ERR_CHART_SCREENSHOT_FAILED	Error creating screenshots	GetLastError
ERR_CHART_TEMPLATE_FAILED	Error applying template	GetLastError
ERR_CHART_WINDOW_NOT_FOUND	Subwindow containing the indicator	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	was not found	
ERR_CHART_WRONG_ID	Wrong chart ID	GetLastError
ERR_CHART_WRONG_PARAMETER	Error value of the parameter for the function of working with charts	GetLastError
ERR_CHART_WRONG_PROPERTY	Wrong chart property ID	GetLastError
ERR_CUSTOM_WRONG_PROPERTY	Wrong ID of the custom indicator property	GetLastError
ERR_DIRECTORY_NOT_EXIST	Directory does not exist	GetLastError
ERR_DOUBLE_ARRAY_ONLY	Must be an array of type	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	double	
ERR_FILE_BINSTRINGSIZE	String size must be specified, because the file is opened as binary	GetLastError
ERR_FILE_CACHEBUFFER_ERROR	Not enough memory for cache to read	GetLastError
ERR_FILE_CANNOT_REWRITE	File can not be rewritten	GetLastError
ERR_FILE_IS_DIRECTORY	This is not a file, this is a directory	GetLastError
ERR_FILE_ISNOT_DIRECTORY	This is a file, not a directory	GetLastError
ERR_FILE_NOT_EXIST	File does not exist	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_FILE_NOTBIN	The file must be opened as a binary one	GetLastError
ERR_FILE_NOTCSV	The file must be opened as CSV	GetLastError
ERR_FILE_NOTTOREAD	The file must be opened for reading	GetLastError
ERR_FILE_NOTTOWRITE	The file must be opened for writing	GetLastError
ERR_FILE_NOTTXT	The file must be opened as a text	GetLastError
ERR_FILE_NOTTXTORCSV	The file must be opened as a text	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	or CSV	
ERR_FILE_READERROR	File reading error	GetLastError
ERR_FILE_WRITEERROR	Failed to write a resource to a file	GetLastError
ERR_FLOAT_ARRAY_ONLY	Must be an array of type float	GetLastError
ERR_FTP_SEND_FAILED	File sending via ftp failed	GetLastError
ERR_FUNCTION_NOT_ALLOWED	Function is not allowed for call	GetLastError
ERR_GLOBALVARIABLE_EXISTS	Global variable of the client terminal with the same name already exists	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_GLOBALVARIABLE_NOT_FOUND	Global variable of the client terminal is not found	GetLastError
ERR_HISTORY_NOT_FOUND	Requested history not found	GetLastError
ERR_HISTORY_WRONG_PROPERTY	Wrong ID of the history property	GetLastError
ERR_INCOMPATIBLE_ARRAYS	Copying incompatible arrays. String array can be copied only to a string array, and a numeric array - in numeric array only	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_INCOMPATIBLE_FILE	A text file must be for string arrays, for other arrays - binary	GetLastError
ERR_INDICATOR_CANNOT_ADD	Error applying an indicator to chart	GetLastError
ERR_INDICATOR_CANNOT_APPLY	The indicator cannot be applied to another indicator	GetLastError
ERR_INDICATOR_CANNOT_CREATE	Indicator cannot be created	GetLastError
ERR_INDICATOR_CUSTOM_NAME	The first parameter in the array must be the name of the custo	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	m indicator	
ERR_INDICATOR_DATA_NOT_FOUND	Requested data not found	GetLastError
ERR_INDICATOR_NO_MEMORY	Not enough memory to add the indicator	GetLastError
ERR_INDICATOR_PARAMETER_TYPE	Invalid parameter type in the array when creating an indicator	GetLastError
ERR_INDICATOR_PARAMETERS_MISSING	No parameters when creating an indicator	GetLastError
ERR_INDICATOR_UNKNOWN_SYMBOL	Unknown symbol	GetLastError
ERR_INDICATOR_WRONG_HANDLE	Wrong indica	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	tor handle	
ERR_INDICATOR_WRONG_INDEX	Wrong index of the requested indicator buffer	GetLastError
ERR_INDICATOR_WRONG_PARAMETERS	Wrong number of parameters when creating an indicator	GetLastError
ERR_INT_ARRAY_ONLY	Must be an array of type int	GetLastError
ERR_INTERNAL_ERROR	Unexpected internal error	GetLastError
ERR_INVALID_ARRAY	Array of a wrong type, wrong size, or a damaged object of a	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	dynamic array	
ERR_INVALID_DATETIME	Invalid date and/or time	GetLastError
ERR_INVALID_FILEHANDLE	A file with this handle was closed, or was not opening at all	GetLastError
ERR_INVALID_PARAMETER	Wrong parameter when calling the system function	GetLastError
ERR_INVALID_POINTER	Wrong pointer	GetLastError
ERR_INVALID_POINTER_TYPE	Wrong type of pointer	GetLastError
ERR_LONG_ARRAY_ONLY	Must be an array of	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	type long	
ERR_MAIL_SEND_FAILED	Email sending failed	GetLastError
ERR_MARKET_LASTTIME_UNKNOWN	Time of the last tick is not known (no ticks)	GetLastError
ERR_MARKET_NOT_SELECTED	Symbol is not selected in MarketWatch	GetLastError
ERR_MARKET_SELECT_ERROR	Error adding or deleting a symbol in MarketWatch	GetLastError
ERR_MARKET_UNKNOWN_SYMBOL	Unknown symbol	GetLastError
ERR_MARKET_WRONG_PROPERTY	Wrong identifier of a symbol	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	property	
ERR_MQL5_WRONG_PROPERTY	Wrong identifier of the program property	GetLastError
ERR_NO_STRING_DATE	No date in the string	GetLastError
ERR_NOT_ENOUGH_MEMORY	Not enough memory to perform the system function	GetLastError
ERR_NOTIFICATION_SEND_FAILED	Failed to send a notification	GetLastError
ERR_NOTIFICATION_TOO_FREQUENT	Too frequent sending of notifications	GetLastError
ERR_NOTIFICATION_WRONG_PARAMETER	Invalid parameter	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	for sending a notification - an empty string or NULL has been passed to the SendNotification() function	
ERR_NOTIFICATION_WRONG_SETTINGS	Wrong settings of notifications in the terminal (ID is not specified or permission is not set)	GetLastError
ERR_NOTINITIALIZED_STRING	Not initialized string	GetLastError
ERR_NUMBER_ARRAYS_ONLY	Must be a numer	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ic array	
ERR_OBJECT_ERROR	Error working with a graphical object	GetLastError
ERR_OBJECT_GETDATE_FAILED	Unable to get date corresponding to the value	GetLastError
ERR_OBJECT_GETVALUE_FAILED	Unable to get value corresponding to the date	GetLastError
ERR_OBJECT_NOT_FOUND	Graphical object was not found	GetLastError
ERR_OBJECT_WRONG_PROPERTY	Wrong ID of a graphical object property	GetLastError
ERR_ONEDIM_ARRAYS_ONLY	Must be a one-	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	dimensional array	
ERR_OPENCL_BUFFER_CREATE	Failed to create an OpenCL buffer	GetLastError
ERR_OPENCL_CONTEXT_CREATE	Error creating the OpenCL context	GetLastError
ERR_OPENCL_EXECUTE	OpenCL program runtime error	GetLastError
ERR_OPENCL_INTERNAL	Internal error occurred when running OpenCL	GetLastError
ERR_OPENCL_INVALID_HANDLE	Invalid OpenCL handle	GetLastError
ERR_OPENCL_KERNEL_CREATE	Error creating an Open	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	CL kernel	
ERR_OPENCL_NOT_SUPPORTED	OpenCL functions are not supported on this computer	GetLastError
ERR_OPENCL_PROGRAM_CREATE	Error occurred when compiling an OpenCL program	GetLastError
ERR_OPENCL_QUEUE_CREATE	Failed to create a run queue in OpenCL	GetLastError
ERR_OPENCL_SET_KERNEL_PARAMETER	Error occurred when setting parameters for the Open	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	CL kernel	
ERR_OPENCL_TOO_LONG_KERNEL_NAME	Too long kernel name (OpenCL kernel)	GetLastError
ERR_OPENCL_WRONG_BUFFER_OFFSET	Invalid offset in the OpenCL buffer	GetLastError
ERR_OPENCL_WRONG_BUFFER_SIZE	Invalid size of the OpenCL buffer	GetLastError
ERR_PLAY_SOUND_FAILED	Sound playing failed	GetLastError
ERR_RESOURCE_NAME_DUPLICATED	The names of the dynamic and the static resource match	GetLastError
ERR_RESOURCE_NAME_IS_TOO_LONG	The resource name excee	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ds 63 characters	
ERR_RESOURCE_NOT_FOUND	Resource with this name has not been found in EX5	GetLastError
ERR_RESOURCE_UNSUPPORTED_TYPE	Unsupported resource type or its size exceeds 16 Mb	GetLastError
ERR_SERIES_ARRAY	Timeseries cannot be used	GetLastError
ERR_SHORT_ARRAY_ONLY	Must be an array of type short	GetLastError
ERR_SMALL_ARRAY	Too small array, the starting position is outsid	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	e the array	
ERR_SMALL_ASSERIES_ARRAY	The receiving array is declared as AS_SERIES, and it is of insufficient size	GetLastError
ERR_STRING_OUT_OF_MEMORY	Not enough memory for the string	GetLastError
ERR_STRING_RESIZE_ERROR	Not enough memory for the relocation of string	GetLastError
ERR_STRING_SMALL_LEN	The string length is less than expected	GetLastError
ERR_STRING_TIME_ERROR	Error converting string	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	to date	
ERR_STRING_TOO_BIGNUMBER	Too large number, more than ULONG_MAX	GetLastError
ERR_STRING_UNKNOWNTYPE	Unknown data type when converting to a string	GetLastError
ERR_STRING_ZEROADDED	0 added to the string end, a useless operation	GetLastError
ERR_STRINGPOS_OUTOFRANGE	Position outside the string	GetLastError
ERR_STRUCT_WITHOBJECTS_ORCLASS	The structure contains objects of strings and/or	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	dynamic arrays and/or structure of such objects and/or classes	
ERR_SUCCESS	The operation completed successfully	GetLastError
ERR_TERMINAL_WRONG_PROPERTY	Wrong identifier of the terminal property	GetLastError
ERR_TOO_LONG_FILENAME	Too long file name	GetLastError
ERR_TOO_MANY_FILES	More than 64 files cannot be opened at the same time	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_TOO_MANY_FORMATTERS	Amount of format specifiers more than the parameters	GetLastError
ERR_TOO_MANY_PARAMETERS	Amount of parameters more than the format specifiers	GetLastError
ERR_TRADE_DEAL_NOT_FOUND	Deal not found	GetLastError
ERR_TRADE_DISABLED	Trading by Expert Advisors prohibited	GetLastError
ERR_TRADE_ORDER_NOT_FOUND	Order not found	GetLastError
ERR_TRADE_POSITION_NOT_FOUND	Position not found	GetLastError
ERR_TRADE_SEND_FAILED	Trade request sendi	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ng failed	
ERR_TRADE_WRONG_PROPERTY	Wrong trade property ID	GetLastError
ERR_USER_ERROR_FIRST	User defined errors start with this code	GetLastError
ERR_WEBREQUEST_CONNECT_FAILED	Failed to connect to specified URL	GetLastError
ERR_WEBREQUEST_INVALID_ADDRESS	Invalid URL	GetLastError
ERR_WEBREQUEST_REQUEST_FAILED	HTTP request failed	GetLastError
ERR_WEBREQUEST_TIMEOUT	Timeout exceeded	GetLastError
ERR_WRONG_DIRECTORYNAME	Wrong directory name	GetLastError
ERR_WRONG_FILEHANDLE	Wrong file handle	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
ERR_WRONG_FILENAME	Invalid file name	GetLastError
ERR_WRONG_FORMATSTRING	Invalid format string	GetLastError
ERR_WRONG_INTERNAL_PARAMETER	Wrong parameter in the inner call of the client terminal function	GetLastError
ERR_WRONG_STRING_DATE	Wrong date in the string	GetLastError
ERR_WRONG_STRING_OBJECT	Damaged string object	GetLastError
ERR_WRONG_STRING_PARAMETER	Damaged parameter of string type	GetLastError
ERR_WRONG_STRING_TIME	Wrong time in the string	GetLastError
ERR_ZEROSIZE_ARRAY	An array	GetLastError

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	of zero length	
FILE_ACCESS_DATE	Date of the last access to the file	FileGetInteger
FILE_ANSI	Strings of ANSI type (one byte symbols). Flag is used in FileOpen().	FileOpen
FILE_BIN	Binary read/write mode (without string to string conversion). Flag is used in FileOpen().	FileOpen
FILE_COMMON	The file path in the	FileOpen, FileCopy, FileMove, FileIsExist

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	common folder of all client terminals \Terminal\Common\Files. Flag is used in FileOpen(), FileCopy(), FileMove() and in FileIsExist() functions.	
FILE_CREATE_DATE	Date of creation	FileGetInteger
FILE_CSV	CSV file (all its elements are converted to strings of the appropriate	FileOpen

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	type, Unicode or ANSI, and separated by separator). Flag is used in FileOpen().	
FILE_END	Get the end of file sign	FileGetInteger
FILE_EXISTS	Check the existence	FileGetInteger
FILE_IS_ANSI	The file is opened as ANSI (see FILE_ANSI)	FileGetInteger
FILE_IS_BINARY	The file is opened as a binary file (see FILE_BIN)	FileGetInteger
FILE_IS_COMMON	The file is opene	FileGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	d in a shared folder of all terminals (see FILE_COMMON)	
FILE_IS_CSV	The file is opened as CSV (see FILE_CSV)	FileGetInteger
FILE_IS_READABLE	The opened file is readable (see FILE_READ)	FileGetInteger
FILE_IS_TEXT	The file is opened as a text file (see FILE_TXT)	FileGetInteger
FILE_IS_WRITABLE	The opened file is writable (see FILE_	FileGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	WRITE)	
FILE_LINE_END	Get the end of line sign	FileGetInteger
FILE_MODIFY_DATE	Date of the last modification	FileGetInteger
FILE_POSITION	Position of a pointer in the file	FileGetInteger
FILE_READ	File is opened for reading. Flag is used in FileOpen(). When opening a file specification of FILE_WRITE and/or FILE_READ	FileOpen

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	is required.	
FILE_REWRITE	Possibility for the file rewrite using functions FileCopy() and FileMove(). The file should exist or should be opened for writing, otherwise the file will not be opened.	FileCopy, FileMove
FILE_SHARE_READ	Shared access for reading from several	FileOpen

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	programs. Flag is used in FileOpen(), but it does not replace the necessity to indicate FILE_WRITE and/or the FILE_READ flag when opening a file.	
FILE_SHARE_WRITE	Shared access for writing from several programs. Flag is used in FileOpen(), but it	FileOpen

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	does not replace the necessity to indicate FILE_WRITE and/or the FILE_READ flag when opening a file.	
FILE_SIZE	File size in bytes	FileGetInteger
FILE_TXT	Simple text file (the same as csv file, but without taking into account the separators). Flag is used in FileOpen().	FileOpen

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
FILE_UNICODE	Strings of UNICODE type (two byte symbols). Flag is used in FileOpen().	FileOpen
FILE_WRITE	File is opened for writing. Flag is used in FileOpen(). When opening a file specification of FILE_WRITE and/or FILE_READ is required.	FileOpen
FLT_DIG	Number of signifi	Numerical Type Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	cant decimal digits for float type	
FLT_EPSILON	Minimal value, which satisfies the condition: 1.0+DBL_EPSILON != 1.0 (for float type)	Numerical Type Constants
FLT_MANT_DIG	Bits count in a mantissa for float type	Numerical Type Constants
FLT_MAX	Maximal value, which can be represented by float type	Numerical Type Constants
FLT_MAX_10_EXP	Maximal decimal	Numerical Type Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	value of exponent degree for float type	
FLT_MAX_EXP	Maximal binary value of exponent degree for float type	Numerical Type Constants
FLT_MIN	Minimal positive value, which can be represented by float type	Numerical Type Constants
FLT_MIN_10_EXP	Minimal decimal value of exponent degree for float type	Numerical Type Constants

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
FLT_MIN_EXP	Minimal binary value of exponent degree for float type	Numerical Type Constants
FRIDAY	Friday	SymbolInfoInteger, SymbolInfoSessionQuote, SymbolInfoSessionTrade
GANN_DOWN_TREND	Line corresponding to the downward trend	ObjectSetInteger, ObjectGetInteger
GANN_UP_TREND	Line corresponding to the uptrend line	ObjectSetInteger, ObjectGetInteger
GATORJAW_LINE	Jaw line	Indicators Lines
GATORLIPS_LINE	Lips line	Indicators Lines
GATORTEETH_LINE	Teeth line	Indicators Lines

	cal object	
OBJPROP_CREATETIME	Time of object creation	ObjectSetInteger, ObjectGetInteger
OBJPROP_DATE_SCALE	Displaying the time scale for the Chart object	ObjectSetInteger, ObjectGetInteger
OBJPROP_DEGREE	Level of the Elliott Wave Marking	ObjectSetInteger, ObjectGetInteger
OBJPROP_DEVIATION	Deviation for the Standard Deviation Channel	ObjectSetDouble, ObjectGetDouble
OBJPROP_DIRECTION	Trend of the Gann object	ObjectSetInteger, ObjectGetInteger
OBJPROP_DRAWLINES	Displaying lines for marking the	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	Elliott Wave	
OBJPROP_ELLIPSE	Showing the full ellipse of the Fibonacci Arc object (OBJ_FIBOARC)	ObjectSetInteger, ObjectGetInteger
OBJPROP_FILL	Fill an object with color (for OBJ_RECTANGLE, OBJ_TRIANGLE, OBJ_ELLIPSE, OBJ_CHANNEL, OBJ_STDDEVCHANNEL, OBJ_REGRESSION)	ObjectSetInteger, ObjectGetInteger
OBJPROP_FONT	Font	ObjectSetString, ObjectGetString
OBJPROP_FONTSIZE	Font size	ObjectSetInteger, ObjectGetInteger
OBJPROP_HIDDEN	Prohibit showi	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ng of the name of a graphical object in the list of objects from the terminal menu "Charts" - "Objects" - "List of objects". The true value allows to hide an object from the list. By default, true is set to the objects that display calendar event	

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	s, trading history and to the objects created from MQL5 programs. To see such graphical objects and access their properties, click on the "All" button in the "List of objects" window.	
OBJPROP_LEVELCOLOR	Color of the line-level	ObjectSetInteger, ObjectGetInteger
OBJPROP_LEVELS	Number of levels	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
OBJPROP_LEVELSTYLE	Style of the line-level	ObjectSetInteger, ObjectGetInteger
OBJPROP_LEVELTEXT	Level description	ObjectSetString, ObjectGetString
OBJPROP_LEVELVALUE	Level value	ObjectSetDouble, ObjectGetDouble
OBJPROP_LEVELWIDTH	Thickness of the line-level	ObjectSetInteger, ObjectGetInteger
OBJPROP_NAME	Object name	ObjectSetString, ObjectGetString
OBJPROP_PERIOD	Timeframe for the Chart object	ObjectSetInteger, ObjectGetInteger
OBJPROP_PRICE	Price coordinate	ObjectSetDouble, ObjectGetDouble
OBJPROP_PRICE_SCALE	Displaying the price scale for the Chart object	ObjectSetInteger, ObjectGetInteger
OBJPROP_RAY	A vertical line goes through all	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	the windows of a chart	
OBJPROP_RAY_LEFT	Ray goes to the left	ObjectSetInteger, ObjectGetInteger
OBJPROP_RAY_RIGHT	Ray goes to the right	ObjectSetInteger, ObjectGetInteger
OBJPROP_READONLY	Ability to edit text in the Edit object	ObjectSetInteger, ObjectGetInteger
OBJPROP_SCALE	Scale (properties of Gann objects and Fibonacci Arcs)	ObjectSetDouble, ObjectGetDouble
OBJPROP_SELECTABLE	Object availability	ObjectSetInteger, ObjectGetInteger
OBJPROP_SELECTED	Object is selected	ObjectSetInteger, ObjectGetInteger
OBJPROP_STATE	Button state (pressed /	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	depressed)	
OBJPROP_STYLE	Style	ObjectSetInteger, ObjectGetInteger
OBJPROP_SYMBOL	Symbol for the Chart object	ObjectSetString, ObjectGetString
OBJPROP_TEXT	Description of the object (the text contained in the object)	ObjectSetString, ObjectGetString
OBJPROP_TIME	Time coordinate	ObjectSetInteger, ObjectGetInteger
OBJPROP_TIMEFRAMES	Visibility of an object at timeframes	ObjectSetInteger, ObjectGetInteger
OBJPROP_TOOLTIP	The text of a tooltip. If the property is not set, then the tooltip gener	ObjectSetString, ObjectGetString

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ated automatically by the terminal is shown. A tooltip can be disabled by setting the "\n" (line feed) value to it	
OBJPROP_TYPE	Object type	ObjectSetInteger, ObjectGetInteger
OBJPROP_WIDTH	Line thickness	ObjectSetInteger, ObjectGetInteger
OBJPROP_XDISTANCE	The distance in pixels along the X axis from the binding corner (see note)	ObjectSetInteger, ObjectGetInteger
OBJPROP_XOFFSET	The X coordinate of the upper	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	left corner of the rectangular visible area in the graphical objects "Bitmap Label" and "Bitmap" (OBJ_BITMAP_LABEL and OBJ_BITMAP). The value is set in pixels relative to the upper left corner of the original image.	
OBJPROP_XSIZE	The object's width along the X axis	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	in pixels. Specified for OBJ_LABEL (read only), OBJ_BUTTON, OBJ_CHART, OBJ_BITMAP, OBJ_BITMAP_LABEL, OBJ_EDIT, OBJ_RECTANGLE_LABEL objects.	
OBJPROP_YDISTANCE	The distance in pixels along the Y axis from the binding corner (see note)	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
OBJPROP_YOFFSET	The Y coordinate of the upper left corner of the rectangular visible area in the graphical objects "Bitmap Label" and "Bitmap" (OBJ_BITMAP_LABEL and OBJ_BITMAP). The value is set in pixels relative to the upper left corner of the original image.	ObjectSetInteger, ObjectGetInteger
OBJPROP_YSIZE	The object	ObjectSetInteger, ObjectGetInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	's height along the Y axis in pixels. Specified for OBJ_LABEL (read only), OBJ_BUTTON, OBJ_CHART, OBJ_BITMAP, OBJ_BITMAP_LABEL, OBJ_EDIT, OBJ_RECTANGLE_LABEL objects.	
OBJPROP_ZORDER	Priority of a graphical object for receiving events of	ObjectSetInteger, ObjectGetInteger

Constant	Description	Usage
	an asset at a specified price	
SYMBOL_OPTION_STRIKE	The strike price of an option. The price at which an option buyer can buy (in a Call option) or sell (in a Put option) the underlying asset, and the option seller is obliged to sell or buy the appropriate amount of the	SymbolInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	underlying asset.	
SYMBOL_ORDER_LIMIT	Limit orders are allowed (Buy Limit and Sell Limit)	SymbolInfoInteger
SYMBOL_ORDER_MARKET	Market orders are allowed (Buy and Sell)	SymbolInfoInteger
SYMBOL_ORDER_MODE	Flags of allowed order types	SymbolInfoInteger
SYMBOL_ORDER_SL	Stop Loss is allowed	SymbolInfoInteger
SYMBOL_ORDER_STOP	Stop orders are allowed (Buy Stop and Sell Stop)	SymbolInfoInteger
SYMBOL_ORDER_STOP_LIMIT	Stop-limit orders are	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	allowed (Buy Stop Limit and Sell Stop Limit)	
SYMBOL_ORDER_TP	Take Profit is allowed	SymbolInfoInteger
SYMBOL_PATH	Path in the symbol tree	SymbolInfoString
SYMBOL_POINT	Symbol point value	SymbolInfoDouble
SYMBOL_SELECT	Symbol is selected in Market Watch	SymbolInfoInteger
SYMBOL_SESSION_AW	Average weighted price of the current session	SymbolInfoDouble
SYMBOL_SESSION_BUY_ORDERS	Number of Buy orders at the	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	moment	
SYMBOL_SESSION_BUY_ORDERS_VOLUME	Current volume of Buy orders	SymbolInfoDouble
SYMBOL_SESSION_CLOSE	Close price of the current session	SymbolInfoDouble
SYMBOL_SESSION_DEALS	Number of deals in the current session	SymbolInfoInteger
SYMBOL_SESSION_INTEREST	Summary open interest	SymbolInfoDouble
SYMBOL_SESSION_OPEN	Open price of the current session	SymbolInfoDouble
SYMBOL_SESSION_PRICE_LIMIT_MAX	Maximal price of the current session	SymbolInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
SYMBOL_SESSION_PRICE_LIMIT_MIN	Minimal price of the current session	SymbolInfoDouble
SYMBOL_SESSION_PRICE_SETTLEMENT	Settlement price of the current session	SymbolInfoDouble
SYMBOL_SESSION_SELL_ORDERS	Number of Sell orders at the moment	SymbolInfoInteger
SYMBOL_SESSION_SELL_ORDERS_VOLUME	Current volume of Sell orders	SymbolInfoDouble
SYMBOL_SESSION_TURNOVER	Summary turnover of the current session	SymbolInfoDouble
SYMBOL_SESSION_VOLUME	Summary volume of current sessio	SymbolInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	n deals	
SYMBOL_SPREAD	Spread value in points	SymbolInfoInteger
SYMBOL_SPREAD_FLOAT	Indication of a floating spread	SymbolInfoInteger
SYMBOL_START_TIME	Date of the symbol trade beginning (usually used for futures)	SymbolInfoInteger
SYMBOL_SWAP_LONG	Long swap value	SymbolInfoDouble
SYMBOL_SWAP_MODE	Swap calculation model	SymbolInfoInteger
SYMBOL_SWAP_MODE_CURRENCY_DEPOSIT	Swaps are charged in money, in client deposit	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	currency	
SYMBOL_SWAP_MODE_CURRENCY_MARGIN	Swaps are charged in money in margin currency of the symbol	SymbolInfoInteger
SYMBOL_SWAP_MODE_CURRENCY_SYMBOL	Swaps are charged in money in base currency of the symbol	SymbolInfoInteger
SYMBOL_SWAP_MODE_DISABLED	Swaps disabled (no swaps)	SymbolInfoInteger
SYMBOL_SWAP_MODE_INTEREST_CURRENT	Swaps are charged as the specified annual interest from the	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	instrument price at calculation of swap (standard bank year is 360 days)	
SYMBOL_SWAP_MODE_INTEREST_OPEN	Swaps are charged as the specified annual interest from the open price of position (standard bank year is 360 days)	SymbolInfoInteger
SYMBOL_SWAP_MODE_POINTS	Swaps are charged in points	SymbolInfoInteger
SYMBOL_SWAP_MODE_REOPEN_BID	Swaps are charg	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ed by reopening positions. At the end of a trading day the position is closed. Next day it is reopened by the current Bid price +/- specified number of points (parameters SYMBOL_SWAP_LONG and SYMBOL_SWAP_SHORT)	
SYMBOL_SWAP_MODE_REOPEN_CURRENT	Swaps are charged by reope	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ning positions. At the end of a trading day the position is closed. Next day it is reopened by the close price +/- specified number of points (parameters SYMBOL_SWAP_LONG and SYMBOL_SWAP_SHORT)	
SYMBOL_SWAP_ROLLOVER3DAYS	Day of week to charge 3 days swap	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	rollover	
SYMBOL_SWAP_SHORT	Short swap value	SymbolInfoDouble
SYMBOL_TICKS_BOOKDEPTH	Maximal number of requests shown in Depth of Market. For symbols that have no queue of requests, the value is equal to zero.	SymbolInfoInteger
SYMBOL_TIME	Time of the last quote	SymbolInfoInteger
SYMBOL_TRADE_CALC_MODE	Contract price calculation mode	SymbolInfoInteger
SYMBOL_TRADE_CONTRACT_SIZE	Trade contract size	SymbolInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
SYMBOL_TRADE_EXECUTION_EXCHANGE	Exchange execution	SymbolInfoInteger
SYMBOL_TRADE_EXECUTION_INSTANT	Instant execution	SymbolInfoInteger
SYMBOL_TRADE_EXECUTION_MARKET	Market execution	SymbolInfoInteger
SYMBOL_TRADE_EXECUTION_REQUEST	Execution by request	SymbolInfoInteger
SYMBOL_TRADE_EXEMODE	Deal execution mode	SymbolInfoInteger
SYMBOL_TRADE_FREEZE_LEVEL	Distance to freeze trade operations in points	SymbolInfoInteger
SYMBOL_TRADE_MODE	Order execution type	SymbolInfoInteger
SYMBOL_TRADE_MODE_CLOSEONLY	Allowed only position close operations	SymbolInfoInteger
SYMBOL_TRADE_MODE_DISABLED	Trade is disabl	SymbolInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ed for the symbol	
SYMBOL_TRADE_MODE_FULL	No trade restrictions	SymbolInfoInteger
SYMBOL_TRADE_MODE_LONGONLY	Allowed only long positions	SymbolInfoInteger
SYMBOL_TRADE_MODE_SHORTONLY	Allowed only short positions	SymbolInfoInteger
SYMBOL_TRADE_STOPS_LEVEL	Minimal indention in points from the current close price to place Stop orders	SymbolInfoInteger
SYMBOL_TRADE_TICK_SIZE	Minimal price change	SymbolInfoDouble
SYMBOL_TRADE_TICK_VALUE	Value of SYMBOL_TRADE_TICK	SymbolInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	_VALUE_PROFIT	
SYMBOL_TRADE_TICK_VALUE_LOSS	Calculated tick price for a losing position	SymbolInfoDouble
SYMBOL_TRADE_TICK_VALUE_PROFIT	Calculated tick price for a profitable position	SymbolInfoDouble
SYMBOL_VOLUME	Volume of the last deal	SymbolInfoInteger
SYMBOL_VOLUME_LIMIT	Maximum allowed aggregate volume of an open position and pending orders in one direction (buy	SymbolInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	or sell) for the symbol. For example, with the limitation of 5 lots, you can have an open buy position with the volume of 5 lots and place a pending order Sell Limit with the volume of 5 lots. But in this case you cannot place a Buy	

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	Limit pending order (since the total volume in one direction will exceed the limitation) or place Sell Limit with the volume more than 5 lots.	
SYMBOL_VOLUME_MAX	Maximal volume for a deal	SymbolInfoDouble
SYMBOL_VOLUME_MIN	Minimal volume for a deal	SymbolInfoDouble
SYMBOL_VOLUME_STEP	Minimal volume change step for deal	SymbolInfoDouble

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	execution	
SYMBOL_VOLUMEHIGH	Maximal day volume	SymbolInfoInteger
SYMBOL_VOLUMELOW	Minimal day volume	SymbolInfoInteger
TENKANSEN_LINE	Tenkan-sen line	Indicators Lines
TERMINAL_BUILD	The client terminal build number	TerminalInfoInteger
TERMINAL_CODEPAGE	Number of the code page of the language installed in the client terminal	TerminalInfoInteger
TERMINAL_COMMONDATA_PATH	Common path for all of the terminals installed on	TerminalInfoString

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	a computer	
TERMINAL_COMMUNITY_ACCOUNT	The flag indicates the presence of MQL5.community authorization data in the terminal	TerminalInfoInteger
TERMINAL_COMMUNITY_BALANCE	Balance in MQL5.community	TerminalInfoDouble
TERMINAL_COMMUNITY_CONNECTION	Connection to MQL5.community	TerminalInfoInteger
TERMINAL_COMPANY	Company name	TerminalInfoString
TERMINAL_CONNECTED	Connection to a trade server	TerminalInfoInteger
TERMINAL_CPU_CORES	The numb	TerminalInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	er of CPU cores in the system	
TERMINAL_DATA_PATH	Folder in which terminal data are stored	TerminalInfoString
TERMINAL_DISK_SPACE	Free disk space for the MQL5\Files folder of the terminal (agent), MB	TerminalInfoInteger
TERMINAL_DLLS_ALLOWED	Permission to use DLL	TerminalInfoInteger
TERMINAL_EMAIL_ENABLED	Permission to send e-mails using SMTP-server and login, specified in the	TerminalInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	terminal settings	
TERMINAL_FTP_ENABLED	Permission to send reports using FTP-server and login, specified in the terminal settings	TerminalInfoInteger
TERMINAL_LANGUAGE	Language of the terminal	TerminalInfoString
TERMINAL_MAXBARS	The maximal bars count on the chart	TerminalInfoInteger
TERMINAL_MEMORY_AVAILABLE	Free memory of the terminal (agent) process, MB	TerminalInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
TERMINAL_MEMORY_PHYSICAL	Physical memory in the system, MB	TerminalInfoInteger
TERMINAL_MEMORY_TOTAL	Memory available to the process of the terminal (agent), MB	TerminalInfoInteger
TERMINAL_MEMORY_USED	Memory used by the terminal (agent), MB	TerminalInfoInteger
TERMINAL_MQID	The flag indicates the presence of MetaQuotes ID data for Push notifications	TerminalInfoInteger
TERMINAL_NAME	Terminal	TerminalInfoString

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	name	
TERMINAL_NOTIFICATIONS_ENABLED	Permission to send notifications to smartphone	TerminalInfoInteger
TERMINAL_OPENCL_SUPPORT	The version of the supported OpenCL in the format of 0x00010002 = 1.2. "0" means that OpenCL is not supported	TerminalInfoInteger
TERMINAL_PATH	Folder from which the terminal is started	TerminalInfoString
TERMINAL_PING_LAST	The last known value of a	TerminalInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ping to a trade server in microseconds. One second comprises of one million microseconds	
TERMINAL_SCREEN_DPI	The resolution of information display on the screen is measured as number of Dots in a line per Inch (DPI).	TerminalInfoInteger
TERMINAL_TRADE_ALLOWED	Permission to trade	TerminalInfoInteger
TERMINAL_X64	Indication of the "64-	TerminalInfoInteger

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	bit terminal"	
THURSDAY	Thursday	SymbolInfoInteger, SymbolInfoSessionQuote, SymbolInfoSessionTrade
TRADE_ACTION_DEAL	Place a trade order for an immediate execution with the specified parameters (market order)	MqlTradeRequest
TRADE_ACTION_MODIFY	Modify the parameters of the order placed previously	MqlTradeRequest
TRADE_ACTION_PENDING	Place a trade order for the execution under specified condit	MqlTradeRequest

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	ions (pending order)	
TRADE_ACTION_REMOVE	Delete the pending order placed previously	MqlTradeRequest
TRADE_ACTION_SLTP	Modify Stop Loss and Take Profit values of an opened position	MqlTradeRequest
TRADE_RETCODE_CANCEL	Request canceled by trader	MqlTradeResult
TRADE_RETCODE_CLIENT_DISABLES_AT	Autotrading disabled by client terminal	MqlTradeResult
TRADE_RETCODE_CONNECTION	No connection with the trade server	MqlTradeResult

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
TRADE_RETCODE_DONE	Request completed	MqlTradeResult
TRADE_RETCODE_DONE_PARTIAL	Only part of the request was completed	MqlTradeResult
TRADE_RETCODE_ERROR	Request processing error	MqlTradeResult
TRADE_RETCODE_FROZEN	Order or position frozen	MqlTradeResult
TRADE_RETCODE_INVALID	Invalid request	MqlTradeResult
TRADE_RETCODE_INVALID_EXPIRATION	Invalid order expiration date in the request	MqlTradeResult
TRADE_RETCODE_INVALID_FILL	Invalid order filling type	MqlTradeResult
TRADE_RETCODE_INVALID_ORDER	Incorrect or prohibited	MqlTradeResult

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	order type	
TRADE_RETCODE_INVALID_PRICE	Invalid price in the request	MqlTradeResult
TRADE_RETCODE_INVALID_STOPS	Invalid stops in the request	MqlTradeResult
TRADE_RETCODE_INVALID_VOLUME	Invalid volume in the request	MqlTradeResult
TRADE_RETCODE_LIMIT_ORDERS	The number of pending orders has reached the limit	MqlTradeResult
TRADE_RETCODE_LIMIT_VOLUME	The volume of orders and positions for the symbol has reached the limit	MqlTradeResult

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
TRADE_RETCODE_LOCKED	Request locked for processing	MqlTradeResult
TRADE_RETCODE_MARKET_CLOSED	Market is closed	MqlTradeResult
TRADE_RETCODE_NO_CHANGES	No changes in request	MqlTradeResult
TRADE_RETCODE_NO_MONEY	There is not enough money to complete the request	MqlTradeResult
TRADE_RETCODE_ONLY_REAL	Operation is allowed only for live accounts	MqlTradeResult
TRADE_RETCODE_ORDER_CHANGED	Order state changed	MqlTradeResult
TRADE_RETCODE_PLACED	Order placed	MqlTradeResult
TRADE_RETCODE_POSITION_CLOSED	Position with the	MqlTradeResult

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	specified POSITION_IDENTIFIER has already been closed	
TRADE_RETCODE_PRICE_CHANGED	Prices changed	MqlTradeResult
TRADE_RETCODE_PRICE_OFF	There are no quotes to process the request	MqlTradeResult
TRADE_RETCODE_REJECT	Request rejected	MqlTradeResult
TRADE_RETCODE_REQUOTE	Requote	MqlTradeResult
TRADE_RETCODE_SERVER_DISABLES_AT	Autotrading disabled by server	MqlTradeResult
TRADE_RETCODE_TIMEOUT	Request canceled by timeout	MqlTradeResult
TRADE_RETCODE_TOO_MANY_REQUESTS	Too frequent	MqlTradeResult

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	requests	
TRADE_RETCODE_TRADE_DISABLED	Trade is disabled	MqlTradeResult
TRADE_TRANSACTION_DEAL_ADD	Adding a deal to the history. The action is performed as a result of an order execution or performing operations with an account balance.	MqlTradeTransaction
TRADE_TRANSACTION_DEAL_DELETE	Deleting a deal from the history. There may be cases when a	MqlTradeTransaction

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	previously executed deal is deleted from a server. For example, a deal has been deleted in an external trading system (exchange) where it was previously transferred by a broker.	
TRADE_TRANSACTION_DEAL_UPDATE	Updating a deal in the history. There may be cases	MqlTradeTransaction

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	when a previously executed deal is changed on a server. For example, a deal has been changed in an external trading system (exchange) where it was previously transferred by a broker.	
TRADE_TRANSACTION_HISTORY_ADD	Adding an order to the history as a result of execu	MqlTradeTransaction

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	tion or cancellation.	
TRADE_TRANSACTION_HISTORY_DELETE	Deleting an order from the orders history. This type is provided for enhancing functionality on a trade server side.	MqlTradeTransaction
TRADE_TRANSACTION_HISTORY_UPDATE	Changing an order located in the orders history. This type is provided for enhancing functionality on a trade	MqlTradeTransaction

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	server side.	
TRADE_TRANSACTION_ORDER_ADD	Adding a new open order.	MqlTradeTransaction
TRADE_TRANSACTION_ORDER_DELETE	Removing an order from the list of the open ones. An order can be deleted from the open ones as a result of setting an appropriate request or execution (filling) and moving to the history.	MqlTradeTransaction

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
TRADE_TRANSACTION_ORDER_UPDATE	Updating an open order. The updates include not only evident changes from the client terminal or a trade server sides but also changes of an order state when setting it (for example, transition from ORDER_STATE_STARTED to ORDER_STATE_PLACE	MqlTradeTransaction

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	D or from ORDER_STATE_PLACED to ORDER_STATE_PARTIAL, etc.).	
TRADE_TRANSACTION_POSITION	Changing a position not related to a deal execution. This type of transaction shows that a position has been changed on a trade server side. Position volume, open price, Stop Loss	MqlTradeTransaction

© 2000-2025, MetaQuotes Ltd.

Constant	Description	Usage
	and Take Profit levels can be changed. Data on changes are submitted in MqlTradeTransaction structure via OnTradeTransaction handler. Position change (adding, changing or closing), as a result of a deal execution, does not lead to the
