Version with output of the results to the original array:

```cpp
bool MathArctan(
    double& array[]        // array of values
)
```

**Parameters**

array[
  [in] Array of values.

result[
  [out] Array of output values.

array[
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathSinPi

Calculates the values of the \( \sin(\pi x) \) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathSinPi(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathSinPi(
    const double& array[]   // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
**MathCosPi**

Calculates the values of the \( \cos(\pi x) \) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathCosPi(
    const double& array[],    // array of values
    double&    result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCosPi(
    double&    array[]        // array of values
)
```

**Parameters**

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
**MathTanPi**

Calculates the values of the tan(pi*x) function for array elements.

Version with output of the result to a new array:

```c
bool  MathTanPi(
    const double&  array[],  // array of values
    double&        result[]   // array of results
}
```

Version with output of the result to the original array:

```c
bool  MathTanPi(
    double&        array[]     // array of values
}
```

**Parameters**

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathAbs

Calculates the absolute values of array elements.

Version with output of the results to a new array:

```cpp
bool MathAbs(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathAbs(
    double& array[]       // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathCeil

Returns the nearest larger integers for array elements.

Version with output of the results to a new array:

```c
bool MathCeil(
    const double& array[],  // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```c
bool MathCeil(
    double& array[]        // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathFloor

Returns the nearest smaller integers for array elements.

Version with output of the results to a new array:

```cpp
bool MathFloor(
    const double& array[],  // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathFloor(
    double& array[]         // array of values
)
```

Parameters

array[]

[in] Array of values.

result[]

[out] Array of output values.

array[]

[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathSqrt

Calculates the square roots of array elements.

Version with output of the results to a new array:

```cpp
bool MathSqrt(
    const double& array[], // array of values
    double& result[]  // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathSqrt(
    double& array[]  // array of values
)
```

**Parameters**

- `array[]`
  - [in] Array of values.

- `result[]`
  - [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathExp

Calculates the values of the exp(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathExp(
    const double& array[], // array of values
    double& result[]   // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathExp(
    double& array[]  // array of values
)
```

Parameters

array[]

[in] Array of values.

result[]

[out] Array of output values.

array[]

[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
### MathPow

Calculates the values of the pow(x, power) function for array elements.

Version with output of the results to a new array:

```c
bool MathPow(
    const double& array[],     // array of values
    const double power,        // power
    double& result[]           // array of results
)
```

Version with output of the results to the original array:

```c
bool MathPow(
    double& array[],           // array of values
    const double power         // power
)
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

- `array[]`  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
**MathLog**

Calculates the values of the log(x) function for array elements.

Version for calculating the natural logarithm with output of the results to a new array.

```cpp
bool MathLog(
    const double& array[],    // array of values
    double& result[]          // array of results
)
```

Version for calculating the natural logarithm with output of the results to the original array.

```cpp
bool MathLog(
    double& array[]            // array of values
)
```

Version for calculating the logarithm to a specified base with output of the results to a new array.

```cpp
bool MathLog(
    const double& array[],    // array of values
    const double base,        // base of the logarithm
    double& result[]          // array of results
)
```

Version for calculating the logarithm to a specified base with output of the results to the original array.

```cpp
bool MathLog(
    double& array[],          // array of values
    const double base)        // base of the logarithm
)
```

**Parameters**

- `array[]`
  
  [in] Array of values.

- `base`
  
  [in] The base of the logarithm.

- `array[]`
  
  [out] Array of output values.

- `result[]`
  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathLog2

Calculates the logarithm to the base 2 for the array elements.

Version with output of the results to a new array:

```cpp
bool MathLog2(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathLog2(
    double& array[]        // array of values
)
```

Parameters

- `array[]`
  - [in] Array of values.
- `result[]`
  - [out] Array of output values.
- `array[]`
  - [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathLog10

Calculates the logarithm to the base 10 for the array elements.

Version with output of the results to a new array:

```cpp
bool MathLog10(
    const double& array[],  // array of values
    double& result[]        // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathLog10(
    double& array[]        // array of values
)
```

Parameters

`array[]`

[in] Array of values.

`result[]`

[ out] Array of output values.

`array[]`

[ out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathLog1p

Calculates the values of the log(1+x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathLog1p(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathLog1p(
    double& array[]          // array of values
)
```

Parameters

array[]
[in] Array of values.

result[]
[out] Array of output values.

array[]
[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathDifference

Generates an array with element differences of $y[i]=x[i+\text{lag}]-x[i]$.

Version for a single generation of an array of real values:

```cpp
bool MathDifference(
    const double &array[], // array of values
    const int lag,          // lag
    double &result[]       // array of results
)
```

Version for a single generation of an array of integer values:

```cpp
bool MathDifference(
    const int &array[],    // array of values
    const int lag,         // lag
    int &result[]          // array of results
)
```

Version for iterated generation of an array of real values (the number of iterations is set in the input parameters):

```cpp
bool MathDifference(
    const double &array[],   // array of values
    const int lag,            // lag
    const int differences,    // number of iterations
    double &result[]         // array of results
)
```

Version for iterated generation of an array of integer values (the number of iterations is set in the input parameters):

```cpp
bool MathDifference(
    const int &array[],    // array of values
    const int lag,         // lag
    const int differences, // number of iterations
    int &result[]          // array of results
)
```

Parameters

- `array[]`  
  [in] Array of values.

- `lag` 
  [in] Lag parameter.

- `differences` 
  [in] The number of iterations.

- `result[]`
Standard Library

[out] Array to output the results.

Return Value

Returns true if successful, otherwise false.
MathSample

Generates a random sample from the array elements.

Version for working with an array of real values:

```cpp
bool MathSample(
    const double& array[],  // array of values
    const int count,        // count
    double& result[]        // array of results
)
```

Version for working with an array of integer values:

```cpp
bool MathSample(
    const int& array[],     // array of values
    const int count,        // count
    int& result[]           // array of results
)
```

Version for working with an array of real values. It is possible to obtain a sample with replacement:

```cpp
bool MathSample(
    const double& array[],  // array of values
    const int count,        // count
    const bool replace,     // flag
    double& result[]        // array of results
)
```

Version for working with an array of integer values. It is possible to obtain a sample with replacement:

```cpp
bool MathSample(
    const int& array[],     // array of values
    const int count,        // count
    const bool replace,     // flag
    int& result[]           // array of results
)
```

Version for working with an array of real values, for which the probabilities of sampling are defined:

```cpp
bool MathSample(
    const double& array[],  // array of values
    double& probabilities[], // array of probabilities
    const int count,        // count
    double& result[]        // array of results
)
```

Version for working with an array of integer values, for which the probabilities of sampling are defined.
bool MathSample(
    const int& array[], // array of values
    double& probabilities[], // array of probabilities
    const int count, // count
    int& result[] // array of results
)

Version for working with an array of real values, for which the probabilities of sampling are defined. It is possible to obtain a sample with replacement:

bool MathSample(
    const double& array[], // array of values
    double& probabilities[], // array of probabilities
    const int count, // count
    const bool replace, // flag
    double& result[] // array of results
)

Version for working with an array of integer values, for which the probabilities of sampling are defined. It is possible to obtain a sample with replacement:

bool MathSample(
    const int& array[], // array of values
    double& probabilities[], // array of probabilities
    const int count, // count
    const bool replace, // flag
    int& result[] // array of results
)

Parameters

array[]
    [in] Array of integer values.
probabilities[]
    [in] Array of probabilities for sampling the elements.
count
    [in] The number of elements.
replace
    [in] Parameter that allows sampling with replacement.
result[]
    [out] Array to output the results.

Return Value

Returns true if successful, otherwise false.

Note
The replace=true argument allows performing random sampling of the elements with replacement back to the original sequence.
MathTukeySummary

Calculates the Tukey's five-number summary (minimum, lower quartile, median, upper quartile, maximum) for the array elements.

```cpp
bool MathTukeySummary(
    const double& array[],  // array of values
    const bool removeNAN,    // flag
    double& minimum,         // minimum value
    double& lower_hinge,     // lower quartile
    double& median,          // median value
    double& upper_hinge,     // upper quartile
    double& maximum          // maximum value
)
```

### Parameters

- `array[]`
  - [in] Array of real values.

- `removeNAN`
  - [in] Flag that indicates if non-numeric values are to be removed.

- `minimum`
  - [out] Variable to store the minimum value.

- `lower_hinge`
  - [out] Variable to store the lower quartile.

- `median`
  - [out] Variable to store the median value.

- `upper_hinge`
  - [out] Variable to store the upper quartile.

- `maximum`
  - [out] Variable to store the maximum value.

### Return Value

Returns true if successful, otherwise false.
MathRange

Calculates the minima and maxima of array elements.

```cpp
bool MathRange(
    const double& array[], // array of values
    double& min,           // minimum value
    double& max            // maximum value
)
```

Parameters

`array[]`

[in] Array of values.

`min`

[out] Variable to store the minimum value.

`max`

[out] Variable to store the maximum value.

Return Value

Returns true if successful, otherwise false.
**MathMin**

Returns the minimum value of all array elements.

```cpp
double MathMin(
    const double array[]  // array of values
)
```

**Parameters**

`array[]`

[in] Array of values.

**Return Value**

The minimum value.
MathMax

Returns the maximum value of all array elements.

```c
double MathMax(
    const double& array[]  // array of values
)
```

Parameters

- `array[]`
  - [in] Array of values.

Return Value

- The maximum value.
MathSum

Returns the sum of array elements.

```c
double MathSum(
    const double array[]  // array of values
)
```

Parameters

- `array[]`  
  [in] Array of values.

Return Value

- The sum of the elements.
MathProduct

Returns the product of array elements.

```c
double MathProduct(
    const double& array[]   // array of values
)
```

Parameters

- `array[]`
  - [in] Array of values.

Return Value

- The product of the elements.
MathStandardDeviation

Calculates the standard deviation of array elements.

```c
double MathStandardDeviation(
    const double array[]   // array of values
)
```

**Parameters**

`array[]`

[in] Array of values.

**Return Value**

Standard deviation.
MathAverageDeviation

The function calculates the average absolute deviation of array elements.

```c
double MathAverageDeviation(
    const double& array[]  // array of values
)
```

Parameters

`array[]`

[IN] Array of values.

Return Value

The average absolute deviation of array elements.
MathMedian

Calculates the median value of array elements.

```c
double MathMedian(
    double& array[]  // array of values
)
```

**Parameters**

`array[]`

[in] Array of values.

**Return Value**

The median value.
**MathMean**

Calculates the mean values of array elements.

```cpp
double MathMean(
    const double& array[] // array of values
)
```

**Parameters**

`array[]`

[in] Array of values.

**Return Value**

The mean value.
MathVariance

The function calculates the variance (second moment) of array elements.

```cpp
double MathVariance(
    const double& array[]  // array of values
)
```

**Parameters**

*array[]*

[in] Array of values.

**Return Value**

Value of the variance.
MathSkewness

The function calculates the skewness (third moment) of array elements.

```cpp
double MathSkewness{
    const double& array[]  // array of values
}
```

Parameters

array[]

[in] Array of values.

Return Value

Skewness.
MathKurtosis

The function calculates the kurtosis (fourth moment) of array elements.

```c
double MathKurtosis(
    const double& array[]   // array of values
)
```

**Parameters**

*array[]*

[in] Array of values.

**Return Value**

Kurtosis.
MathExpm1

Calculates the values of the exp(x)-1 function for array elements.

Version with output of the results to a new array:

```cpp
bool MathExpm1(
    const double& array[],  // array of values
    double& result[]  // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathExpm1(
    double& array[]  // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathSinh

Calculates the values of the sinh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathSinh(
    const double& array[], // array of values
double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathSinh(
    double& array[]      // array of values
)
```

Parameters

`array[]`
- [in] Array of values.

`result[]`
- [out] Array of output values.

`array[]`
- [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathCosh

Calculates the values of the cosh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathCosh(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCosh(
    double& array[]        // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
**MathTanh**

Calculates the values of the tanh(x) function for array elements.

**Version with output of the results to a new array:**

```cpp
bool MathTanh(
    const double& array[],    // array of values
    double& result[]          // array of results
)
```

**Version with output of the results to the original array:**

```cpp
bool MathTanh(
    double& array[]            // array of values
)
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
**MathArcsinh**

Calculates the values of the arcsinh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArcsinh(
    const double& array[],  // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArcsinh(
    double& array[]         // array of values
)
```

**Parameters**

- `array[]`
  - [in] Array of values.

- `result[]`
  - [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
**MathArccosh**

Calculates the values of the arccosh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArccosh(
    const double& array[], // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArccosh(
    double& array[]        // array of values
)
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathArctanh

Calculates the values of the arctanh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArctanh(
    const double& array[], // array of values
    double& result[]  // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArctanh(
    double& array[]       // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathSignif

 Rounds a value to the specified number of digits in the mantissa.

 Version for working with a real value:

```cpp
double MathSignif(
    const double x, // value
    const int digits // number of decimal places
)
```

Return Value

The rounded value.

 Version for working with an array of real values and with output of the results to a separate array:

```cpp
bool MathSignif(
    const double& array[], // array of values
    int digits, // number of decimal places
    double result[] // array of results
)
```

Return Value

Returns true if successful, otherwise false.

 Version for working with an array of real values and with output of the results to the original array:

```cpp
bool MathSignif(
    double& array[], // array of values
    int digits // number of decimal places
)
```

Return Value

Returns true if successful, otherwise false.

Parameters

x

[in] Real value to be rounded.

digits

[in] Number of decimal places.

array[]

[in] Array of real values.

array[]

[out] Array of output values.

result[]

[out] Array of output values.
MathRank

Calculates the ranks of array elements.

Version for working with an array of real values:

```cpp
bool MathRank(
    const double& array[], // array of values
double& rank[]          // array of ranks
)
```

Version for working with an array of integer values:

```cpp
bool MathRank(
    const int& array[], // array of values
double& rank[]       // array of ranks
)
```

Parameters

array[]
  [in] Array of values.

rank[]
  [out] Array to output the ranks.

Return Value

Returns true if successful, otherwise false.
MathCorrelationPearson

Calculates the Pearson’s correlation coefficient.

Version for working with arrays of real values:

```c
bool MathCorrelationPearson(
    const double& array1[], // the first array of values
    const double& array2[], // the second array of values
    double& r           // correlation coefficient
)
```

Version for working with arrays of integer values:

```c
bool MathCorrelationPearson(
    const int& array1[], // the first array of values
    const int& array2[], // the second array of values
    double& r           // correlation coefficient
)
```

**Parameters**

`array1[]`

[in] The first array of values.

`array2[]`

[in] The second array of values.

`r`

[out] Variable to store the correlation coefficient.

**Return Value**

Returns true if successful, otherwise false.
MathCorrelationSpearman

Calculates the Spearman’s correlation coefficient.

Version for working with arrays of real values:

```cpp
bool MathCorrelationSpearman(
    const double& array1[], // the first array of values
    const double& array2[], // the second array of values
    double& r               // correlation coefficient
)
```

Version for working with arrays of integer values:

```cpp
bool MathCorrelationSpearman(
    const int& array1[],   // the first array of values
    const int& array2[],   // the second array of values
    double& r              // correlation coefficient
)
```

**Parameters**

array1[]

[in] The first array of values.

array2[]

[in] The second array of values.

r

[out] Variable to store the correlation coefficient.

**Return Value**

Returns true if successful, otherwise false.
MathCorrelationKendall

Calculates the Kendall's correlation coefficient.

Version for working with arrays of real values:

```c
bool MathCorrelationKendall(
    const double& array1[], // the first array of values
    const double& array2[], // the second array of values
    double& tau // correlation coefficient
)
```

Version for working with arrays of integer values:

```c
bool MathCorrelationKendall(
    const int& array1[], // the first array of values
    const int& array2[], // the second array of values
    double& tau // correlation coefficient
)
```

Parameters

`array1[]`
- [in] The first array of values.

`array2[]`
- [in] The second array of values.

`tau`
- [out] Variable to store the correlation coefficient.

Return Value

Returns true if successful, otherwise false.
MathQuantile

Calculates sample quantiles corresponding to the specified probabilities: 
\[ Q[i](p) = (1 - \text{gamma}) \times x[j] + \text{gamma} \times x[j+1] \]

```c
bool MathQuantile(
    const double& array[],             // array of values
    const double& probs[],             // array of probabilities
    double& quantile[]                 // array to output the quantiles
)
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `probs[]`  

- `quantile[]`  
  [out] Array to output the quantiles.

**Return Value**

Returns true if successful, otherwise false.
MathProbabilityDensityEmpirical

The function calculates the empirical probability density function (pdf) for random values from an array.

```cpp
bool MathProbabilityDensityEmpirical(
    const double& array[], // array of random values
    const int count, // the number of pairs
    double& x[], // array of x values
    double& pdf[] // array of pdf values
)
```

Parameters

`array[]`
- [in] Array of random values.

`count`
- [in] The number of (x, pdf(x)) pairs.

`x[]`
- [out] Array to output the x values.

`pdf[]`
- [out] Array to output the pdf(x) values.

Return Value

Returns true if successful, otherwise false.
MathCumulativeDistributionEmpirical

The function calculates the empirical cumulative distribution function (cdf) for random values from an array.

```cpp
bool MathCumulativeDistributionEmpirical(
    const double& array[], // array of random values
    const int count, // the number of pairs
    double& x[], // array of x values
    double& cdf[] // array of cdf values
)
```

Parameters

array[]
- [in] Array of random values.

count
- [in] The number of (x, cdf(x)) pairs.

x[]
- [out] Array to output the x values.

cdf[]
- [out] Array to output the cdf(x) values.

Return Value

Returns true if successful, otherwise false.
Fuzzy is a library for working with fuzzy logic

Fuzzy logic is a synthesis of the traditional Aristotelian logic when truth is marked as a linguistic variable. Fuzzy logic, equivalent to classical logic, has its own fuzzy logic operations on fuzzy sets defined. There are the same operations for fuzzy sets as well as for ordinary sets, only their calculation is by far more difficult. We should also note that the composition of fuzzy sets constitutes as a fuzzy set.

The main principles of fuzzy logic, setting it apart from classical logic, are the maximum proximity to the reflection of reality and a high level of subjectivity, which can lead to significant errors in calculations.

Fuzzy model (or system) is a mathematical model whose calculation is based on fuzzy logic. Construction of such models is applicable when the subject of study has a weak formalization and its exact mathematical description is too complex or unknown. The quality of these models’ output values (error model) directly depends only on the Expert Advisor, which set up this model. The best option to minimize errors is to draw the most complete and comprehensive model and subsequently adjust it with machine learning on a large training set.

The progress of a model construction can be divided into three main stages:
1. Definition of input and output characteristics of a model.
2. Building a knowledge base.
3. Selecting one of the methods of fuzzy inference (Mamdani or Sugeno).

The first stage directly effects the consequent two and determines the future operation of the model. A knowledge base or, as sometimes called, rule base is a set of fuzzy rules type: "if, then" that define the relationship between inputs and outputs of the examined object. The number of rules in the system is not limited and is also determined by the Expert Advisor. The generalized format of fuzzy rules is as follows:

If rule condition, then rule conclusion.

Rule condition describes the current state of the object, and rule conclusion — how this condition affects the object. General view of conditions and conclusions cannot be selected because they are determined by a fuzzy inference.

Each rule in the system has its weight — this characteristic defines the importance of a rule in the model. Weighting factors are assigned to a rule within range \([0, 1]\). In many examples with fuzzy models, which can be found in the relevant literature, weight data is not specified, but it does not mean that it is not present. In fact, in such case for each rule from the database, the weight is fixed and equals unity. There can be two types of terms and conclusions for each rule:
1. simple — includes one fuzzy variable;
2. complex — includes several fuzzy variables.

Depending on the created knowledge base, the system of fuzzy inference is determined for a model. Fuzzy logical inference is a receipt of conclusion in form of a fuzzy set corresponding to the current value of the inputs with use of knowledge base and fuzzy operations. The two main types of fuzzy inference are Mamdani and Sugeno.
# Membership functions

A membership function is a function that allows to calculate the membership degree of a random element of the universal set to a fuzzy set. Consequently, the domain of a membership function should be within the range $[0, 1]$.

In most cases, the membership function is continuous and monotonic.

</table>
**CConstantMembershipFunction**

Class for implementing a membership function as a straight line in parallel with the coordinate axis.

**Description**

The function is described by the equation:

\[ y(x) = c \]

Therefore, the membership degree for the function is the same along the entire numerical axis and is equal to the parameter specified in the constructor.

![Chart](image)

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CConstantMembershipFunction : public IMembershipFunction
```

**Title**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

    graphic.YAxis().Min(0.0);
    graphic.YAxis().Max(1.1);
    graphic.YAxis().DefaultStep(0.2);

    //--- plot
```
### GetValue

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const double x  // membership function argument
)
```

**Parameters**

- `x`

**Return Value**

Membership function value.
CCompositeMembershipFunction

Class for implementing a composition of membership functions.

Description

Composition of membership functions is a combination of two or more membership functions using a specified operator.

A sample code for plotting a chart is displayed below.

Declaration

class CCompositeMembershipFunction : public IMembershipFunction

Title

#include <Math\Fuzzy\membershipfunction.mqh>

Inheritance hierarchy

CObject
   IMembershipFunction
      CCompositeMembershipFunction

Example

```csharp
#include <Math\Fuzzy\membershipfunction.mqh>
#include <Graphics\Graphic.mqh>

//--- Create membership functions
CProductTwoSigmoidalMembershipFunctions func1(2,1,-1,7);
CP_ShapedMembershipFunction func2(0,6,7,9);
CCompositeMembershipFunction composite(ProdMF, GetPointer(func1), GetPointer(func2));
//--- Create wrappers for membership functions
double ProductTwoSigmoidalMembershipFunctions(double x) { return func1.GetValue(x); }
double P_ShapedMembershipFunction(double x) { return func2.GetValue(x); }
double CompositeMembershipFunction(double x) { return composite.GetValue(x); }

void OnStart()
{
    //--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"CompositeMembershipFunction",0,30,30,780,380))
    {
        graphic.Attach(0,"CompositeMembershipFunction");
    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("CompositeMembershipFunction");
    graphic.BackgroundMainSize(16);

    //--- create curve
    graphic.CurveAdd(P_ShapedMembershipFunction,0.0,10.0,0.1,CURVE_LINES,"Func1");
    graphic.CurveAdd(ProductTwoSigmoidalMembershipFunctions,0.0,10.0,0.1,CURVE_LINES,"Func2");
    graphic.CurveAdd(CompositeMembershipFunction,0.0,10.0,0.1,CURVE_LINES,"Func1 * Func2");

    //--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
    graphic.XAxis().Min(0.0);
    graphic.XAxis().Max(10.0);
    graphic.XAxis().DefaultStep(1.0);

    //--- sets the Y-axis properties
    graphic.YAxis().AutoScale(false);
    graphic.YAxis().Min(0.0);
    graphic.YAxis().Max(1.1);
    graphic.YAxis().DefaultStep(0.2);

    //--- plot
```
CompositionType

Sets the composition operator.

```cpp
void CompositionType(
    MfCompositionType value // operator type
)
```

Parameters

- **value**
  - [in] Composition operator type.

Note

The following operator types are available:
- MinMF (minimum of functions)
- MaxMF (maximum of functions)
- ProdMF (product of functions)
- SumMF (sum of functions)

MembershipFunctions

Gets the list of membership functions included into a composition.

```cpp
CList* MembershipFunctions(
    void // list of membership functions
)
```

Return Value

List of membership functions.

GetValue

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const x // membership function argument
)
```

Parameters

- **x**

Return Value
Membership function value.
CDifferencTwoSigmoidalMembershipFunction

Class for implementing the membership function in the form of a difference between two sigmoid functions with the \( A_1, A_2, C_1 \) and \( C_2 \) parameters.

**Description**

The function is based on a sigmoid curve. It allows creating membership functions with the values equal to 1 beginning with an argument value. Such functions are suitable if you need to set such linguistic terms as "short" or "long".

![DifferencTwoSigmoidalMembershipFunction](image)

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CDifferencTwoSigmoidalMembershipFunction : public IMembershipFunction
```

**Title**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

**Inheritance hierarchy**

- **CObject**

    graphic.YAxis().Max(1.1);
    graphic.YAxis().DefaultStep(0.2);
    //--- plot
    graphic.CurvePlotAll();
    graphic.Update();
}

A1 (Get method)

Gets the first membership function slope ratio.

```cpp
double A1()
```

Return Value

Slope ratio value.

A1 (Set method)

Sets the first membership function slope ratio.

```cpp
void A1(
    const double a1 // slope ratio value
)
```

Parameters

a1

[in] Slope ratio value.

A2 (Get method)

Gets the second membership function slope ratio.

```cpp
double A2()
```

Return Value

Slope ratio value.

A2 (Set method)
Sets the second membership function slope ratio.

```c
void A2{
    const double a2   // slope ratio value
}
```

**Parameters**

- `a2`
  - [in] Slope ratio value.

---

**C1 (Get method)**

Gets the first membership function inflection coordinate parameter.

```c
double C1()
```

**Return Value**

Inflection coordinate value.

---

**C1 (Set method)**

Sets the first membership function inflection coordinate parameter.

```c
void C1{
    const double c1   // inflection coordinate value
}
```

**Parameters**

- `c1`
  - [in] Inflection coordinate value.

---

**C2 (Get method)**

Gets the second membership function inflection coordinate parameter.

```c
double C2()
```

**Return Value**

Inflection coordinate value.

---

**C2 (Set method)**

Sets the second membership function inflection coordinate parameter.

```c
void C2{
    const double c2   // inflection coordinate value
}
```
Parameters

$c_2$

[in] Inflection coordinate value.

**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const double  x  // membership function argument
)
```

Parameters

$x$

Return Value

Membership function value.
**CGeneralizedBellShapedMembershipFunction**

Class for implementing a generalized bell-shaped membership function with A, B and C parameters.

**Description**

Generalized bell-shaped membership function shape is similar to Gaussian functions. The function is smooth and takes non-zero values along the entire definition area.

![Diagram](image)

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CGeneralizedBellShapedMembershipFunction : public IMembershipFunction
```

**Title**

//--- Sets the X-axis properties

graphic.XAxis().AutoScale(false);

graphic.XAxis().Min(0.0);
```
A (Get method)

Gets the membership function concentration ratio.

```cpp
double A()
```

**Return Value**

Concentration ratio value.

A (Set method)

Sets the membership function concentration ratio.

```cpp
void A(
    const double a // concentration ratio value
)
```

**Parameters**

- `a`
  - [in] Membership function concentration ratio.

B (Get method)

Gets the membership function slope ratio.

```cpp
double B()
```

**Return Value**

Slope ratio value.

B (Set method)

Sets the membership function slope ratio.
void B(
    const double b // slope ratio value
)

Parameters

b

C (Get method)

Gets the membership function maximum coordinate.

double C()

Return Value

Membership function maximum coordinate.

C (Set method)

Sets the membership function maximum coordinate.

void C(
    const double c // maximum coordinate value
)

Parameters

c
    [in] Membership function maximum coordinate.

GetValue

Calculates the value of the membership function by a specified argument.

double GetValue(
    const x // membership function argument
)

Parameters

x

Return Value

Membership function value.
CNormalCombinationMembershipFunction

Class for implementing a two-sided Gaussian membership function with the B1, B2, Sigma1 and Sigma2 parameters.

Description

The two-sided Gaussian membership function is formed using Gaussian distribution. It allows setting asymmetrical membership functions. The function is smooth and takes non-zero values along the entire definition area.

![Graph of CNormalCombinationMembershipFunction](image)

A sample code for plotting a chart is displayed below.

Declaration

```cpp

B1 (Get method)

Gets the value of the first membership function center.

double B1()

Return Value

Value of the first membership function center.

B1 (Set method)

Sets the value of the first membership function center.

void B1(
    const double b1  // first center value
)

Parameters

b

[in] Value of the first membership function center.

B2 (Get method)

 Gets the value of the second membership function center.

double B2()

Return Value

The value of the second membership function center.
B2 (Set method)

Sets the value of the second membership function center.

```cpp
void B2(
    const double b2   // second center value
)
```

Parameters

b2

[in] Value of the second membership function center.

Sigma1 (Get method)

Gets the first parameter of the membership function curvature.

```cpp
double Sigma1()
```

Return Value

The value of the first parameter of the membership function curvature.

Sigma1 (Set method)

Sets the value of the first parameter of the membership function curvature.

```cpp
void Sigma1(
    const double sigma1   // first curvature parameter value
)
```

Parameters

sigma1

[in] The first parameter of the membership function curvature.

Sigma2 (Get method)

Gets the second parameter of the membership function curvature.

```cpp
double Sigma2()
```

Return Value

The value of the second parameter of the membership function curvature.

Sigma2 (Set method)
Sets the value of the second parameter of the membership function curvature.

```c
void Sigma2(
    const double sigma2 // second curvature parameter value
);
```

**Parameters**

*sigma2*

[in] The second curvature parameter of the membership function.

---

**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const x // membership function argument
);
```

**Parameters**

*x*

**Return Value**

Membership function value.
**CNormalMembershipFunction**

Class for implementing a symmetrical Gaussian membership function with the B and Sigma parameters.

**Description**

The symmetrical Gaussian membership function is formed using Gaussian distribution. The function is smooth and takes non-zero values along the entire definition area.

![NormalMembershipFunction](chart.png)

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CNormalMembershipFunction : public IMembershipFunction
```

**Title**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

**Inheritance hierarchy**

- CObject
  - IMembershipFunction
    - CNormalMembershipFunction

**Class methods**

### Example

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
#include <Graphics\Graphic.mqh>

//--- Create membership functions
CNormalMembershipFunction func1(5,0.5);
CNormalMembershipFunction func2(5,1);
CNormalMembershipFunction func3(5,3);

//--- Create wrappers for membership functions
double NormalMembershipFunction1(double x) { return(func1.GetValue(x)); }  
double NormalMembershipFunction2(double x) { return(func2.GetValue(x)); }  
double NormalMembershipFunction3(double x) { return(func3.GetValue(x)); }
```

```cpp
//--- Script program start function

void OnStart()
{
//--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"NormalMembershipFunction",0,30,30,780,380))
    {
        graphic.Attach(0,"NormalMembershipFunction");
    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("NormalMembershipFunction");
    graphic.BackgroundMainSize(16);

//--- create curve
    graphic.CurveAdd(NormalMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,"[5, 0.0]");
    graphic.CurveAdd(NormalMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,"[5, 1]");
    graphic.CurveAdd(NormalMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,"[5, 3]");

//--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
    graphic.XAxis().Min(0.0);
    graphic.XAxis().Max(10.0);
    graphic.XAxis().DefaultStep(1.0);
//--- sets the Y-axis properties
}  
```

### Description

**GetValue**
Calculates the value of the membership function by a specified argument.

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Save**, **Load**, **Type**, **Compare**

---

© 2000-2021, MetaQuotes Ltd
```csharp
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);
//--- plot
graphic.CurvePlotAll();
graphic.Update();
```

### B (Get method)

**Gets** the membership function center.

```csharp
double B()
```

**Return Value**

The value of the membership function center.

### B (Set method)

**Sets** the value of the membership function center.

```csharp
void B(
    const double b // function center value
)
```

**Parameters**

- `b`
  
  [in] Value of the membership function center.

### Sigma (Get method)

**Gets** the parameter of the membership function curvature.

```csharp
double Sigma()
```

**Return Value**

The value of the membership function curvature parameter.

### Sigma (Set method)

**Sets** the value of the membership function curvature parameter.

```csharp
void Sigma(
    const double sigma // curvature parameter value
)
```

**Parameters**

- `sigma`

**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const double x  // argument
)
```

**Parameters**

- `x`

**Return Value**

- Membership function value.
**CP_ShapedMembershipFunction**

Class for implementing a pi-shaped membership function with the A, B, C and D parameters.

**Description**

The pi-shaped membership function has the form of a curvilinear trapezoid. The function is used to set asymmetric membership functions with a smooth transition from pessimistic to optimistic fuzzy number assessment.

![P_ShapedMembershipFunction](image)

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>

class CP_ShapedMembershipFunction : public IMembershipFunction
```

    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("P_ShapedMembershipFunction");
    graphic.BackgroundMainSize(16);
    //--- create curve
    graphic.CurveAdd(P_ShapedMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,\[0, 0.5, 3,
    graphic.CurveAdd(P_ShapedMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,\[0, 4, 5.5,
    graphic.CurveAdd(P_ShapedMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,\[0, 6, 7, 9
```

--- sets the X-axis properties---
A (Get method)

Gets the parameter of the fuzzy set beginning.

```c++
double A()
```

Return Value

Parameter of the fuzzy set beginning.

A (Set method)

Sets the parameter of the fuzzy set beginning.

```c++
void A(
    const double a // parameter of the fuzzy set beginning
)
```

Parameters

a

[in] Parameter of the fuzzy set beginning.

B (Get method)

Gets the first parameter of the fuzzy set core.

```c++
double B()
```

Return Value

The first parameter of the fuzzy set core.

B (Set method)

Sets the first parameter of the fuzzy set core.

```c++
void B(
    const double b // value of the fuzzy set core first parameter
)
Parameters

$ b $

\textbf{[in]} The first parameter of the fuzzy set core.

\section*{C (Get method)}

\textbf{Gets the second parameter of the fuzzy set core.}

\begin{verbatim}
double C()
\end{verbatim}

\section*{Return Value}

The second parameter of the fuzzy set core.

\section*{C (Set method)}

\textbf{Sets the second parameter of the fuzzy set core.}

\begin{verbatim}
void C(
    const double c  // value of the fuzzy set core second parameter
)
\end{verbatim}

Parameters

$ c $

\textbf{[in]} The second parameter of the fuzzy set core.

\section*{D (Get method)}

\textbf{Gets the parameter of the fuzzy set end.}

\begin{verbatim}
double D()
\end{verbatim}

\section*{Return Value}

Value of the fuzzy set end parameter.

\section*{D (Set method)}

\textbf{Sets the parameter of the fuzzy set end.}

\begin{verbatim}
void D(
    const double d  // value of the fuzzy set end parameter
)
\end{verbatim}

Parameters

$ d $

\textbf{[in]} Value of the fuzzy set end parameter.
**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(const double x)
```

**Parameters**

- `x` 
  
  [in] membership function argument

**Return Value**

- membership function value
CProductTwoSigmoidalMembershipFunction

Class for implementing the membership function in the form of a product of two sigmoid functions with the A1, A2, C1 and C2 parameters.

Description

A product of two sigmoid membership functions is applied for setting smooth asymmetric functions. It allows creating membership functions with the values equal to 1 beginning with an argument value. Such functions are suitable if you need to set such linguistic terms as "short" or "long".

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CProductTwoSigmoidalMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

CObject
   IMembershipFunction
      CProductTwoSigmoidalMembershipFunctions

    graphic.YAxis().DefaultStep(0.2);
    //--- plot
    graphic.CurvePlotAll();
    graphic.Update();
}
```

### A1 (Get method)

Gets the first membership function slope ratio.

```cpp
double A1()
```

**Return Value**

The first membership function slope ratio.

### A1 (Set method)

Sets the first membership function slope ratio.

```cpp
void A1(
    const double a1 // the first membership function slope ratio
)
```

**Parameters**

- **a1**
  - [in] The first membership function slope ratio.

### A2 (Get method)

Gets the second membership function slope ratio.

```cpp
double A2()
```

**Return Value**

The second membership function slope ratio.
A2 (Set method)

Sets the second membership function slope ratio.

```cpp
void A2(
    const double a2  // the second membership function slope ratio
)
```

Parameters

- `a2`
  - [in] The second membership function slope ratio.

C1 (Get method)

Gets the first membership function inflection coordinate parameter.

```cpp
double C1()
```

Return Value

- The first membership function inflection coordinate.

C1 (Set method)

Sets the first membership function inflection coordinate.

```cpp
void C1(
    const double c1  // the first membership function inflection coordinate
)
```

Parameters

- `c1`
  - [in] The first membership function inflection coordinate.

C2 (Get method)

Gets the second membership function inflection coordinate parameter.

```cpp
double C2()
```

Return Value

- The second membership function inflection coordinate.

C2 (Set method)

Sets the second membership function inflection coordinate.

```cpp
void C2(
    const double c2  // the second membership function inflection coordinate
)
```
Parameters

\( c2 \)

[in] The second membership function inflection coordinate.

**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const x // membership function argument
)
```

Parameters

\( x \)

Return Value

Membership function value.
**CS_ShapedMembershipFunction**

Class for implementing an S-like membership function with the A and B parameters.

**Description**

The function sets an S-like two-parameter membership function. This is a non-decreasing function that takes values from 0 to 1. The A and B parameters define the interval, within which the function increases in non-linear trajectory from 0 to 1.

The function represents fuzzy sets of “very high” type (i.e. non-decreasing membership functions with saturation are set).

![S_ShapedMembershipFunction](image)

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CS_ShapedMembershipFunction : public IMembershipFunction
```

**Title**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

**Inheritance hierarchy**

```
CObject
IMembershipFunction
CS_ShapedMembershipFunction
```

    graphic.BackgroundMainSize(16);

    //--- create curve
    graphic.CurveAdd(S_ShapedMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,"[2, 1]");
    graphic.CurveAdd(S_ShapedMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,"[2, 4]");
    graphic.CurveAdd(S_ShapedMembershipFunction3,0.0,10.0,0.1,CURVES_LINES,"[2, 7]");

    //--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
    graphic.XAxis().Min(0.0);
}"
```
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);
//-- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);
//-- plot
graphic.CurvePlotAll();
graphic.Update();
}

A (Get method)

Gets the parameter of the increasing interval start.

```cpp
double A()
```

Return Value

Increasing interval start parameter.

A (Set method)

Sets the parameter of the increasing interval start.

```cpp
void A(
    const double a // increasing interval start parameter
)
```

Parameters

- `a`
  - [in] Increasing interval start parameter.

B (Get method)

Gets the first parameter of the fuzzy set core.

```cpp
double B()
```

Return Value

The first parameter of the fuzzy set core.

B (Set method)

Sets the first parameter of the fuzzy set core.

```cpp
void B(
    const double b // the first parameter of the fuzzy set core
)
Parameters

\( b \)

[in] The first parameter of the fuzzy set core.

**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const x  // membership function argument
)
```

Parameters

\( x \)

Return Value

Membership function value.
CSigmoidalMembershipFunction

Class for implementing a sigmoid membership function with the A and C parameters.

Description

The sigmoid function is applied when setting monotonous membership functions. It allows creating membership functions with the values equal to 1 beginning with an argument value. Such functions are suitable if you need to set such linguistic terms as "short" or "long".

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CSigmoidalMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

```
CObject
    IMembershipFunction

graphic.XAxis().Min(0.0);
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);

//--- sets the Y-axis properties
```
A (Get method)

Gets the membership function slope ratio.

```cpp
double A()
```

Return Value

The membership function slope ratio.

A (Set method)

Sets the membership function slope ratio.

```cpp
void A(
    const double a // the first membership function slope ratio
)
```

Parameters

a

C (Get method)

Gets the membership function inflection coordinate parameter.

```cpp
double C()
```

Return Value

Membership function inflection coordinate.

C (Set method)

Sets the membership function inflection coordinate.

```cpp
void C(
    const double c // membership function inflection coordinate
)
```

Parameters

C
[in] The membership function inflection coordinate.

**GetValue**

Calculates the value of the membership function by a specified argument.

```
double GetValue(
    const x  // membership function argument
)
```

**Parameters**

- `x`
  

**Return Value**

Membership function value.
CTrapezoidMembershipFunction

Class for implementing a trapezoidal membership function with the X1, X2, X3 and X4 parameters.

Description

The function is formed using piecewise linear approximation. This is a generalization of the triangular function allowing you to assign a fuzzy set core as an interval. Such a membership function makes it possible to conveniently interpret optimistic/pessimistic assessments.

The function is used to set asymmetric membership functions of the variables with their most critical values defined within a certain interval.

A sample code for plotting a chart is displayed below.

Declaration

class CTrapezoidMembershipFunction : public IMembershipFunction

Title

#include <Math\Fuzzy\membershipfunction.mqh>

graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);

//--- plot
graphic.CurvePlotAll();
graphic.Update();
}

X1 (Get method)

Gets the value of the first point on the X axis.

```cpp
double X1()
```

Return Value

The value of the first point on the X axis.

X1 (Set method)

Sets the value of the first point on the X axis.

```cpp
void X1(
    const double x1 // value of the first point on the X axis
)
```

Parameters

x1

[in] The value of the first point on the X axis.

X2 (Get method)

Gets the value of the second point on the X axis.

```cpp
double X2()
```

Return Value

The value of the second point on the X axis.

X2 (Set method)
Sets the value of the second point on the X axis.

```cpp
void X2{
    const double x2 // value of the second point on the X axis
}
```

**Parameters**

- `x2`  
  [in] The value of the second point on the X axis.

### X3 (Get method)

Gets the value of the third point on the X axis.

```cpp
double X3()
```

**Return Value**

- The value of the third point on the X axis.

### X3 (Set method)

Sets the value of the third point on the X axis.

```cpp
void X3{
    const double x3 // value of the third point on the X axis
}
```

**Parameters**

- `x3`  
  [in] The value of the third point on the X axis.

### X4 (Get method)

Gets the value of the fourth point on the X axis.

```cpp
double X4()
```

**Return Value**

- The value of the fourth point on the X axis.

### X4 (Set method)

Sets the value of the fourth point on the X axis.

```cpp
void X4{
    const double x4 // value of the fourth point on the X axis
}
```

**Parameters**

- `x4`
The value of the fourth point on the X axis.

**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const x // membership function argument
)
```

**Parameters**

`x`

**Return Value**

Membership function value.
CTriangularMembershipFunction

Class for implementing a triangle membership function with the X1, X2 and X3 parameters.

Description

The function sets a membership function in the form of a triangle. This is a simple and most frequently applied membership function.

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CTriangularMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

CObject

IMembershipFunction

CTriangularMembershipFunction

Example

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
#include <Graphics\Graphic.mqh>

//--- Create membership functions
CTriangularMembershipFunction func1(0,2,5);
CTriangularMembershipFunction func2(0,5,10);
CTriangularMembershipFunction func3(8,8,10);
//--- Create wrappers for membership functions
double TriangularMembershipFunction1(double x) { return(func1.GetValue(x)); } 
double TriangularMembershipFunction2(double x) { return(func2.GetValue(x)); } 
double TriangularMembershipFunction3(double x) { return(func3.GetValue(x)); } 

//--- Script program start function
void OnStart()
{
    //--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"TriangularMembershipFunction",0,30,30,780,380))
    {
        graphic.Attach(0,"TriangularMembershipFunction");
    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("TriangularMembershipFunction");
    graphic.BackgroundMainSize(16);
    //--- create curve
    graphic.CurveAdd(TriangularMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,"[0, 2, 5]");
    graphic.CurveAdd(TriangularMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,"[0, 5, 10]);
    graphic.CurveAdd(TriangularMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,"[8, 8, 10]");
}
```
//--- sets the X-axis properties
graphic.XAxis().AutoScale(false);
graphic.XAxis().Min(0.0);
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);
//--- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);
//--- plot
graphic.CurvePlotAll();
graphic.Update();
}

**X1 (Get method)**

Gets the value of the first point on the X axis.

```cpp
double X1()
```

**Return Value**

The value of the first point on the X axis.

**X1 (Set method)**

Sets the value of the first point on the X axis.

```cpp
void X1{
    const double x1 // value of the first point on the X axis
}
```

**Parameters**

- `x1`
  - [in] The value of the first point on the X axis.

**X2 (Get method)**

Gets the value of the second point on the X axis.

```cpp
double X2()
```

**Return Value**

The value of the second point on the X axis.

**X2 (Set method)**

Sets the value of the second point on the X axis.

```cpp
void X2{
```
const double x2  // value of the second point on the X axis
}

Parameters

x2

[in] The value of the second point on the X axis.

**X3 (Get method)**

**Get**s the value of the third point on the X axis.

double X3()

Return Value

The value of the third point on the X axis.

**X3 (Set method)**

**Set**s the value of the third point on the X axis.

void X3(
   const double x3  // value of the third point on the X axis
)

Parameters

x3

[in] The value of the third point on the X axis.

**ToNormalMF**

**Converts** a triangle membership function into a Gaussian one.

CNormalMembershipFunction* ToNormalMF()

Return Value

The pointer to a **Gaussian membership function**.

**GetValue**

**Calculates** the value of the membership function by a specified argument.

double GetValue(
   const x  // membership function argument
)

Parameters

x
Membership function argument.

Return Value

Membership function value.
**CZ_ShapedMembershipFunction**

Class for implementing a z-like membership function with the A and B parameters.

**Description**

The function sets a z-like two-parameter membership function. This is a non-increasing membership function that takes values from 1 to 0. The function parameters define an interval, within which the function decreases in non-linear trajectory from 1 to 0.

The function represents fuzzy sets of "very low" type. In other words, it sets non-increasing membership functions with saturation.

![Z_ShapedMembershipFunction](chart.png)

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CZ_ShapedMembershipFunction : public IMembershipFunction
```

**Title**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

**Inheritance hierarchy**

    graphic.CurveAdd(Z_ShapedMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,"[2, 9]" );

    //--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
    graphic.XAxis().Min(0.0);
}
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);
//--- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);
//--- plot
graphic.CurvePlotAll();
graphic.Update();
}

A (Get method)

Gets the parameter of the decreasing interval start.

double A()

Return Value

Decreasing interval start parameter.

A (Set method)

Sets the parameter of the decreasing interval start.

void A(
    const double a // decreasing interval start parameter
)

Parameters

a

[in] Decreasing interval start parameter.

B (Get method)

Gets the parameter of the decreasing interval end.

double B()

Return Value

Decreasing interval end parameter.

B (Set method)

Sets the parameter of the decreasing interval end.

void B(
    const double b // decreasing interval end parameter
)
Parameters

\( b \)

[in] Decreasing interval end parameter.

**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
def GetValue(
    const x // membership function argument
)
```

Parameters

\( x \)

**Return Value**

Membership function value.
**IMembershipFunction**

Basic class for all membership function classes.

```

**Parameters**

- `x`

**Return Value**

- Membership function value.
Fuzzy systems rules

A fuzzy system (fuzzy logical inference system) is a receipt of conclusion in the form of a fuzzy set corresponding to the current values of the inputs with the use of a set of fuzzy rules and fuzzy operations.

The fuzzy rules determine the relationship between inputs and outputs of an examined object. Amount of rules in the system is unlimited. The generalized format of fuzzy rules is as follows:

if rule condition, then rule conclusion.

Rule condition describes the current state of the object. Rule conclusion describes how the condition affects the object.

<table>

</tr>
</tbody>
</table>
**CMamdaniFuzzyRule**

Mamdani-type fuzzy inference — one of the two basic types of fuzzy systems. Output variable values are set using fuzzy terms.

**Description**

Fuzzy logic rule for the Mamdani algorithm can be described as follows:

\[ if(X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n) \text{ then } (Y \text{ is } d)(W) \]

where:

- \( X = (X_1, X_2, X_3 \ldots X_n) \) — vector of input variables;
- \( Y \) — output variable;
- \( a = (a_1, a_2, a_3 \ldots a_n) \) — vector of input variable values;
- \( d \) — output variable value;
- \( W \) — rule weight.

**Declaration**

```cpp
class CMamdaniFuzzyRule : public CGenericFuzzyRule
```

**Title**

```cpp
#include <Math\Fuzzy\fuzzyrule.mqh>
```

**Inheritance hierarchy**

Conclusion (Get method)

Gets the Mamdani fuzzy rule conclusion.

```cpp
CSingleCondition* Conclusion()
```

Return Value

Conclusion of a Mamdani fuzzy rule.

Conclusion (Set method)

Sets the Mamdani fuzzy rule conclusion.

```cpp
void Conclusion(
    CSingleCondition* value // conclusion of a Mamdani fuzzy rule
)
```

Parameters

- `value`
  - `[in]` Conclusion of a Mamdani fuzzy rule.

Weight (Get method)

Gets the Mamdani fuzzy rule weight.

```cpp
double Weight()
```

Return Value

Mamdani fuzzy rule weight.

Weight (Set method)

Sets the Mamdani fuzzy rule weight.

```cpp
void Weight(
    const double value // weight of a Mamdani fuzzy rule
)
```

Parameters

- `value`
  - `[in]` Weight of a Mamdani fuzzy rule.
Sugeno-type fuzzy inference — one of the two basic types of fuzzy systems. Output variable values are set as a linear combination of input variables.

Description

Unlike the Mamdani rule, an input variable value is set by a linear function from input parameters rather than by a fuzzy term. Fuzzy logic rule for the Sugeno algorithm can be described as follows:

\[ if (X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n) \text{ then } Y = b_0 + b_1 \cdot X_1 + b_2 \cdot X_2 + \ldots + b_n \cdot X_n (W) \]

where:

- \( X = (X_1, X_2, X_3 \ldots X_n) \) — vector of input variables;
- \( Y \) — output variable;
- \( a = (a_1, a_2, a_3 \ldots an) \) — vector of input variable values;
- \( b = (b_1, b_2, b_3 \ldots bn) \) — free term ratio in the linear function for an output value;
- \( W \) — rule weight.

Declaration

```cpp
class CSugenoFuzzyRule : public CGenericFuzzyRule
```

Title

```cpp
#include <Math\Fuzzy\fuzzyrule.mqh>
```

Inheritance hierarchy

- CObject
  - IParsableRule
    - CGenericFuzzyRule
      - CSugenoFuzzyRule

Conclusion (Get method)
**Conclusion**

Gets the Sugeno fuzzy rule conclusion.

```cpp
CSingleCondition* Conclusion()
```

**Return Value**

Sugeno fuzzy rule conclusion.

### Conclusion (Set method)

Sets the Sugeno fuzzy rule conclusion.

```cpp
void Conclusion(
    CSingleCondition* value  // conclusion of a Sugeno fuzzy rule
)
```

**Parameters**

- `value`
  - `[in]` Conclusion of a Sugeno fuzzy rule.
**CSingleCondition**

The class sets a fuzzy condition expressed by "Fuzzy variable — Fuzzy term" pair.

**Description**

According to a fuzzy condition, one variable corresponds to one term. A fuzzy condition can be described by the following expression: \( X \) is \( a \),

where:

- \( X \) is a fuzzy variable;
- \( a \) is a fuzzy variable value (fuzzy term).

**Declaration**

```cpp
class CSingleCondition : public ICondition
```

**Title**

```cpp
#include <Math\Fuzzy\fuzzyrule.mqh>
```

</tbody>
</table>

**Methods inherited from class CObject**

- Prev, Prev, Next, Next, Save, Load, Type, Compare

**Not (Get method)**

Gets the flag indicating whether it is necessary to apply negation to this condition.

```cpp
bool Not()
```
Return Value

The flag value.

**Not (Set method)**

Sets the flag indicating whether it is necessary to apply negation to this condition.

```c
void Not(
    bool not  // flag value
)
```

**Parameters**

- `not` [in] Flag value.

**Term (Get method)**

Gets a fuzzy term for the given condition.

```c
INamedValue* Term()
```

**Return Value**

A fuzzy term for the given condition.

**Term (Set method)**

Sets a fuzzy term for the given condition.

```c
void Term(
    INamedValue*& value  // fuzzy term for the given condition
)
```

**Parameters**

- `value` [in] A fuzzy term for the given condition.

**Var (Get method)**

Gets a fuzzy variable for the given condition.

```c
INamedVariable* Var()
```

**Return Value**

A fuzzy variable for the given condition.

**Var (Set method)**

Sets a fuzzy variable for the given condition.
void Var(
    INamedVariable* & value // a fuzzy variable for the given condition
)

Parameters

value

    [in] fuzzy variable.
**CConditions**

Class defines a set of fuzzy conditions connected to each other by an operator.

**Description**

A set of fuzzy conditions connected to each other by an operator may be described as follows:

\[(X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n)\]

where:

- \(X = (X_1, X_2, X_3 \ldots X_n)\) — vector of input variables;
- \(a = (a_1, a_2, a_3 \ldots an)\) — vector of input variable values.

In this example, the **and** operator is used. Besides, the **or** operator is available in this class.

**Declaration**

```cpp
class CConditions : public ICondition

#include <Math\Fuzzy\fuzzyrule.mqh>
```

**Inheritance hierarchy**

- **CObject**
  - **ICondition**
  - **CConditions**

</tr>
</tbody>
</table>

Methods inherited from class **CObject**

- **Prev, Prev, Next, Next**, **Save, Load, Type, Compare**

**ConditionsList**

Gets the list of all conditions.

```cpp
CList* ConditionsList()
```
Return Value
List of all conditions.

**Not (Get method)**

Gets the flag indicating whether it is necessary to apply negation to these conditions.

```cpp
bool Not()
```

**Return Value**
The flag value.

**Not (Set method)**

Sets the flag indicating whether it is necessary to apply negation to these conditions.

```cpp
void Not(bool not // flag value)
```

**Parameters**

*not*

[in] Flag value.

**Op (Get method)**

Gets a type of the conditions bundle operator. The *and* and *or* operators are available.

```cpp
OperatorType Op()
```

**Return Value**
Type of the conditions bundle operator.

**Op (Set method)**

Set the conditions bundle operator. The *and* and *or* operators are available.

```cpp
void Op(OperatorType op // type of the conditions bundle operator)
```

**Parameters**

*op*

[in] Type of the conditions bundle operator.
**CGenericFuzzyRule**

Base class for both types of fuzzy rules.

### Declaration

### Conclusion (Get method)

Gets the conclusion of a fuzzy rule.

```cpp
CSingleConditon* Conclusion()
```

**Return Value**

Conclusion of a fuzzy rule.

### Conclusion (Set method)

Sets the fuzzy rule conclusion.

```cpp
virtual void Conclusion(
    CSingleConditon* value  // conclusion of a fuzzy rule
)`
Parameters

value
   [in] Conclusion of a fuzzy rule.

**Condition (Get method)**

Gets the 'if' condition (set of conditions) for a fuzzy rule.

```cpp
CConditons* Condition()
```

Return Value

Fuzzy condition (set of conditions).

**Condition (Set method)**

Sets the 'if' condition (set of conditions) for a fuzzy rule.

```cpp
void Condition(
    CConditons* value       // 'if' condition (set of conditions) for a fuzzy rule
)
```

Parameters

value
   [in] Fuzzy condition (set of conditions).

**CreateCondition**

Creates a condition for a fuzzy rule by specified parameters.

```cpp
CFuzzyCondition* CreateCondition(
    CFuzzyVariable* var,     // fuzzy variable
    CFuzzyTerm* term         // fuzzy term
)
```

Parameters

var

term

Return Value

Fuzzy rule status.

**CreateCondition**
Create a condition for a fuzzy rule by specified parameters.

```cpp
CFuzzyCondition* CreateCondition(
    CFuzzyVariable* var,       // fuzzy variable
    CFuzzyTerm* term,          // fuzzy term
    bool not,                  // flag indicating whether it is necessary to apply negation to a condition
)
```

**Parameters**

- **var**

- **term**

- **not**
  - [in] Flag indicating whether it is necessary to apply negation to a condition.

**Return Value**

- Fuzzy rule status.

Create a condition for a fuzzy rule by specified parameters.

```cpp
CFuzzyCondition* CreateCondition(
    CFuzzyVariable* var,       // fuzzy variable
    CFuzzyTerm* term,          // fuzzy term
    bool not,                  // flag indicating whether it is necessary to apply negation to a condition
    HedgeType hedge            // condition bundle type
)
```

**Parameters**

- **var**

- **term**

- **not**
  - [in] Flag indicating whether it is necessary to apply negation to a condition.

- **hedge**
  - [in] Condition bundle type.

**Return Value**

- Fuzzy rule status.
Fuzzy systems variables

Fuzzy (linguistic) variables are applied in fuzzy systems. These are the variables whose values are words or word combinations in a natural or artificial language.

Linguistic variables comprise fuzzy sets. The nature and number of fuzzy variables change for each certain task when defining fuzzy sets.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>

</tr>
</tbody>
</table>
CFuzzyVariable

Class for creating general fuzzy variables.

Description

Here, a fuzzy variable is created with the following parameters:

- maximum variable value;
- minimum variable value;
- fuzzy variable name;
- term set (set of all possible values, which a linguistic variable is capable of receiving).

Declaration

```cpp
class CFuzzyVariable : public CNamedVariableImpl
```

Title

```cpp
#include <Math\Fuzzy\fuzzyvariable.mqh>
```

Inheritance hierarchy

- CObject
  - INamedValue

### AddTerm

Adds a single fuzzy term to a fuzzy variable.

```c
void AddTerm(
    CFuzzyTerm* & term // fuzzy term
)
```

**Parameters**

- `term`

### GetTermByName

Gets a fuzzy term by a specified name.

```c
CFuzzyTerm* GetTermByName(
    const string name // fuzzy term name
)
```

**Parameters**

- `name`
  - [in] Fuzzy term name.

**Return Value**

- Fuzzy term with a specified name.

### Max (Get method)

Gets the maximum value for a fuzzy variable.

```c
double Max()
```

**Return Value**

- Maximum value for a fuzzy variable.

### Max (Set method)

Sets the maximum value for a fuzzy variable.

```c
void Max(
    const double max // maximum value for a fuzzy variable
)
Parameters

`max`

**Min (Get method)**

Gets the minimum value for a fuzzy variable.

```cpp
double Min()
```

**Return Value**

Minimum value for a fuzzy variable.

**Max (Set method)**

Sets the minimum value for a fuzzy variable.

```cpp
void Min(
    const double min // minimum value for a fuzzy variable
)
```

Parameters

`min`

**Terms (Get method)**

Gets a list of fuzzy terms for the given fuzzy variable.

```cpp
CList* Terms()
```

**Return Value**

List of fuzzy terms for the given fuzzy variable.

**Terms (Set method)**

Sets a list of fuzzy terms for the given fuzzy variable.

```cpp
void Terms(
    CList* terms // list of fuzzy terms for the given variable
)
```

Parameters

`terms`

[in] List of fuzzy terms for the given fuzzy variable.
Values

Gets a list of fuzzy terms for the given fuzzy variable.

CList* Values()

Return Value

List of fuzzy terms for the given variable.
CSugenoVariable

Class for creating fuzzy Sugeno-type variables.

Description

Fuzzy Sugeno-type variable is different from the general linguistic variable since it is not set by a term set but by a set of linear functions.

Declaration

```c
class CSugenoVariable : public CNamedVariableImpl
```

Title

```c
#include <Math\Fuzzy\sugenovariable.mqh>
```

Inheritance hierarchy

```
CObject
  INamedValue
    INamedVariable
      CNamedVariableImpl
        CSugenoVariable
```

Methods inherited from class CNamedVariableImpl

- Name, Name

Functions

Gets the list of linear functions of the fuzzy Sugeno variable.

```c
CList* Functions()
```

Return Value
List of linear functions.

**GetFuncByName**

Gets the linear function by a specified name.

```cpp
ISugenoFunction* GetFuncByName(
    const string name  // linear function name
)
```

**Parameters**

- `name`
  - [in] Linear function name.

**Return Value**

- Linear function with a specified name.

**Values**

Gets the list of linear functions of the fuzzy Sugeno variable.

```cpp
CList* Values()
```

**Return Value**

- List of linear functions of the fuzzy Sugeno variable.
CFuzzyTerm (fuzzy terms)

Class for implementing fuzzy terms.

Description

A term is any element of a term set. A term is defined by two components:

- fuzzy term name;
- membership function.

Declaration

```cpp
class CFuzzyTerm : public CNamedValueImpl
```

Title

```cpp
#include <Math\Fuzzy\fuzzyterm.mqh>
```

MembershipFunction

Gets a membership function for the fuzzy term.

| IMembershipFunction* MembershipFunction() |

Return Value

Membership function
Fuzzy systems

Fuzzy system (or fuzzy model) is a mathematical model whose calculation is based on fuzzy logic. Construction of such models is applicable when the subject of study has a weak formalization and its exact mathematical description is too complex or unknown.

The progress of a model construction can be divided into three main stages:

1. Definition of input and output characteristics of a model.
2. Building a knowledge base.
3. Selecting one of the methods of fuzzy inference (Mamdani and Sugeno).

The first stage directly effects the consequent two and determines the future operation of the model.

A knowledge base (rule base) is a set of fuzzy rules of “if, then” type that define the relationship between inputs and outputs of the examined object.

Rule condition describes the current state of the object, and rule conclusion — how this condition affects the object.

There can be two types of terms and conclusions for each rule:

1. simple (link to Csinglcond) — includes one fuzzy variable;
2. complex (link to Cconditions) — includes several fuzzy variables.

Each rule in the system has its weight — importance of a rule in the model. Weighting factors are assigned to a rule within range [0, 1].

Depending on the created knowledge base, the system of fuzzy inference is determined for a model. Fuzzy logical inference is a receipt of conclusion in form of a fuzzy set corresponding to the current value of the inputs with use of knowledge base and fuzzy operations. The two main types of fuzzy inference are Mamdani and Sugeno.
Mamdani system

Output variable values in the Mamdani system are set using fuzzy terms.

Description

Fuzzy logic rule for the Mamdani algorithm can be described as follows:

\[ if(X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n) \text{ then } (Y \text{ is } d)(W) \]

where:
- \( X = (X_1, X_2, X_3 \ldots X_n) \) — vector of input variables;
- \( Y \) — output variable;
- \( a = (a_1, a_2, a_3 \ldots a_n) \) — vector of input variable values;
- \( d \) — output variable value;
- \( W \) — rule weight.

**AggregationMethod**

Sets the type of conditions aggregation method.

```c
void AggregationMethod(
    AggregationMethod value \ comment aggregation method type
)```

© 2000-2021, MetaQuotes Ltd
Parameters

value
  [in] Type of conditions aggregation method.

Calculate

Calculates a fuzzy inference for the system

```cpp
CList* Calculate(
    CList* inputValues // input data
)
```

Parameters

inputValues
  [in] Input data for calculation.

Return Value

Calculation result.

DefuzzificationMethod

Sets defuzzification method type.

```cpp
void DefuzzificationMethod(
    DefuzzificationMethod value // defuzzification method type.
)
```

Parameters

value

EmptyRule

Creates an empty fuzzy Mamdani rule based on the current system

```cpp
CMamdaniFuzzyRule* EmptyRule()
```

Return Value

Fuzzy Mamdani rule.

ImplicationMethod

Sets a type of the conditions implication operator.

```cpp
void ImplicationMethod(
    ImplicationMethod value // implication operator type
)
```
Parameters

value

[in] Type of the conditions implication operator.

Output

Gets the list of fuzzy Mamdani output variables.

CList* Output()

Return Value

List of fuzzy variables.

OutputByName

Gets a fuzzy Mamdani output variable by a specified name.

CFuzzyVariable* OutputByName{
    const string name // fuzzy variable name
}

Parameters

name

[in] Fuzzy variable name.

Return Value

Fuzzy Mamdani variable with a specified name.

ParseRule

Creates a fuzzy Mamdani rule based on a specified line.

CMamdaniFuzzyRule* ParseRule{
    const string rule // string representation of a fuzzy rule
}

Parameters

rule

[in] String representation of a fuzzy Mamdani rule.

Return Value

Fuzzy Mamdani rule.

Rules
Returns the list of fuzzy Mamdani rules.

```cpp
List* Rules()
```

**Return Value**

List of fuzzy Mamdani rules.
**Sugeno system**

Sugeno fuzzy logic system is one of the two basic types of fuzzy systems. Output variable values are set as a linear combination of input variables.

**Description**

Unlike the Mamdani rule, an input variable value is set by a linear function from entries rather than by a fuzzy term. Fuzzy logic rule for the Sugeno algorithm can be described as follows:

\[ i f (X_1 is a_1) \land (X_2 is a_2) \land \ldots \land (X_n is a_n) \ then \ (Y = b_0 + b_1 \cdot X_1 + b_2 \cdot X_2 + \ldots + b_n \cdot X_n)(W) \]

where:
- \( X = (X_1, X_2, X_3 \ldots X_n) \) — vector of input variables;
- \( Y \) — output variable;
- \( a = (a_1, a_2, a_3 \ldots a_n) \) — vector of input variable values;
- \( b = (b_1, b_2, b_3 \ldots b_n) \) — free term ratio in the linear function for an output value
- \( W \) — rule weight.

**Calculate**

Calculates a fuzzy inference for the system

```cpp
CList* Calculate(
    CList* inputValues // input data
)
```
### Parameters

**inputValues**

[in] Input data for calculation.

### Return Value

Calculation result.

### CreateSugenoFunction

Creates a linear Sugeno function for the system.

```cpp
CLinearSugenoFunction* CreateSugenoFunction(
    const string name, // function name
    const double& coeffs[] // function ratios
);
```

### Parameters

**name**

[in] Function name.

**coeffs[]**

### Return Value

Linear Sugeno function.

### Note

The size of the ratio array may be equal to a number of inputs or exceed that number by one. In the first case, the free term of the Sugeno linear function is equal to zero, while in the second case, it is equal to the last ratio.

### CreateSugenoFunction

Creates a linear Sugeno function for the system.

```cpp
CLinearSugenoFunction* CreateSugenoFunction(
    const string name, // function name
    const double& coeffs[] // function ratios
);
```

### Parameters

**name**

[in] Function name.

**coeffs[]**

Return Value

Linear Sugeno function.

**EmptyRule**

Creates an empty fuzzy Sugeno rule based on the current system.

```cpp
CSugenoFuzzyRule* EmptyRule()
```

Return Value

Fuzzy Sugeno rule.

**Output**

Gets the list of fuzzy Sugeno output variables.

```cpp
CList* Output()
```

Return Value

List of fuzzy variables.

**OutputByName**

Gets a fuzzy Sugeno output variable by a specified name.

```cpp
CSugenoVariable* OutputByName(
    const string name   // fuzzy variable name
)
```

Parameters

- `name`
  - Fuzzy variable name.

Return Value

Fuzzy Sugeno variable with a specified name.

**ParseRule**

Creates a fuzzy Sugeno rule based on a specified line.

```cpp
CSugenoFuzzyRule* ParseRule(
    const string rule     // string representation of a fuzzy Sugeno rule
)
```

Parameters

- `rule`
Return Value

Fuzzy Sugeno rule.

Rules

Returns the list of fuzzy rules.

```c
CList* Rules()
```

Return Value

List of fuzzy rules.
Class for working with OpenCL programs

The COpenCL class is a wrapper to facilitate working with the OpenCL functions. In some cases, use of the GPU allows to substantially increase the speed of computations.

Examples of class use for calculations based on float and double values can be found in the corresponding subdirectories of the MQL5\Scripts\Examples\OpenCL folder. The source codes of the OpenCL programs are located in MQL5\Scripts\Examples\OpenCL\Double\Kernels and MQL5\Scripts\Examples\OpenCL\Float\Kernels subdirectories.

- MatrixMult.mq5 - example of matrix multiplication using global and local memory
- BitonicSort.mq5 - example of parallel sorting of array elements in GPU
- FFT.mq5 - example of fast Fourier transform calculation
- Wavelet.mq5 - example of wavelet transform of data using the Morlet wavelet.

It is recommended to write the source code for OpenCL in separate CL files, which can later be included in the MQL5 program using the resource variables.

Declaration

```cpp
class COpenCL
```

Title

```cpp
#include <OpenCL/OpenCL.mqh>
```

</tbody>
</table>
BufferCreate

Creates an OpenCL buffer at the specified index.

```c
bool BufferCreate(
    const int buffer_index,  // buffer index
    const uint size_in_bytes,  // buffer size in bytes
    const uint flags          // combination of flags that define the buffer properties
);
```

Parameters

buffer_index

[in] Index buffer.

size_in_bytes

flags

[in] Buffer properties that are set using a combination of flags.

Return Value

In case of successful execution, returns true, otherwise - false.
BufferFree

Deletes buffer at the specified index.

```c
bool BufferFree(
    const int buffer_index  // buffer index
);
```

**Parameters**

- `buffer_index`
  - [in] Index buffer.

**Return Value**

- In case of successful execution, returns true, otherwise - false.
BufferFromArray

Creates a buffer at the specified index from an array of values.

```cpp
template<typename T>
bool BufferFromArray(
    const int buffer_index, // buffer index
    T &data[],              // array of values
    const uint data_array_offset, // offset in the array of values, in bytes
    const uint data_array_count, // number of values from the array to write
    const uint flags // combination of flags that define the buffer
);
```

Parameters

- `buffer_index` [in] Index buffer.
- `data[]` [in] An array of values to be written into the OpenCL buffer.
- `data_array_offset` [in] Offset in the array of values in bytes, from which writing of values begins.
- `data_array_count` [in] The number of values to be written.
- `flags` [in] Buffer properties that are set using a combination of flags.

Return Value

In case of successful execution, returns true, otherwise - false.
BufferRead

Reads an OpenCL buffer at the specified index into an array.

```cpp
template<typename T>
bool BufferRead(
    const int buffer_index, // buffer index
    T &data[],           // array of values
    const uint cl_buffer_offset, // offset in the OpenCL buffer, in bytes
    const uint data_array_offset, // shift in the array elements
    const uint data_array_count // number of values from the buffer to read
);
```

**Parameters**

- `buffer_index`  
  - [in] Index buffer.
- `data[]`  
  - [in] Array to obtain the values of the OpenCL buffer.
- `cl_buffer_offset`  
  - [in] Offset in the OpenCL buffer in bytes, from which to start reading values.
- `data_array_offset`  
  - [in] Index of the first element of the array to write values of the OpenCL buffer.
- `data_array_count`  
  - [in] The number of values to be read.

**Return Value**

In case of successful execution, returns true, otherwise - false.
BufferWrite

Writes an array of values into buffer at the specified index.

```cpp
template<typename T>
bool BufferWrite(
    const int buffer_index,       // buffer index
    T & data[],                   // array of values
    const uint cl_buffer_offset,  // offset in the OpenCL buffer, in bytes
    const uint data_array_offset, // shift in the array elements
    const uint data_array_count   // number of values from the array to write
);
```

**Parameters**

- `buffer_index`:
  - `[in]` Index buffer.
- `data[]`:
  - `[in]` An array of values to be written into the OpenCL buffer.
- `cl_buffer_offset`:
  - `[in]` Offset in the OpenCL buffer in bytes, from which to start writing values.
- `data_array_offset`:
  - `[in]` Index of the first element of the array, starting from which the array values are written to the OpenCL buffer.
- `data_array_count`:
  - `[in]` The number of values to be written.

**Return Value**

In case of successful execution, returns true, otherwise - false.
Execute

Executes the OpenCL program at the specified index.

```cpp
bool Execute(
    const int kernel_index,             // index of the kernel
    const int work_dim,                 // dimension of the tasks space
    const uint &work_offset[],          // initial offset in the tasks space
    const uint &work_size[]             // total number of tasks
);
```

Executes the OpenCL kernel with the specified index and number of tasks in the local group.

```cpp
bool Execute(
    const int kernel_index,             // index of the kernel
    const int work_dim,                 // dimension of the tasks space
    const uint &work_offset[],          // initial offset in the tasks space
    const uint &work_size[],            // total number of tasks
    const uint &local_work_size[]       // number of tasks in the local group
);
```

Parameters

- `kernel_index` [in] Index of the kernel object.
- `work_dim` [in] Dimension of the tasks space.

Return Value

In case of successful execution, returns true, otherwise - false.
GetContext

Returns handle of the OpenCL context.

```
int GetContext();
```

Return Value

Handle of the OpenCL context.
GetKernel

Returns handle of the kernel object at the specified index.

```c
int GetKernel(
    const int kernel_index // index of the kernel
);
```

Parameters

- `kernel_index`:
  - [in] Index of the kernel object.

Return Value

- Handle of the kernel object.
GetKernelName

Returns name of the kernel object at the specified index.

```c++
string GetKernelName(
    const int kernel_index // index of the kernel
);
```

Parameters

- `kernel_index`
  - [in] Index of the kernel object.

Return Value

- Name of the kernel object.
GetProgram

Returns handle of the OpenCL program.

```c
text GetProgram();
```

Return Value

Handle of the OpenCL program.
Initialize

Initializes the OpenCL program.

```cpp
bool Initialize(
    const string program,  // handle of the OpenCL program
    const bool show_log=true  // keep a log
);
```

Parameters

- `program` [in] Handle of the OpenCL program.
- `show_log=true` [in] Enable logging messages.

Return Value

Returns true, if the initialization succeeded. Otherwise, it returns false.
KernelCreate

Creates an entry point into the OpenCL program at the specified index.

```cpp
bool KernelCreate(
    const int kernel_index,  // index of the kernel
    const string kernel_name  // name of the kernel
);
```

Parameters

- `kernel_index`
  - [in] Index of the kernel object.

- `kernel_name`
  - [in] Name of the kernel object.

Return Value

In case of successful execution, returns true, otherwise - false.
KernelFree

Removes an OpenCL start function at the specified index.

```cpp
bool KernelFree(
    const int kernel_index  // index of the kernel
);
```

Parameters

kernel_index

[in] Index of the kernel object.

Return Value

In case of successful execution, returns true, otherwise - false.
SetArgument

Sets a parameter for the OpenCL function at the specified index.

```cpp
template<typename T>
bool SetArgument(
    const int kernel_index,  // index of the kernel
    const int arg_index,     // index of the function argument
    T value                  // source code
);
```

Parameters

kernel_index

[in] Index of the kernel object.

arg_index

[in] Index of the function argument.

value

[in] The value of the function argument.

Return Value

In case of successful execution, returns true, otherwise - false.
SetArgumentBuffer

Sets an OpenCL buffer as a parameter of the OpenCL function at the specified index.

```cpp
bool SetArgumentBuffer(
    const int kernel_index,       // index of the kernel
    const int arg_index,          // index of the function argument
    const int buffer_index        // buffer index
);
```

Parameters

- `kernel_index` [in] Index of the kernel object.
- `arg_index` [in] Index of the function argument.
- `buffer_index` [in] Index buffer.

Return Value

In case of successful execution, returns true, otherwise - false.
SetArgumentLocalMemory

Sets a parameter in local memory for the OpenCL function at the specified index.

```cpp
bool SetArgumentLocalMemory(
    const int kernel_index,  // index of the kernel
    const int arg_index,     // index of the function argument
    const int local_memory_size // size of the local memory
);
```

**Parameters**

- `kernel_index`  
  [in] Index of the kernel object.

- `arg_index`  
  [in] Index of the function argument.

- `local_memory_size`  
  [in] Size of the local memory.

**Return Value**

- In case of successful execution, returns true, otherwise - false.
SetBuffersCount

Sets the number of buffers.

```cpp
bool SetBuffersCount(
    const int total_buffers  // number of buffers
);
```

Parameters

`total_buffers`

[in] The total number of buffers.

Return Value

In case of successful execution, returns true, otherwise - false.
SetKernelsCount

Sets the number of kernel objects.

```cpp
bool SetKernelsCount(
    const int total_kernels // number of kernels
);
```

Parameters

total_kernels
    [in] The total number of kernels.

Return Value

In case of successful execution, returns true, otherwise - false.
Shutdown

Unloads the OpenCL program.

```cpp
void Shutdown();
```

Return Value

No return value.
SupportDouble

Checks if floating point data types are supported on the device.

```cpp
bool SupportDouble();
```

Return Value

Returns true, if the device supports floating point data types.
Basic Class CObject

Class CObject is the base class for constructing a MQL5 Standard Library.

Description

Class CObject allows all its descendants to be part of a linked list. Also, a number of virtual methods for further implementation in descendant classes are identified.

Declaration

```cpp
class CObject
```

Title

```cpp
#include <Object.mqh>
```

Inheritance hierarchy

CObject

Direct descendants

# Prev

Gets a pointer to the previous element in the list.

```cpp
CObject* Prev()
```

## Return Value

Pointer to the previous element in the list. If an item is listed first, then return NULL.

## Example:

```cpp
#include <Object.mqh>

void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
    object_second.Prev(object_first);
    //--- use prev object
    CObject *object=object_second.Prev();
    //--- delete objects
    delete object_first;
    delete object_second;
}
```
Prep

Sets the pointer to the previous element in the list.

```c
void Prep(
    CObject* object // Pointer to the previous element in the list
)
```

**Parameters**

- `object`
  - [in] New value of the pointer to the previous element in the list.

**Example:**

```c
//--- example for CObject::Prep(CObject*)
#include <Object.mqh>
//---
void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
    object_second.Prev(object_first);
    //--- use objects
    //--- ...
    //--- delete objects
    delete object_first;
    delete object_second;
}
```
**Next**

Gets a pointer to the next element in the list.

```cpp
CObject* Next()
```

**Return Value**

Pointer to the next element in the list. If this is the last element in the list, return NULL.

**Example:**

```cpp
//--- example for CObject::Next()
#include <Object.mqh>
//---
void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
    object_second.Prev(object_first);
    //--- use next object
    CObject *object=object_first.Next();
    //--- delete objects
    delete object_first;
    delete object_second;
}
```
Sets the pointer to the next element in the list.

```c
void Next(
   COBject* object   // Pointer to the next element in the list
)
```

**Parameters**

- **object**
  - [in] New value of the pointer to the next element in the list.

**Example:**

```c
//--- example for COBject::Next(COject*)
#include <Object.mq>
//---
void OnStart()
{
   COBject *object_first,*object_second;
   //---
   object_first=new COBject;
   if(object_first==NULL)
   {
      printf("Object create error");
      return;
   }
   object_second=new COBject;
   if(object_second==NULL)
   {
      printf("Object create error");
      delete object_first;
      return;
   }
   //--- set interconnect
   object_first.Next(object_second);
   object_second.Prev(object_first);
   //--- use objects
   //--- ...
   //--- delete objects
   delete object_first;
   delete object_second;
}```
**Compare**

Compares the data on a list element with data on another list element.

```cpp
virtual int Compare(
    const CObject* node,  // element
    const int mode=0      // variant
) const
```

**Parameters**

- **node**
  - [in] Pointer to a list element to compare

- **mode=0**
  - [in] Comparison variant

**Return Value**

0 - in case the list elements are equal, -1 - if the list element is less than the element used for comparison (node), 1 - if the list element is greater than the element used for comparison (node).

**Note**

Compare() method in CObject class always returns 0 and does not perform any action. If you want to compare data in derived class, the Compare(...) method should be implemented. The 'mode' parameter should be used when implementing multivariate comparison.

**Example:**

```cpp
#include <Object.mqh>

void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
```
object_second.Prev(object_first);

//--- compare objects
int result = object_first.Compare(object_second);

//--- delete objects
delete object_first;
delete object_second;
}
Save
Saves list element data in a file.

```cpp
virtual bool Save(
    int file_handle // File handle
)
```

Parameters

file_handle
[in] Handle of the binary file opened earlier using the FileOpen () function

Return Value

true - successfully completed, false - error.

Note

Save(int) method in CObject class always returns 'true' and does not perform any action. If you want to save the data of a derived class in a file, the Save(int) method should be implemented.

Example:

```cpp
//--- example for CObject::Save(int)
#include <Object.mqh>
//---
void OnStart()
{
    int file_handle;
    CObject *object=new CObject;
    //---
    if(object!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- set objects data
    //--- . . .
    //--- open file
    file_handle=FileOpen("MyFile.bin", FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!object.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!", GetLastError());
            delete object;
            FileClose(file_handle);
            //---
            return;
        }
    }
}
```
FileClose(file_handle);
}
delete object;
}
Load

Loads list element data from a file.

```cpp
virtual bool Load(int file_handle) // file handle
```

**Parameters**

`file_handle`

[in] Handle of the binary file opened earlier using the FileOpen() function.

**Return Value**

true - successfully completed, false - error.

**Note**

Load(int) method in the CObject class always returns 'true' and does not perform any action. If you want to load the data of a derived class from a file, the Load(int) method should be implemented.

**Example:**

```cpp
//--- example for CObject::Load(int)
#include <Object.mqh>
//@
void OnStart()
{
    int file_handle;
    CObject *object=new CObject;
    //---
    if(object!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!object.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete object;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
}
```
```cpp
//--- use object
//--- ...
    delete object;
}
```
Type

Gets the type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Type identifier (for CObject - 0).

**Example:**

```cpp
//--- example for CObject::Type()
#include <Object.mqh>
//---
void OnStart()
{
    CObject *object=new CObject;
    //---
    object=new CObject;
    if(object == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get objects type
    int type=object.Type();
    //--- delete object
    delete object;
}
```
Data Structures

This section contains the technical details on working with various data structures (arrays, linked lists, etc.) and description of the relevant components of the MQL5 Standard Library.

Using classes of data structures will save time when creating custom data stores of various formats (including composite data structures).

MQL5 Standard Library (in terms of data sets) is placed in the working directory of the terminal in the Include\Arrays folder.

Data Arrays

Use of classes of dynamic data arrays will save time when creating a custom data stores of various formats (including multidimensional arrays).

MQL5 Standard Library (in terms of arrays of data) is located in the working directory of the terminal in the Include\Arrays folder.

</table>
CArray

CArray class is the base class of a dynamic array of variables.

Description

Class CArray is intended to operate on dynamic arrays of variables: memory allocation, sorting, and working with files.

Declaration

```cpp
class CArray : public CObject
```

Title

```cpp
#include <Arrays\Array.mqh>
```

Inheritance hierarchy

- CObject
- CArray

Direct descendants

- CArrayChar
- CArrayDouble
- CArrayFloat
- CArrayInt
- CArrayLong
- CArrayObj
- CArrayShort
- CArrayString

**Methods inherited from class CObject**

- Prev, Prev, Next, Next, **Type**, **Compare**
Step

Gets the increment size of the array.

```c
int Step() const
```

Return Value

Increment size of the array.

Example:

```c
//--- example for CArray::Step()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get resize step
    int step=array.Step();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Step

Sets the increment size of the array.

```c
bool Step(
    int step       // step
);```

Parameters

**step**

Return Value

true - successful, false - there was an attempt to establish a step less than or equal to zero.

Example:

```c
//--- example for CArray::Step(int)
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- set resize step
    bool result=array.Step(1024);
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
Total

Gets the number of elements in the array.

```cpp
int Total() const;
```

**Return Value**

Number of elements in the array.

**Example:**

```cpp
//--- example for CArray::Total()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check total
    int total=array.Total();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Available

Gets the number of free elements of the array that are available without additional memory allocation.

```cpp
int Available() const
```

Return Value

Number of free elements of the array available without additional memory allocation.

Example:

```cpp
//--- example for CArray::Available()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check available
    int available=array.Available();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Max

Gets the maximum possible size of the array without memory reallocation.

```cpp
int Max() const
```

Return Value

The maximum possible size of the array without memory reallocation.

Example:

```cpp
#include <Arrays\Array.mqh>

void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check maximum size
    int max=array.Max();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
IsSorted

Gets the flag of array being sorted using the specified sorting mode.

```cpp
bool IsSorted(
    int mode=0  // sorting mode
) const
```

Parameters

- `mode=0`
  - [in] Tested sorting mode.

Return Value

Flag of the sorted list. If the list is sorted using the specified mode - true, otherwise - false.

Note

The sort flag cannot be changed directly. It is set by the Sort() method and reset by any add/insert method except for the InserSort(...).

Example:

```cpp
//--- example for CArray::IsSorted()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check sorted
    if(array.IsSorted())
    {
        //--- use methods for sorted array
        //--- ...
    }
    //--- delete array
    delete array;
}
```
SortMode

Gets the sorting mode for an array.

```cpp
int SortMode() const;
```

Return Value

Sorting mode.

Example:

```cpp
//--- example for CArray::SortMode()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check sort mode
    int sort_mode=array.SortMode();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Clear

Deletes all of the array elements without memory release.

```cpp
void Clear()
```

Return Value

None.

Example:

```cpp
//--- example for CArray::Clear()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if (array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- use array
    //--- ...
    //--- clear array
    array.Clear();
    //--- delete array
    delete array;
}
```
Sort

Sorts an array using the specified option.

```cpp
void Sort(
    int mode=0 // sorting mode
)
```

Parameters

- `mode=0`
  

Return Value

- No.

Note

Sorting an array is always ascending. For arrays of primitive data types (CArrayChar, CArrayShort, etc.), the 'mode' parameter is not used. For the CArrayObj array, multivariate sorting should be implemented in the Sort(int) method of derived classes.

Example:

```cpp
//-- example for CArray::Sort(int)
#include <Arrays\Array.mqh>
//--
void OnStart()
{
    CArray *array=new CArray;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- sorting by mode 0
    array.Sort(0);
    //-- use array
    //-- ...
    //-- delete array
    delete array;
}
```
Save

Saves data array in the file.

```
virtual bool Save(
    int  file_handle  // file handle
)
```

**Parameters**

*file_handle*

[in] Handle of a binary file previously opened using the FileOpen(...) function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```
    //--- example for CArray::Save(int)
    #include <Arrays\Array.mqh>
    //---
    void OnStart()
    {
        int  file_handle;
        CArray *array=new CArray;
        //---
        if(array!=NULL)
        {
            printf("Object create error");
            return;
        }
        //--- open file
        file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
        if(file_handle>=0)
        {
            if(!array.Save(file_handle))
            {
                //--- file save error
                printf("File save: Error %d",GetLastError());
                delete array;
                FileClose(file_handle);
                //---
                return;
            }
            FileClose(file_handle);
        }
        //--- delete array
        delete array;
    }
```
Load

Loads data array from a file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

Parameters

`file_handle`

[in] Handle of a binary file previously opened using the `FileOpen()` function.

Return Value

true - successfully completed, false - error.

Example:

```cpp
//--- example for CArray::Load(...)  
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    int    file_handle;
    CArray *array=new CArray;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- delete array
    delete array;
}
CArrayChar

CArrayChar is a class of dynamic array of char or uchar variables.

Description

CArrayChar class provides the ability to work with a dynamic array of char or uchar variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

class CArrayChar : public CArray

Title

#include <Arrays\ArrayChar.mqh>

Inheritance hierarchy

CObject
  CArray
    CArrayChar

Methods inherited from class CObject

Prev, Prev, Next, Next, **Compare**

Methods inherited from class CArray

**Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort**
**Reserve**

Allocates memory to increase the size of the array.

```cpp
bool Reserve(
    int size // number
)
```

**Parameters**

* size
  
  [in] The number of additional elements of the array.

**Return Value**

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

**Note**

To reduce fragmentation of memory, the array size is increased by the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayChar::Reserve(int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size  // size
)
```

**Parameters**

`size`

[in] New size of the array.

**Return Value**

`true` - successful, `false` - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayChar::Resize(int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array = new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
Shutdown

Cleans the array with a full memory release.

bool  Shutdown()

Return Value

true - successful, false - error.

Example:

```c
//--- example for CArrayChar::Shutdown()
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}```
**Add**

Adds an element to the end of the array.

```cpp
bool Add(
    char element // element to add
)
```

**Parameters**

- **element**

  [in] Value of the element to add to the array.

**Return Value**

- true - successful, false - cannot add an element.

**Example:**

```cpp
//--- example for CArrayChar::Add(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const char & src[]  // source array
)
```

Parameters

`src[]`

[in] Reference to an array of source elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayChar::AddArray(const char &[])
#include <Arrays/ArrayChar.h>
//--
char src[];
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayChar* src // pointer to the source
)
```

**Parameters**

*src*

[in] Pointer to an instance of CArrayChar class used as a source of elements to add.

**Return Value**

true - successful, false - cannot add items.

**Example:**

```cpp
//--- example for CArrayChar::AddArray(const CArrayChar*)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {  
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayChar *src=new CArrayChar;
    if(src==NULL)
    {  
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
}
//--- use array
//--- . .
///--- delete array
deflect array;
}
**Insert**

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    char element, // element to insert
    int pos       // position
)
```

**Parameters**

- `element`
  
  [in] Value of the element to be inserted into the array

- `pos`
  
  [in] Position in the array to insert

**Return Value**

- `true` - successful, `false` - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayChar::Insert(char,int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const char* src[], // source array
    int pos // position
)
```

Parameters

- `src[]` - [in] Reference to an array used as a source of elements to insert
- `pos` - [in] Position in the array to insert

Return Value

- `true` - successful, `false` - cannot insert items.

Example:

```cpp
//--- example for CArrayChar::InsertArray(const char *[], int)
#include <Arrays\ArrayChar.mqh>
//---
char src[];
//---
void OnStart()
{
    CArrayChar *array = new CArrayChar;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if (!array.InsertArray(src, 0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayChar* src,   // pointer to the source
    int pos           // position
)
```

Parameters

src

[in]  Pointer to an instance of the CArrayChar class used as a source of elements to insert.

pos

[in]  Position in the array to insert

Return Value

true - successful, false - cannot insert items.

Example:

```cpp
//--- example for CArrayChar::InsertArray(const CArrayChar*,int)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayChar *src=new CArrayChar;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}
```
return;
}

//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
**AssignArray**

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const char* src[] // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayChar::AssignArray(const char*[])
#include <Arrays\ArrayChar.mqh>
//---
char src[];
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(const CArrayChar* src) // pointer to the source
```

**Parameters**

`src`

[in] Pointer to an instance of the CArrayChar class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```cpp
//--- example for CArrayChar::AssignArray(const CArrayChar*)
#include <Arrays\\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- create source array
    CArrayChar *src =new CArrayChar;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //-- add source arrays elements
    //-- . . .
    //-- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //-- arrays are identical
    //-- delete source array
```
```cpp
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
```

## Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,  // position
    char element  // value
)
```

**Parameters**

- `pos`
  - [in] Position of the element in the array to change

- `element`
  - [in] New value of the element

**Return Value**

- true · successful, false · cannot change the element.

**Example:**

```cpp
//--- example for CArrayChar::Update(int,char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,'A'))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
## Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos, // position
    int shift // value
)
```

### Parameters

- **pos**
  - [in] Position of the moved element in the array

- **shift**
  - [in] The shift value (both positive and negative).

### Return Value

- true - successful, false - cannot move the element.

### Example:

```cpp
//--- example for CArrayChar::Shift(int,int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array = new CArrayChar;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos  // position
)
```

**Parameters**

`pos`

[in] Position of the array element to be removed.

**Return Value**

true - successful, false - cannot remove the element.

**Example:**

```cpp
//--- example for CArrayChar::Delete(int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from,  // position of the first element
    int to     // position of the last element
)
```

**Parameters**

- `from`
  - [in] Position of the first array element to be removed.

- `to`
  - [in] Position of the last array element to be removed.

**Return Value**

- `true` - successful, `false` - cannot remove the elements.

**Example:**

```cpp
//--- example for CArrayChar::DeleteRange(int,int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```
char At(
    int pos       // position
) const
```

Parameters

`pos`

[in] Position of the desired element in the array.

Return Value

The value of the element - success, CHAR_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

Note

Of course, CHAR_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

Example:

```
//--- example for CArrayChar::At(int)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    for(int i=0;i<array.Total();i++)
    {
        char result=array.At(i);
        if(result==CHAR_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- error of reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //-- use element
        //-- . . .
    }
}
```
//--- delete array
delete array;
}
### CompareArray

**Compares the array with another one.**

```cpp
bool CompareArray(
    const char & src[]  // source array
) const
```

**Parameters**

`src[]`

- **[in]** Reference to an array used as a source of elements for comparison.

**Return Value**

- `true` - arrays are equal, `false` - arrays are not equal.

**Example:**

```cpp
#include <Arrays\ArrayChar.mqh>

char src[];

void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=src.CompareArray(src);
    //--- delete array
    delete array;
}
```
**CompareArray**

Compares the array with another one.

```c
bool CompareArray(
    const CArrayChar* src // pointer to the source
) const
```

**Parameters**

`src`

[in] Pointer to an instance of the CArrayChar class used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```c
//--- example for CArrayChar::CompareArray(const CArrayChar*)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayChar *src=new CArrayChar;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    char element
) // element to insert
```

**Parameters**

- **element**
  - [in] Value of the element to be inserted into a sorted array

**Return Value**

- true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayChar::InsertSort(char)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort('A'))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```c
int Search(
    char element // sample
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayChar::Search(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```c
int SearchGreat(
    char element // sample
) const
```

Parameters

element

[in] The sample element to search in the array.

Return Value

The position of the found element, if successful, -1 - the element not found.

Example:

```c
//--- example for CArrayChar::SearchGreat(char)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //-- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    char element // sample
) const
```

Parameters

element

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayChar::SearchLess(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual(
    char element  // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayChar::SearchGreatOrEqual(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLessOrEqual**

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(
    char element  // sample
) const
```

**Parameters**

*element*

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayChar::SearchLessOrEqual(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchFirst**

Searches for the first element equal to the sample in the sorted array.

```cpp
int SearchFirst(
    char element  // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayChar::SearchFirst(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLast

Searches for the last element equal to the sample in the sorted array.

```c
int SearchLast(
    char element // sample
) const
```

Parameters

- **element**
  - [in] The sample element to search in the array.

Return Value

- The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayChar::SearchLast(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLinear

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    char element // sample
) const
```

**Parameters**

- `element`
  - [in] The sample element to search in the array.

**Return Value**

- The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayChar::SearchLinear(char)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
  int file_handle // file handle
)
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayChar::Save(int)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
  int file_handle;
  CArrayChar *array=new CArrayChar;
  //---
  if(array!=NULL)
  {
    printf("Object create error");
    return;
  }
  //--- open file
  file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
  if(file_handle>=0)
  {
    if(!array.Save(file_handle))
    {
      //--- file save error
      printf("File save: Error %d!",GetLastError());
      delete array;
      FileClose(file_handle);
      //---
      return;
    }
  }
  FileClose(file_handle);
  //--- delete array
  delete array;
}
Load

 Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the `FileOpen(...)` function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayChar::Load(int)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayChar *array=new CArrayChar;
    //--
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //-- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //--
            return;
        }
        FileClose(file_handle);
    }
    //-- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = '%c'",i,array.At(i));
    }
}
```
```cpp
} //--- delete array
delete array;
```
**Type**

Gets the array type identifier.

```c++
virtual int Type() const
```

**Return Value**

Array type identifier (for CArrayChar - 77).

**Example:**

```c++
//--- example for CArrayChar::Type()
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
        {
        printf("Object create error");
        return;
        }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
**CArrayShort**

CArrayShort is a class of dynamic array of short or ushort variables.

**Description**

Class CArrayShort provides the ability to work with a dynamic array of short or ushort variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

**Declaration**

```cpp
class CArrayShort : public CArray

#include <Arrays\ArrayShort.mqh>
```

**Inheritance hierarchy**

- CObject
  - CArray
    - CArrayShort

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Compare**

### Methods inherited from class CArray

- Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort
Reserve

Allocates memory to increase the size of the array.

```cpp
bool Reserve{
    int size // number
}
```

Parameters

size

[in] The number of additional elements of the array.

Return Value

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

Example:

```cpp
//--- example for CArrayShort::Reserve(int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size    // size
)
```

Parameters

Return Value

- `true` - successful, `false` - there was an attempt to set the size less than zero.

Note

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

Example:

```cpp
//--- example for CArrayShort::Resize(int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shutdown

Clears the array with a full memory release.

```cpp
bool Shutdown()
```

**Return Value**

true - successful, false - error.

**Example:**

```cpp
//--- example for CArrayShort::Shutdown()
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Add

Adds an element to the end of the array.

```c
bool Add(
    short element // element to add
)
```

**Parameters**

- **element**
  - [in] Value of the element to add to the array.

**Return Value**

- true - successful, false - cannot add an element.

**Example:**

```c
//--- example for CArrayShort::Add(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const short& src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array of source elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
#include <Arrays\ArrayShort.mqh>

short src[];

void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayShort* src  // pointer to the source
)
```

**Parameters**

- `src` - [in] Pointer to an instance of CArrayShort class used as a source of elements to add.

**Return Value**

- true - successful, false - cannot add items.

**Example:**

```cpp
//--- example for CArrayShort::AddArray(const CArrayShort*)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src=new CArrayShort;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
//--- use array
//--- ...
//--- delete array
delete array;
}
Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    short element,   // element to insert
    int pos         // position
)
```

**Parameters**

*element*

[in] Value of the element to be inserted into the array

*pos*

[in] Position in the array to insert

**Return Value**

true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayShort::Insert(short,int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const short & src[], // source array
    int pos // position
)
```

**Parameters**

- `src[]`  
  [in] Reference to an array used as a source of elements to insert

- `pos`  
  [in] Position in the array to insert

**Return Value**

- `true` - successful, `false` - cannot insert items.

**Example:**

```cpp
//--- example for CArrayShort::InsertArray(const short &[], int)
#include <Arrays\ArrayShort.mqh>
include <Arrays\ArrayShort.mqh>
//---
short src[];
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayShort* src,  // pointer to the source
    int pos        // position
)
```

**Parameters**

- **src**
  
  [in] Pointer to an instance of the CArrayShort class used as a source of elements to insert.

- **pos**
  
  [in] Position in the array to insert.

**Return Value**

- true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayShort::InsertArray(const CArrayShort*,int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src=new CArrayShort;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
    }
    return;
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
    }
    delete array;
```
return;
}

//--- delete source array
delete src;

//--- use array
//--- . . .

//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const short & src[] // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayShort::AssignArray(const short &[])
#include <Arrays\ArrayShort.mqh>
//--
short src[];
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //-- use array
    //--- . . .
    //-- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayShort* src, // pointer to the source
)
```

Parameters

src

[in] Pointer to an instance of the CArrayShort class used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the elements.

Example:

```cpp
//--- example for CArrayShort::AssignArray(const CArrayShort*)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src =new CArrayShort;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
}
```cpp
delete src;
//--- use array
//--- ...
//--- delete array
delete array;
```
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,  // position
    short element  // value
)
```

Parameters

- **pos**
  - [in] Position of the element in the array to change

- **element**
  - [in] New value of the element

Return Value

- `true` - successful, `false` - cannot change the element.

Example:

```cpp
//--- example for CArrayShort::Update(int,short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,100))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,  // positions
    int shift  // shift
)
```

Parameters

- **pos**
  - [in] Position of the moved element in the array

- **shift**
  - [in] The shift value (both positive and negative).

Return Value

- true - successful, false - cannot move the element.

Example:

```cpp
//--- example for CArrayShort::Shift(int,int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos    // position
)
```

Parameters

- `pos`  
  [in] Position of the array element to be removed.

Return Value

- true - successful, false - cannot remove the element.

Example:

```cpp
//--- example for CArrayShort::Delete(int)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from, // position of the first element
    int to    // position of the last element
)
```

Parameters

- **from**
  - [in] Position of the first array element to be removed.

- **to**
  - [in] Position of the last array element to be removed.

Return Value

- true - successful, false - cannot remove the elements.

Example:

```cpp
#include <Arrays\ArrayShort.mqh>
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```
short At(
    int pos // position
) const
```

Parameters

pos

[in] Position of the desired element in the array.

Return Value

The value of the element - success, SHORT_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

Note

Of course, SHORT_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

Example:

```c
//--- example for CArrayShort::At(int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        short result=array.At(i);
        if(result==SHORT_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- error of reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
}
```
///--- delete array
delete array;
}

## CompareArray

Compares the array with another one.

```cpp
bool CompareArray(
    const short& src[] // source array
) const
```

### Parameters

`src[]`

[in] Reference to an array used as a source of elements for comparison.

### Return Value

true - arrays are equal, false - arrays are not equal.

### Example:

```cpp
//--- example for CArrayShort::CompareArray(const short &[])
#include <Arrays\ArrayShort.mgh>
//---
short src[];
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
CompareArray

Compares the array with another one.

```cpp
bool CompareArray(
    const CArrayShort* src // pointer to the source
) const
```

Parameters

`src`

[in] Pointer to an instance of the CArrayShort class used as a source of elements for comparison.

Return Value

true - arrays are equal, false - arrays are not equal.

Example:

```cpp
//--- example for CArrayShort::CompareArray(const CArrayShort*)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src=new CArrayShort;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
**InsertSort**

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    short element  // element to insert
)
```

**Parameters**

`element`

[in] Value of the element to be inserted into a sorted array

**Return Value**

true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayShort::InsertSort(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort(100))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```c
int Search(
    short element  // sample
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayShort::Search(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```cpp
int SearchGreat(
    short element // sample
) const
```

Parameters

`element`

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - element not found.

Example:

```cpp
//--- example for CArrayShort::SearchGreat(short)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLess**

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    short element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//-- example for CArrayShort::SearchLess(short)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . .
    //-- sort array
    array.Sort();
    //-- search element
    if(array.SearchLess(100)!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```cpp
int SearchGreatOrEqual(
    short element // sample
) const
```

**Parameters**

- `element`
  - [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayShort::SearchGreatOrEqual(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLessOrEqual**

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(  
    short element       // sample  
) const
```

**Parameters**

- **element**
  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
#include <Arrays\ArrayShort.mqh>

void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    short element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayShort::SearchFirst(short)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(100) != -1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLast**

Searches for the last element equal to the sample in the sorted array.

```c
int SearchLast(
    short element  // sample
) const
```

**Parameters**

- `element`
  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayShort::SearchLast(short)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLinear

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    short element        // sample
) const
```

**Parameters**

- `element`

  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayShort::SearchLinear(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- search element
    if(array.SearchLinear(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- **file_handle**
  - [in] Handle of the binary file previously opened using the `FileOpen(...)` function.

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayShort::Save(int)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayShort *array = new CArrayShort;
    //--
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //-- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //--
            return;
        }
    }
    FileClose(file_handle);
}
```
```cpp
}
    delete array;
}
```
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

Parameters

- `file_handle`
  - [in] Handle of the binary file previously opened using the `FileOpen(...)` function.

Return Value

- `true` - successfully completed, `false` - error.

Example:

```cpp
//--- example for CArrayShort::Load(int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayShort *array=new CArrayShort;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %d",i,array.At(i));
    }
}
```
}  
    delete array;  
}
## Type

Gets the array type identifier.

```cpp
virtual int Type() const
```

### Return Value

Array type identifier (for CArrayShort - 82).

### Example:

```cpp
//--- example for CArrayShort::Type()
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array = new CArrayShort;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type = array.Type();
    //--- delete array
    delete array;
}
```
CArrayInt

CArrayInt is a class of dynamic array of int or uint variables.

Description

The class CArrayInt provides the ability to work with a dynamic array of int or uint variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayInt : public CArray
```

#include <Arrays\ArrayInt.mqh>

Inheritance hierarchy

CObject
  CArray
    CArrayInt

Direct descendants

CSpreadBuffer

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Compare**

### Methods inherited from class CArray

- **Step**, **Step**, **Total**, **Available**, **Max**, IsSorted, **SortMode**, Clear, **Sort**
Reserve

Allocates memory to increase the size of the array.

```cpp
bool Reserve{
    int size    // number
}
```

Parameters

size

[in] The number of additional elements of the array.

Return Value

ture - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

Example:

```cpp
//--- example for CArrayInt::Reserve(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```c
bool Resize(
    int size // number
)
```

**Parameters**

`size`

[in] New size of the array.

**Return Value**

true - successful, false - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```c
//--- example for CArrayInt::Resize(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**Shutdown**

Clears the array with a full memory release.

```cpp
bool Shutdown()
```

**Return Value**

true - successful, false - error.

**Example:**

```cpp
//--- example for CArrayInt::Shutdown()
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Add

Adds an element to the end of the array.

```cpp
bool Add(
    int element // element to add
)
```

**Parameters**

*element*

[in] Value of the element to add to the array.

**Return Value**

true - successful, false - cannot add an element.

**Example:**

```cpp
//--- example for CArrayInt::Add(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(const int& src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array of source elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
#include <ArrayInt.mqh>

int src[];

void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayInt* src  // pointer to the source
)
```

Parameters

src

[in] Pointer to an instance of CArrayInt class used as a source of elements to add.

Return Value

ture - successful, false - cannot add items.

Example:

```cpp
#include <Arrays<ArrayInt.mqh>
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src=new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //---...
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
}
```
//--- use array
//--- . . .
//--- delete array
delete array;
}
Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    int element, // element to insert
    int pos      // position
)
```

Parameters

- **element**
  - [in] Value of the element to be inserted into the array

- **pos**
  - [in] Position in the array to insert

Return Value

- true - successful, false - cannot insert the element.

Example:

```cpp
//--- example for CArrayInt::Insert(int,int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const int& src[], // source array
    int pos       // position
)
```

Parameters

- `src[]`
  - [in] Reference to an array used as a source of elements to insert
- `pos`
  - [in] Position in the array to insert

Return Value

- `true` - successful, `false` - cannot insert items.

Example:

```cpp
//--- example for CArrayInt::InsertArray(const int &, int)
#include <Arrays\ArrayInt.mqh>
//---
int src[];
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src, 0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayInt* src,  // pointer to the source
    int pos          // position
)
```

**Parameters**

*src*

[**in**] Pointer to an instance of the CArrayInt class used as a source of elements to insert.

*pos*

[**in**] Position in the array to insert.

**Return Value**

true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayInt::InsertArray(const CArrayInt*,int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src=new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}
```
return;
}

//--- delete source array
delete src;

//--- use array

//--- . .

//--- delete array

delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const int& src[] // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayInt::AssignArray(const int &[])  
#include <Arrays\ArrayInt.hh>
//---
int src[];
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayInt* src // pointer to the source
)
```

Parameters

- **src**
  
  [in] Pointer to an instance of the CArrayInt class used as a source of elements to copy.

Return Value

- true - successful, false - cannot copy the elements.

Example:

```cpp
//--- example for CArrayInt::AssignArray(const CArrayInt*)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src =new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
}
```
//--- arrays is identical
//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,  // position
    int element // value
)
```

Parameters

- `pos`
  - [in] Position of the element in the array to change.

- `element`
  - [in] New value of the element

Return Value

- true - successful, false - cannot change the element.

Example:

```cpp
//--- example for CArrayInt::Update(int,int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,10000))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,  // position
    int shift  // shift
)
```

Parameters

pos

[in] Position of the moved element in the array

shift

[in] The shift value (both positive and negative).

Return Value

true - successful, false - cannot move the element.

Example:

```cpp
#include <Arrays\ArrayInt.mqh>
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos  // position
)
```

**Parameters**

`pos`

[in] Position of the array element to be removed.

**Return Value**

true - successful, false - cannot remove the element.

**Example:**

```cpp
//--- example for CArrayInt::Delete(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}```
2954

Standard Library

DeleteRange
Deletes

a group of elements from the specified array position.

bool DeleteRange(
int from,
// position of the first element
int to
// position of the last element
)
Parameters

from
[in]

Position of the first array element to be removed.

to
[in]

Position of the last array element to be removed.

Return Value

true - successful, false - cannot remove the elements.
Example:

//--- example for CArrayInt::DeleteRange(int,int)
#include <Arrays\ArrayInt.mqh>
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- delete elements
if(!array.DeleteRange(0,10))
{
printf("Delete error");
delete array;
return;
}
//--- delete array
delete array;
}

© 2000-2021, MetaQuotes Ltd


**At**

Gets the element from the specified array position.

```cpp
int At(
    int pos  // position
) const
```

**Parameters**

*pos*

[in] Position of the desired element in the array.

**Return Value**

The value of the element - success, `INT_MAX` - there was an attempt to get an element from a non-existing position (the last error code is `ERR_OUT_OF_RANGE`).

**Note**

Of course, `INT_MAX` may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```cpp
//--- example for CArrayInt::At(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    ///---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    ///--- add arrays elements
    ///--- . . .
    for(int i=0;i<array.Total();i++)
    {
        int result=array.At(i);
        if(result==INT_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- error of reading from array
            printf("Get element error");
            delete array;
            return;
        }
        ///--- use element
        ///--- . . .
    }
}
```
//--- delete array
delete array;
}
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const int& src[] // source array
) const
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

`true` - arrays are equal, `false` - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayInt::CompareArray(const int &[])
#include <Arrays\ArrayInt.mqh>
//---
int src[];
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const CArrayInt* src // pointer to the source
) const
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayInt class used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayInt::CompareArray(const CArrayInt*)
#include <Arrays\ArrayList.hpp>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src=new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
**InsertSort**

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    int element // element to insert
)
```

**Parameters**

- `element`

  [in] Value of the element to be inserted into a sorted array

**Return Value**

- true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayInt::InsertSort(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort(10000))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
Search

Searches for an element equal to the sample in the sorted array.

```cpp
int Search(
    int element // sample
) const
```

Parameters

- **element**
  - [in] The sample element to search in the array.

Return Value

- The position of the found element - successful, -1 - the element not found.

Example:

```cpp
//--- example for CArrayInt::Search(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array = new CArrayInt;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if (array.Search(10000) != -1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```c
int SearchGreat(
    int element // sample
) const
```

**Parameters**

- `element`  
  [in] The sample element to search in the array.

**Return Value**

- The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayInt::SearchGreat(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
2962

Standard Library

SearchLess
S earches

for an element with a value less than the value of the sample in the sorted array.

int SearchLess(
int element
) const

// sample

Parameters

element
[in]

The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.
Example:

//--- example for CArrayInt::SearchLess(int)
#include <Arrays\ArrayInt.mqh>
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchLess(10000)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual(const int element) // sample
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayInt::SearchGreatOrEqual(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
} 
```
SearchLessOrEqual

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```cpp
int SearchLessOrEqual(
    int element  // sample
) const
```

Parameters

element

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```cpp
//--- example for CArrayInt::SearchLessOrEqual(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchFirst**

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    int element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
#include <Arrays\ArrayInt.mqh>

void OnStart()
{
    CArrayInt *array = new CArrayInt;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if (array.SearchFirst(10000) != -1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
2966

Standard Library

SearchLast
S earches

for the last element equal to the sample in the sorted array.

int SearchLast(
int element
) const

// sample

Parameters

element
[in]

The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.
Example:

//--- example for CArrayInt::SearchLast(int)
#include <Arrays\ArrayInt.mqh>
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchLast(10000)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

SearchLinear

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    int element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayInt::SearchLinear(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
Save

Saves data array in the file.

virtual bool Save(
    int file_handle  // file handle
)

Parameters

file_handle

[in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

true - successfully completed, false - error.

Example:

//--- example for CArrayInt::Save(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayInt *array=new CArrayInt;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            // file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
} delete array;
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

Parameters

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayInt::Load(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayInt *array=new CArrayInt;
    //--
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //-- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d",GetLastError());
            delete array;
            FileClose(file_handle);
            //--
            return;
        }
        FileClose(file_handle);
    }
    //-- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %d",i,array.At(i));
    }
}
```

}  
    delete array;

}
**Type**

Gets the array type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Array type identifier (for CArrayInt - 82).

**Example:**

```cpp
//--- example for CArrayInt::Type()
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array = new CArrayInt;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type = array.Type();
    //--- delete array
    delete array;
}
```
CArrayLong

CArrayLong class is a class of dynamic array of long or ulong variables.

Description

The CArrayLong class provides the ability to work with a dynamic array of long or ulong variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayLong : public CArray
```

Title

```cpp
#include <Arrays\ArrayLong.mqh>
```

Inheritance hierarchy

- CObject
- CArray
- CArrayLong

Direct descendants

- CRealVolumeBuffer, CTickVolumeBuffer, CTimeBuffer

**Methods inherited from class CObject**

- Prev, Prev, Next, Next, **Compare**

**Methods inherited from class CArray**

- **Step**, **Step**, **Total**, **Available**, **Max**, **IsSorted**, **SortMode**, **Clear**, **Sort**
**Reserve**

Allocates memory to increase the size of the array.

```cpp
bool Reserve(
    int size  // number
)
```

**Parameters**

- `size`
  
  [in] The number of additional elements of the array.

**Return Value**

- true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

**Note**

To reduce fragmentation of memory, the array size is changed using the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayLong::Reserve(int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size    // size
)
```

**Parameters**

`size`

[in] New size of the array.

**Return Value**

true - successful, false - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayLong::Resize(int)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //-- . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}```
# Shutdown

Clears the array with a full memory release.

```c
bool Shutdown()
```

## Return Value

- `true` - successful, `false` - error.

## Example:

```c
//--- example for CArrayLong::Shutdown()
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
Add

Adds an element to the end of the array.

```cpp
bool Add(
    long element  // element to add
)
```

**Parameters**

- `element`  
  
  [in] Value of the element to add to the array.

**Return Value**

- true - successful, false - cannot add an element.

**Example:**

```cpp
//--- example for CArrayLong::Add(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const long & src[]    // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array of source elements to add.

**Return Value**

true - successful, false - cannot add items.

**Example:**

```cpp
//--- example for CArrayLong::AddArray(const long &[])
#include <Arrays\ArrayLong.mqh>
//---
long src[];
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(const CArrayLong* src) // pointer to the source
```

**Parameters**

`src`

[in] Pointer to an instance of CArrayLong class used as a source of elements to add.

**Return Value**

true - successful, false - cannot add items.

**Example:**

```cpp
//--- example for CArrayLong::AddArray(const CArrayLong*)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayLong *src=new CArrayLong;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
```cpp
//--- use array
//--- . . .
//--- delete array
delete array;
```
Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    long  element, // element to insert
    int   pos       // position
)
```

Parameters

- **element**
  - [in] Value of the element to be inserted into the array

- **pos**
  - [in] Position in the array to insert

Return Value

- true - successful, false - cannot insert the element.

Example:

```cpp
//--- example for CArrayLong::Insert(long,int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const long& src[], // source array
    int pos            // position
)
```

**Parameters**

- `src[]`  
  [in] Reference to an array used as a source of elements to insert

- `pos`  
  [in] Position in the array to insert

**Return Value**

- `true` - successful, `false` - cannot insert items.

**Example:**

```cpp
#include <Arrays\ArrayLong.mqh>

//--- example for CArrayLong::InsertArray(const long &, int)

void OnStart()
{
    CArrayLong *array = new CArrayLong;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if (!array.InsertArray(src, 0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
# InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayLong* src, // pointer to the source
    int pos // position
)
```

**Parameters**

- **src**
  - [in] Pointer to an instance of the CArrayLong class used as a source of elements to insert.

- **pos**
  - [in] Position in the array to insert

**Return Value**

- true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayLong::InsertArray(const CArrayLong*, int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if (array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayLong *src=new CArrayLong;
    if (src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if (!array.InsertArray(src, 0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}
```
return;
}
//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const long & src[]  // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements to copy.

**Return Value**

`true` - successful, `false` - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayLong::AssignArray(const long &[])
#include <Arrays\ArrayLong.mqh>
//--
long src[];
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //-- . . .
    //--- delete array
    delete array;
}
```
**AssignArray**

Copies the elements of one array to another.

```cpp
bool AssignArray(const CArrayLong* src) // pointer to the source
```

**Parameters**

`src`

[in] Pointer to an instance of the CArrayLong class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```cpp
//--- example for CArrayLong::AssignArray(const CArrayLong*)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
  CArrayLong *array=new CArrayLong;  //---
  if(array==NULL)
  {
    printf("Object create error");
    return;
  }
  //--- create source array
  CArrayLong *src =new CArrayLong;
  if(src==NULL)
  {
    printf("Object create error");
    delete array;
    return;
  }
  //--- add source arrays elements
  //--- ...
  //--- assign another array
  if(!array.AssignArray(src))
  {
    printf("Array assigned error");
    delete src;
    delete array;
    return;
  }
  //--- arrays is identical
  //--- delete source array
```
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,  // position
    long element  // value
)
```

Parameters

- **pos**
  - [in] Position of the element in the array to change

- **element**
  - [in] New value of the element

Return Value

- true - successful, false - cannot change the element.

Example:

```cpp
//--- example for CArrayLong::Update(int, long)
#include <Arrays/ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,1000000))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**Shift**

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,   // position
    int shift  // shift
)
```

**Parameters**

- `pos`  
  - [in] Position of the moved element in the array

- `shift`  
  - [in] The shift value (both positive and negative).

**Return Value**

true - successful, false - cannot move the element.

**Example:**

```cpp
//--- example for CArrayLong::Shift(int,int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos  // position
)
```

Parameters

`pos`

[in] Position of the array element to be removed.

Return Value

true - successful, false - cannot remove the element.

Example:

```cpp
//--- example for CArrayLong::Delete(int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from,  // position of the first element
    int to     // position of the last element
)
```

Parameters

- **from**
  - [in] Position of the first array element to be removed.

- **to**
  - [in] Position of the last array element to be removed.

Return Value

- true - successful, false - cannot remove the elements.

Example:

```cpp
//--- example for CArrayLong::DeleteRange(int,int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**At**

Gets the element from the specified array position.

```cpp
long At(
    int pos    // position
) const
```

**Parameters**

pos

[in] Position of the desired element in the array.

**Return Value**

The value of the element - success, LONG_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, LONG_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```cpp
//--- example for CArrayLong::At(int)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        long result=array.At(i);
        if(result==LONG_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- Error reading from the array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
}
```
//--- delete array
delete array;
}
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const long& src[]     // source array
) const
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayLong::CompareArray(const long &[])
#include <Arrays\ArrayLong.mqh>
//---
long src[];
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //---- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
**CompareArrayconst**

Compares the array with another one.

```cpp
bool CompareArrayconst(
    const CArrayLong* src // pointer to the source
) const
```

**Parameters**

src

[in] Pointer to an instance of the CArrayLong class used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
#include <Arrays\ArrayLong.mqh>

void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayLong *src=new CArrayLong;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}```
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    long element // element to insert
)
```

Parameters

`element`

[in] Value of the element to be inserted into a sorted array

Return Value

true - successful, false - cannot insert the element.

Example:

```cpp
//--- example for CArrayLong::InsertSort(long)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- sort array
    array.Sort();
    //-- insert element
    if(!array.InsertSort(1000000))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //-- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```c
int Search(
    long element  // sample
) const
```

**Parameters**

*element*

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayLong::Search(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
## SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```cpp
int SearchGreat(
    long element // sample
) const
```

### Parameters

**element**

[in] The sample element to search in the array.

### Return Value

The position of the found element - successful, -1 - the element not found.

### Example:

```cpp
//--- example for CArrayLong::SearchGreat(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    long element // sample
) const
```

Parameters

`element`

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayLong::SearchLess(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```cpp
int SearchGreatOrEqual(
    long element // sample
) const
```

**Parameters**

- `element`
  - [in] The sample element to search in the array.

**Return Value**

- The position of the found element - successful, `-1` if the element not found.

**Example:**

```cpp
//--- example for CArrayLong::SearchGreatOrEqual(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array = new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
**SearchLessOrEqual**

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(
    long element       // sample
) const
```

**Parameters**

- `element`
  - [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayLong::SearchLessOrEqual(long)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- sort array
    array.Sort();
    //-- search element
    if(array.SearchLessOrEqual(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    long element       // sample
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayLong::SearchFirst(long)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLast**

Searches for the last element equal to the sample in the sorted array.

```csharp
int SearchLast(
    long element  // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```csharp
//--- example for CArrayLong::SearchLast(long)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
        {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . .
    //-- sort array
    array.Sort();
    //-- search element
    if(array.SearchLast(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
**SearchLinear**

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    long element // sample
) const
```

**Parameters**

- `element`

  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayLong::SearchLinear(long)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- ...
    //-- search element
    if(array.SearchLinear(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
Save

Saves data array in the file.

```c
virtual bool Save(
    int file_handle   // file handle
);
```

**Parameters**

- `file_handle`

  [in] Handle of the binary file previously opened using the `FileOpen(...)` function.

**Return Value**

- `true` - successfully completed, `false` - error.

**Example:**

```c
//--- example for CArrayLong::Save(int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    int    file_handle;
    CArrayLong *array=new CArrayLong;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
}
```
delete array;
Load

Loads data array from the file.

```
virtual bool Load(
    int file_handle    // file handle
)
```

Parameters

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayLong::Load(int)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayLong *array=new CArrayLong;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %I64",i,array.At(i));
    }
}
```cpp
} delete array;
```
Type

Gets the array type identifier.

```cpp
virtual int Type() const
```

Return Value

Array type identifier (for CArrayLong - 84).

Example:

```cpp
//--- example for CArrayLong::Type()
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
   CArrayLong *array=new CArrayLong;
   //---
   if(array==NULL)
   {
      printf("Object create error");
      return;
   }
   //--- get array type
   int type=array.Type();
   //--- delete array
   delete array;
}
```
CArrayFloat

CArrayFloat class is a class of dynamic array of float variables.

Description

The CArrayFloat class provides the ability to work with a dynamic array of float variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayFloat : public CArray
```

Title

```cpp
#include <Arrays\ArrayFloat.mqh>
```

Inheritance hierarchy

- CObject
- CArray
- CArrayFloat

#### Input/output

- **virtual Save**
  - Saves data array in the file
- **virtual Load**
  - Loads data array from the file
- **virtual Type**
  - Gets the type identifier of the array

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Compare**

### Methods inherited from class CArray

- **Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort**
**Delta**

Sets the comparison tolerance.

```c
void Delta(
    float delta  // tolerance
)
```

**Parameters**

- `delta`
  
  [in] The new value of the comparison tolerance.

**Return Value**

None

**Note**

Comparison tolerance is used in the search. Values are considered equal if their difference is less than or equal to tolerance. The default tolerance is 0.0.

**Example:**

```c
//--- example for CArrayFloat::Delta(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
        {
        printf("Object create error");
        return;
        }
    //--- set compare variation
    array.Delta(0.001);
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Reserve

Allocates memory to increase the size of the array.

```cpp
bool Reserve(
    int size // number
)
```

Parameters

- `size`
  - [in] The number of additional elements of the array.

Return Value

- `true` - successful, `false` - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

Example:

```cpp
#include <Arrays\ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**Resize**

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size // size
)
```

**Parameters**

`size`

[in] New size of the array.

**Return Value**

true - successful, false - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```cpp
#ifdef example for CArrayFloat:Resize(int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}```
Shutdown

Clears the array with a full memory release.

```cpp
bool Shutdown()
```

Return Value

true - successful, false - error.

Example:

```cpp
//--- example for CArrayFloat::Shutdown()
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
Add
Adds an element to the end of the array.

```c++
bool Add(
    float element  // element to add
)
```

Parameters

element

[in] Value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Example:

```c++
#include <Arrays\ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const float& src[] // source array
)
```

Parameters

**src[]**

[in] Reference to an array of source elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayFloat::AddArray(const float &[])
#include <Arrays\ArrayFloat.mqh>
//---
float src[];
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayFloat* src // pointer to the source
);
```

Parameters

src

[in] Pointer to an instance of CArrayFloat class used as a source of elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayFloat::AddArray(const CArrayFloat*)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src=new CArrayFloat;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
//--- use array
//--- . . .
//--- delete array
delete array;
}

Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    float element, // element to insert
    int pos        // position
)
```

Parameters

- `element`
  - [in] Value of the element to be inserted into an array

- `pos`
  - [in] Position in the array to insert

Return Value

- `true` - successful, `false` - cannot insert the element.

Example:

```cpp
//--- example for CArrayFloat::Insert(float,int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array = new CArrayFloat;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //---- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const float& src[], // source array
    int pos // position
);
```

**Parameters**

- `src[]`  
  - [in] Reference to an array used as a source of elements to insert

- `pos`  
  - [in] Position in the array to insert

**Return Value**

- true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayFloat::InsertArray(const float &[], int)
#include <Arrays\ArrayFloat.mqh>
//---
float src[];
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src, 0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayFloat* src, // pointer to the source
    int pos        // position
)
```

**Parameters**

- **src**  
  [in] Pointer to an instance of the CArrayFloat class used as a source of elements to insert.

- **pos**  
  [in] Position in the array to insert

**Return Value**

- **true** - successful, **false** - cannot insert items.

**Example:**

```cpp
//--- example for CArrayFloat::InsertArray(const CArrayFloat*,int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src=new CArrayFloat;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}  
```
return;
}
//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```c
bool AssignArray(
    const float & src[]  // source array
)
```

Parameters

`src[]`

[in] Reference to an array used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the items.

Example:

```c
//--- example for CArrayFloat::AssignArray(const float &[])
#include <Arrays\ArrayFloat.mqh>
//---
float src[];
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayFloat* src // pointer to the source
);
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayFloat class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```cpp
#include <Arrays\ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array = new CArrayFloat;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src = new CArrayFloat;
    if (src == NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if (!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
```
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos, // position
    float element // value
)
```

Parameters

- **pos**
  - [in] Position of the element in the array to change

- **element**
  - [in] New value of the element

Return Value

- true - successful, false - cannot change the element.

Example:

```cpp
//--- example for CArrayFloat::Update(int, float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart() {
    CArrayFloat *array = new CArrayFloat;
    //---
    if (array == NULL) {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if (!array.Update(0, 100.0)) {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,  // position
    int shift // shift
)
```

**Parameters**

`pos`
- [in] Position of the moved element in the array

`shift`
- [in] The shift value (both positive and negative).

**Return Value**

true - successful, false - cannot move the element.

**Example:**

```cpp
#include <CArrayFloat.h>

void OnStart()
{
    CArrayFloat *array = new CArrayFloat;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if (!array.Shift(10, -5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos   // position
)
```

**Parameters**

`pos`

[in] Position of the array element to be removed.

**Return Value**

true - successful, false - cannot remove the element.

**Example:**

```cpp
#include <Arrays\ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from,  // position of the first element
    int to     // position of last element
)
```

**Parameters**

- `from`  
  - [in] Position of the first array element to be removed.
- `to`  
  - [in] Position of the last array element to be removed.

**Return Value**

- `true` - successful, `false` - cannot remove the elements.

**Example:**

```cpp
//--- example for CArrayFloat::DeleteRange(int,int)
#include <ArraysArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```
float At(
    int pos    // position
) const
```

Parameters

`pos`

[in] Position of the desired element in the array.

Return Value

The value of the element - success, FLT_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

Note

Of course, FLT_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

Example:

```c
//--- example for CArrayFloat::At(int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        float result=array.At(i);
        if(result==FLT_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- error reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
}
```
///--- delete array
delete array;
}
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const float & src[] // source array
) const
```

**Parameters**

*src[]* 

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayFloat::CompareArray(const float &[])
#include <Arrays\ArrayFloat.mqh>
//---
float src[];
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
AssignArrayconst

Compares the array with another one.

```cpp
bool AssignArrayconst(
    const CArrayFloat* src // pointer to the source
) const
```

Parameters

`src` [in] Pointer to an instance of the CArrayFloat class used as a source of elements for comparison.

Return Value

true - successful, false - cannot copy the items.

Example:

```cpp
//--- example for CArrayFloat::CompareArray(const CArrayFloat*)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src=new CArrayFloat;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    float element // element to insert
)
```

**Parameters**

*element*

[in] Value of the element to be inserted into a sorted array

**Return Value**

true - successful, false - cannot insert the element.

**Example:**

```cpp
void OnStart()
{
    CArrayFloat *array = new CArrayFloat;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if (!array.InsertSort(100.0))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```cpp
int Search(
    float element  // sample
) const
```

Parameters

`element`

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```cpp
//--- example for CArrayFloat::Search(float)
#include <Arrays\ArrayFloat.mgh>
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}```
**SearchGreat**

Searches for an element with a value exceeding the value of the sample in the sorted array.

```cpp
int SearchGreat(
    float element     // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayFloat::SearchGreat(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```cpp
int SearchLess(
    float element,  // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayFloat:: SearchLess(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }  //---
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```cpp
int SearchGreatOrEqual(
    float element     // sample
) const
```

**Parameters**

- `element`
  - [in] The sample element to search in the array.

**Return Value**

- The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayFloat::SearchGreatOrEqual(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array = new CArrayFloat;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(100.0) != -1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
3043

Standard Library

SearchLessOrEqual
S earches

for an element with a value less than or equal to the value of the sample in the sorted array.

int SearchLessOrEqual(
float element
// sample
) const
Parameters

element
[in]

The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.
Example:

//--- example for CArrayFloat::SearchLessOrEqual(float)
#include <Arrays\ArrayFloat.mqh>
//--void OnStart()
{
CArrayFloat *array=new CArrayFloat;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchLessOrEqual(100.0)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

Standard Library

SearchFirst
S earches

for the first element equal to the sample in the sorted array.

int SearchFirst(
float element
) const

// sample

Parameters

element
[in]

The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.
Example:

//--- example for CArrayFloat::SearchFirst(float)
#include <Arrays\ArrayFloat.mqh>
//--void OnStart()
{
CArrayFloat *array=new CArrayFloat;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchFirst(100.0)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

SearchLast

Searches for the last element equal to the sample in the sorted array.

```
int SearchLast(
    float element // sample
) const
```

Parameters

element

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```
//--- example for CArrayFloat::SearchLast(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLinear

Searches for the element equal to the sample in the array.

```c
int SearchLinear(
    float element  // sample
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

- The position of the found element - successful, -1 - the element not found.

Note

- The method uses the linear search (or sequential search) algorithm for unsorted arrays.

Example:

```c
//--- example for CArrayFloat::SearchLinear(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- **file_handle**
  - [in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayFloat::Save(int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin", FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d\n", GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
```
```cpp
    }
    delete array;
    }
```
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`  
  [in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

- true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayFloat::Load(int)
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %.2f",i,array.At(i));
    }
}
```
```cpp
}
delete array;
```
Type

Gets the array type identifier.

```python
virtual int Type() const
```

Return Value

Array type identifier (for CArrayFloat - 87).

Example:

```c++
#include <Arrays\ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
CArrayDouble

CArrayDouble class is a class of dynamic array of double variables.

Description

The CArrayDouble class provides the ability to work with a dynamic array of double variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayDouble : public CArray
```

Title

```cpp
#include <Arrays\ArrayDouble.mqh>
```

Inheritance hierarchy

CObject
  CArray
    CArrayDouble

Direct descendants

### Input/output

- **virtual Save** Saves data array in the file
- **virtual Load** Loads data array from the file
- **virtual Type** Gets the type identifier of the array

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Compare**

### Methods inherited from class CArray

- Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort
**Delta**

Sets the comparison tolerance.

```cpp
void Delta(
    double delta  // tolerance
)
```

**Parameters**

`delta`

[in] The new value of the comparison tolerance.

**Return Value**

No

**Note**

Comparison tolerance is used in the search. Values are considered equal if their difference is less than or equal to tolerance. The default tolerance is 0.0.

**Example:**

```cpp
//--- example for CArrayDouble::Delta(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- set compare variation
    array.Delta(0.001);
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Reserve

Allocates memory to increase the size of the array.

```c
bool Reserve(
    int size   // number
)
```

Parameters

size

[in] The number of additional elements of the array.

Return Value

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

Example:

```c
//--- example for CArrayDouble::Reserve(int)
#include <ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size   // size
)
```

**Parameters**

`size`
- [in] New size of the array.

**Return Value**

true - successful, false - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayDouble::Resize(int)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //-- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shutdown

Clears the array with a full memory release.

```cpp
bool Shutdown()
```

Return Value

true - successful, false - error.

Example:

```cpp
//--- example for CArrayDouble::Shutdown()
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
  CArrayDouble *array=new CArrayDouble;
  //---
  if(array==NULL)
  {
    printf("Object create error");
    return;
  }
  //--- add arrays elements
  //--- . . .
  //--- shutdown array
  if(!array.Shutdown())
  {
    printf("Shutdown error");
    delete array;
    return;
  }
  //--- delete array
  delete array;
}```
Add

Adds an element to the end of the array.

```cpp
bool Add(
    double element // element to add
)
```

Parameters

**element**

[in] Value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Example:

```cpp
//--- example for CArrayDouble::Add(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array = new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const double & src[]  // source array
)
```

**Parameters**

*src[]*

[in] Reference to an array of source elements to add.

**Return Value**

true - successful, false - cannot add items.

**Example:**

```cpp
#include <Arrays\ArrayDouble.mqh>

double src[];

void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayDouble* src  // pointer to the source
)
```

Parameters

- `src`  
  [in] Pointer to an instance of CArrayDouble class used as a source of elements to add.

Return Value

- true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayDouble::AddArray(const CArrayDouble*)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayDouble *src=new CArrayDouble;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
```cpp
//--- use array
//--- . . .
//--- delete array
delete array;
}````
Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    double element,   // element to insert
    int pos          // position
)
```

Parameters

- `element`
  
  [in] Value of the element to be inserted into an array

- `pos`
  
  [in] Position in the array to insert

Return Value

`true` - successful, `false` - cannot insert the element.

Example:

```cpp
//--- example for CArrayDouble::Insert(double,int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const double& src[], // source array
    int pos         // position
)
```

Parameters

src[]

[in] Reference to an array used as a source of elements to insert

pos

[in] Position in the array to insert

Return Value

true - successful, false - cannot insert items.

Example:

```cpp
//--- example for CArrayDouble::InsertArray(const double &[],int)
#include <Arrays\ArrayDouble.mqh>
//--
double src[];
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //-- use array
    //--- . . .
    //-- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

bool InsertArray(
    CArrayDouble* src, // pointer to the source
    int pos // position
)

Parameters

src
   [in] Pointer to an instance of the CArrayDouble class used as a source of elements to insert.

pos
   [in] Position in the array to insert

Return Value

true - successful, false - cannot insert items.

Example:

#include <Arrays\ArrayDouble.mqh>
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayDouble *src=new CArrayDouble;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
return;
}
//--- delete source array
delete src;
//--- use array
//--- . .
//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const double& src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the items.

Example:

```cpp
//--- example for CArrayDouble::AssignArray(const double &[])
#include <Arrays/ArrayDouble.mqh>
//--
double src[];
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```c
bool AssignArray(
    const CArrayDouble* src // pointer to the source
)
```

**Parameters**

`src`

[in] Pointer to an instance of the CArrayDouble class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```c
//--- example for CArrayDouble::AssignArray(const CArrayDouble*)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayDouble *src =new CArrayDouble;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
```
```cpp
delete src;
//--- use array
//--- . .
//--- delete array
delete array;
```

Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,       // position
    double element // value
)
```

Parameters

- `pos`
  - [in] Position of the element in the array to change
- `element`

Return Value

true - successful, false - cannot change the element.

Example:

```cpp
//--- example for CArrayDouble::Update(int,double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,100.0))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
3071

Standard Library

Shift
Moves an item from a given position in the array to the specified offset.
bool Shift(
int pos,
int shift
)

// position
// shift

Parameters

pos
[in]

Position of the moved element in the array

shift
[in]

The shift value (both positive and negative).

Return Value

true - successful, false - cannot move the element.
Example:

//--- example for CArrayDouble::Shift(int,int)
#include <Arrays\ArrayDouble.mqh>
//--void OnStart()
{
CArrayDouble *array=new CArrayDouble;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- shift element
if(!array.Shift(10,-5))
{
printf("Shift error");
delete array;
return;
}
//--- delete array
delete array;
}

Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos  // position
)
```

**Parameters**

*pos*

[in] Position of the array element to be removed.

**Return Value**

true - successful, false - cannot remove the element.

**Example:**

```cpp
//--- example for CArrayDouble::Delete(int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from, // position of the first element
    int to    // position of the last element
)
```

Parameters

- **from**
  - [in] Position of the first array element to be removed.

- **to**
  - [in] Position of the last array element to be removed.

Return Value

- true - successful, false - cannot remove the elements.

Example:

```cpp
//--- example for CArrayDouble::DeleteRange(int,int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```c
double  At(
    int  pos        // position
) const
```

**Parameters**

`pos`

[in] Position of the desired element in the array.

**Return Value**

The value of the element - success, DBL_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, DBL_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```c
//--- example for CArrayDouble::At(int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        double result=array.At(i);
        if(result==DBL_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- Error reading from the array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
```
```cpp
//--- delete array
delete array;
}
```
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const double& src[] // source array
) const
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayDouble::CompareArray(const double &[])
#include <Arrays\ArrayDouble.mqh>
//---
double src[];
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
## CompareArray

Compares the array with another one.

```cpp
bool CompareArray(
    const CArrayDouble* src // pointer to the source
) const
```

### Parameters

**src**

[in] Pointer to an instance of the CArrayDouble class used as a source of elements for comparison.

### Return Value

true - successful, false - cannot copy the items.

### Example:

```cpp
//--- example for CArrayDouble::CompareArray(const CArrayDouble*)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayDouble *src=new CArrayDouble;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
Minimum

Gets index of the lowest element of the array in the specified range.

```c
int Minimum(
    int start,  // starting index
    int count   // number of elements
) const
```

**Parameters**

- `start`  
  [in] Starting index of the search range.

- `count`  
  [in] Search range size (number of elements).

**Return Value**

Index of the lowest element in the specified range.
Maximum

Gets index of the highest element of the array in the specified range.

```c
int Maximum(
    int start, // starting index
    int count  // number of elements
) const
```

**Parameters**

- `start`
  - [in] Starting index of the search range.

- `count`
  - [in] Search range size (number of elements).

**Return Value**

Index of the highest element in the specified range.
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    double element // element to insert
)
```

**Parameters**

`element`
- [in] Value of the element to be inserted into a sorted array

**Return Value**

true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayDouble: :InsertSort(double)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array = new CArrayDouble;
    //---
    if (array == NULL)
        {
            printf("Object create error");
            return;
        }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array. Sort();
    //--- insert element
    if ( !array. InsertSort(100.0) )
        {
            printf("Insert error");
            delete array;
            return;
        }
    //--- delete array
    delete array;
}```
Search

Searches for an element equal to the sample in the sorted array.

```c
int Search(
    double element // sample
) const
```

**Parameters**

- `element`

  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayDouble::Search(double)
#include <Arrays\ArrayDouble.mqh>
---
void OnStart()
{
    CArrayDouble *array = new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search(100.0)!=-1) printf("Element found");
    else
        printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```c
int SearchGreat(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayDouble::SearchGreat(double)
#include <Arrays/ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    double element // sample
) const
```

Parameters

- `element` ([in]) The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayDouble:: SearchLess(double)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //---...
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual(
    double element // sample
) const
```

**Parameters**

*element*

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayDouble::SearchGreatOrEqual(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLessOrEqual**

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```cpp
int SearchLessOrEqual(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayDouble::SearchLessOrEqual(double)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
} 
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    double element // sample
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
///--- example for CArrayDouble::SearchFirst(double)
#include <Arrays\ArrayDouble.mqh>
///---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLast

Searches for the last element equal to the sample in the sorted array.

```cpp
int SearchLast(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
#include <Arrays\ArrayDouble.mqh>

void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLinear

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayDouble::SearchLinear(double)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle  // file handle
)
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the `FileOpen(...)` function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayDouble::Save(int)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    int    file_handle;
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
    }
    FileClose(file_handle);
```
//--- delete array
delete array;
}
Load

Loads data array from the file.

virtual bool Load(
    int file_handle   // file handle
)

Parameters

file_handle

[in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

true - successfully completed, false - error.

Example:

//--- example for CArrayDouble::Load(int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    int    file_handle;
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %f",i,array.At(i));
    }
}
delete array;
}

//--- delete array
delete array;
}
Type

Gets the array type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Array type identifier (for CArrayDouble - 87).

**Example:**

```cpp
//--- example for CArrayDouble::Type()
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
CArrayString

CArrayString class is a class of dynamic array of string variables.

Description

The CArrayString class provides the ability to work with a dynamic array of string variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayString : public CArray
```

#include <Arrays\ArrayString.mqh>

Inheritance hierarchy

CObject
   CArray
      CArrayString

**Methods inherited from class CObject**
- Prev, Prev, Next, Next, **Compare**

**Methods inherited from class CArray**
- Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort
Reserve

Allocates memory to increase the size of the array.

```cpp
bool Reserve{
    int size // number
}
```

Parameters

size

[in] The number of additional elements of the array.

Return Value

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

Example:

```cpp
//--- example for CArrayString::Reserve(int)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size // size
)
```

**Parameters**

- `size`
  
  [in] New size of the array.

**Return Value**

- true - successful, false - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayString::Resize(int)
#include <ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shutdown

Clears the array with a full memory release.

```c
bool Shutdown()
```

Return Value

true - successful, false - error.

Example:

```c
//--- example for CArrayString::Shutdown()
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Add

Adds an element to the end of the array.

```c
bool Add(
    string element // element to add
)
```

Parameters

element

[in] Value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Example:

```c
//--- example for CArrayString::Add(string)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(IntegerToString(i)))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //-- use array
    //-- . . .
    //-- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const string& src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array of source elements to add.

Return Value

ture - successful, false - cannot add items.

Example:

```cpp
#include <Arrays\ArrayString.mqh>

void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Add elements of one array to the end of another.

```cpp
bool AddArray(const CArrayString* src)
```

Parameters

src

[in] Pointer to an instance of CArrayString class used as a source of elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
#include <Arrays\ArrayString.mqh>

void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if (array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayString *src=new CArrayString;
    if (src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if (!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
}
//--- use array
//--- ...
//--- delete array
delete array;
}
Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    string element, // element to insert
    int pos        // position
)
```

Parameters

element

[in] Value of the element to be inserted into an array

pos

[in] Position in the array to insert

Return Value

true - successful, false - cannot insert the element.

Example:

```cpp
//--- example for CArrayString::Insert(string,int)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(IntegerToString(i),0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```c
bool InsertArray(
    const string & src[], // source array
    int pos  // position
)
```

Parameters

src[]  
[in] Reference to an array used as a source of elements to insert

pos  
[in] Position in the array to insert

Return Value

true - successful, false - cannot insert items.

Example:

```c
//--- example for CArrayString::InsertArray(const string &,int)
#include <Arrays\ArrayString.mqh>
//---
string src[];
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```c
bool InsertArray(  
    CArrayString* src,  // pointer to the source  
    int pos  // position  
);
```

Parameters

`src`
- [in] Pointer to an instance of the CArrayString class used as a source of elements to insert.

`pos`
- [in] Position in the array to insert

Return Value

- true - successful, false - cannot insert items.

Example:

```c
#include <Arrays\ArrayString.mqh>

void OnStart()  
{  
    CArrayString *array=new CArrayString;  
    //---  
    if(array==NULL)  
    {  
        printf("Object create error");  
        return;  
    }  
    //--- create source array  
    CArrayString *src=new CArrayString;  
    if(src==NULL)  
    {  
        printf("Object create error");  
        delete array;  
        return;  
    }  
    //--- add source arrays elements  
    //--- . . .  
    //--- insert another array  
    if(!array.InsertArray(src,0))  
    {  
        printf("Array inserting error");  
        delete src;  
        delete array;
    }
```
return;
}

//--- delete source array
delete src;

//--- use array
//--- . . .

//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const string& src[] // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayString::AssignArray(const string &[])
#include <Arrays\ArrayString.mqh>
//--
string src[];
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //-- use array
    //--- . . .
    //-- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayString* src // pointer to the source
)
```

Parameters

`src`

[in] Pointer to an instance of the CArrayString class used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the elements.

Example:

```cpp
//--- example for CArrayString::AssignArray(const CArrayString*)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array = new CArrayString;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayString *src = new CArrayString;
    if(src == NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
    delete src;
}
```
```cpp
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
```
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,  // position
    string element  // value
);
```

**Parameters**

- `pos`  
  [in] Position of the element in the array to change

- `element`  
  [in] New value of the element

**Return Value**

true - successful, false - cannot change the element.

**Example:**

```cpp
#include <Arrays/ArrayString.mqh>

void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,"ABC"))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,       // position
    int shift      // shift
)
```

**Parameters**

*pos*

[in] Position of the moved element in the array

*shift*

[in] The shift value (both positive and negative).

**Return Value**

true - successful, false - cannot move the element.

**Example:**

```cpp
//--- example for CArrayString::Shift(int,int)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos // position
);
```

Parameters

- `pos`
  - [in] Position of the array element to be removed.

Return Value

- `true` - successful, `false` - cannot remove the element.

Example:

```cpp
//-- example for CArrayString::Delete(int)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //--
    if(array==NULL)
        {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- delete element
    if(!array.Delete(0))
        {
        printf("Delete error");
        delete array;
        return;
    }
    //-- delete array
    delete array;
}"
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from,  // position of the first element
    int to     // position of last element
)
```

Parameters

- `from`
  - [in] Position of the first array element to be removed.
- `to`
  - [in] Position of the last array element to be removed.

Return Value

- `true` - successful, `false` - cannot remove the elements.

Example:

```cpp
//--- example for CArrayString::DeleteRange(int,int)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```cpp
string At(
    int pos  // position
) const
```

**Parameters**

- `pos`
  - [in] Position of the desired element in the array.

**Return Value**

The value of the element - success, "" - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, "" may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```cpp
//--- example for CArrayString::At(int)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        string result=array.At(i);
        if(result=="" && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- Error reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
}
```
//--- delete array
delete array;
}
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const string & src[] // source array
) const
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayString::CompareArray(const string &[])
#include "Arrays\ArrayString.mqh"
//--
string src[];
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
CompareArray

Compares the array with another one.

```cpp
bool CompareArrays(
    const CArrayString* src // pointer to the source
) const
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayString class used as a source of elements for comparison.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayString::CompareArray(const CArrayString*)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayString *src=new CArrayString;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    string element  // element to insert
)
```

**Parameters**

- `element`
  
  [in] Value of the element to be inserted into a sorted array

**Return Value**

- true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayString::InsertSort(string)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort("ABC"))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```cpp
int Search(
    string element  // sample
) const
```

Parameters

`element`

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```cpp
//--- example for CArrayString::Search(string)
#include <Arrays\ArrayString.mqh>
///--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //---- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search("ABC")!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```cpp
int SearchGreat(
    string element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayString::SearchGreat(string)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //--- . . .
    //-- sort array
    array.Sort();
    //-- search element
    if(array.SearchGreat("ABC")!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```cpp
int SearchLess(
    string element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayString::SearchLess(string)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //---...
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess("ABC")!=-1) printf("Element found");
    else
    printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual(
    string element       // sample
) const
```

Parameters

element

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
#include <Arrays/ArrayString.mqh>

void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual("ABC")!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLessOrEqual

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(
    string element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayString::SearchLessOrEqual(string)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual("ABC")!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```cpp
int SearchFirst(
    string element  // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayString:: SearchFirst(string)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . .
    //--- sort array
    array.Sort();
    //-- search element
    if(array.SearchFirst("ABC")!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
**SearchLast**

Searches for the last element equal to the sample in the sorted array.

```cpp
int SearchLast(string element) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayString::SearchLast(string)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast("ABC")!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLinear

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    string element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayString::SearchLinear(string)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear("ABC")!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

**Parameters**

*file_handle*

[in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayString::Save(int)
#include <Arrays\ArrayString.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayString *array=new CArrayString;
    //--
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(IntegerToString(i));
    }
    //-- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d",GetLastError());
            delete array;
            FileClose(file_handle);
            //--
            return;
        }
        FileClose(file_handle);
    }
}
```
```cpp
}
    delete array;
}
```
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

Parameters

- `file_handle`
  
  [in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayString::Load(int)
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayString *array = new CArrayString;
    //---
    if(array != NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle = FileOpen("MyFile.bin", FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle > 0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d", GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i = 0; i < array.Total(); i++)
    {
        printf("Element[%d] = '%s'", i, array.At(i));
    }
}```
```cpp
} delete array;
```
Type

Gets the array type identifier.

```cpp
virtual int Type() const
```

Return Value

Array type identifier (for CArrayString - 89).

Example:

```cpp
//--- example for CArrayString::Type()
#include <Arrays\ArrayString.mqh>
//---
void OnStart()
{
    CArrayString *array=new CArrayString;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //---- delete array
    delete array;
}
```
**CArrayObj**

CArrayObj class is a class of dynamic array of pointers to instances of CObject and its derived classes.

**Description**

Class CArrayObj provides the ability to work with a dynamic array of pointers to instances of CObject and its derived classes. This allows working both with multidimensional dynamic arrays of primitive data types and with data structures that have more complex organization of data.

The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

There are certain subtleties of the class CArrayObj.

**Declaration**

```cpp
class CArrayObj : public CArray
```

**Title**

```cpp
#include <Arrays\ArrayObj.mqh>
```

**Inheritance hierarchy**

- CObject
  - CArray
    - CArrayObj

**Direct descendants**

- CIndicators, CSeries

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CArray

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort

Arrays of the CObject class have practical application (including all classes of the Standard Library).

For example, consider the options for two-dimensional array:

```cpp
#include <Arrays\ArrayDouble.mqh>
#include <Arrays\ArrayObj.mqh>

void OnStart()
{
    int i,j;
    int first_size=10;
    int second_size=100;
    //--- create array
    CArrayObj *array=new CArrayObj;
    CArrayDouble *sub_array;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create subarrays
    for(i=0;i<first_size;i++)
```
```cpp
{  
    sub_array=new CArrayDouble;
    if(sub_array==NULL)
    {  
        delete array;
        printf("Object create error");
        return;  
    }  
    //--- fill array  
    for(j=0;j<second_size;j++)
    {  
        sub_array.Add(i*j);
    }
    array.Add(sub_array);
}
//--- create array OK  
for(i=0;i<first_size;i++)
{  
    sub_array=array.At(i);  
    for(j=0;j<second_size;j++)
    {  
        double element=sub_array.At(j);  
        //--- use array element  
    }
    delete array;  
}
```

**Subtleties**

The class has a mechanism to control dynamic memory, so be careful when working with elements of the array.

Mechanism of memory management can be switched on/off using the method FreeMode (bool). By default, the mechanism is enabled.

Accordingly, there are two options for dealing with the CArrayObj class:

1. Mechanism of memory management is enabled. (default)

In this case, CArrayObj takes responsibility for releasing the memory used for the elements after their removal from the array. A custom program should not release the array elements.

**Example:**

```cpp
int i;  
//--- create an array  
CArrayObj *array=new CArrayObj;  
//--- fill array elements  
for(i=0;i<10;i++) array.Add(new COobject);
```
2. Mechanism of memory management is disabled.

In this case, CArrayObj is not responsible for deallocating of the elements' memory after their removal from the array. Besides, the user program must deallocate the array elements.

Example:

```cpp
int i;
//--- create an array
CArrayObj *array=new CArrayObj;
//--- disable the mechanism of memory management
array.FreeMode(false);
//--- fill array with elements
for(i=0;i<10;i++) array.Add(new CObject);
//--- do something
for(i=0;i<array.Total();i++)
{
    CObject *object=array.At(i);
    //--- actions performed with the element
    . . .
}
//--- remove array elements
while(array.Total()) delete array.Detach();
//--- remove empty array
delete array;
```
FreeMode

Gets the flag of memory management.

```cpp
bool FreeMode() const
```

**Return Value**

Flag of memory management.

**Example:**

```cpp
//--- example for CArrayObj::FreeMode()
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get free mode flag
    bool array_free_mode=array.FreeMode();
    //--- delete array
    delete array;
}
```
FreeMode

Sets the flag of memory management.

```cpp
void FreeMode(
    bool mode  // new flag
)
```

Parameters

- `mode`
  - [in] New value of the memory management flag.

Return Value

- None.

Note

Setting the memory management flag is an important part in the CArrayObj class use. Since the array elements are pointers to dynamic objects, it is important to determine what to do with them when removing from the array.

If the flag is set, removing an element from the array, the element is automatically deleted by the delete operator. If the flag is not set, it is assumed that a pointer to the deleted object is still somewhere in the user program and will be deallocated by the program afterwards.

If the user program resets the flag of memory management, the user must understand his responsibility for the removal of the array before the termination of the program. Otherwise the memory allocated for elements by the new operator is not released.

For large amounts of data this could lead even to crash of your terminal.

If the user does not reset the memory management flag, there is another pitfall. When pointer elements in array are stored somewhere in the local variables, then removing the array will lead to a critical error and crash of the user program. By default, the memory management flag is set, i.e. the class of the array is responsible for freeing the memory elements.

Example:

```cpp
//--- example for CArrayObj::FreeMode(bool)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reset free mode flag
    array.FreeMode(false);
```

```cpp
    //--- use array
    //--- . .
    //--- delete array
    delete array;
```
Reserve

Allocates memory to increase the size of the array.

```c
bool Reserve(
    int size  // number
);
```

Parameters

- `size`
  
  [in] The number of additional elements of the array.

Return Value

- `true` - successful, `false` - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

Example:

```c
//--- example for CArrayObj::Reserve(int)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //---...
    //--- delete array
    delete array;
}
```
**Resize**

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size    // size
);
```

### Parameters

- **size**
  - [in] New size of the array.

### Return Value

- `true` - successful, `false` - there was an attempt to set the size less than zero.

### Note

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. The memory of the lost elements is released or not depending on the memory management mode.

To reduce fragmentation of memory, change the size of the array is made with a step previously given through the method of `Step` (int), or 16 (default).

### Example:

```cpp
//--- example for CArrayObj::Resize(int)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Clear

Removes all elements of the array without the release of the memory array.

```c
void Clear()
```

Return Value

No.

Note

If the memory management flag is enabled, the memory used for the deleted objects is released.

Example:

```c
//-- example for CArrayObj::Clear()
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- clear array
    array.Clear();
    //-- delete array
    delete array;
}
```
Shutdown

Clears the array with full deallocation of memory for it (but not for its elements).

```cpp
bool Shutdown()
```

Return Value

true - successful, false - an error occurred.

Note

If memory management is enabled, the memory of deleted elements is deallocated.

Example:

```cpp
//--- example for CArrayObj::Shutdown()
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
CreateElement

Creates a new array element at the specified position.

```cpp
bool CreateElement(
    int index    // position
)
```

Parameters

`index`

[in] Position in which you want to create a new element.

Return Value

true - successful, false - cannot create an element.

Note

Method `CreateElement(int)` in class `CArrayObj` always returns false and does not perform any action. If necessary, the `CreateElement(int)` method should be implemented in a derived class.

Example:

```cpp
//--- example for CArrayObj::CreateElement(int)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    int size=100;
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- fill array
    array.Reserve(size);
    for(int i=0; i<size; i++)
    {
        if(!array.CreateElement(i))
        {
            printf("Element create error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- ...
    //--- delete array
    delete array;
```
Add

Adds an element to the end of the array.

```cpp
bool Add(
    CObject* element  // element to add
)
```

Parameters

element

[in] value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Note

Element is not added to the array if an invalid pointer (such as NULL) is passed as a parameter.

Example:

```cpp
//--- example for CArrayObj::Add(CObject*)
#include <ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    
    
    
    {
    
    
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    
    
    
    { iarray.Add(new CObject)
    
    
    
    
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements from one array to the end of another.

```cpp
bool AddArray(
    const CArrayObj * src  // pointer to the source array
)
```

Parameters

src

[in] Pointer to an instance of the `CArrayDouble` class - source of elements to add.

Return Value

true - successful, false - cannot add items.

Note

Adding elements from array to array is actually copying the pointers. Therefore, when calling the method, there is a pitfall - there may be a pointer to a dynamic object in more than one variable.

```cpp
//--- example
extern bool make_error;
extern int error;
extern CArrayObj *src;
//--- create a new instance CArrayObj
//--- default memory management is turned on
CArrayObj *array = new CArrayObj;
//--- add (copy) the elements from the source array
if (array != NULL)
    bool result = array.AddArray(src);
if (make_error)
{
    //--- perform erroneous actions
    switch (error)
    {
    case 0:
        //--- remove the source array without checking its memory management flag
        delete src;
        //--- result:
        //--- it is possible to address an element by invalid pointer in the receiver
        break;
    case 1:
        //--- disable the mechanism of memory management in the source array
        if (src.FreeMode()) src.FreeMode(false);
        //--- but do not remove the source array
        //--- result:
        //--- after removing the receiver array, it is possible to address an element
        break;
    case 2:
    ```
//--- disable the mechanism of memory management in the source array
src.FreeMode(false);
//--- disable the mechanism of memory management in the receiver array
array.FreeMode(false);
//-- result:
//-- after the program termination, get a "memory leak"
break;
}

} else {

//--- disable the mechanism of memory management in the source array
if(src.FreeMode()) src.FreeMode(false);
//--- delete the source array
delete src;
//-- result:
//-- addressing the receiver array element will be correct
//-- deleting the receiver array will lead to deleting its elements

Example:

//-- example for CArrayObj::AddArray(const CArrayObj*)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array = new CArrayObj;
    //--
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //-- create source array
    CArrayObj *src = new CArrayObj;
    if(src == NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //-- reset free mode flag
    src.FreeMode(false);
    //-- fill source array
    //-- ...
    //-- add another array
    if(!array.AddArray(src))
```c
{
    printf("Array addition error");
    delete src;
    delete array;
    return;
}

//--- delete source array without elements
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
```
**Insert**

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    CObject* element, // element to insert
    int pos // position
)
```

**Parameters**

- **element**
  - [in] Value of the element to be inserted into an array

- **pos**
  - [in] Position in the array to insert

**Return Value**

- true - successful, false - cannot insert the element.

**Note**

Element is not added to the array if an invalid pointer (such as NULL) is passed as a parameter.

**Example:**

```cpp
//--- example for CArrayObj::Insert(CObject*,int)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj* array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(new CObject,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
```
```cpp
    delete array;
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const CArrayObj* src, // pointer to the source
    int pos             // position
)
```

Parameters

src

[in] Pointer to an instance of the CArrayObj class used as a source of elements to insert.

pos

[in] Position in the array to insert

Return Value

true - successful, false - cannot insert items.

Note

See: CArrayObj::AddArray(const CArrayObj*).

Example:

```cpp
//--- example for CArrayObj::InsertArray(const CArrayObj*,int)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayObj *src=new CArrayObj;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- reset free mode flag
    src.FreeMode(false);
    //--- fill source array
    //--- . . .
    //--- insert another array
```
if(!array.InsertArray(src,0))
{
    printf("Array inserting error");
    delete src;
    delete array;
    return;
}

//--- delete source array without elements
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
AssignArray

Compares the array with another one.

```c
bool AssignArray(
    const CArrayObj* src  // pointer to the source
)
```

**Parameters**

* src

[in] Pointer to an instance of the CArrayObj class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Note**

If the receiver array is not empty when calling AssignArray, then all its elements will be removed; and if the memory management flag is set, the memory used for the deleted elements will be released. The receiver array becomes an exact copy of the source one. Additionally, see `CArrayObj::AddArray(const CArrayObj*)`.

**Example:**

```c
#include <Arrays\ArrayObj.mqh>

void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayObj *src=new CArrayObj;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- reset free mode flag
    src.FreeMode(false);
    //--- fill source array
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
```
```c
{
    printf("Array assigned error");
    delete src;
    delete array;
    return;
}

//--- arrays is identical
//-- delete source array without elements
delete src;
//-- use array
//--...
//-- delete array
delete array;
```
Update

Changes the element at the specified array position.

```c++
bool Update(
    int pos, // position
    CObject* element // value
)
```

Parameters

- `pos`
  - [in] Position of the element in the array to change

- `element`
  - [in] New value of the element

Return Value

- `true` - successful, `false` - cannot change the element.

Note

The element will not change if an invalid pointer (for example, `NULL`) is passed as a parameter. If the memory management is enabled, the memory of a replaced element is deallocated.

Example:

```c++
//-- example for CArrayObj::Update(int,CObject*)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
   //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
   //-- add arrays elements
   //-- ... 
   //-- update element
    if(!array.Update(0,new CObject))
    {
        printf("Update error");
        delete array;
        return;
    }
   //-- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,      // position
    int shift     // shift
)
```

Parameters

- **pos**
  - [in] Position of the moved element in the array

- **shift**
  - [in] The shift value (both positive and negative).

Return Value

- true - successful, false - cannot move the element.

Example:

```cpp
//--- example for CArrayObj::Shift(int,int)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Detach

Removes an element from a given position in the array.

```cpp
CObject*  Detach(
    int  pos  // position
)
```

Parameters

`pos`

[in] Position of a removed item in the array.

Return Value

Pointer to the removed element - success, NULL - cannot remove the element.

Note

When an element is removed from the array, it will not be deleted regardless of the memory management flag. Once the array element pointer is used, it has to be deallocated.

Example:

```cpp
//-- example for CArrayObj::Detach(int)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    CObject *object=array.Detach(0);
    if(object==NULL)
    {
        printf("Detach error");
        delete array;
        return;
    }
    //--- use element
    //--- . . .
    //--- delete element
    delete object;
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos // position
)
```

**Parameters**

`pos`

[in] Position of the array element to be removed.

**Return Value**

true - successful, false - cannot remove the element.

**Note**

If the memory management is enabled, the memory of deleted elements is deallocated.

**Example:**

```cpp
//--- example for CArrayObj::Delete(int)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array = new CArrayObj;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}```
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from, // position of the first element
    int to    // position of last element
)
```

**Parameters**

*from*
- [in] Position of the first array element to be removed.

*to*
- [in] Position of the last array element to be removed.

**Return Value**

ture - successful, false - cannot remove elements.

**Note**

If the memory management is enabled, the memory of deleted elements is deallocated.

**Example:**

```cpp
//--- example for CArrayObj::DeleteRange(int,int)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```cpp
CObject* At(
    int pos // position
)
```

**Parameters**

`pos`

[in] Position of the desired element in the array.

**Return Value**

The value of the element - successful, NULL- there was an attempt to get an element of a non-existent position.

**Example:**

```cpp
//--- example for CArrayObj::At(int)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj* array = new CArrayObj;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add elements
    //--- . . .
    for (int i = 0; i < array->Total(); i++)
    {
        CObject* result = array->At(i);
        if (result == NULL)
        {
            //--- Error reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
    delete array;
}
```
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const CArrayObj* src // pointer to the source
) const
```

**Parameters**

`src`

[in] Pointer to an instance of the CArrayObj class used as a source of elements for comparison.

**Return Value**

true - the arrays are equal - the arrays are not equal.

**Example:**

```cpp
//--- example for CArrayObj::CompareArray(const CArrayObj*)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayObj *src=new CArrayObj;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- fill source array
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    CObject* element  // element to insert
)
```

**Parameters**

*element*

[in] Value of the element to be inserted into a sorted array

**Return Value**

true - successful, false - cannot insert the element.

**Note**

Element is not added to the array if an invalid pointer (such as NULL) is passed as a parameter.

**Example:**

```cpp
//--- example for CArrayObj::InsertSort(CObject*)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- sort array
    array.Sort();
    //-- insert element
    if(!array.InsertSort(new CObject))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //-- delete array
    delete array;
}
```
**Search**

Searches for an element equal to the sample in the sorted array.

```c
int Search(
    CObject* element  // sample
) const
```

**Parameters**

- `element`
  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
#include <Arrays\ArrayObj.mqh>

void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //---...
    //--- sort array
    array.Sort();
    //--- create sample
    CObject *sample=new CObject;
    if(sample==NULL)
    {
        printf("Sample create error");
        delete array;
        return;
    }
    //--- set sample attributes
    //---...
    //--- search element
    if(array.Search(sample)!=-1) printf("Element found");
    else                     printf("Element not found");
    //--- delete array
    delete array;
}
```

© 2000-2021, MetaQuotes Ltd
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```cpp
int SearchGreat(
    CObject* element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayObj::SearchGreat(CObject*)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj* array = new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- sort array
    array.Sort();
    //--- create sample
    CObject* sample = new CObject;
    if(sample==NULL)
    {
        printf("Sample create error");
        delete array;
        return;
    }
    //--- set sample attributes
    //--- ...
    //--- search element
    if(array.SearchGreat(sample)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLess**

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    CObject* element   // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayObj:: SearchLess(CObject*)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- create sample
    CObject *sample=new CObject;
    if(sample==NULL)
    {
        printf("Sample create error");
        delete array;
        return;
    }
    //--- set sample attributes
    //--- . . .
    //--- search element
    if(array.SearchLess(sample)=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchGreatOrEqual**

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```cpp
int SearchGreatOrEqual(
    CObject* element // sample
) const
```

**Parameters**

*element*  
[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayObj::SearchGreatOrEqual(CObject*)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- create sample
    CObject *sample=new CObject;
    if(sample==NULL)
    {
        printf("Sample create error");
        delete array;
        return;
    }
    //--- set sample attributes
    //--- . . .
    //--- search element
    if(array.SearchGreatOrEqual(sample)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLessOrEqual

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(
    CObject* element // sample
) const
```

**Parameters**

- `element`
  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayObj:: SearchLessOrEqual(CObject*)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
        {
            printf("Object create error");
            return;
        }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- create sample
    CObject *sample=new CObject;
    if(sample==NULL)
        {
            printf("Sample create error");
            delete array;
            return;
        }
    //--- set sample attributes
    //--- . . .
    //--- search element
    if(array.SearchLessOrEqual(sample)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchFirst**

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    CObject* element // sample
) const
```

**Parameters**

*element*

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayObj::SearchFirst(CObject*)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    ///// . . .
    //--- sort array
    array.Sort();
    //--- create sample
    CObject *sample=new CObject;
    if(sample==NULL)
    {
        printf("Sample create error");
        delete array;
        return;
    }
    //--- set sample attributes
    ///// . . .
    //--- search element
    if(array.SearchFirst(sample)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLast

Searches for the last element equal to the sample in the sorted array.

```cpp
int SearchLast(
    CObject* element  // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayObj::SearchLast(CObject*)
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- create sample
    CObject *sample=new CObject;
    if(sample==NULL)
    {
        printf("Sample create error");
        delete array;
        return;
    }
    //--- set sample attributes
    //--- . . .
    //--- search element
    if(array.SearchLast(sample)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle  // file handle
);
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayObj::Save(int)
#include <Arrays\ArrayObj.mqh>
//--
void OnStart()
{
  int file_handle;
  CArrayObj *array=new CArrayObj;
  //---
  if(array!=NULL)
  {
    printf("Object create error");
    return;
  }
  //--- add arrays elements
  //--- . . .
  //--- open file
  file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
  if(file_handle>=0)
  {
    if(!array.Save(file_handle))
    {
      //--- file save error
      printf("File save: Error %d!",GetLastError());
      delete array;
      FileClose(file_handle);
      //---
      return;
    }
    FileClose(file_handle);
  }
  delete array;
}
```
Load

Loads data array from the file.

```
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

true - successfully completed, false - error.

**Note**

When reading array elements from the file, the `CArrayObj::CreateElement(int)` method is called to create each element.

**Example:**

```c++
//--- example for CArrayObj::Load(int)
#include "Arrays\ArrayObj.mqh"
//--
void OnStart()
{
    int file_handle;
    CArrayObj *array=new CArrayObj;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
```
```cpp
//--- use arrays elements
//--- . . .
//--- delete array
delete array;
}```
Type

Gets the array type identifier.

```
virtual int Type() const
```

Return Value

Array type identifier (for CArrayObj - 7778).

Example:

```cpp
//--- example for CArrayObj::Type()
#include <Arrays\ArrayObj.mqh>
//---
void OnStart()
{
    CArrayObj *array=new CArrayObj;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
CList

CList Class is a class of dynamic list of instances of the CObject class and its derived classes.

Description

Class CList provides the ability to work with a list of instances of CObject and its derived classes. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

There are some subtleties of working with the CList class. The class has a mechanism to control dynamic memory, so be careful when working with elements of the list.

Subtleties of the mechanism of memory management similar to those described in CArrayObj.

Declaration

```cpp
#include <Arrays\List.mqh>
```

Attributes

Delete methods

**DetachCurrent**
Removes an element from the current position in the list without deleting it “physically”

**DeleteCurrent**
Removes the element from the current position in the list

**Delete**
Removes the element from the specified position in the list

**Clear**
Removes all list elements

Navigation

**IndexOf**
Gets the index of the specified list element

**GetNodeAtIndex**
Gets an item with the specified index of the list

**GetFirstNode**
Gets the first element of the list

**GetPrevNode**
Gets the previous element of the list

**GetCurrentNode**
Gets the current list element

**GetNextNode**
Gets the next element in the list

**GetLastNode**
Gets the last element in the list

Ordering methods

**Sort**
Sorts the list

**MoveToIndex**
Moves the current element in the list to the specified position

**Exchange**
Swaps two elements in the list

Compare methods

**CompareList**
Compares the list with another one

Search methods

**Search**
Searches for an element equal to the sample in sorted list

Input/output

**virtual** **Save**
Saves list data in the file

**virtual** **Load**
Loads list data from the file

**virtual** **Type**
Gets the list type identifier

Methods inherited from class CObject

Prev, Prev, Next, Next, **Compare**
FreeMode

Gets the flag of memory management when deleting list elements.

```cpp
bool FreeMode() const
```

**Return Value**

Flag of memory management.

**Example:**

```cpp
//--- example for CList::FreeMode()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get free mode flag
    bool list_free_mode=list.FreeMode();
    //--- delete list
    delete list;
}
```
FreeMode

Sets the flag of memory management when deleting list elements.

```cpp
void FreeMode(
    bool mode  // new value
)
```

**Parameters**

*mode*

**Note**

Setting the memory management flag is an important part in the CList class use. Since the list elements are pointers to dynamic objects, it is important to determine what to do with them when removing from the list.

If the flag is set, when removing an element from the list, the element is automatically deleted by the delete operator. If the flag is not set, it is assumed that a pointer to the deleted object is still somewhere in the user program and will be deallocated by the program afterwards.

If the user program resets the flag of memory management, users should understand their responsibility for the removal of the list elements before the termination of the program. Otherwise, the memory allocated for elements by the new operator is not released.

For large amounts of data this could lead even to a terminal crash.

If the user program does not reset the memory management flag, there is another "pitfall". When pointer elements in list are stored somewhere in the local variables, then removing the list will lead to a critical error and crash of the user program. By default, the memory management flag is set, i.e. the class of the list is responsible for releasing the memory elements.

**Example:**

```cpp
//--- example for CList::FreeMode(bool)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reset free mode flag
    list.FreeMode(false);
    //--- use list
    //--- ..
    //--- delete list
```
delete list;
}
Total

Gets the number of elements in the list.

```cpp
int Total() const
```

Return Value

Number of elements in the list.

Example:

```cpp
//--- example for CList::Total()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check total
    int total=list.Total();
    //--- use list
    //--- ...
    //--- delete list
    delete list;
}
```
IsSorted

Gets the sorted list flag.

```cpp
bool IsSorted(
    int mode=0  // sorting mode
) const
```

**Parameters**

* mode=0  
  [in] Checked sort mode.

**Return Value**

Flag of the sorted list. Returns true if the list is sorted using the specified mode, otherwise returns false.

**Note**

Flag of the sorted list cannot be changed directly. The flag is set by `Sort(int)` and resets by any add/insert methods.

**Example:**

```cpp
#include <Arrays\List.mqh>

void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check sorted
    if(list.IsSorted(0))
    {
        //--- use methods for sorted list
        //--- ...
    }
    //--- delete list
    delete list;
}
```
SortMode

Gets the version of the sorting.

```cpp
int SortMode() const
```

**Return Value**

Sorting mode, or -1 if the list is not sorted.

**Example:**

```cpp
#include <Arrays\List.mqh>

void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check sort mode
    int sort_mode=list.SortMode();
    //--- use list
    //--- ...
    //--- delete list
    delete list;
}
```
CreateElement

Creates a new element of the list.

CObject* CreateElement()

Return Value

Pointer to the newly created element - successful, NULL - cannot create an element.

Note

Method CreateElement() in the CList class always returns NULL and does not perform any actions. If necessary, method CreateElement() should be implemented in a derived class.

Example:

```cpp
//--- example for CList::CreateElement(int)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    int size=100;
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- fill list
    for(int i=0;i<size;i++)
    {
        CObject *object=list.CreateElement();
        if(object==NULL)
        {
            printf("Element create error");
            delete list;
            return;
        }
        list.Add(object);
    }
    //--- use list
    //--- . . .
    //--- delete list
    delete list;
}
```
Add

Adds an element to the end of the list.

```cpp
int Add(
    CObject* element // element to add
)
```

**Parameters**

`element`

[in] Value of the element to add to the list.

**Return Value**

Index of the added element - success, -1 - error.

**Note**

The element is not added to the list, if an invalid pointer (for example, NULL) is passed as a parameter.

**Example:**

```cpp
#include <Arrays\List.mqh>

void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 elements
    for(int i=0;i<100;i++)
    {
        if(list.Add(new CObject)==-1)
        {
            printf("Element addition error");
            delete list;
            return;
        }
    }
    //--- use list
    //--- . . .
    //--- delete list
    delete list;
}
Insert

Inserts an element to the specified position in the list.

```c
int Insert(
    CObject* element,  // element to insert
    int    pos         // position
)
```

**Parameters**

- `element`
  
  [in] value of the element to insert in the list

- `pos`
  
  [in] position in the list to insert

**Return Value**

index of inserted element - success, -1 - error.

**Note**

The element is not added to the list, if an invalid pointer (for example, NULL) is passed as a parameter.

**Example:**

```c
//--- example for CList::Insert(CObject*,int)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert 100 elements
    for(int i=0;i<100;i++)
    {
        if(list.Insert(new CObject,0)==-1)
        {
            printf("Element insert error");
            delete list;
            return;
        }
    }
    //--- use list
    //--- . . .
```
//--- delete list
delete list;
}
**DetachCurrent**

Extracts an element from the current position in the list without its "physical" deletion.

```cpp
CObject* DetachCurrent()
```

**Return Value**

Pointer to the removed element in case of success, NULL - cannot remove the element.

**Note**

When removed from the list, the element is not removed in any state of the memory management flag. The pointer to the extracted element should be released after it has been used.

**Example:**

```cpp
//--- example for CList::DetachCurrent()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    CObject *object=list.DetachCurrent();
    if(object==NULL)
    {
        printf("Detach error");
        delete list;
        return;
    }
    //--- use element
    //--- . . .
    //--- delete element
delete object;
    //--- delete list
    delete list;
}
```
DeleteCurrent

Removes the element from the current position in the list.

**bool DeleteCurrent()**

**Return Value**

- true - successful, false - cannot remove the element.

**Note**

If the memory management is enabled, memory for the removed element is deallocated.

**Example:**

```cpp
//--- example for CList::DeleteCurrent()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    if(!list.DeleteCurrent())
    {
        printf("Delete error");
        delete list;
        return;
    }
    //--- delete list
    delete list;
}
```
Delete

Removes the element from the given position in the list.

```cpp
bool Delete(
    int pos  // position
)
```

**Parameters**

`pos`
- [in] position of element to be removed from the list.

**Return Value**

true - successful, false - cannot remove the element.

**Note**

If the memory management flag is enabled, the memory used for the deleted element is released.

**Example:**

```cpp
//--- example for CList::Delete(int)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    if(!list.Delete(0))
    {
        printf("Delete error");
        delete list;
        return;
    }
    //--- delete list
    delete list;
}
```
Clear

Removes all elements of the list.

```cpp
void Clear()
```

Note

If the memory management is enabled, the memory of deleted elements is deallocated.

Example:

```cpp
//--- example for CList::Clear()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    //--- clear list
    list.Clear();
    //--- delete list
    delete list;
}
```
IndexOf

Gets the index of the specified list element.

```c
int IndexOf(
    CObject* element) // pointer to the element
```

**Parameters**

- `element`
  
  [in] pointer to the list element.

**Return Value**

List element index, or -1.

**Example:**

```c
//--- example for CList::IndexOf(CObject*)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    CObject *object=new CObject;
    if(object==NULL)
    {
        printf("Element create error");
        delete list;
        return;
    }
    if(list.Add(object))
    {
        int pos=list.IndexOf(object);
    }
    //--- delete list
    delete list;
}
```
**GetNodeAtIndex**

Gets an element from the specified position in the list.

```cpp
CObject* GetNodeAtIndex(int pos) // position
```

**Parameters**

- **pos**
  
  [in] element position in the list.

**Return Value**

- Pointer to the element - success, NULL - cannot receive a pointer.

**Example:**

```cpp
//--- example for CList::GetNodeAtIndex(int)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    CObject *object=list.GetNodeAtIndex(10);
    if(object==NULL)
    {
        printf("Get node error");
        delete list;
        return;
    }
    //--- use element
    //--- . . .
    //--- do not delete element
    //--- delete list
    delete list;
}
```
GetFirstNode

Gets the first element of the list.

`CObject* GetFirstNode();`

Return Value

Pointer to the first element - success, NULL - cannot get a pointer.

Example:

```cpp
//--- example for CList::GetFirstNode()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    CObject *object=list.GetFirstNode();
    if(object==NULL)
    {
        printf("Get node error");
        delete list;
        return;
    }
    //--- use element
    //--- . . .
    //--- do not delete element
    //--- delete list
    delete list;
}
GetPrevNode

Gets the previous element of the list.

CObject* GetPrevNode()

Return Value

Pointer to the previous element - successful, NULL - cannot get a pointer.

Example:

```cpp
//--- example for CList::GetPrevNode()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    CObject *object=list.GetPrevNode();
    if(object==NULL)
    {
        printf("Get node error");
        delete list;
        return;
    }
    //--- use element
    //--- . . .
    //--- do not delete element
    //--- delete list
    delete list;
}
```
GetCurrentNode

Gets the current list element.

CObject* GetCurrentNode()

Return Value

Pointer to the current element - successful, NULL - cannot get a pointer.

Example:

```c++
//--- example for CList::GetCurrentNode()
#include <Arrays\List.mqh>
//---
void OnStart()
{
  CList *list=new CList;
  //---
  if(list==NULL)
  {
    printf("Object create error");
    return;
  }
  //--- add list elements
  //--- . . .
  CObject *object=list.GetCurrentNode();
  if(object==NULL)
  {
    printf("Get node error");
    delete list;
    return;
  }
  //--- use element
  //--- . . .
  //--- do not delete element
  //--- delete list
  delete list;
}```
GetNextNode

Gets the next element in the list.

\[
\text{CObject* GetNextNode()}
\]

Return Value

Pointer to the next element - successful, NULL - cannot get a pointer.

Example:

```c
//--- example for CList::GetNextNode()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add list elements
    //--- . . .
    CObject *object=list.GetNextNode();
    if(object==NULL)
    {
        printf("Get node error");
        delete list;
        return;
    }
    //--- use element
    //--- . . .
    //--- do not delete element
    //--- delete list
    delete list;
}
```
GetLastNode

Gets the last element of the list.

CObject* GetLastNode()

Return Value

Pointer to the last element - success, NULL - cannot get a pointer.

Example:

```c
//--- example for CList::GetLastNode()
#include <Arrays\List.mqh>
//---
void OnStart()
{
   CList *list=new CList;
   //---
   if(list==NULL)
   {
      printf("Object create error");
      return;
   }
   //--- add list elements
   //--- . . .
   CObject *object=list.GetLastNode();
   if(object==NULL)
   {
      printf("Get node error");
      delete list;
      return;
   }
   //--- use element
   //--- . . .
   //--- do not delete element
   //--- delete list
   delete list;
}
```
Sort

Sorts a list.

```c
void Sort(
    int mode  // sorting mode
)
```

**Parameters**

*mode*

[in] Sorting mode.

**Return Value**

No.

**Note**

The list is always sorted in ascending order.

**Example:**

```c
//--- example for CList::Sort(int)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- sorting by mode 0
    list.Sort(0);
    //--- use list
    //--- ...
    //--- delete list
    delete list;
}
```
**MoveToIndex**

Moves the current element in the list to the specified position.

```cpp
bool MoveToIndex(
    int pos  // position
)
```

**Parameters**

- `pos`
  - [in] position in the list to move.

**Return Value**

- `true` - successful, `false` - cannot move the element.

**Example:**

```cpp
//--- example for CList::MoveToIndex(int)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- move current node to begin
    list.MoveToIndex(0);
    //--- use list
    //--- . . .
    //--- delete list
    delete list;
}
```
Exchange

Swaps two elements in the list.

```c
bool Exchange(
    CObject* node1, // list element
    CObject* node2  // list element
)
```

Parameters

- **node1**
  - [in] list element
- **node2**
  - [in] list element

Return Value

- true - successful, false - cannot swap the elements.

Example:

```c
//--- example for CList::Exchange(CObject*,CObject*)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    } //--- exchange
    list.Exchange(list.GetFirstNode(),list.GetLastNode());
    //--- use list
    //--- . . .
    //--- delete list
    delete list;
}
```
CompareList

Compares the list with another one.

```cpp
bool CompareList(
    CList* list // pointer to the source
)
```

**Parameters**

- `list`
  - [in] a pointer to an instance of the CList class used as a source of elements for comparison.

**Return Value**

- `true` - the lists are equal, `false` - the lists are not equal.

**Example:**

```cpp
#include <Arrays\List.mqh>

void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source list
    CList *src=new CList;
    if(src==NULL)
    {
        printf("Object create error");
        delete list;
        return;
    }
    //--- fill source list
    //--- . . .
    //--- compare with another list
    bool result=list.CompareList(src);
    //--- delete lists
    delete src;
    delete list;
}
```
Search

Searches for an element equal to the sample in the sorted list.

CObject* Search(
    CObject* element     // sample
)

Parameters

element

[in] element sample to search for in the list.

Return Value

Pointer to the found element - successful, NULL - the element is not found.

Example:

//--- example for CList::Search(CObject*)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add lists elements
    //--- . . .
    //--- sort list
    list.Sort(0);
    //--- create sample
    CObject *sample=new CObject;
    if(sample==NULL)
    {
        printf("Sample create error");
        delete list;
        return;
    }
    //--- set sample attributes
    //--- . . .
    //--- search element
    if(list.Search(sample)!=NULL) printf("Element found");
    else                      printf("Element not found");
    //--- delete list
    delete list;
}
Save
Saves list data in the file.

```cpp
virtual bool Save(
    int file_handle  // file handle
)
```

Parameters
file_handle
[in] Handle of the binary file previously opened using the FileOpen () function.

Return Value
true - successfully completed, false - error.

Example:
```cpp
//--- example for CList::Save(int)
#include <Arrays\List.mqh>
//---
void OnStart()
{
    int file_handle;
    CList *list = new CList;
    //---
    if (list != NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add lists elements
    //--- . .
    //--- open file
    file_handle = FileOpen("MyFile.bin", FILE_WRITE|FILE_BIN|FILE_ANSI);
    if (file_handle > 0)
    {
        if (!list.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d", GetLastError());
            delete list;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- delete list
    delete list;
```

```cpp
}
```
Load

Loads list data from the file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the `FileOpen()` function.

**Return Value**

true - successfully completed, false - error.

**Note**

When reading list elements from the file, the `CList::createElement(int)` method is called to create each element.

**Example:**

```cpp
#include <Arrays\List.mqh>

void OnStart() {
    int file_handle;
    CList *list=new CList;
    //---
    if(list!=NULL) {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0) {
        if(!list.Load(file_handle)) {
            //--- file load error
            printf("File load: Error %d",GetLastError());
            delete list;
            FileClose(file_handle);
            //---
            return;
        }
    } FileClose(file_handle);
}  
```
//--- use list elements
//--- ...
//--- delete list
delete list;
}
# Type

Gets the list type identifier.

```cpp
virtual int Type()
```

## Return Value

List type identifier (for CList - 7779).

## Example:

```cpp
//--- example for CList::Type()
#include <Arrays\List.mqh>
//---
void OnStart()
{
    CList *list=new CList;
    //---
    if(list==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get list type
    int type=list.Type();
    //--- delete list
    delete list;
}
```
**CTreeNode**

CTreeNode is a class of the CTree binary tree node.

**Description**

CTreeNode provides the ability to work with nodes of the CTree binary tree. Options of navigation through the tree are implemented in the class. Besides, methods of working with the file are implemented.

**Declaration**

```cpp
class CTreeNode : public CObject
```

**Title**

```cpp
#include <Arrays\TreeNode.mqh>
```

**Inheritance hierarchy**

- **CObject**
  - **CTreeNode**

**Direct descendants**

- **CTree**

Methods inherited from class CObject

Prev, Prev, Next, Next, **Save**, **Load**, **Compare**

Trees of CTreeNode class descendants have practical application.

A descendant of CTreeNode class should have predefined methods: **CreateSample** creates a new instance of the descendant class of CTreeNode, **Compare** compares values of key fields of the descendant class of CTreeNode, **Type** (if it is necessary to identify a node), **SaveNode** and **LoadNode** (if it is necessary to work with a file).

Let's consider an example of a CTree descendant class.

```cpp
#include <Arrays\TreeNode.mqh>

class CMyTreeNode : public CTreeNode
{
public:
    CMYTreeNode();

protected:
    //--- user's data
    long m_long; // key field of long type
    double m_double; // custom variable of double type
    string m_string; // custom variable of string type
    datetime m_datetime; // custom variable of datetime type

public:
    CMYTreeNode();
    //--- methods of accessing user's data
    long GetLong(void) { return m_long; }
};
```
void SetLong(long value) { m_long=value; }

double GetDouble( void) { return(m_double); }

void SetDouble(double value) { m_double=value; }

string GetString( void) { return(m_string); }

void SetString(string value) { m_string=value; }

datetime GetDateTime( void) { return(m_datetime); }

void SetDateTime(datetime value) { m_datetime=value; }

//--- methods for working with files
virtual bool Save(int file_handle);
virtual bool Load(int file_handle);

protected:
    virtual int Compare(const CObject *node, int mode);

    //--- method of creating class instances
    virtual CTreeNode* CreateSample();

void CMyTreeNode::CMyTreeNode()
{
    //--- initialization of user's data
    m_long =0;
    m_double =0.0;
    m_string ="");
    m_datetime =0;
}

int CMyTreeNode::Compare(const CObject *node, int mode)
{
    //--- mode parameter is ignored, because tree construction algorithm is the only one
    int res=0;

    //--- explicit type casting
    CMyTreeNode *n=node;
    res=(int)(m_long-n.m_long);

    //---
    return(res);
}

//| Creation of a new class instance.
//| INPUT: none.

CTreeNode* CMyTreeNode::CreateSample()
{
    CMyTreeNode *result = new CMyTreeNode;
    //---
    return (result);
    //---
}

bool CMyTreeNode::Save(int file_handle)
{
    uint i=0,len;
    //--- checks
    if(file_handle<0) return(false);
    //--- writing user data
    //--- writing custom variable of long type
    if(FileWriteLong(file_handle,m_long)!-sizeof(long)) return(false);
    //--- writing custom variable of double type
    if(FileWriteDouble(file_handle,m_double)!-sizeof(double)) return(false);
    //--- writing custom variable of string type
    len=StringLength(m_string);
    //--- write string length
    if(FileWriteInteger(file_handle,len,INT_VALUE)!-INT_VALUE) return(false);
    //--- write the string
    if(len!=0 && FileWriteString(file_handle,m_string,len)!=len) return(false);
    //--- writing custom variable of datetime type
    if(FileWriteLong(file_handle,m_datetime)!-sizeof(long)) return(false);
    //---
    return(true);
}

bool CMyTreeNode::Load(int file_handle)
{
    uint i=0,len;
    //--- checks
    if(file_handle<0) return(false);
    //--- reading
    if(FileIsEnding(file_handle)) return(false);
//--- reading custom variable of char type
//--- reading custom variable of long type
m_long=FileReadLong(file_handle);
//--- reading custom variable of double type
m_double=FileReadDouble(file_handle);
//--- reading custom variable of string type
//--- read the string length
len=FileReadInteger(file_handle, INT_VALUE);
//--- read the string
if(len!=0) m_string=FileReadString(file_handle, len);
else m_string="";
//--- reading custom variable of datetime type
m_datetime=FileReadLong(file_handle);
//--
return(true);
Owner

Gets the pointer of the owner node.

```cpp
CTreeNode* Owner()
```

Return Value

Pointer of the owner node.

Owner

Sets the pointer of the owner node.

```cpp
void Owner(
    CTreeNode* node  // node
)
```

Parameters

- `node`
  - [in] New value of the pointer of the owner node.

Return Value

None.
**Left**

Gets the pointer of the left node.

```cpp
CTreeNode* Left()
```

**Return Value**

Pointer of the left node.

**Left**

Sets the pointer of the left node.

```cpp
void Left(
    CTreeNode* node  // node
)
```

**Parameters**

*node*

[in] New value of the pointer of the left node.

**Return Value**

None.
Right

Gets the pointer of the right node.

```cpp
CTreeNode* Right()
```

Return Value

The pointer of the right node.

Right

Sets the pointer of the right node.

```cpp
void Right(
    CTreeNode* node   // node
)
```

Parameters

- `node`
  - [in] New value of the pointer of the right node.

Return Value

None.
**Balance**

Gets the node balance.

```c
int Balance() const
```

**Return Value**

Node balance.
BalanceL

Gets the balance of the left sub-branch of the node.

```cpp
int BalanceL() const
```

Return Value

Balance of the left sub-branch of the node.
**BalanceR**

Gets the balance of the right sub-branch of the node.

```cpp
int BalanceR() const
```

**Return Value**

Balance of the right sub-branch of the node.
**CreateSample**

Creates a new node sample.

```cpp
virtual CTreeNode* CreateSample()
```

**Return Value**

Pointer to the new node sample or NULL.
**RefreshBalance**

Recalculates the node balance.

```c
int RefreshBalance()
```

**Return Value**

Node balance.
**GetNext**

Gets the pointer of the next node.

```cpp
CTreeNode* GetNext(
    CTreeNode* node     // node
)
```

**Parameters**

*node*

**Return Value**

Pointer of the next node.
SaveNode

Writes node data to a file.

```cpp
bool SaveNode(
    int file_handle  // handle
)
```

Parameters

- `file_handle`
  
  [in] Handle of a binary file that was earlier opened for writing.

Return Value

- `true` - success, otherwise `false`. 
LoadNode

Reads node data from a file.

```cpp
bool LoadNode(
    int file_handle,   // handle
    CTreeNode* main    // node
)
```

Parameters

**file_handle**

[in] Handle of a binary file that was earlier opened for reading.

**main**

[in] Node for data.

Return Value

true - success, otherwise false.
Type

_gets the identifier of the node type._

```
virtual int Type() const
```

_Return Value_

_Identifier of the node type._
**CTree**

CTree is a class of the binary tree of the instances of CTreeNode class and its descendants.

**Description**

CTree class provides the possibility to work with the binary tree of CTreeNode class instances and its descendants. Options of adding/inserting/deleting of tree elements and search in the tree are implemented in the class. Besides that, methods of working with a file are implemented.

Note that mechanism of dynamic memory management is not implemented in class CTree (unlike classes CList and CArrayObj). All tree nodes are deleted with memory deallocation.

**Declaration**

```cpp
class CTree : public CTreeNode
```

**Title**

```cpp
#include <Arrays\Tree.mqh>
```

**Inheritance hierarchy**

```
CObject
    CTreeNode
        CTree
```

Methods inherited from class CTreeNode

Parent, Parent, Left, Left, Right, Right, Balance, BalanceL, BalanceR, RefreshBalance, GetNext, SaveNode, LoadNode

Trees of CTreeNode class descendants - descendants of class CTree - have practical application.

Descendant of CTree class should have a predefined method CreateElement that creates a new instance of the CTreeNode descendant class.

Let's consider an example of the CTree descendant class.

```cpp
#include <Arrays\Tree.mqh>
#include "MyTreeNode.mqh"

input int extCountedNodes = 100;

class CMyTree : public CTree
{
public:
    //--- methods of searching in the tree by custom data
    CMyTreeNode* FindByLong(long find_long);
    //--- method of creation of the tree element
    virtual CTreeNode *CreateElement();
};

CMyTree MyTree;
```
CTreeNode *CMyTree::CreateElement()
{
    CMyTreeNode *node = new CMyTreeNode;
    //---
    return (node);
}
//+------------------------------------------------------------------+

//| Search of element in a list by value m_long.                     |
//| INP|UT: find_long - searched value.                              |
//| O|UTP|UT: pointer of a found list element, or NULL.                |
//| REMARK: none.                                                    |
//+------------------------------------------------------------------+
CMyTreeNode* CMyTree::FindByLong(long find_long)
{
    CMyTreeNode *res = NULL;
    CMyTreeNode *node;
    //--- create a tree node to pass the search parameter
    node = new CMyTreeNode;
    if (node == NULL) return (NULL);
    node.SetLong(find_long);
    //---
    res = Find(node);
    delete node;
    //---
    return (res);
}
//+------------------------------------------------------------------+

//--- script "testing of class CMyTree"                                |
//+------------------------------------------------------------------+
//--- array for string initialization
//---
int OnStart() export
{
    int i;
    uint pos;
    int beg_time, end_time;
    CMyTreeNode *node;  //--- temporary pointer to the sample of class CMyTreeNode
    //---
    printf("Start test \$s\", __FILE__);
    //--- Fill out MyTree with instances of class MyTreeNode in the amount of extCountedNodes.
    beg_time = GetTickCount();
    for (i = 0; i < extCountedNodes; i++)
    {
        node = MyTree.CreateElement();
    }
if (node == NULL)
{
    //--- emergency exit
    printf("%s (%4d): create error", __FILE__, __LINE__);
    return(__LINE__);
}
NodeSetData(node, i);
node.SetLong(i);
MyTree.Insert(node);
}
end_time = GetTickCount();
printf("Filling time of MyTree is %d ms.", end_time-beg_time);
//--- Create a temporary tree TmpMyTree.
CMyTree TmpMyTree;
//--- Detach 50% of tree elements (all even)
//--- and add them to the temporary tree TmpMyTree.
beg_time = GetTickCount();
for (i = 0; i < extCountedNodes; i += 2)
{
    node = MyTree.FindByLong(i);
    if (node != NULL)
        if (MyTree.Detach(node)) TmpMyTree.Insert(node);
}
end_time = GetTickCount();
printf("Deletion time of %d elements from MyTree is %d ms.", extCountedNodes/2, end_time - beg_time);
//--- Return the detached
node = TmpMyTree.Root();
while (node != NULL)
{
    if (TmpMyTree.Detach(node)) MyTree.Insert(node);
    node = TmpMyTree.Root();
}
//--- Check work of method Save(int file_handle);
int file_handle;
file_handle = FileOpen("MyTree.bin", FILE_WRITE|FILE_BIN|FILE_ANSI);
if (file_handle >= 0)
{
    if (!MyTree.Save(file_handle))
    {
        //--- error writing to a file
        //--- emergency exit
        printf("%s Error %d in %d!", __FILE__, GetLastError(), __LINE__);
        //--- close file before leaving!!
        FileClose(file_handle);
        return(__LINE__);
    }
    FileClose(file_handle);
}
//--- Check work of method Load(int file_handle);
file_handle=FileOpen("MyTree.bin",FILE_READ|FILE_BIN|FILE_ANSI);
if(file_handle>=0)
{
    if(!TmpMyTree.Load(file_handle))
    {
        //--- error reading from file
        //--- emergency exit
        printf("%s: Error %d in %d!",__FILE__,__LINE__,GetLastError());
        //--- close file before leaving!!!
        FileClose(file_handle);
        return(__LINE__);
    }
    FileClose(file_handle);
}

//---
MyTree.Clear();
TmpMyTree.Clear();
//---
printf("End test %s. OK!",__FILE__);
Root

Gets the root node of the tree.

CTreeNode* Root() const

Return Value

Pointer of the root node of the tree.
**CreateElement**

Creates a new instance of the node.

```cpp
virtual CTreeNode* CreateElement()
```

**Return Value**

*Pointer of the new instance of the node or NULL.*
Insert

Adds a node to a tree.

```cpp
CTreeNode* Insert(
    CTreeNode* new_node  // node
)
```

Parameters

`new_node`

[in] Pointer of a node to insert to a tree.

Return Value

Pointer of the owner node or NULL.
**Detach**

Detaches a specified node from a tree.

```cpp
bool Detach(
    CTreeNode* node  // node
)
```

**Parameters**

- `node`
  - [in] Node pointer to detach.

**Return Value**

- `true` - success, otherwise `false`.

**Note**

- After detachment, the node pointer is not released. The tree is balanced.
Delete

Deletes a specified node from a tree.

```cpp
bool Delete(
    CTreeNode* node  // node
)
```

**Parameters**

- node
  - [in] Node pointer to delete.

**Return Value**

- true - success, otherwise false.

**Note**

After deletion, a node pointer is released. The tree is balanced.
Clear

Deletes all nodes of a tree.

```cpp
void Clear()
```

Return Value

None.

Note

After deletion, node pointers are released.
Find

Searches for a node in a tree by sample.

```c
CTreeNode* Find(
    CTreeNode* node  // node
)
```

**Parameters**

*node*

[in] Node that contains data used as a search sample.

**Return Value**

Pointer of the found node or NULL.
Save

Writes tree data to a file.

```cpp
virtual bool Save(
    int file_handle // handle
)
```

Parameters

`file_handle`

[in] Handle of a binary file that was earlier opened for writing.

Return Value

true - success, otherwise false.
Load

Reads tree data from a file.

```cpp
virtual bool Load(
    int file_handle  // handle
)
```

**Parameters**

- `file_handle`

  [in] Handle of a binary file that was earlier opened for reading.

**Return Value**

- true - success, otherwise false.
**Type**

Gets identifier of the tree type.

```cpp
virtual int Type() const
```

Return Value

Identifier of the tree type.
## Generic Data Collections

The library provides classes and interfaces that define generic collections, which allow users to create strongly typed collections. These collections provide greater convenience and data handling performance than non-generic typed collections.

The library is available in the Include\Generic folder of the terminal working directory.

ICollection<T>

ICollection<T> is an interface for implementing generic data collections.

Description

The ICollection<T> interface determines basic methods to work with collections, including methods to count elements, to clear a collection, to add or delete elements, and others.

Declaration

```
template<typename T>
interface ICollection
```

Header

```
#include <Generic\Interfaces\ICollection.mgh>
```

Inheritance Hierarchy

ICollection

<td>Removes the first occurrence of the specified element from a collection</td>
</tr>
</tbody>
</table>
Add

Adds an element to a collection.

```cpp
bool Add(
    T value  // the value of the element
);
```

**Parameters**

- `value`
  - `[in]` The value of the element to add.

**Return Value**

- Returns true on successful, or false otherwise.
Count

Returns the number of elements in a collection.

```cpp
int Count();
```

**Return Value**

Returns the number of elements.
Contains

Determines whether a collection contains an element with the specified value.

```cpp
bool Contains(
    T item    // the search value
);
```

Parameters

`item`

[in] The searched value.

Return Value

Returns true if an element with the specified value is found in the collection, or false otherwise.
CopyTo

Copies all elements of a collection to the specified array starting at the specified index.

```c
int CopyTo(
    T& dst_array[], // an array for writing
    const int dst_start=0 // starting index for writing
);
```

**Parameters**

`dst_array[]`
- [out] An array to which the elements of the collection will be written.

`dst_start=0`
- [in] An index in the array from which copying starts.

**Return Value**

Returns the number of copied elements.
Clear

Removes all elements of a collection.

```plaintext
void Clear();
```
Remove

Removes the first occurrence of the specified element from a collection.

```cpp
bool Remove(
    T item      // the element value
);
```

Parameters

- `item`
  - [in] The value of the element to be deleted.

Return Value

- Returns true on successful, or false otherwise.
IEqualityComparable<T>

IEqualityComparable<T> is an interface for implementing objects that can be compared.

Description

The IEqualityComparable<T> interface defines methods to retrieve the hash code of the current object and to check whether it is equal to another object of the same type.

Declaration

```
template<typename T>
interface IEqualityComparable
```

Header

```
#include <Generic\Interfaces\IEqualityComparable.mqh>
```

Inheritance Hierarchy

</thead>
<tbody>
<tr>
<td>Equals</td>
<td>Compares the current object with the specified value</td>
</tr>
<tr>
<td>HashCode</td>
<td>Calculates the hash code value for the current object</td>
</tr>
</tbody>
</table>
Equals

Compares the current object with the specified value.

```cpp
bool Equals(
    T value  // the value to compare
);
```

Parameters

`value`

[in] The value to compare the current object with.

Return Value

Returns true if the objects are equal, or false otherwise.
HashCode

Calculates the hash code value for the current object.

```cpp
int HashCode();
```

Return Value

Returns the hash code.
IComparable<T>

IComparable<T> is an interface for implementing objects that can be compared to find out whether one is greater than, less than or equal to the other one.

Description

The IComparable<T> interface defines a method to compare the current object to another object of the same type, on the basis of which the collection of these objects can be sorted.

Declaration

```cpp
template<typename T>
interface IComparable : public IEqualityComparable<T>
```

Header

```cpp
#include <Generic\Interfaces\IComparable.mqh>
```

Inheritance Hierarchy

IEqualityComparable

Class Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compare</td>
<td>Compares the current object with the specified value</td>
</tr>
</tbody>
</table>
**Compare**

Compares the current object with the specified value.

```c
int Compare(
    T value  // the value to compare
);
```

**Parameters**

- `value`  
  
  [in] The value to compare the current object with.

**Return Value**

Returns a number that expresses the ratio of the current and passed object:

- if the result is less than zero, the current object is less than the passed one
- if the result is zero, the current object is equal to than the passed one
- if the result is greater than zero, the current object is greater than the passed one
IComparer<T>

IComparer<T> is an interface for implementing a generic class that compares two objects of the T type, whether one is greater than, less than or equal to the other one.

**Description**

The IComparer<T> interface determines a method to compare two objects of the T type, on the basis of which a collection of these objects can be sorted.

**Declaration**

```cpp
template<typename T>
interface IComparer
```

**Header**

```cpp
#include <Generic\Interfaces\IComparer.mqh>
```

**Inheritance Hierarchy**

- IComparer

**Direct descendants**

- CDefaultComparer

**Class Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compare</td>
<td>Compares two values of type T</td>
</tr>
</tbody>
</table>
Compare

Compares two values of type T.

```c
int Compare(
    T x,       // the first value
    T y       // the second value
);
```

Parameters

- `x`
  - [in] The first value to compare.

- `y`
  - [in] The first value to compare.

Return Value

Returns a number that expresses the ratio of the two compared values:

- if the result is less than zero, `x` is less than `y` (`x < y`)
- if the result is equal to zero, `x` is equal to `y` (`x = y`)
- if the result is greater than zero, `x` is greater than `y` (`x > y`)
IEqualityComparer<T>

IEqualityComparer<T> is an interface for implementing a generic class that compares two object of the T type.

Description

The IEqualityComparer<T> interface defines methods to retrieve the hash code of a T type object and to check whether two objects of type T are equal.

Declaration

```cpp
template<typename T>
interface IEqualityComparer
```

Header

```cpp
#include <Generic\Interfaces\IEqualityComparer.hpp>
```

Inheritance Hierarchy

IEqualityComparer

Direct descendants

CDefaultEqualityComparer

Class Methods

</thead>
<tbody>
<tr>
<td>Equals</td>
<td>Compares two values of type T</td>
</tr>
<tr>
<td>HashCode</td>
<td>Calculates the hash code value based on the T type object</td>
</tr>
</tbody>
</table>
# Equals

Compares two values of type T.

```c
bool Equals(
    T x,       // the first value
    T y        // the second value
);
```

## Parameters

- `x`  
  - `[in]` The first value to compare.

- `y`  
  - `[in]` The second value to compare.

## Return Value

Returns true if the values are equal, or false otherwise.
HashCode

Calculates the hash code value based on the T type object.

```cpp
int HashCode(
    T value  // an object for calculation
);
```

Parameters

value

[in] The object for which you want to get the hash code.

Return Value

Returns the hash code.
IList\<T\> is an interface for implementing generic data lists.

**Description**

The IList\<T\> interface defines basic methods to work with lists, such as to access an element by index, to search and delete elements, sort, and others.

**Declaration**

```cpp
template<typename T>
interface IList : public ICollection<T>
```

**Header**

```cpp
#include <Generic\Interfaces\IList.mqh>
```

**Inheritance Hierarchy**

- ICollection
- IList
- ArrayList

**Class Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TryGetValue</td>
<td>Gets a list element at the specified index</td>

</tr>
<tr>
<td>LastIndexOf</td>
<td>Searches for the last occurrence of a value in a list</td>
</tr>
<tr>
<td>RemoveAt</td>
<td>Removes a list element at the specified index</td>
</tr>
</tbody>
</table>
TryGetValue

Gets a list element at the specified index.

```cpp
bool TryGetValue(
    const int index, // element index
    T& value // a variable for writing
);
```

Parameters

- `index`
  - [in] The index of the element from the list.

- `value`
  - [out] The variable to which the specified value of the element from the list will be written.

Return Value

Returns true on successful, or false otherwise.
TrySetValue

Changes a value from the list at the specified index.

```cpp
bool TrySetValue(
    const int index,  // element index
    T value          // new value
);
```

**Parameters**

- **index**
  
  [in] The index of the element from the list.

- **value**
  
  [in] The new value to assign to the specified list element.

**Return Value**

Returns true on successful, or false otherwise.
Insert

Inserts an element into the list at the specified index.

```cpp
bool Insert(
    const int index, // index to insert at
    T item          // the value to be inserted
);
```

Parameters

- **index**
  - [in] The index to insert at.

- **item**
  - [in] The value to be inserted at the specified index.

Return Value

Returns true on successful, or false otherwise.
**IndexOf**

Searches for the first occurrence of a value in a list.

```cpp
int IndexOf(
    T item // the search value
);
```

**Parameters**

*item*

[in] The searched value.

**Return Value**

Returns the index of the first found element. If the value is not found, returns -1.
LastIndexOf

Searches for the last occurrence of a value in a list.

```cpp
int LastIndexOf(
    T item       // the search value
);
```

**Parameters**

`item`

[in] The searched value.

**Return Value**

Returns the index of the last found element. If the value is not found, returns -1.
RemoveAt

Removes a list element at the specified index.

```cpp
bool RemoveAt(
    const int index // element index
);
```

Parameters

- **index**
  
  [in] The index of the element that you want to delete.

Return Value

Returns true on successful, or false otherwise.
**IMap<TKey, TValue>**

IMap<TKey, TValue> is an interface for implementing generic collections of key/value pairs.

**Description**

The IMap<TKey, TValue> interface defines basic methods to work with collections whose data are stored as key/value pairs.

**Declaration**

```cpp
template<typename TKey, typename TValue>
interface IMap : public ICollection<TKey>
```

**Header**

```cpp
#include <Generic\Interfaces\IMap.mqh>
```

**Inheritance Hierarchy**

- `ICollection`
  - `IMap`

**Direct descendants**

- `CHashMap`, `CSortedMap`

**Class Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add</strong></td>
<td>Adds a key/value pair to a collection</td>
</tr>
<tr>
<td><strong>Contains</strong></td>

<td>Changes the value of the key/value pair from a collection at the specified key</td>
</tr>
<tr>
<td><strong>CopyTo</strong></td>
<td>Copies all key/value pairs from a collection to specified arrays, starting at the specified index</td>
</tr>
</tbody>
</table>
Add

Adds a key/value pair to a collection.

```cpp
bool Add(
    TKey key, // key
    TValue value // value
);
```

Parameters

- **key**
  - [in] Key.
- **value**
  - [in] Value.

Return Value

Returns true on successful, or false otherwise.
Contains

Determines whether a collection contains the key/value table with the specified key.

```cpp
bool Contains(
    TKey key,  // key
    TValue value  // value
);
```

Parameters

- **key**
  - [in] Key.

- **value**
  - [in] Value.

Return Value

Returns true, if the collection contains the key/value pair with the specified key and value, or false otherwise.
Remove

Remove the first occurrence of a key/value pair from a collection.

```cpp
bool Remove(
    TKey key // key
);
```

Parameters

- **key**: [in] Key.

Return Value

Returns true on successful, or false otherwise.
**TryGetValue**

Gets an element with the specified key from a collection.

```csharp
bool TryGetValue(
    TKey key,       // key
    TValue& value   // a variable for writing the value
);
```

**Parameters**

- **key**
  
  [in] Key.

- **value**
  
  [out] The variable to which the specified value of the key/value pair will be written.

**Return Value**

Returns true on successful, or false otherwise.
TrySetValue

Changes the value of the key/value pair from the collection at the specified key.

```c
bool TrySetValue(  
    TKey key,      // key  
    TValue value    // new value
);
```

**Parameters**
- `key`
  - [in] Key.
- `value`
  - [in] The new value to assign to the specified key-value pair.

**Return Value**
- Returns true on successful, or false otherwise.
CopyTo

Copies all key/value pairs from a collection to the specified arrays, starting at the specified index.

```cpp
int CopyTo(
    TKey&  dst_keys[],  // an array for writing keys
    TValue& dst_values[],  // an array for writing values
    const int dst_start=0  // the starting index for writing
);
```

Parameters

- `&dst_keys[]`  
  [out] An array to which all keys from the collection will be written.

- `&dst_values[]`  
  [out] An array to which values of corresponding keys from the collection will be written.

- `dst_start=0`  
  [in] An index in the array from which copying starts.

Return Value

Returns the number of copied key/value pairs.
**ISet<T>**

`ISet<T>` is an interface for implementing generic data sets.

**Description**

The `ISet` interface defines basic methods to work with sets, such as: the union and intersection of sets, definition of strict and non-strict subsets, and others.

**Declaration**

```cpp
template<typename T>
interface ISet : public ICollection<T>
```

**Header**

```cpp
#include <Generic\Interfaces\ISet.mqh>
```

**Inheritance Hierarchy**

- `ICollection`
  - `ISet`

**Direct descendants**

- `HashSet`, `SortedSet`

</tbody>
</table>
ExceptWith

Produces the operation of difference between the current collection and a passed collection (array). It removes from the current collection (array) all elements that are present in the specified collection (array).

A version for working with the collection that implements the ICollection<T> interface.

```csharp
void ExceptWith(
    ICollection<T>* collection // collection
);
```

A version for working with an array.

```csharp
void ExceptWith(
    T& array[] // array
);
```

Parameters

*collection

[in] A collection to be excepted from the current set.

&collection[]

[in] An array to be excepted from the current set.

Note

The result is written to the current collection (array).
IntersectWith

Produces the operation of intersection of the current collection and a passed collection (array). It modifies the current collection to only contain elements that are present in the specified collection (array).

A version for working with the collection that implements the ICollection<T> interface.

```csharp
void IntersectWith(
    ICollection<T>^ collection  // collection
);
```

A version for working with an array.

```csharp
void IntersectWith(
    T[] array[]            // array
);
```

Parameters

*collection

[in] A collection with which the current set will be intersected.

&collection[]

[in] An array with which the current set will be intersected.

Note

The result is written to the current collection (array).
SymmetricExceptWith

Produces the operation of symmetrical difference between the current collection and a passed collection (array). It modifies the current collection to only contain elements that are present in the source object or in the specified collection (array), but not in both of them.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
void SymmetricExceptWith(
    ICollection<T>* collection // collection
);```

A version for working with an array.

```csharp
void SymmetricExceptWith(
    T& array[] // array
);```

Parameters

*collection
  [in] A collection to produce the symmetrical difference with.

&collection[]
  [in] An array to produce the symmetrical difference with.

Note

The result is written to the current collection (array).
**UnionWith**

Produces the union of the current collection and a passed collection (array). It adds to the current collection (array) missing elements from the specified collection (array).

A version for working with the collection that implements the ICollection\<T\> interface.

```csharp
void UnionWith(
    ICollection\<T\>* collection         // collection
);
```

A version for working with an array.

```csharp
void UnionWith(
    T& array[]                   // array
);
```

**Parameters**

*collection

[in] A collection with which the current set will be united.

*collection[]

[in] An array with which the current set will be united.

**Note**

The result is written to the current collection (array).
**IsProperSubsetOf**

Determines whether the current set is a proper subset of the specified collection or array.

A version for working with the collection that implements the `ICollection<T>` interface.

```csharp
bool IsProperSubsetOf(
    ICollection<T>* collection // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsProperSubsetOf(
    T4 array[] // an array to determine the relation
);
```

**Parameters**

*collection*

[in] A collection to determine the relation.

&collection[]

[in] An array to determine the relation.

**Return Value**

Returns true if the current set is a proper subset, or false otherwise.
IsProperSupersetOf

Determines whether the current set is a proper superset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsProperSupersetOf(
    ICollection<T>* collection  // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsProperSupersetOf(
    T4* array[]  // an array to determine the relation
);
```

Parameters

*collection

  [in] A collection to determine the relation.

&collection[]

  [in] An array to determine the relation.

Return Value

Returns true if the current set is a proper superset, or false otherwise.
IsSubsetOf

Determines whether the current set is a subset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

bool IsSubsetOf(
   ICollection<T>*   collection   // a collection to determine the relation
);

A version for working with an array.

bool IsSubsetOf(
   T&   array[]                  // an array to determine the relation
);

Parameters

*collection
   [in] A collection to determine the relation.

&collection
   [in] An array to determine the relation.

Return Value

Returns true if the current set is a subset, or false otherwise.
IsSupersetOf

Determines whether the current set is a superset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsSupersetOf(
    ICollection<T>* collection    // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsSupersetOf(
    T4& array[]       // an array to determine the relation
);
```

Parameters

*collection

[in] A collection to determine the relation.

&collection[]

[in] An array to determine the relation.

Return Value

Returns true if the current set is a superset, or false otherwise.
Overlaps

Determines whether the current set overlaps the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```cpp
bool Overlaps(
    ICollection<T>* collection // a collection to compare
);```

A version for working with an array.

```cpp
bool Overlaps(
    T& array[] // an array to compare
);```

Parameters

*collection

&collection[]

Return Value

Returns true if the current set and a collection or an array overlap, or false otherwise.
SetEquals

Determines whether the current set contains all elements of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool SetEquals(
    ICollection<T>* collection // a collection to compare
);
```

A version for working with an array.

```csharp
bool SetEquals(
    T& array[] // an array to compare
);
```

Parameters

*collection

&collection[]

Return Value

Returns true if the current set contains all elements of the specified collection or array, or false otherwise.
# CDefaultComparer<T>

CDefaultComparer<T> is a helper class that implements the IComparer<T> generic interface based on Compare global methods.

## Description

The CDefaultComparer<T> class is used by default in generic data collections, unless the user implicitly uses another class implementing the IComparer<T> interface.

## Declaration

```cpp
template<typename T>
class CDefaultComparer : public IComparer<T>
```

## Header

```cpp
#include <Generic\Internal\DefaultComparer.mqh>
```

## Inheritance Hierarchy

- IComparer
  - CDefaultComparer

## Class Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compare</td>
<td>Compares two values of type T</td>
</tr>
</tbody>
</table>
Compare

Compares two values of type T.

```cpp
int Compare(
    T x,  // the first value
    T y   // the second value
);
```

Parameters

- `x`  
  [in] The first value to compare.

- `y`  
  [in] The second value to compare.

Return Value

Returns a number that expresses the ratio of the two compared values:

- if the result is less than zero, `x` is less than `y` (`x < y`)
- if the result is equal to zero, `x` is equal to `y` (`x = y`)
- if the result is greater than zero, `x` is greater than `y` (`x > y`)

Note

The `x` and `y` values are compared based on one of the overloads of the `Compare` global method depending on the `T` type.
CDefaultEqualityComparer<T>

CDefaultEqualityComparer<T> is a helper class that implements the IEqualityComparer<T> generic interface based on Equals<T> and GetHashCode global methods.

Description

The CDefaultEqualityComparer<T> class is used by default in generic data collections, unless the user implicitly uses another class implementing the IEqualityComparer<T> interface.

Declaration

```
template<typename T>
class CDefaultEqualityComparer : public IEqualityComparer<T>
```

Header

```
#include <Generic\Internal\DefaultEqualityComparer.mqh>
```

Inheritance Hierarchy

- IEqualityComparer
  - CDefaultEqualityComparer

Class Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equals</td>
<td>Compares two values of type T</td>
</tr>
<tr>
<td>GetHashCode</td>
<td>Calculates the hash code value based on the T type object</td>
</tr>
</tbody>
</table>
**Equals**

Compares two values of type T.

```cpp
bool Equals(
    T x,  // the first value
    T y   // the second value
);
```

**Parameters**

- **x**
  
  [in] The first value to compare.

- **y**
  
  [in] The second value to compare.

**Return Value**

Returns true if the values are equal, or false otherwise.
**HashCode**

Calculates the hash code value based on the T type object.

```cpp
int HashCode(
    T value  // an object for calculation
);
```

**Parameters**

- `value`
  - [in] The object for which you want to get the hash code.

**Return Value**

Returns the hash code.
CRedBlackTreeNode<T>

CRedBlackTreeNode<T> is a helper class used in implementing the CRedBlackTree<T> class.

Description

The CRedBlackTreeNode<T> class is a node of the CRedBlackTree<T>. Tree navigation methods are implemented in the class.

Declaration

```cpp
template<typename T>
class CRedBlackTreeNode
```

Header

```cpp
#include "Generic\RedBlackTree.mqh"
```

Class Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>Returns and sets a node value</td>
</tr>
<tr>
<td>Parent</td>
<td>Returns and sets a pointer to the parent node</td>
</tr>
<tr>
<td>Left</td>
<td>Returns and sets a pointer to the left node</td>
</tr>
<tr>
<td>Right</td>
<td>Returns and sets a pointer to the right node</td>
</tr>
<tr>
<td>Color</td>
<td>Returns and sets a node color</td>
</tr>
<tr>
<td>IsLeaf</td>
<td>Determines whether the specified node is a leaf</td>
</tr>
<tr>
<td>CreateEmptyNode</td>
<td>Creates a new black node with no parent and children, and returns a pointer to it</td>
</tr>
</tbody>
</table>
## Value (the Get method)

Returns the node value.

```cpp
T Value();
```

### Return Value

Returns the node value.

## Value (the Set method)

Sets the node value

```cpp
void Value(
    T value // node value
);
```

### Parameters

- `value`
  - [in] Node value.
Parent (the Get method)

Returns a pointer to the parent node.

```cpp
CRedBlackTreeNode<T>* Parent();
```

Return Value

Returns a pointer to the parent node.

Parent (the Set method)

Sets a pointer to the parent node.

```cpp
void Parent(
    CRedBlackTreeNode<T>* node  // a pointer to the parent node
);
```

Parameters

*node

[in] A pointer to the parent node.
**Left (the Get method)**

Returns a pointer to the left node.

```cpp
CRedBlackTreeNode<T>* Left();
```

**Return Value**

Returns a pointer to the left node.

**Left (the Set method)**

Sets a pointer to the left node.

```cpp
void Left(
    CRedBlackTreeNode<T>* node     // a pointer to the left node
);
```

**Parameters**

*node

[in] A pointer to the left node.
**Right (the Get method)**

Returns a pointer to the right node.

```cpp
CRedBlackTreeNode<T>* Right();
```

**Return Value**

Returns a pointer to the right node.

**Right (the Set method)**

Sets a pointer to the right node.

```cpp
void Right(
    CRedBlackTreeNode<T>* node  // a pointer to the right node
);
```

**Parameters**

*node

[in] A pointer to the right node.
## Color (Get method)

Returns a node color.

```c
ENUM_RED_BLACK_TREE_NODE_TYPE Color();
```

## Return Value

Returns a node color.

## Color (Set method)

Sets the node color.

```c
void Color(
    ENUM_RED_BLACK_TREE_NODE_TYPE clr  // node color
);
```

### Parameters

- `clr`
  - `[in]` Node color.

### Note

The color of the node is set using a value from `ENUM_RED_BLACK_TREE_NODE_TYPE`. It can be of two types:

- `RED_BLACK_TREE_NODE_RED` — the red color of the node;
- `RED_BLACK_TREE_NODE_BLACK` — the black color of the node.
IsLeaf

Determines whether the specified node is a leaf.

```cpp
bool IsLeaf();
```

Return Value

Returns true if the node is a leaf, or false otherwise.
CreateEmptyNode

Creates a new black node with no parent and children, and returns a pointer to it.

```cpp
static CRadBlackTreeNode<T>* CreateEmptyNode();
```

Return Value

Returns a pointer to the new node.
**CLinkedListNode<T>**

CLinkedListNode<T> is a helper class used in implementing the CLinkedListNode<T> class.

**Description**

The CLinkedListNode<T> class is a node of the doubly linked list CLinkedListNode<T>. List navigation methods are implemented in the class.

**Declaration**

```cpp
template<typename T>
class CLinkedListNode
```

**Header**

```cpp
#include <Generic\LinkedList.mqh>
```

**Class Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List</td>
<td>Returns and sets a pointer to the CLinkedList&lt;T&gt;</td>
</tr>
<tr>
<td>Next</td>
<td>Returns and sets a pointer to the next node</td>
</tr>
<tr>
<td>Previous</td>
<td>Returns and sets a pointer to the previous node</td>
</tr>
<tr>
<td>Value</td>
<td>Returns and sets the node value</td>
</tr>
</tbody>
</table>
List (the Get method)

Returns a pointer to the `CLinkedList<T>`.

```cpp
CLinkedList<T>* List();
```

Return Value

Returns a pointer to the `CLinkedList<T>` linked list.

List (the Set method)

Sets a pointer to the `CLinkedList<T>`.

```cpp
void List(
    CLinkedList<T>* value  // a pointer to the list
);
```

Parameters

*value

[in] A pointer to the linked list `CLinkedList<T>`. 
Next (the Get method)

Returns a pointer to the next node.

```cpp
CPolyLinkedList<T>* Next();
```

Return Value

Returns a pointer to the next node.

Next (the Set method)

Sets a pointer to the next node.

```cpp
void Next(
    CPolyLinkedList<T>* value  // a pointer to the next node
);
```

Parameters

*value

[in] A pointer to the next node.
Previous (the Get method)

Returns a pointer to the previous node.

```cpp
CLinkedListNode<T>* Previous();
```

Return Value

Returns a pointer to the previous node.

Previous (the Set method)

Sets a pointer to the previous node.

```cpp
void Previous(
    CLinkedListNode<T>* value  // a pointer to the previous node
);`

Parameters

`*value`

[in] A pointer to the previous node.
Value (the Get method)

Returns the node value.

```
T Value();
```

Return Value

Returns the node value.

Value (the Set method)

Sets the node value.

```
void Value(
    T value // Node value
);
```

Parameters

value

[in] Node value.
CKeyValuePair<TKey, TValue>

The CKeyValuePair<TKey, TValue> class implements a key/value pair.

Description

The CKeyValuePair<TKey, TValue> class implements methods for working with the key and the value of the key/value pair.

Declaration

```cpp
template<typename TKey, typename TValue>
class CKeyValuePair : public IComparable<CKeyValuePair<TKey, TValue>*/
```

Header

```
#include <Generic\HashMap.mqh>
```

Inheritance Hierarchy

IEqualityComparable
    IComparable
        CKeyValuePair

Class Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Gets and sets the key in the key/value pair</td>
</tr>
<tr>
<td>Value</td>
<td>Gets and sets the value in the key/value pair</td>
</tr>
<tr>
<td>Clone</td>
<td>Creates a new key/value pair whose key and value are equal to the current ones</td>
</tr>
<tr>
<td>Compare</td>
<td>Compares the current key/value pair to the specified one</td>
</tr>
<tr>
<td>Equals</td>
<td>Checks whether the current key/value pair and the specified one are equal</td>
</tr>
<tr>
<td>HashCode</td>
<td>Calculates the hash value based on the key/value pair</td>
</tr>
</tbody>
</table>
Key (the Get method)

Gets the key in the key/value pair.

```cpp
TKey Key();
```

Return Value

Returns the key.

Key (the Set method)

Sets the key in the key/value pair.

```cpp
void Key(
    TKey key \// key
);
```

Parameters

- `key`[in] Key.
Value (the Get method)

Gets the value in the key/value pair.

```cpp
TValue Value();
```

Return Value

Returns the value.

Value (the Set method)

Sets the value in the key/value pair.

```cpp
void Value(
    TValue value    // value
);`

Parameters

- `value`  
  
  [in] Value
Clone

Creates a new key/value pair whose key and value are equal to the current ones.

`TValue>* Clone();`

Return Value

Returns a new key/value pair
**Compare**

Compares the current key/value pair to the specified one.

```cpp
int Compare(
    CKeyValuePair<TKeyTValue>* pair        // the pair to compare
);
```

**Parameters**

*pair*  
[in] The pair to compare.

**Return Value**

Returns a number that expresses the ratio of the current and passed key-value pairs:

- if the result is less than zero, the current key/value pair is less than the passed one
- if the result is zero, the current key/value pair is equal to than the passed one
- if the result is greater than zero, the current key/value pair is greater than the passed one

**Note**

Key/value pairs are compared based on their keys.
**Equals**

Checks whether the current key/value pair and the specified one are equal.

```cpp
bool Equals(
    CKeyValuePair<TKeyTValue>* pair  // the pair to compare
);
```

**Parameters**

*pair

[in] The pair to compare

**Return Value**

Returns true if the key/value pairs are equal, or false otherwise.

**Note**

Key/value pairs are compared based on their keys.
**HashCode**

Calculates the hash value based on the key/value pair.

```cpp
int HashCode();
```

**Return Value**

Returns the hash code.

**Note**

The hash code of the key/value pair is equal to the key hash code.
CArrayList<T>

CArrayList<T> is a generic class that implements the IList<T> interface.

Description

The CArrayList<T> class is an implementation of the dynamic data list of the T type. This class provides the basic methods to work with the list, such as to access an element by index, to search and delete elements, sort, and others.

Declaration

```
template<typename T>
class CArrayList : public IList<T>
```

Header

```
#include <Generic\ArrayList.mqh>
```

Inheritance Hierarchy

- ICollection
  - IList
    - CArrayList

<tr>
<td><code>Reverse</code></td>
<td>Reverses the order of elements in the list</td>
</tr>
<tr>
<td><code>Sort</code></td>
<td>Sorts elements in the list</td>
</tr>
</tbody>
</table>
## Capacity (the Get method)

Returns the current list capacity.

```c
int Capacity();
```

### Return Value

Returns the current list capacity.

## Capacity (the Set method)

Sets the current capacity of a list.

```c
void Capacity(
    const int capacity  // capacity value
);
```

### Parameters

- `capacity`
Count

Returns the number of elements in the list.

```c
int Count();
```

Return Value

Returns the number of elements.
Contains

Determines whether the list contains an element with the specified value.

```cpp
bool Contains(
    T item // the search value
);
```

Parameters

- `item` [in] The searched value.

Return Value

Returns true if an element with the specified value is found in the list, or false otherwise.
TrimExcess

Sets the capacity of a list to the actual number of elements, and thus frees up unused memory.

```cpp
void TrimExcess();
```
**TryGetValue**

Gets an element of the list at the specified index.

```cpp
bool TryGetValue(
    const int index,  // index
    T& value          // a variable to write
);
```

**Parameters**

*index*

[in] The index of the list element the value of which you want to get.

*value*

[out] The variable to write the element value to.

**Return Value**

Returns true on successful, or false otherwise.
**TrySetValue**

Sets the value of the list element at the specified index.

```cpp
bool TrySetValue(
    const int index,  // index
    T value          // element value
);
```

**Parameters**

- `index`
  - [in] The index of the list element the value of which you want to set.

- `value`
  - [in] Sets the value of the list element.

**Return Value**

Returns true on successful, or false otherwise.
Add

Adds an element to the list.

```cpp
bool Add(
    T value    // the value of the element
);
```

Parameters

`value`

[in] The value of the element to add.

Return Value

Returns true on successful, or false otherwise.
AddRange

Adds a collection or an array of elements to the list.

The version that adds an array.

```cpp
bool AddRange(
    const T& array[]  // an array to be added
);
```

The version that adds a collection.

```cpp
bool AddRange(
    ICollection<T>* collection  // a collection to be added
);
```

Parameters

- `array[]`
  - [in] An array to be added.

- `collection`
  - [in] A collection to be added.

Return Value

Returns true on successful, or false otherwise.
Insert

Inserts an element into the list at the specified index.

```cpp
bool Insert(
    const int  index,  // index to insert at
    T item         // the value to be inserted
);
```

Parameters

- **index**
  - [in] The index to insert at.

- **item**
  - [in] The value to be inserted at the specified index.

Return Value

Returns true on successful, or false otherwise.
InsertRange

Inserts a collection or an array of elements into the list at the specified index.

The version that inserts an array.

```cpp
bool InsertRange(
    const int index, // index to insert at
    const T& array[] // an array to be inserted
);
```

The version that inserts a collection.

```cpp
bool InsertRange(
    const int index, // index to insert at
    ICollection<T>* collection // a collection to be inserted
);
```

Parameters

`index`

[in] The index to insert at.

`&array[]`

[in] An array to be inserted at the specified index.

`*collection`

[in] A collection to be inserted at the specified index.

Return Value

Returns true on successful, or false otherwise.
CopyTo

Copies all elements of a list to the specified array starting at the specified index.

```cpp
int CopyTo(
    T& dst_array[], // an array for writing
    const int dst_start=0 // the starting index for writing
);
```

Parameters

- `dst_array[]`
  - [out] An array to which the elements of the list will be written.

- `dst_start=0`
  - [in] An index in the array from which copying starts.

Return Value

Returns the number of copied elements.
BinarySearch

Searches for the specified value in an ascending-sorted list.

The version that searches in the specified range of values using the class that implements the `IComparer<T>` interface for comparing elements.

```cpp
int BinarySearch(
    const int index, // the starting index
    const int count, // the search range
    T item, // the search value
    IComparer<T>* comparer // interface to compare
);
```

The version that searches using the class that implements the `IComparer<T>` interface for comparing elements.

```cpp
int BinarySearch(
    T item, // the search value
    IComparer<T>* comparer // interface to compare
);
```

The version that searches using the `::Compare` global method for comparing elements.

```cpp
int BinarySearch(
    T item // the search value
);
```

Parameters

`index`
- [in] The starting index from which the search begins.

`count`
- [in] The length of the search range.

`item`
- [in] The searched value.

`*comparer`

Return Value

Returns the index of the found element. If the search value is not found, it returns the index of the smallest element, which is closest in value.
IndexOf

Searches for the first occurrence of a value in a list.

**Version that searches in the entire list.**

```c++
int IndexOf(
    T item // the search value
);
```

**Version that searches from the specified position and to the end of the list.**

```c++
int IndexOf(
    T item, // the search value
    const int start_index // the starting index
);
```

**Version that searches from the specified position in the specified range.**

```c++
int IndexOf(
    T item, // the search value
    const int start_index, // the starting index
    const int count // the search range
);
```

**Parameters**

- `item` [in] The searched value.
- `start_index` [in] The starting index from which the search begins.
- `count` [in] The length of the search range.

**Return Value**

Returns the index of the first found element. If the value is not found, returns -1.
LastIndexOf

Searches for the last occurrence of a value in a list.

**Version that searches in the entire list.**

```cpp
int LastIndexOf(
    T item, // the search value
);
```

**Version that searches from the specified position and to the end of the list.**

```cpp
int LastIndexOf(
    T item, // the search value
    const int start_index // the starting index
);
```

**Version that searches from the specified position in the specified range.**

```cpp
int LastIndexOf(
    T item, // the search value
    const int start_index, // the starting index
    const int count // the search range
);
```

**Parameters**

- **item**
  - [in] The searched value.
- **start_index**
  - [in] The starting index from which the search begins.
- **count**
  - [in] The length of the search range.

**Return Value**

Returns the index of the last found element. If the value is not found, returns -1.
Clear

Removes all elements of a collection.

```cpp
void Clear();
```
Remove

Removes the first occurrence of the specified element from the list.

```c
bool Remove(
    T item      // the element value
);
```

Parameters

- **item**
  - [in] The value of the element to be deleted.

Return Value

- Returns true on successful, or false otherwise.
**RemoveAt**

Removes an element at the specified index of the list.

```cpp
bool RemoveAt(
    const int index    // index
);
```

**Parameters**

- `index`
  - [in] The index of the element to remove.

**Return Value**

Returns true on successful, or false otherwise.
RemoveRange

Removes a range of elements from the list.

```cpp
bool RemoveRange(
    const int start_index, // the starting index
    const int count       // the number of elements
);
```

Parameters

- `start_index` [in] The starting index from which the deletion begins.
- `count` [in] The number of elements to be deleted.

Return Value

Returns true on successful, or false otherwise.
Reverse

Reverses the order of elements in the list.

The version for working with the entire list.

```cpp
bool Reverse();
```

The version for working with the specified range of list elements.

```cpp
bool Reverse(
    const int start_index,  // the starting index
    const int count        // the number of elements
);
```

Parameters

- `start_index`
  - [in] The starting index.

- `count`
  - [in] The number of list elements participating in the operation.

Return Value

Returns true on successful, or false otherwise.
## Sort

Sorts elements in the list.

The version that sorts all elements in the list.

```cpp
bool Sort();
```

The version that sorts all elements in the list using the class that implements the `IComparable<T>` interface for comparing elements.

```cpp
bool Sort(IComparer<T>* comparer);  // interface for comparing
```

The version that sorts the specified range of elements in the list using the class that implements the `IComparable<T>` interface for comparing elements.

```cpp
bool Sort(const int start_index,  // the starting index
          const int count,     // the number of elements
          IComparer<T>* comparer // interface to compare
);  
```

### Parameters

*comparer*

*start_index*
- `[in]` The starting index from which sorting begins.

*count*
- `[in]` The length of the sorting range.

### Return Value

Returns true on successful, or false otherwise.
**CHashMap<TKey, TValue>**

CHashMap<TKey, TValue> is a generic class that implements the IMap<TKey, TValue> interface.

**Description**

The CHashMap<TKey, TValue> class is an implementation of the dynamic hash table, the data of which are stored in the form of unordered key/value pairs taking into account the key uniqueness requirement. This class provides basic methods to work with a hash table, such as to access a value by key, to search and delete a key/value pair, and others.

**Declaration**

```csharp
template<typename TKey, typename TValue>
class CHashMap : public IMap<TKey, TValue>
```

**Header**

```csharp
#include <Generic\HashMap.mqh>
```

**Inheritance Hierarchy**

- ICollection
  - IMap
    - CHashMap

**Class Methods**

</tbody>
</table>
Add

Adds a key/value pair to the hash table.

A version that adds a generated key/value pair.

```cpp
bool Add(
    CKeyValuePair<TKeyTValue>* pair  // the key/value pair
);
```

A version that adds a new key/value pair with the specified key and value.

```cpp
bool Add(
    TKey key,                           // key
    TValue value                        // value
);
```

Parameters

*pair
  [in] The key/value pair.

key
  [in] Key.

value
  [in] Value.

Return Value

Returns true on successful, or false otherwise.
Count

Returns the number of elements in the hash table.

```c
int Count();
```
Comparer

Returns a pointer to the IEqualityComparer<T> interface, used to organize a hash table.

IEqualityComparer<TKey>* Comparator() const;

Return Value

Returns a pointer to the IEqualityComparer<T> interface.
Contains

Determines whether the hash table contains the specified key/value pair.

The version for working with a generated key/value pair.

```cpp
bool Contains(
    CKeyValuePair<TKeyTValue>* item   // the key/value pair
);
```

The version for working with a key/value pair in the form of a separately set key and value.

```cpp
bool Contains(
    TKey   key,          // key
    TValue value         // value
);
```

Parameters

*item

[in] The key/value pair.

key

[in] Key.

value

[in] Value.

Return Value

Returns true, if the hash table contains the key/value pair with the specified key and value, or false otherwise.
ContainsKey

Determines whether the hash table contains the key/value pair with the specified key.

```cpp
bool ContainsKey(
    TKey key     // key
);
```

**Parameters**

`key`

[in] Key.

**Return Value**

Returns true if the hash table contains a key/value pair with the specified key, or false otherwise.
ContainsValue

Determines whether the hash table contains the key/value pair with the specified value.

```cpp
bool ContainsValue(
    TValue value   // value
);
```

Parameters

value
  [in] Value.

Return Value

Returns true if the hash table contains a key/value pair with the specified value, or false otherwise.
CopyTo

Copies all key/value pairs from the hash table to the specified arrays, starting at the specified index.

The version that copies a hash table to the array of key/value pairs.

```cpp
int CopyTo(
    CKeyValuePair<TKeyValue>*& dst_array[],  // an array for writing key/value pairs
    const int dst_start=0  // the starting index for writing
);
```

The version that copies a hash table to separate arrays for keys and values.

```cpp
int CopyTo(
    TKey& dst_keys[],  // an array for writing keys
    TValue& dst_values[],  // an array for writing values
    const int dst_start=0  // starting index for writing
);
```

**Parameters**

*dst_array[]*

[out] An array to which all pairs from the hash table will be written.

*dst_keys[]*

[out] An array to which all keys from the hash table will be written.

*dst_values[]*

[out] An array to which all values from the hash table will be written.

*dst_start=0*

[in] The array index from which copying starts.

**Return Value**

Returns the number of copied key/value pairs.
Clear

Removes all elements from the hash table.

```cpp
void Clear();
```
Remove

Removes the first occurrence of the key/value pair from the hash table.

The version that removes a key-value pair based on the generated key-value pair.

```cpp
bool Remove(
    CKeyValuePair<TKeyTValue>* item /* the key/value pair*/
);
```

The version that removes a key-value pair based on the key.

```cpp
bool Remove(
    TKey key /* key*/
);
```

**Parameters**

*item
    [in]  The key/value pair.

key
    [in]  Key.

**Return Value**

Returns true on successful, or false otherwise.
TryGetValue

Gets an element with the specified key from the hash table.

```cpp
bool TryGetValue(
    TKey key,  // key
    TValue& value = // a variable for writing the value
);
```

Parameters

- `key`
  - [in] Key.

- `value`
  - [out] The variable to which the specified value of the key/value pair will be written.

Return Value

Returns true on successful, or false otherwise.
TrySetValue

Changes the value of a key/value pair from the hash table at the specified key.

```cpp
bool TrySetValue(
    TKey key, // key
    TValue value // new value
);
```

Parameters

- **key**
  - [in] Key.

- **value**
  - [in] The new value to assign to the specified key-value pair.

Return Value

Returns true on successful, or false otherwise.
**CHashSet<T>**

CHashSet<T> is a generic class that implements the ISet<T> interface.

**Description**

The CHashSet<T> class is an implementation of the unordered dynamic data set of type T, with the required uniqueness of each value. This class provides basic methods to work with sets and related operations, such as: the union and intersection of sets, definition of strict and non-strict subsets, and others.

**Declaration**

```cpp
template<typename T>
class CHashSet : public ISet<T>
```

**Header**

```cpp
#include <Generic\HashSet.mqh>
```

**Inheritance Hierarchy**

- ICollection
  - ISet
    - CHashSet

**Class Methods**

</tr>
</tbody>
</table>
Add

Adds an element to a set.

```c
bool Add(
    T value  // the value of the element
);
```

**Parameters**

- **value**
  - [in] The value of the element to add.

**Return Value**

Returns true on successful, or false otherwise.
Count

Returns the number of elements in a set.

```c
int Count();
```

Return Value

Returns the number of elements.
**Contains**

Determines whether a set contains an element with the specified value.

```cpp
bool Contains(
    T item // the search value
);
```

**Parameters**

*item*

[in] The searched value.

**Return Value**

Returns true if an element with the specified value is found in the set, or false otherwise.
Comparer

Returns a pointer to the IEqualityComparer<T> interface, used to organize a set.

```
IEqualityComparer<T>* Comparator() const;
```

Return Value

Returns a pointer to the IEqualityComparer<T> interface.
**TrimExcess**

Sets the capacity of a set to the actual number of elements, and thus frees up unused memory.

```cpp
void TrimExcess();
```
CopyTo

Copies all elements of a set to the specified array starting at the specified index.

```c
int CopyTo(
    T& dst_array[], // an array for writing
    const int dst_start=0 // starting index for writing
);
```

Parameters

- `dst_array[]`  
  [out] An array to which the elements of the set will be written.

- `dst_start=0`  
  [in] An index in the array from which copying starts.

Return Value

Returns the number of copied elements.
Clear

Removes all elements from a set.

```cpp
void Clear();
```
Remove

Removes the specified element from a set.

```cpp
bool Remove(T item // the element value );
```

Parameters

`item`

[in] The value of the element to be deleted.

Return Value

Returns true on successful, or false otherwise.
**ExceptWith**

Produces the operation of difference between the current collection and a passed collection (array). It removes from the current collection (array) all elements that are present in the specified collection (array).

A version for working with the collection that implements the `ICollection<T>` interface.

```csharp
void ExceptWith(
    ICollection<T>* collection // collection
);
```

A version for working with an array.

```csharp
void ExceptWith(
    T& array[] // array
);
```

**Parameters**

- `*collection`  
  
  `[in]` A collection to be excepted from the current set.

- `&collection[]`  
  
  `[in]` An array to be excepted from the current set.

**Note**

The result is written to the current collection (array).
IntersectWith

Produces the operation of intersection of the current collection and a passed collection (array). It modifies the current collection to only contain elements that are present in the specified collection (array).

A version for working with the collection that implements the ICollection<T> interface.

```csharp
void IntersectWith(
    ICollection<T>* collection // collection
);
```

A version for working with an array.

```csharp
void IntersectWith(
    T& array[] // array
);
```

Parameters

*collection
  *in* A collection with which the current set will be intersected.

&collection[]
  *in* An array with which the current set will be intersected.

Note

The result is written to the current collection (array).
**SymmetricExceptWith**

Produces the operation of symmetrical difference between the current collection and a passed collection (array). It modifies the current collection to only contain elements that are present in the source object or in the specified collection (array), but not in both of them.

A version for working with the collection that implements the `IICollection<T>` interface.

```csharp
void SymmetricExceptWith(
    ICollection<T>^ collection // collection
);
```

A version for working with an array.

```csharp
void SymmetricExceptWith(
    T[] array[] // array
);
```

**Parameters**

- `*collection`
  
  [in] A collection to produce the symmetrical difference with.

- `&collection[]`

  [in] An array to produce the symmetrical difference with.

**Note**

The result is written to the current collection (array).
UnionWith

Produces the union of the current collection and a passed collection (array). It adds to the current collection (array) missing elements from the specified collection (array).

A version for working with the collection that implements the ICollection<T> interface.

```csharp
void UnionWith(
    ICollection<T>* collection  // collection
);
```

A version for working with an array.

```csharp
void UnionWith(
    T& array[]                // array
);
```

Parameters

*collection
   [in] A collection with which the current set will be united.

&collection[
   [in] An array with which the current set will be united.

Note

The result is written to the current collection (array).
IsProperSubsetOf

Determines whether the current set is a proper subset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsProperSubsetOf(
    ICollection<T>* collection // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsProperSubsetOf(
    T4 array[] // an array to determine the relation
);
```

Parameters

*collection

[in] A collection to determine the relation.

&collection[]

[in] An array to determine the relation.

Return Value

Returns true if the current set is a proper subset, or false otherwise.
IsProperSupersetOf

Determines whether the current set is a proper superset of the specified collection or array.

A version for working with the collection that implements the ICollection<
T>
interface.

```cpp
bool IsProperSupersetOf(
    ICollection<T>* collection    // a collection to determine the relation
);```

A version for working with an array.

```cpp
bool IsProperSupersetOf(
    T& array[]                    // an array to determine the relation
);```

Parameters

`*collection`

[in] A collection to determine the relation.

`&collection[]`

[in] An array to determine the relation.

Return Value

Returns true if the current set is a proper superset, or false otherwise.
IsSubsetOf

Determines whether the current set is a subset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsSubsetOf( ICollection<T>* collection )
```

A version for working with an array.

```csharp
bool IsSubsetOf( T* array[] )
```

Parameters

* `collection`
  
  [in] A collection to determine the relation.

* `collection[]`
  
  [in] An array to determine the relation.

Return Value

Returns true if the current set is a subset, or false otherwise.
IsSupersetOf

Determines whether the current set is a superset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsSupersetOf(
    ICollection<T>* collection  // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsSupersetOf(
    T4* array[]  // an array to determine the relation
);
```

Parameters

*collection

[in] A collection to determine the relation.

&collection[]

[in] An array to determine the relation.

Return Value

Returns true if the current set is a superset, or false otherwise.
Overlaps

Determines whether the current set overlaps the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool Overlaps(
    ICollection<T>* collection // a collection to compare
);
```

A version for working with an array.

```csharp
bool Overlaps(
    T* array[] // an array to compare
);
```

Parameters

*collection

&collection[]

Return Value

Returns true if the current set and a collection or an array overlap, or false otherwise.
SetEquals

Determines whether the current set contains all elements of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```cpp
bool SetEquals(
    ICollection<T>*   collection   // a collection to compare
);
```

A version for working with an array.

```cpp
bool SetEquals(
    T*     array[]     // an array to compare
);
```

Parameters

*collection

&collection
   [in] An array to compare elements.

Return Value

Returns true if the current set contains all elements of the specified collection or array, or false otherwise.
CLinkedList\<T\> is a generic class that implements the ICollection\<T\> interface.

**Description**

The CLinkedList\<T\> class is an implementation of the dynamic doubly linked data list of the T type. This class provides basic methods to work with doubly linked lists, such as to add, delete, search elements, and others.

**Declaration**

```cpp
template<typename T>
class CLinkedList : public ICollection<T>
```

**Header**

```cpp
#include <Generic\LinkedList.mqh>

</tr>
<tr>
<td>FindLast</td>
<td>Searches for the last occurrence of the specified value in the linked list</td>
</tr>
</tbody>
</table>
Add

Add an element to a linked list.

```cpp
bool Add(
    T value  // the value of the element
);
```

Parameters

- `value`
  - `[in]` The value of the element to add.

Return Value

Returns true on successful, or false otherwise.
**AddAfter**

Adds an element after the specified node in the linked list.

The version that adds an element by value.

```cpp
CLinkedListNode<T>* AddAfter(
    CLinkedListNode<T>* node,  // the node after which the element should be added
    T value                // the element to add
);
```

**Return Value**

Returns a pointer to the added node.

The version that adds an element as a formed node by value.

```cpp
bool AddAfter(
    CLinkedListNode<T>* node,  // the node after which the element should be added
    CLinkedListNode<T>* new_node // the node to be added
);
```

**Parameters**

*node
  [in] The node of the linked list, after which a new element will be added.

*value
  [in] An element to be added.

*new_node
  [in] A node to be added.

**Return Value**

Returns true on successful, or false otherwise.
AddBefore

Adds an element before the specified node in the linked list.

The version that adds an element by value.

```cpp
CLinkedListNode<T>* AddBefore(
    CLinkedListNode<T>* node, // the node before which the element should be added
    T value // the element to add
);
```

Return Value

Returns a pointer to the added node.

The version that adds an element as a formed node by value.

```cpp
bool AddBefore(
    CLinkedListNode<T>* node, // the node before which the element should be added
    CLinkedListNode<T>* new_node // the node to be added
);
```

Parameters

* `*node`
  
  [in] The node of the linked list, before which a new element will be added.

* `value`
  
  [in] An element to be added.

* `*new_node`
  
  [in] A node to be added.

Return Value

Returns true on successful, or false otherwise.
AddFirst

Adds an element at the beginning of the linked list.

The version that adds an element by value.

```cpp
CLinkedListNode<T> * AddFirst(
    T value // an element to add
);
```

Return Value

Returns a pointer to the added node.

The version that adds an element as a formed node by value.

```cpp
bool AddFirst(
    CLinkedListNode<T> * node // the node to add
);
```

Parameters

- `value`
  - [in] An element to be added.

- `node`
  - [in] A node to be added.

Return Value

Returns true on successful, or false otherwise.
AddLast

Adds an element at the end of the linked list

The version that adds an element by value.

```cpp
CLinkedList<mint>* AddLast(
    mint value, // an element to add
);
```

Return Value

Returns a pointer to the added node.

The version that adds an element as a formed node by value.

```cpp
bool AddLast(
    CLinkedList<mint>* node // the node to add
);
```

Parameters

- `value`
  - [in] An element to be added.

- `*node`
  - [in] A node to be added.

Return Value

Returns true on successful, or false otherwise.
Count

Returns the number of elements in the linked list.

```c
int Count();
```

Return Value

Returns the number of elements.
Head

Returns a pointer to the first node of the linked list.

```
CLinkedListNode<T>* Head();
```

Return Value

Returns a pointer to the first node.
First

Returns a pointer to the first node of the linked list.

```cpp
CLinkedListNode<T>* First();
```

Return Value

Returns a pointer to the first node.
**Last**

Returns a pointer to the last node of the linked list.

```cpp
CLinkedListNode<T>* Last();
```

**Return Value**

Returns a pointer to the last node.
**Contains**

Determines whether the linked list contains an element with the specified value.

```cpp
bool Contains(T item);  // the search value
```

**Parameters**

`item`

[in] The searched value.

**Return Value**

Returns true if an element with the specified value is found in the linked list, or false otherwise.
CopyTo

Copies all elements of the linked list to the specified array starting at the specified index.

```cpp
int CopyTo(
    T& dst_array[], // an array for writing
    const int dst_start=0 // the starting index for writing
);
```

Parameters

- `dst_array[]` [out] An array to which the elements of the linked list will be written.
- `dst_start=0` [in] An index in the array from which copying starts.

Return Value

Returns the number of copied elements.
Clear

Removes all elements of a collection.

```cpp
void Clear();
```
Remove

Removes the first occurrence of the specified element from the linked list.

The version that removes an element by value.

```cpp
bool Remove(
    T item // the element value
);
```

The version that removes an element by a pointer to a node.

```cpp
bool Remove(
    CLinkedListNode<T>* node // the element node
);
```

Parameters

- `item`
  - [in] The value of the element to be deleted.

- `*node`
  - [in] The node of the element to be deleted.

Return Value

Returns true on successful, or false otherwise.
RemoveFirst

Removes the first element of the linked list.

```cpp
bool RemoveFirst();
```

Return Value

Returns true on successful, or false otherwise.
RemoveLast

Removes the last element of the linked list.

```cpp
bool RemoveLast();
```

Return Value

Returns true on successful, or false otherwise.
Find

Searches for the first occurrence of the specified value in the linked list.

```cpp
CLinkedListNode<T>* Find(
    T value    // the search value
);
```

Parameters

- `value`
  - `[in]` The searched value.

Return Value

Returns a pointer to the first found node containing the search value on success, or NULL otherwise.
FindLast

Searches for the last occurrence of the specified value in the linked list.

```cpp
CLinkedList<

Parameters

value [in] The searched value.

Return Value

Returns a pointer to the last found node containing the search value on success, or NULL otherwise.
**CQueue<T>**

CQueue<T> is a generic class that implements the ICollection<T> interface.

**Description**

The CQueue<T> class is a dynamic collection of T type data, which is organized as a queue that operates on the FIFO (first in, first out) principle.

**Declaration**

```
template<typename T>
class CQueue : public ICollection<T>
```

**Header**

```
#include <Generic\Queue.mqh>
```

**Inheritance Hierarchy**

- ICollection
  - CQueue

**Class Methods**

</tr>
</tbody>
</table>
Add

Adds an element to a queue.

```cpp
bool Add(T value) // the value of the element
```

**Parameters**

value

[in] The value of the element to add.

**Return Value**

Returns true on successful, or false otherwise.
Enqueue

Adds an element to a queue.

```cpp
bool Enqueue(
    T value  // element to add
);
```

Parameters

value

[in] An element to be added.

Return Value

Returns true on successful, or false otherwise.
Count

Returns the number of elements in the queue.

`int Count();`

Return Value

Returns the number of elements.
Contains
Determines whether the queue contains an element with the specified value.

```cpp
bool Contains(
    T item // the search value
);
```

Parameters
item
   [in] The searched value.

Return Value
Returns true if an element with the specified value is found in the queue, or false otherwise.
TrimExcess

Sets the capacity of a queue to the actual number of elements, and thus frees up unused memory.

```c
void TrimExcess();
```
CopyTo

Copies all elements of a queue to the specified array starting at the specified index.

```cpp
int CopyTo(
    T& dst_array[],  // an array for writing
    const int dst_start=0  // the starting index for writing
);
```

Parameters

- `dst_array[]` [out] An array to which the elements of the queue will be written.
- `dst_start=0` [in] An index in the array from which copying starts.

Return Value

Returns the number of copied elements.
Clear

Removes all elements from a queue.

```cpp
void Clear();
```
Remove

Removes the first occurrence of the specified element from the queue.

```cpp
bool Remove(T item); // the element value
```

Parameters

- `item`  
  [in] The value of the element to be deleted.

Return Value

- Returns true on successful, or false otherwise.
Dequeue

Returns the first element and removes it from the queue.

\[ T \text{ Dequeue}(); \]

Return Value

Returns the starting element.
 Peek

Returns the first element not removing it from the queue.

T Peek();

Return Value

Returns the starting element.
CRedBlackTree<T>

CRedBlackTree<T> is a generic class that implements the ICollection<T> interface.

Description

The CRedBlackTree<T> class is an implementation of a dynamic red-black tree whose nodes store T type data. The class provides basic methods to work with red-black trees, such as to add, delete, search for the maximum and minimum value, and more.

Declaration

```cpp
template<typename T>
class CRedBlackTree : public ICollection<T>
```

Header

```cpp
#include <Generic\RedBlackTree.mqh>
```

Inheritance Hierarchy

<td>Searches for an element with the minimum value in a red-black tree</td>
</tr>
</tbody>
</table>
Add

Adds an element to a red-black tree.

```cpp
bool Add(
    T value    // element to add
);
```

Parameters

value

[in] An element to be added.

Return Value

Returns true on successful, or false otherwise.
Count

Returns the number of elements in the red-black tree.

```cpp
int Count();
```

Return Value

Returns the number of elements.
Root

Returns a pointer to the root of the red-black tree.

CRedBlackTreeNode<T>* Root();

Return Value

Returns a pointer to the root.
Contains

Determines whether the red-black tree contains an element with the specified value.

```cpp
bool Contains(
    T item  // the search value
);
```

Parameters

- `item`
  - `[in]` The searched value.

Return Value

Returns true if an element with the specified value is found in the red-black tree, or false otherwise.
Comparer

Returns a pointer to the IComparer<T> interface used to organize a red-black tree.

IComparer<T>* Comparer() const;

Return Value

Returns a pointer to the IComparer<T> interface.
TryGetMin

Gets the minimum element of a red-black tree.

```cpp
bool TryGetMin(
    T& min // a variable for writing the value
);
```

Parameters

`&min`

[out] The variable to which the minimum value will be written.

Return Value

Returns true on successful, or false otherwise.
TryGetMax

Gets the maximum element of a red-black tree.

```cpp
bool TryGetMax(
    T& max       // a variable for writing the value
);
```

**Parameters**

`&max`

`[out]` The variable to which the maximum value will be written.

**Return Value**

Returns true on successful, or false otherwise.
CopyTo

Copies all elements of a red-black tree to the specified array starting at the specified index.

```cpp
int CopyTo(
    T& dst_array[], // an array for writing
    const int dst_start=0 // starting index for writing
);
```

Parameters

`dst_array[]`

[out] An array to which the elements of the red-black tree will be written.

`dst_start=0`

[in] An index in the array from which copying starts.

Return Value

Returns the number of copied elements.
Clear

Removes all elements from a red-black tree.

```cpp
void Clear();
```
Remove

Removes the occurrence of the specified element from a red-black tree.

The version that removes an element with the specified value.

```cpp
bool Remove(
    T value  // the element value
);
```

The version that removes an element by a pointer to a node.

```cpp
bool Remove(
    CRedBlackTreeNode<T>* node  // the element node
);
```

Parameters

* item
  [in] The value of the element to be deleted.

* node
  [in] The node of the element to be deleted.

Return Value

Returns true on successful, or false otherwise.
RemoveMin

Removes an element with the minimum value from a red-black tree.

```cpp
bool RemoveMin();
```

Return Value

Returns true on successful, or false otherwise.
RemoveMax

Removes an element with the maximum value from a red-black tree.

```cpp
bool RemoveMax();
```

Return Value

Returns true on successful, or false otherwise.
Find

Searches for the occurrence of a specified value in a red-black tree.

```cpp
CRedBlackTreeNode<T>* Find(
    T  value    // the search value
);
```

Parameters

- `value`
  - [in] The searched value.

Return Value

Returns a pointer to the found node containing the search value on success, or NULL otherwise.
**FindMin**

Searches for an element with the minimum value in a red-black tree.

```cpp
CRedBlackTreeNode<T>* FindMin();
```

**Return Value**

Returns a pointer to the node containing the minimum value on success, or NULL otherwise.
FindMax

Searches for an element with the maximum value in a red-black tree.

```cpp
CRedBlackTreeNode<T>* FindMax();
```

**Return Value**

Returns a pointer to the node containing the maximum value on success, or NULL otherwise.
CSortedMap<TKey,TValue>

CSortedMap<TKey,TValue> is a generic class that implements the IMap<TKey,TValue> interface.

Description

The CSortedMap<TKey,TValue> class is an implementation of a dynamic hash table whose data are stored as key/value pairs sorted by key and taking into account the key uniqueness requirement. This class provides basic methods to work with a hash table, such as to access a value by key, to search and delete a key/value pair, and others.

Declaration

```cpp
#include <Generic\SortedMap.mqh>
```

Header

Inheritance Hierarchy

- ICollection
  - IMap
    - CSortedMap

Class Methods

</tr>
<tr>
<td><strong>TrySetValue</strong></td>
<td>Changes a key/value pair with the specified key from the sorted hash table</td>
</tr>
</tbody>
</table>
Add

Adds a key/value pair to the hash table.

A version that adds a generated key/value pair.

```cpp
bool Add(
    CKeyValuePair<TKeyTValue>* pair  // the key/value pair
);```

A version that adds a new key/value pair with the specified key and value.

```cpp
bool Add(
    TKey key,  // key
    TValue value // value
);```

Parameters

*pair
  [in] The key/value pair.

key
  [in] Key.

value
  [in] Value.

Return Value

Returns true on successful, or false otherwise.
Count

Returns the number of elements in the sorted hash table.

```c
int Count();
```
Comparer

Returns a pointer to the IComparer<T> interface, used to organize a sorted hash table.

```
IComparer<TKey>*Comparer() const;
```

Return Value

Returns a pointer to the IComparer<T> interface.
Contains

Determines whether the sorted hash table contains the specified key/value table.

The version for working with a generated key/value pair.

```cpp
bool Contains(
    CKeyValuePair<TKeyTValue>* item  // the key/value pair
);
```

The version for working with a key/value pair in the form of a separately set key and value.

```cpp
bool Contains(
    TKey key,  // key
    TValue value  // value
);
```

Parameters

*item
  [in] The key/value pair.

key
  [in] Key.

value
  [in] Value.

Return Value

Returns true, if the sorted hash table contains the key/value pair with the specified key and value, or false otherwise.
ContainsKey

Determines whether the sorted hash table contains the key/value table with the specified key.

```cpp
bool ContainsKey(
    TKey key  // key
);
```

Parameters

key

[in] Key.

Return Value

Returns true, if the sorted hash table contains the key/value pair with the specified key, or false otherwise.
ContainsValue

Determines whether the sorted hash table contains the key/value table with the specified value.

```cpp
bool ContainsValue(
    TValue value  // value
);
```

**Parameters**

value

[in] Value.

**Return Value**

Returns true, if the sorted hash table contains the key/value pair with the specified value, or false otherwise.
### CopyTo

Copies all key/value pairs from the sorted hash table to the specified arrays, starting at the specified index.

The version that copies a hash table to the array of key/value pairs.

```cpp
int CopyTo(
    CKeyValuePair<TKey, TValue>* dst_array[], // an array for writing key/value pairs
    const int dst_start=0 // the starting index for writing
);
```

The version that copies a hash table to separate arrays for keys and values.

```cpp
int CopyTo(
    TKey& dst_keys[], // an array for writing keys
    TValue& dst_values[], // an array for writing values
    const int dst_start=0 // the starting index for writing
);
```

### Parameters

- `*&dst_array[]`
  - [out] An array to which all pairs from the hash table will be written.

- `&dst_keys[]`
  - [out] An array to which all keys from the hash table will be written.

- `&dst_values[]`
  - [out] An array to which all values from the hash table will be written.

- `dst_start=0`
  - [in] An index in the array from which copying starts.

### Return Value

Returns the number of copied key/value pairs.
Clear

Removes all elements from the sorted hash table.

```cpp
void Clear();
```
Remove

Removes the first occurrence of the key/value pair from the sorted hash table.

The version that removes a key-value pair based on the generated key-value pair.

```cpp
bool Remove(
    CKeyValuePair<TKeyTValue>* item,  // the key/value pair
);
```

The version that removes a key-value pair based on the key.

```cpp
bool Remove(
    TKey key,  // key
);
```

Parameters

* `*item`
  
  [in] The key/value pair.

* `key`
  
  [in] Key.

Return Value

Returns true on successful, or false otherwise.
TryGetValue

Gets an element with the specified key from the sorted hash table.

```csharp
bool TryGetValue(
    TKey key,      // key
    TValue& value, // a variable for writing the value
);
```

Parameters

- **key**
  - [in] Key.

- **value**
  - [out] The variable to which the specified value of the key/value pair will be written.

Return Value

Returns true on successful, or false otherwise.
TrySetValue

Changes the value of the key/value pair from the sorted hash table at the specified key.

```c++
bool TrySetValue(
    TKey key, // key
    TValue value // new value
);
```

Parameters

key

[in] Key.

value

[in] The new value to assign to the specified key-value pair.

Return Value

Returns true on successful, or false otherwise.
CSortedSet<T>

CSortedSet<T> is a generic class that implements the ISet<T> interface.

Description

The CSortedSet<T> class is an implementation of the sorted dynamic data set of type T, with the required uniqueness of each value. This class provides basic methods to work with sets and related operations, such as: the union and intersection of sets, definition of strict and non-strict subsets, and others.

Declaration

```
template<typename T>
class CSortedSet : public ISet<T>
```

Header

```
#include <Generic\SortedSet.mqh>
```

Inheritance Hierarchy

- ICollection
  - ISet
    - CSortedSet

<tr>
<td>GetReverse</td>
<td>Gets a copy of the current sorted set, in which all the elements are arranged in a reverse order</td>
</tr>
</tbody>
</table>
**Add**

Adds an element to a sorted set.

```cpp
bool Add(
    T value // the value of the element
);
```

**Parameters**

- `value`
  
  [in] The value of the element to add.

**Return Value**

Returns true on successful, or false otherwise.
Count

Returns the number of elements in the sorted set.

```cpp
int Count();
```

Return Value

Returns the number of elements.
Contains

Determines whether the sorted set contains an element with the specified value.

```cpp
bool Contains(
    T item     // the search value
);
```

**Parameters**

- `item`
  - `[in]` The searched value.

**Return Value**

Returns true if an element with the specified value is found in the set, or false otherwise.
Comparer

Returns a pointer to the IComparer<T> interface, used to organize a sorted set.

```cpp
IComparer<T>* Comparator() const;
```

Return Value

Returns a pointer to the IComparer<T> interface.
TryGetMin

Gets the minimum element from the sorted set.

```cpp
bool TryGetMin(
    T& min  // a variable for writing the value
);
```

Parameters

- `&min`
  - `[out]` The variable to which the minimum value will be written.

Return Value

- Returns true on successful, or false otherwise.
TryGetMax

Gets the maximum element from the sorted set.

```cpp
bool TryGetMax(
    T& max // a variable for writing the value
);
```

Parameters

- `&max`
  - [out] The variable to which the maximum value will be written.

Return Value

- Returns true on successful, or false otherwise.
CopyTo

Copies all elements of a sorted set to the specified array starting at the specified index.

```cpp
int CopyTo(
    T& dst_array[], // an array for writing
    const int dst_start=0 // the starting index for writing
);
```

**Parameters**

- `dst_array[]`
  - [out] An array to which the elements of the set will be written.

- `dst_start=0`
  - [in] An index in the array from which copying starts.

**Return Value**

Returns the number of copied elements.
Clear

Removes all elements from a sorted set.

```cpp
void Clear();
```
Remove

Removes the occurrence of the specified element from the sorted set.

```cpp
bool Remove(T item) // the element value
```

**Parameters**

`item`

[in] The value of the element to be deleted.

**Return Value**

Returns true on successful, or false otherwise.
### ExceptWith

Produces the operation of difference between the current collection and a passed collection (array). It removes from the current collection (array) all elements that are present in the specified collection (array).

**A version for working with the collection that implements the ICollection<T> interface.**

```csharp
void ExceptWith(
    ICollection<T>* collection  // collection
);
```

**A version for working with an array.**

```csharp
void ExceptWith(
    T& array[]  // array
);
```

**Parameters**

- `*collection`
  - [in] A collection to be excepted from the current sorted set.
- `&collection[]`
  - [in] An array to be excepted from the current sorted set.

**Note**

The result is written to the current collection (array).
**IntersectWith**

Produces the operation of intersection of the current collection and a passed collection (array). It modifies the current collection to only contain elements that are present in the specified collection (array).

A version for working with the collection that implements the ICollection<T> interface.

```csharp
void IntersectWith(
    ICollection<T>* collection    // collection
);
```

A version for working with an array.

```csharp
void IntersectWith(
    T& array[]    // array
);
```

**Parameters**

*collection

  [in] A collection with which the current set will be intersected.

&collection[]

  [in] An array with which the current set will be intersected.

**Note**

The result is written to the current collection (array).
SymmetricExceptWith

Produces the operation of symmetrical difference between the current collection and a passed collection (array). It modifies the current collection to only contain elements that are present in the source object or in the specified collection (array), but not in both of them.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
void SymmetricExceptWith(
    ICollection<T>* collection       // collection
);
```

A version for working with an array.

```csharp
void SymmetricExceptWith(
    T& array[]                     // array
);
```

Parameters

*collection
  
  [in] A collection to produce the symmetrical difference with.

&collection[]
  
  [in] An array to produce the symmetrical difference with.

Note

The result is written to the current collection (array).
UnionWith

Produces the union of the current collection and a passed collection (array). It adds to the current collection (array) missing elements from the specified collection (array).

A version for working with the collection that implements the ICollection\<T\> interface.

```csharp
void UnionWith(
    ICollection\<T\>* collection  // collection
);
```

A version for working with an array.

```csharp
void UnionWith(
    T\& array[]  // array
);
```

Parameters

*collection

    [in] A collection with which the current set will be united.

&collection[]

    [in] An array with which the current set will be united.

Note

The result is written to the current collection (array).
IsProperSubsetOf

Determines whether the current sorted set is a proper subset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsProperSubsetOf(
    ICollection<T>* collection; // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsProperSubsetOf(
    T& array[]; // an array to determine the relation
);
```

Parameters
- *collection
  - [in] A collection to determine the relation.
- &collection[]
  - [in] An array to determine the relation.

Return Value
Returns true if the current sorted set is a proper subset, or false otherwise.
IsProperSupersetOf

Determines whether the current sorted set is a proper superset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsProperSupersetOf(
    ICollection<T>* collection       // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsProperSupersetOf(
    T* array[]                     // an array to determine the relation
);
```

Parameters

`*collection`

[in] A collection to determine the relation.

`&collection[]`

[in] An array to determine the relation.

Return Value

Returns true if the current sorted set is a proper superset, or false otherwise.
IsSubsetOf

Determines whether the current sorted set is a subset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsSubsetOf(
    ICollection<T>* collection    // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsSubsetOf(
    T4 array[]                      // an array to determine the relation
);
```

Parameters

*collection
    [in] A collection to determine the relation.

&collection[]
    [in] An array to determine the relation.

Return Value

Returns true if the current sorted set is a subset, or false otherwise.
IsSupersetOf

Determines whether the current sorted set is a superset of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool IsSupersetOf(  
    ICollection<T>* collection  // a collection to determine the relation
);
```

A version for working with an array.

```csharp
bool IsSupersetOf(  
    T& array[]  // an array to determine the relation
);
```

Parameters

*collection
  [in] A collection to determine the relation.

&collection[]
  [in] An array to determine the relation.

Return Value

Returns true if the current sorted set is a superset, or false otherwise.
Overlaps

Determines whether the current sorted set overlaps the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool Overlaps(
    ICollection<T>* collection       // a collection to compare
);
```

A version for working with an array.

```csharp
bool Overlaps(
    T& array[]                      // an array to compare
);
```

Parameters

*collection

&collection[

Return Value

Returns true if the current sorted set and a collection or an array overlap, or false otherwise.
SetEquals

Determines whether the current sorted set contains all elements of the specified collection or array.

A version for working with the collection that implements the ICollection<T> interface.

```csharp
bool SetEquals(
    ICollection<T>* collection  // a collection to compare
);
```

A version for working with an array.

```csharp
bool SetEquals(
    T& array[]  // an array to compare
);
```

Parameters

*collection

&collection[
    [in] An array to compare elements.

Return Value

Returns true if the current sorted set contains all elements of the specified collection or array, or false otherwise.
GetViewBetween

Gets from the current sorted set a subset specified by the minimum and maximum values.

```cpp
bool GetViewBetween(
    T& array[], // an array for writing
    T lower_value, // the minimum value
    T upper_value // the maximum value
);
```

Parameters

- `array[]`
  - [out] An array for writing the subset.
- `lower_value`
  - [in] The minimum value of the range.
- `upper_value`
  - [in] The maximum value of the range.

Return Value

Returns true on successful, or false otherwise.
GetReverse

Gets a copy of the current sorted set, in which all the elements are arranged in a reverse order.

```cpp
bool GetReverse(
    T& array[] // an array for writing
);
```

Parameters

Return Value

- Returns true on successful, or false otherwise.
CStack<T>

CStack<T> is a generic class that implements the ICollection<T> interface.

Description

The CStack<T> class is a dynamic collection of T type data, which is organized as a stack that operates on the LIFO (last in, first out) principle.

Declaration

```cpp
template<typename T>
class CStack : publicICollection<T>
```

Header

```cpp
#include <Generic\Stack.mqh>
```

Inheritance Hierarchy

```
ICollection

CStack
```

Class Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Adds an element to a stack</td>
</tr>
<tr>
<td>Count</td>
<td>Returns the number of elements in a stack</td>

<td>Peek</td>
<td>Returns the head element without removing it from a stack</td>
</tr>
<tr>
<td>Pop</td>
<td>Returns the head element and removes it from a stack</td>
</tr>
</tbody>
</table>
Add

Adds an element to the stack.

```cpp
bool Add(
    T value  // the value of the element
);
```

Parameters

value

[in] The value of the element to add.

Return Value

Returns true on successful, or false otherwise.
Count

Returns the number of elements in the stack.

```cpp
int Count();
```

Return Value

Returns the number of elements.
Contains

Determines whether a stack contains an element with the specified value.

```cpp
bool Contains(
    T item       // the search value
);
```

Parameters

- `item`
  - [in] The searched value.

Return Value

- Returns true if an element with the specified value is found in the stack, or false otherwise.
TrimExcess

Sets the capacity of a stack to the actual number of elements, and thus frees up unused memory.

```cpp
void TrimExcess();
```
CopyTo

Copies all elements of a stack to the specified array starting at the specified index.

```cpp
int CopyTo(
    T& dst_array[], // an array for writing
    const int dst_start=0 // the starting index for writing
);
```

Parameters

- `dst_array[]`:
  - [out] An array to which the elements of the stack will be written.
  
- `dst_start=0`:
  - [in] An index in the array from which copying starts.

Return Value

Returns the number of copied elements.
Clear

Removes all elements from a stack.

```c
void Clear();
```
Remove

Removes the first occurrence of the specified element from a stack.

```c
bool Remove(
    T item    // the element value
);
```

Parameters

`item`

[in] The value of the element to be deleted.

Return Value

Returns true on successful, or false otherwise.
Push

Add an element to the stack.

```cpp
bool Push(
    T value // element to add
);
```

Parameters

value

[in] An element to be added.

Return Value

Returns true on successful, or false otherwise.
**Peek**

Returns the head element without removing it from a stack.

```cpp
T Peek();
```

**Return Value**

Returns the head element.
Pop

Returns the head element and removes it from a stack.

\[
T \ Pop();
\]

Return Value

Returns the head element.
ArrayBinarySearch

Searches for the specified value in an ascending-sorted one-dimensional array using the IComparable<T> interface to compare elements.

```
template<typename T>
int ArrayBinarySearch(
    const T& array[], // an array for search
    const int start_index, // the starting index
    const int count, // the search range
    const T value, // the search value
    IComparer<T>* comparer // interface to compare
);
```

Parameters

- `&array[]`: [out] The array to search in.
- `value`: [in] The searched value.
- `start_index`: [in] The starting index from which the search begins.
- `count`: [in] The length of the search range.

Return Value

Returns the index of the found element. If the search value is not found, it returns the index of the smallest element, which is closest in value.
ArrayIndexOf

Searches for the first occurrence of a value in a one-dimensional array.

```
template<typename T>
int ArrayIndexOf(
    T& array[],       // an array for search
    T value,          // the search value
    const int start_index,  // the starting index
    const int count // the search range
);
```

Parameters

- `array[]` [out] The array to search in.
- `value` [in] The searched value.
- `start_index` [in] The starting index from which the search begins.
- `count` [in] The length of the search range.

Return Value

Returns the index of the first found element. If the value is not found, returns -1.
ArrayLastIndexOf

Searches for the last occurrence of a value in a one-dimensional array.

```cpp
template<typename T>
int ArrayLastIndexOf(
    T& array[],   // an array for search
    T value,      // the search value
    const int start_index, // the starting index
    const int count    // the search range
);
```

Parameters

- `&array[]`  
  [out] The array to search in.
- `value`  
  [in] The searched value.
- `start_index`  
  [in] The starting index from which the search begins.
- `count`  
  [in] The length of the search range.

Return Value

Returns the index of the last found element. If the value is not found, returns -1.
ArrayReverse

Changes the sequence of elements in a one-dimensional array.

```cpp
template<typename T>
bool ArrayReverse(
    T& array[], // the source array
    const int start_index, // the starting index
    const int count // the number of elements
);
```

**Parameters**

- `array[]`
  - [out] The source array.

- `start_index`
  - [in] The starting index.

- `count`
  - [in] The number of array elements participating in the operation.

**Return Value**

Returns true on successful, or false otherwise.
Compare

Compares the two values, whether one of them is "greater than, less than or equal to" the other one.

A version for comparing two bool values.

```c
int Compare(
    const bool x,  // the first value
    const bool y   // the second value
);
```

A version for comparing two char values.

```c
int Compare(
    const char x,  // the first value
    const char y   // the second value
);
```

A version for comparing two uchar values.

```c
int Compare(
    const uchar x,  // the first value
    const uchar y   // the second value
);
```

A version for comparing two short values.

```c
int Compare(
    const short x,  // the first value
    const short y   // the second value
);
```

A version for comparing two ushort values.

```c
int Compare(
    const ushort x,  // the first value
    const ushort y   // the second value
);
```

A version for comparing two color values.

```c
int Compare(
    const color x,  // the first value
    const color y   // the second value
);
```

A version for comparing two int values.

```c
int Compare(
    const int x,  // the first value
    const int y   // the second value
);
```
A version for comparing two uint values.

```cpp
int Compare(
    const uint x,  // the first value
    const uint y   // the second value
);
```

A version for comparing two datetime values.

```cpp
int Compare(
    const datetime x,  // the first value
    const datetime y   // the second value
);
```

A version for comparing two long values.

```cpp
int Compare(
    const long x,     // the first value
    const long y      // the second value
);
```

A version for comparing two ulong values.

```cpp
int Compare(
    const ulong x,    // the first value
    const ulong y     // the second value
);
```

A version for comparing two float values.

```cpp
int Compare(
    const float x,  // the first value
    const float y   // the second value
);
```

A version for comparing two double values.

```cpp
int Compare(
    const double x,    // the first value
    const double y     // the second value
);
```

A version for comparing two string values.

```cpp
int Compare(
    const string x,   // the first value
    const string y    // the second value
);
```

A version for comparing two values of other types.

```cpp
template<typename T>
int Compare(
```
T x,  // the first value
T y   // the second value
);

Parameters

x  
  [in] The first value
y  
  [in] The second value

Return Value

Returns a number that expresses the ratio of the two compared values:

- if the result is less than zero, x is less than y (x<y)
- if the result is equal to zero, x is equal to y (x=y)
- if the result is greater than zero, x is greater than y (x>y)

Note

If the T type is an object that implements the IComparable<T> interface, then the objects will be compared based on its Compare method. In all other cases, 0 is returned.
Equals

Compares two values for equality.

```cpp
template<typename T>
bool Equals(
    T x,    // the first value
    T y     // the second value
);
```

Parameters

- `x`
  - [in] The first value
- `y`
  - [in] The second value

Return Value

Returns true if the objects are equal, or false otherwise.

Note

If the `T` type is an object that implements the `IEqualityComparable<T>` interface, then the objects will be compared based on its `Equals` comparison method. The standard comparison for equality is used in all other cases.
GetHashCode

Calculates the hash code value.

A version for working with the bool type.

```cpp
int GetHashCode(
    const bool value  // value
);
```

A version for working with the char type.

```cpp
int GetHashCode(
    const char value  // value
);
```

A version for working with the uchar type.

```cpp
int GetHashCode(
    const uchar value  // value
);
```

A version for working with the short type.

```cpp
int GetHashCode(
    const short value  // value
);
```

A version for working with the ushort type.

```cpp
int GetHashCode(
    const ushort value  // value
);
```

A version for working with the color type.

```cpp
int GetHashCode(
    const color value  // value
);
```

A version for working with the int type.

```cpp
int GetHashCode(
    const int value  // value
);
```

A version for working with the uint type.

```cpp
int GetHashCode(
    const uint value  // value
);
```

A version for working with the datetime type.

```cpp
int GetHashCode(
```
A version for working with the long type.

```c
int GetHashCode(
    const long value // value
);
```

A version for working with the ulong type.

```c
int GetHashCode(
    const ulong value // value
);
```

A version for working with the float type.

```c
int GetHashCode(
    const float value // value
);
```

A version for working with the double type.

```c
int GetHashCode(
    const double value // value
);
```

A version for working with the string type.

```c
int GetHashCode(
    const string value // value
);
```

A version for working with other types.

```c
template<typename T>
int GetHashCode(
    T value // value
);
```

**Parameters**

- `value`  
  [in] The value for which you want to get the hash code.

**Return Value**

Returns the hash code.

**Note**

If the `T` type is an object that implements the `IEqualityComparable<T>` interface, then the hash code will be obtained based on its `HashCode` method. In all other cases, the hash code will be calculated as the hash value of the value type name.
File Operations

This section contains the technical details of the file operations classes and descriptions of the corresponding components of the MQL5 standard library.

The file operations classes will save time in developing applications using file input/output operations.

The MQL5 Standard Library (in terms of file operations) is located in the working directory of the terminal in the `Include\Files` folder.

<table>

</tbody>
</table>
CFile

CFile is a base class for CFileBin and CFileTxt classes.

Description

CFile class provides the simplified access to MQL5 API file and folder functions for all of its descendants.

Declaration

```cpp
class CFile: public CObject
```

Title

```cpp
#include <Files\File.mqh>
```

Inheritance hierarchy

- CObject
- CFile

Direct descendants

- CFileBin, CFilePipe, CFileTxt

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Save**, **Load**, **Type**, **Compare**
Handle

Gets file handle of the opened file.

```cpp
int Handle()
```

Return Value

Handle of the opened file assigned to the class instance. If there is no file assigned, it returns -1.
**FileName**

Gets file name of the opened file.

```cpp
string FileName()
```

**Return Value**

File name of the opened file, assigned to the class instance. If there is no file assigned, it returns "".
Flags

Gets flags of the opened file.

```c
int Flags()
```

Return Value

Flags of the opened file assigned to the class instance.
SetUnicode

Sets/clears the FILE_UNICODE flag.

```c
void SetUnicode(
    bool  unicode  // flag value
)
```

**Parameters**

`unicode`

**Note**

The result of string operations is dependent on the FILE_UNICODE flag. If it is false, the ANSI codes are used (one byte symbols). If it set, the UNICODE codes are used (two byte symbols). If the file is already opened, the flag cannot be changed.
SetCommon

Sets/clears the FILE_COMMON flag.

```c
void SetCommon(
    bool common  // flag value
);
```

Parameters

common

Note

The FILE_COMMON flag determines the current working folder. If it is false, the local terminal folder is used as the current working folder. If it is true, the common data folder is used as the current working folder. If the file is already opened, the flag cannot be changed.
Open

Opens the specified file and, if it successful, assigns it to the class instance.

```c
int Open(
  const string  file_name,   // file name
  int           flags,       // flags
  short         delimiter=9  // separator
)
```

Parameters

- `file_name` [in] File name to open.

Return Value

Handle of the opened file.

Note

The working folder is dependent on flag that was previously set/reset using the `SetCommon()` method.
Close

Closes file assigned to the class instance.

```cpp
void Close()
```
Delete

Deletes the file assigned to the file instance.

```cpp
void Delete()
```

## Delete

Deletes the specified file.

```cpp
void Delete(
    const string file_name   // file name
)
```

### Parameters

- `file_name`  
  - [in] File name of the file to delete.

### Note

The working folder is dependent on the flag that was previously set/reset using the `SetCommon()` method.
IsExist

Checks file for existence

```cpp
bool IsExist(const string file_name) // file name
```

**Parameters**

- `file_name`
  - [in] Name of the file to check.

**Return Value**

- true - file exists.
Copy

Copies a file.

```cpp
bool Copy(
    const string src_name,  // file name
    int src_flag,           // flag
    const string dst_name,  // file name
    int dst_flags          // flags
)
```

Parameters

- **src_name**

- **src_flag**
  - [in] Flags of a source file (only FILE_COMMON is used).

- **dst_name**
  - [in] File name of the destination file.

- **dst_flags**
  - [in] Flags of the destination file (only FILE_REWRITE and FILE_COMMON are used).

Return Value

- true - successful, false - cannot copy the file.
Move

Renames/moves file.

```cpp
bool Move(
    const string src_name,  // file name
    int src_flag,            // flag
    const string dst_name,  // file name
    int dst_flags            // flags
)
```

### Parameters

- **src_name**
  - [in] Source file name.

- **src_flag**
  - [in] Source file flags (only FILE_COMMON is used).

- **dst_name**
  - [in] File name of the destination file.

- **dst_flags**
  - [in] Flags of the destination file (only FILE_REWRITE and FILE_COMMON are used).

### Return Value

- true - successful, false - failed to move/rename the file.
Size

Gets file size in bytes.

```c
ulong Size()
```

**Return Value**

file size in bytes. If there is no file assigned, it returns ULONG_MAX.
Tell

Gets the current file pointer's position.

```c
ulong Tell()
```

**Return Value**

the current file position. If there no file assigned, it returns ULONG_MAX.
Seek

Sets file pointer's position.

```c
void Seek(
    long   offset,  // offset
    ENUM_FILE_POSITION origin  // origin
)
```

Parameters

offset

[in] File offset in bytes (can be negative).

origin

Return Value

true - successful, false - cannot change the file pointer.
Flush

Flushes all of the file input/output buffer data on disk.

```c
void Flush()
```
IsEnding

Checks file for end during the file read operations.

```cpp
def IsEnding()
```

Return Value

true - end of file has been achieved during read or seek operation.
**IsLineEnding**

Checks a text file for end during the file read operations.

```c
bool IsLineEnding()
```

**Return Value**

- `true` - end of line has been achieved during a txt or csv file read operation (CR-LF chars).

FolderCreate

Creates new folder.

```csharp
bool FolderCreate(
    const string folder_name  // folder name
)
```

### Parameters

- **folder_name**
  - `[in]` Name of the folder to create. It contains path to the folder relative to the folder defined by FILE_COMMON flag.

### Return Value

- `true` - successful, `false` - cannot create the folder.

### Note

The working folder is dependent on the flag that was previously set/reset using the SetCommon() method.
FolderDelete

Deletes specified folder.

```cpp
bool FolderDelete(
    const string folder_name // folder name
)
```

Parameters

`folder_name`

[in] Name of the folder to delete. It contains path to the folder relative to the folder defined by FILE_COMMON flag.

Return Value

ture - successful, false - cannot delete the folder.

Note

The working folder is dependent on the flag that was previously set/reset using the SetCommon() method.
FolderClean

Cleans specified folder.

```cpp
bool FolderClean(
    const string folder_name  // folder name
)
```

**Parameters**

- `folder_name`  
  [in] Name of the folder to clean. It contains path to the folder relative to the folder defined by FILE_COMMON flag.

**Return Value**

- true - successful, and false - cannot change the folder.

**Note**

The working folder is dependent on the flag previously set/reset by SetCommon() method.
**FileFindFirst**

 Begins file search using the specified filter.

```cpp
int FileFindFirst(
    const string filter,       // search filter
    string& file_name          // reference
)
```

**Parameters**

*filter*

[in] Search filter.

*file_name*

[OUT] The reference to the string the name of the first found file is placed into in case of success.

**Return Value**

The handle that can be used for further file search using FileFindNext, or INVALID_HANDLE if there are no files corresponding to the filter.

**Note**

The working folder is dependent on the flag previously set/reset by SetCommon() method.
FileFindNext

Continues file search started by the FileFindFirst() method.

```c
bool FileFindNext(
    int    search_handle,  // search handle
    string& file_name    // reference
);```

Parameters

- `search_handle`  
  - [in] Search handle returned by FileFindFirst() method.

- `file_name`  
  - [in] The reference to the string the name of the found file is placed into if successful.

Return Value

- true - successful, false - there are no files corresponding to the filter.
FileFindClose

Closes search handle.

```
void FileFindClose(
    int search_handle  // search handle
)
```

**Parameters**

`search_handle`

- **[in]** Search handle returned by `FileFindFirst()` method.
CFileBin

CFileBin is a class for simplified access to binary files.

Description

CFileBin class provides access to binary files.

Declaration

```cpp
class CFileBin: public CFile
```

Title

```cpp
#include <Files\FileBin.mqh>
```

Inheritance hierarchy

```
CObject
  CFile
    CFileBin
```

## Methods inherited from class CObject

- Prev, Prev, Next, Next, Save, Load, Type, Compare

## Methods inherited from class CFile

- Handle, FileName, Flags, SetUnicode, SetCommon, Open, Close, Delete, Size, Tell, Seek, Flush, IsEnding, IsLineEnding, Delete, IsExist, Copy, Move, FolderCreate, FolderDelete, FolderClean, FindFirst, FindNext, FindClose
Open

Opens the specified binary file and, if successful, assigns it to the class instance.

```c
int Open(
    const string file_name, // file name
    int flags // flags
)
```

Parameters

- **file_name**
  - [in] File name of the file to open.

- **flags**
  - [in] File open flags (the FILE_BIN flag is set forcibly).

Return Value

Handle of the opened file.
WriteChar

Writers char or uchar type variable to file.

```c
uint WriteChar(
    char value // value
)
```

**Parameters**

- **value**
  - [in] Variable to write.

**Return Value**

- Number of bytes written.
## WriteShort

Writes short or ushort type variable to file.

```c
uint WriteShort(
    short value  // value
)
```

### Parameters

- **value**
  - [in] Variable to write.

### Return Value

- Number of bytes written.
WriteInteger

Writes int or uint type variable to file.

```c
uint WriteInteger(
    int  value  // value
)
```

Parameters

value

[in] Variable to write.

Return Value

Number of bytes written.
**WriteLong**

Writes `long` or `ulong` type variable to file.

```cpp
uint WriteLong(
    long value // value
)
```

**Parameters**

- **value**
  
  [in] Variable to write.

**Return Value**

- Number of bytes written.
WriteFloat

 Writes float type variable to file.

```c
uint WriteFloat(
    float value   // value
)
```

**Parameters**

- `value`
  - [in] Variable to write.

**Return Value**

- Number of bytes written.
WriteDouble

Writes double type variable to file.

```c
uint WriteDouble(
    double value  // value
)
```

Parameters

value

[in] Variable to write.

Return Value

Number of bytes written.
**WriteString**

**WriteString** writes string type variable to file.

```c
uint WriteString(
    const string value  // value
)
```

**Parameters**

- `value`
  - [in] String to write.

**Return Value**

- Number of bytes written.

**WriteString**

**WriteString** writes string type variable to file.

```c
uint WriteString(
    const string value,  // value
    int size             // size
)
```

**Parameters**

- `value`
  - [in] String to write.
- `size`
  - [in] Number of bytes to write.

**Return Value**

- Number of bytes written.
WriteCharArray

Writes an array of char or uchar type variables to file.

```c
uint WriteCharArray(
    char& array[],    // array
    int start_item=0,  // start element
    int items_count=-1 // number of elements
)
```

Parameters

- `array[]`
  - [in] Array to write.
- `start_item=0`
  - [in] Start element to write from.
- `items_count=-1`
  - [in] Number of elements to write (-1 - whole array).

Return Value

Number of bytes written.
WriteShortArray

Writes an array of short or ushort type variables to file.

```cpp
uint WriteShortArray(
    short& array[],   // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

Parameters

- `array[]`
  - [in] Array to write.
- `start_item=0`
  - [in] Start element to write from.
- `items_count=-1`
  - [in] Number of elements to write (-1 - whole array).

Return Value

Number of bytes written.
WriteIntegerArray

Writes an array of int or uint type variables to file.

```c
uint WriteIntegerArray(
    int& array[], // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

**Parameters**

- `array[]`
  - [in] Array to write.

- `start_item=0`
  - [in] Start element to write from.

- `items_count=-1`
  - [in] Number of elements to write (-1 - whole array).

**Return Value**

Number of bytes written.
WriteLongArray

Writes an array of long or ulong type variables to file.

```c
uint WriteLongArray(
    long& array[],          // array
    int start_item=0,        // start element
    int items_count=-1       // number of elements
)
```

Parameters

- `array[]`
  - [in] Array to write.

- `start_item=0`
  - [in] Start element to write from.

- `items_count=-1`
  - [in] Number of elements to write (-1 - whole array).

Return Value

- Number of bytes written.
**WriteFloatArray**

Writes an array of float type variables to file.

```c
uint WriteFloatArray(
    float& array[], // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

**Parameters**

- `array[]`
  - [in] Array to write.
- `start_item=0`
  - [in] Start element to write from.
- `items_count=-1`
  - [in] Number of elements to write (-1 - whole array).

**Return Value**

Number of bytes written.
**WriteDoubleArray**

Writes an array of double type variables to file.

```c
uint WriteDoubleArray(
    double& array[], // array to write
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

**Parameters**

- `array[]`
  - [in] Array to write.
- `start_item=0`
  - [in] Start element to write from.
- `items_count=-1`
  - [in] Number of elements to write (-1 - whole array).

**Return Value**

Number of bytes written.
WriteObject

Writes data of the CObject class inheritor instance to file.

```cpp
bool WriteObject(
    CObject* object  // reference to the object
)
```

Parameters

`object`

[in] Reference to the CObject class inheritor instance to write.

Return Value

true - successful, false - cannot write the data.
ReadChar

Reads char or uchar type variable from file.

bool ReadChar(
    char& value // flag value
)

Parameters

value
    [in] Reference to the variable for placing read data.

Return Value

true - successful, false - cannot read the data.
ReadShort

Reads short or ushort type variable from file.

```c
bool ReadShort(
    short& value
)
```

**Parameters**

- `value`  
  [in] Reference to the variable for placing read data.

**Return Value**

- true - successful, false - cannot read the data.
ReadInteger

Reads int or uint type variable from file.

```cpp
bool ReadInteger(
    int& value // variable
)
```

Parameters

value

[in] Reference to the variable for placing read data.

Return Value

true - successful, false - cannot read the data.
ReadLong

Reads long or ulong type variable from file.

```cpp
bool ReadLong(
    long& value
)
```

**Parameters**

- `value`
  
  [in] Reference to the variable for placing read data.

**Return Value**

- true - successful, false - cannot read the data.
ReadFloat

Reads float type variable from file.

```cpp
bool ReadFloat(
    float& value  // variable
)
```

**Parameters**

value

[in] Reference to the variable for placing read data.

**Return Value**

true - successful, false - cannot read the data.
ReadDouble

Reads double type variable from file.

```cpp
bool ReadDouble(
    double& value
)
```

Parameters

value

[in] Reference to the variable for placing read data.

Return Value

true - successful, false - cannot read the data.
ReadString

Reads string type variable from file.

```cpp
bool ReadString(
    string& value  // string
)
```

**Parameters**

`value`

[in] Reference to the variable for placing read data.

**Return Value**

true - successful, false - cannot read the data.

ReadString

Reads string type variable from file.

```cpp
bool ReadString(
    string& value
)
```

**Parameters**

`value`

[in] Reference to the variable for placing read data.

**Return Value**

true - successful, false - cannot read the data.
ReadCharArray

Reads an array of char or uchar type variables from file.

```cpp
bool ReadCharArray(
    char& array[], // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

**Parameters**

- `array[]`  
  `[in]` Reference to the variable for placing read data.

- `start_item=0`  
  `[in]` Start element to read from.

- `items_count=-1`  
  `[in]` Number of elements to read (-1 - read to the end of file).

**Return Value**

- `true` - successful, `false` - cannot read the data.
ReadShortArray

Reads an array of short or ushort type variables from file.

```cpp
bool ReadShortArray(
    short& array[], // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

**Parameters**

- `array[]`
  - [in] Reference to the variable for placing read data.

- `start_item=0`
  - [in] Start element to read from.

- `items_count=-1`
  - [in] Number of elements to read (-1 - read to the end of file).

**Return Value**

- true - successful, false - cannot read the data.
ReadIntegerArray

Reads an array of int or uint type variables from file.

```cpp
bool ReadIntegerArray(
    int& array[], // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

Parameters

- `array[]`  
  [in] Reference to the target array of type int or uint.

- `start_item=0`  
  [in] Start element to read from.

- `items_count=-1`  
  [in] Number of elements to read (-1 - read to the end of file).

Return Value

- true - successful, false - cannot read the data.
ReadLongArray

Reads an array of long or ulong type variables from file.

```cpp
bool ReadLongArray(
    long& array[],   // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

Parameters

- `array[]`
  - [in] Reference to the variable for placing read data.
- `start_item=0`
  - [in] Start element to read from.
- `items_count=-1`
  - [in] Number of elements to read (-1 - read to the end of file).

Return Value

- true - successful, false - cannot read the data.
ReadFloatArray

Reads an array of float type variables from file.

```cpp
bool ReadFloatArray(
    float& array[],  // array
    int start_item=0, // start element
    int items_count=-1 // number of elements
)
```

Parameters

**array[]**

[in] Reference to the variable for placing read data.

**start_item=0**

[in] Start element to read from.

**items_count=-1**

[in] Number of elements to read (-1 - read to the end of file).

Return Value

true - successful, false - cannot read the data.
**ReadDoubleArray**

Reads an array of double type variables from file.

```c
bool ReadDoubleArray(
    double& array[],  // array
    int start_item=0,  // start element
    int items_count=-1 // number of elements
)
```

**Parameters**

- `array[]`
  - [in] Reference to the variable for placing read data.

- `start_item=0`
  - [in] Start element to read from.

- `items_count=-1`
  - [in] Number of elements to read (-1 - read to the end of file).

**Return Value**

- `true` - successful, `false` - cannot read the data.
ReadObject

Reads data of the CObject class inheritor instance from file.

```cpp
bool ReadObject(
    CObject* object  // pointer
);```

Parameters

- `object` [in] Pointer to the CObject class inheritor instance to read.

Return Value

- true - successful, false - cannot read the data.
CFileTxt

CFileTxt is a class for simplified access to text files.

Description

CFileTxt class provides access to text files.

Declaration

```cpp
class CFileTxt: public CFile
```

Title

```cpp
#include <Files\FileTxt.mqh>
```

Inheritance hierarchy

```
CObject
   CFile
      CFileTxt
```

```
Open

Opens the specified text file and, if successful, assigns it to the class instance.

```cpp
int Open(
    const string file_name,  // file name
    int flags              // flags
)
```

Parameters

- **file_name**
  - [in] File name to open.

- **flags**
  - [in] File open flags (FILE_TXT flag is forcibly set).

Return Value

Opened file handle.
**WriteString**

Writes string type variable to file.

```c
uint WriteString(
    const string value  // string
}
```

**Parameters**

`value`

[in] String to write.

**Return Value**

Number of bytes written.
ReadString

Reads string type variable from file.

```c
string ReadString()
```

Return Value

String which has been read.
String operations

This section contains the technical details of the string operations classes and descriptions of the corresponding components of the MQL5 standard library.

The use of string operations classes will save time in developing applications processing textual data.

The MQL5 standard library (in terms of string operations) is located in the working directory of the terminal in the Include\Strings folder.

<table>

CString

CString is a class for simplified access to the variables of string type.

Description

CString class provides simplified access to MQL5 API functions working with string variables.

Declaration

```cpp
class CString: public CObject
```

Title

```cpp
#include <Strings\String.mqh>
```

Inheritance hierarchy

- CObject
- CString

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type
Str

Gets a string.

```
string Str() const;
```

Return Value

Copy of a string.
Len

 Gets length of a string.

 ```
 uint Len() const;
 ```

 Return Value

 Length of a string.
Copy

Copies a string by reference.

```cpp
void Copy(
    string& copy  // reference
) const;
```

**Parameters**

`copy`

[in] Reference to a data string.

Copy

Copies a string to the CString class instance.

```cpp
void Copy(
    CString* copy  // pointer
) const;
```

**Parameters**

`copy`

[in] Pointer to CString class instance for data.
Fill

Fills a string with specified char.

```c
bool Fill(
    short character  // character
)
```

Parameters

`character`

[in] Character for filling a string.

Return Value

true - successful, false - cannot fill a string.
Assign

Assigns a string.

```cpp
void Assign(
    const string str // string
)
```

Parameters

- `str`
  - [in] String to assign.

Assign

Assigns a string from the CString class instance.

```cpp
void Assign(
    CString* str // pointer
)
```

Parameters

- `str`
  - [in] Pointer to the CString class instance to assign.
Append

Appends a string.

```cpp
void Append(
    const string str // string
)
```

Parameters

str

[in] String to append.

Append

Appends a string from the CString class instance.

```cpp
void Append(
    CString* string // pointer
)
```

Parameters

string

[in] Pointer to the CString class instance to append.
**Insert**

Inserts a string to the specified position.

```c
uint Insert(
    uint pos,  // position
    const string str  // string
)
```

**Parameters**

- **pos**
  - [in] Insert position.

- **str**
  - [in] String to insert.

**Return Value**

Resulted string length.

---

**Insert**

Inserts a string to the specified position from the CString class instance.

```c
uint Insert(
    uint pos,  // position
    CString* str  // pointer
)
```

**Parameters**

- **pos**
  - [in] Position to insert into.

- **str**
  - [in] Pointer to the CString class instance to insert.

**Return Value**

Resulted string length.
Compare

Compares to a string.

```
int Compare(
    const string str    // string
) const;
```

**Parameters**

*str*

[in] String to compare.

**Return Value**

0 - both strings are equal, -1 - the class string is lower than the string to compare, 1 - the class string is greater than the string to compare.

Compare

Compares to a CString class instance string.

```
int Compare(
    CString* str    // pointer
) const;
```

**Parameters**

*str*

[in] Pointer to CString class instance to compare.

**Return Value**

0 - strings are equal, -1 - the class string is lower than the string to compare, 1 - the class string is greater than the string to compare.
**CompareNoCase**

Performs a case insensitive string comparison.

```c
int CompareNoCase(
    const string str  // string
) const;
```

Parameters

str

[in] String to compare.

Return Value

0 - strings are equal, -1 - a class string is lower than a string to compare, 1 - a class string is greater than a string to compare.

**CompareNoCase**

Compares a string (case insensitive) to a CString class instance string.

```c
int CompareNoCase(
    CString* str    // pointer
) const;
```

Parameters

str

[in] Pointer to CString class instance to compare.

Return Value

0 - if strings are equal, -1 - a class string is lower than a string to compare, 1 - a class string is greater than a string to compare.
Left

Gets a substring of a specified length from the beginning of a string.

```cpp
string Left(
    uint count // length
)
```

Parameters

- `count`
  
  [in] Substring length.

Return Value

- Resulted substring.
Right

Gets a substring of a specified length from the end of a string.

```csharp
string Right(
    uint count // length
)
```

Parameters

Return Value

Resulted substring.
Mid

Gets a substring of a specified length from a specified string position.

```cpp
string Mid(
    uint pos, // position
    uint count // length
)
```

Parameters

- `pos`  
  [in] Substring position.

- `count`  
  [in] Substring length.

Return Value

- Resulted substring.
Trim

Removes all characters within a set (as well as ``,`, `\t`, `\r`, `\n`) at both ends of a string from this string.

```cpp
int Trim(
    const string targets // set
)
```

**Parameters**

*targets*  
[in] Set of characters to remove.

**Return Value**

Number of removed characters.

**Example:**

```cpp
//-- example for CString::Trim
#include <Strings\String.mqh>
//--
void OnStart()
{
    CString str;  
    //--
    str.Assign("  \t\tABCD\r\n");
    printf("Source string '%s'",str.Str());
    //--
    str.Trim("DA-DA-DA");
    printf("Result string '%s'",str.Str());
}
```
TrimLeft

Removes all characters within a set (as well as ' ',
	,

) at the beginning of a string from this string.

```
int TrimLeft(
    const string targets  // set
);
```

Parameters

- **targets**
  - [in] Set of characters to remove.

Return Value

Number of characters removed.
**TrimRight**

Removes all characters within a set (as well as `'`, `\t`, `\r`, `\n`) at the end of a string from this string.

```cpp
int TrimRight(
    const string targets // set
)
```

**Parameters**

- **targets**
  - [in] Set of characters to remove.

**Return Value**

- Number of characters removed.
Clear

Clears a string.

```cpp
bool Clear()
```

Return Value

true - successful, false - cannot clear a string.
ToUpper

Converts all string characters to uppercase.

```c
bool ToUpper()
```

Return Value

- true - successful, false - cannot convert to uppercase.
**ToLower**

Converts all string characters to lowercase.

```cpp
bool ToLower()
```

**Return Value**

- `true` - successful, `false` - cannot convert to lowercase.
Reverse

Reverses a string (initial and final characters exchange places pair-wise).

```c
void Reverse()
```
Find

Searches for the first match of a substring from a specified position.

```c
int Find(
    uint       start,   // position
    const string substring   // substring
) const;
```

**Parameters**

- **start**
  - [in] Initial position for substring search.

- **substring**
  - [in] Sample substring to search for.

**Return Value**

The index of the first match of a substring (-1 - substring is not found).
**FindRev**

Searches for the last match of a substring.

```c
int FindRev(
    const string substring // substring
) const;
```

**Parameters**

*substring*

[in] Sample substring to search for.

**Return Value**

The index of the last match of a substring (-1 - substring is not found).
**Remove**

Removes all substring matches.

```cpp
uint Remove(
    const string substring // substring
)
```

**Parameters**

substring

[in] Sample substring to search for.

**Return Value**

Number of substring removals.
Replace
Replaces all substring matches.

```c
uint Replace(
    const string substring, // substring
    const string newstring // substring
)
```

**Parameters**

*substring*

* [in] Sample substring to search for.

*newstring*

* [in] Sample substring to replace with.

**Return Value**

Number of substring replacements.
Graphic Objects

This section contains the technical details of working with classes of graphical objects and a description of the relevant components of the MQL5 Standard Library.

The use of classes of graphical objects will save time when creating custom programs (scripts, Expert Advisors).

MQL5 Standard Library (in terms of graphical objects) is located in the working directory of the terminal in the Include\ChartObjects folder.

CChartObject

CChartObject is a base class for the classes of chart graphical objects of the Standard MQL5 library.

Description

CChartObject class provides the simplified access to MQL5 API functions for all of its descendants.

Declaration

```cpp
class CChartObject : public CObject
```

Title

```
#include <ChartObjects\ChartObject.mqh>
```

Inheritance hierarchy

- **CObject**
- CChartObject

Direct descendants

- CChartObjectArrow
- CChartObjectBitmap
- CChartObjectBmpLabel
- CChartObjectCycles
- CChartObjectElliottWave3
- CChartObjectEllipse
- CChartObjectFiboArc
- CChartObjectFiboFan
- CChartObjectFiboTimes
- CChartObjectHLine
- CChartObjectRectangle
- CChartObjectSubChart
- CChartObjectText
- CChartObjectTrend
- CChartObjectTriangle
- CChartObjectVLine

</table>

### Methods inherited from class CObject

- Prev, Prev, Next, Next, Compare
ChartId

Gets the ID of the chart a graphical object belongs to.

```cpp
long ChartId() const
```

**Return Value**

ID of the chart where the graphical object is located. If there is no bound object, it returns -1.

**Example:**

```cpp
//--- example for CChartObject::ChartId
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- get chart identifier of chart object
    long chart_id = object.ChartId();
}
```
Window

Gets the index of the chart window where the graphical object is located.

```cpp
int Window() const
```

Return Value

The number of the chart window where the graphical object is located (0 - main window). If there is no bound object, it returns -1.

Example:

```cpp
//--- example for CChartObject::Window
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- get window of chart object
    int window=object.Window();
}```
**Name (Get Method)**

Gets the name of the graphical object.

```cpp
string Name() const
```

**Return Value**

Name of the graphical object attached to an instance of the class. If there is no attached object, it returns NULL.

**Name (Set Method)**

Sets the name of the graphical object.

```cpp
bool Name(
    string name // new name
)
```

**Parameters**

`name`

[in] The new name of the graphical object.

**Return Value**

true - success, false - cannot change the name.

**Example:**

```cpp
//--- example for CChartObject::Name
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- get name of chart object
    string object_name=object.Name();
    if(object_name!="MyChartObject")
    {
        //--- set name of chart object
        object.Name("MyChartObject");
    }
}
```
**NumPoints**

Gets the number of anchor points of a graphical object.

```cpp
int NumPoints() const
```

**Return Value**

Number of points linking a graphical object attached to an instance of the class. If there is no attached object, it returns 0.

**Example:**

```cpp
//--- example for CChartObject::NumPoints
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- get points count of chart object
    int points=object.NumPoints();
}
```
## Attach

Attaches a graphical object to an instance of the class.

```cpp
bool Attach(
    long chart_id, // chart ID
    string name,   // name of the object
    int window,    // chart window
    int points     // number of points
)
```

### Parameters

- `chart_id`  
  [out] Chart identifier.

- `name`  
  [in] Name of the graphical object.

- `window`  
  [in] Chart window number (0 - main window).

- `points`  
  [in] Number of anchor points of the graphical object.

### Return Value

- `true` - success, `false` - cannot bind the object.

### Example:

```cpp
//--- example for CChartObject::Attach
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- attach chart object
    if (!object.Attach(ChartID(), "MyObject", 0, 2))
    {
        printf("Object attach error");
        return;
    }
}
```
## SetPoint

Sets new coordinates of the specified anchor point of the graphical object.

```cpp
bool SetPoint(
    int    point,  // point number
    datetime new_time,  // time coordinate
    double new_price  // price coordinate
)
```

### Parameters

- **point**
  - [in] Number of the graphical object anchor point.

- **new_time**
  - [in] New value for the time coordinate of the specified anchor point.

- **new_price**
  - [in] New value for price coordinate of the specified anchor point.

### Return Value

- true - success, false - cannot change coordinates of the point.

### Example:

```cpp
//--- example for CChartObject::SetPoint
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    double price;
    //--
    if(object.NumPoints()>0)
    {
        //--- set point of chart object
        object.SetPoint(0,CurrTime(),price);
    }
}
```
Delete

Removes an attached graphical object from the chart.

```cpp
bool Delete()
```

Return Value

true - success, false - cannot remove the object.

Example:

```cpp
//--- example for CChartObject::Delete
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- detach chart object
    if(!object.Delete())
    {
        printf("Object delete error");
        return;
    }
}
```
**Detach**

Detaches the graphical object.

```cpp
void Detach()
```

**Return Value**

None.

**Example:**

```cpp
//--- example for CChartObject::Detach
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- detach chart object
    object.Detach();
}
```
**ShiftObject**

Shifts a graphical object.

```cpp
bool ShiftObject(
    datetime d_time, // increment of time coordinate
    double d_price   // increment of price coordinate
)
```

**Parameters**

- **d_time**
  - [in] Increment of the time coordinate of all anchor points.

- **d_price**
  - [in] Increment of the price coordinate of all anchor points.

**Return Value**

true - success, false - cannot shift the object.

**Example:**

```cpp
//--- example for CChartObject::ShiftObject
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    datetime d_time;
    double   d_price;
    //--- shift chart object
    object.ShiftObject(d_time, d_price);
}
```
**ShiftPoint**

Shifts a specified anchor point of the graphical object.

```cpp
bool ShiftPoint(
    int point,  // point number
    datetime d_time,  // increment of time coordinate
    double d_price  // increment of price coordinate
)
```

**Parameters**

- `point`
  
  [in] Number of a graphical object anchor point.

- `d_time`
  
  [in] Increment of the time coordinate of the specified point.

- `d_price`
  
  [in] Increment of the price coordinate of the specified point.

**Return Value**

- true - success, false - cannot shift the point.

**Example:**

```cpp
//--- example for CChartObject::ShiftPoint
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    datetime d_time;
    double d_price;
    //---
    if(object.NumPoints()>0)
    {
        //--- shift point of chart object
        object.ShiftPoint(0,d_time,d_price);
    }
}
```
**Time (Get Method)**

Gets the time coordinate of the specified anchor point of a graphical object.

```cpp
datetime Time(
    int point  // point number
) const
```

**Parameters**

- `point`  
  [in] Number of a graphical object anchor point.

**Return Value**

Time coordinate of the specified anchor point of the graphical object attached to an instance of the class. If there is no attached object or the object does not have this point, it returns 0.

**Time (Set Method)**

Sets the time coordinate of the specified anchor point of a graphical object.

```cpp
bool Time(
    int point,  // point number
    datetime new_time  // time
)
```

**Parameters**

- `point`  
  [in] Number of a graphical object anchor point.

- `new_time`  
  [in] New value for the time coordinate of the specified graphical object anchor point.

**Return Value**

- true - success, false - cannot change the time coordinate.

**Example:**

```cpp
//--- example for CChartObject::Time
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //---
    for(int i=0;i<object.NumPoints();i++)
    {
        //--- get time of the chart object point
        datetime point_time=object.Time(i);
        if(point_time==0)
```
{  
    //--- set time of the chart object point  
    object.Time(i, TimeCurrent());  
}  
}
Price (Get Method)

Gets the price coordinate of the specified anchor point of a graphical object.

```cpp
double Price(
    int point // point number
) const
```

**Parameters**

- `point`
  - [in] Number of a graphical object anchor point.

**Return Value**

Price coordinate of the specified anchor point of the graphical object attached to an instance of the class. If there is no attached object or the object does not have this point, it returns `EMPTY_VALUE`.

Price (Set Method)

Sets the price coordinate of the specified anchor point of a graphical object.

```cpp
bool Price(
    int point,       // point number
    double new_price // price
)
```

**Parameters**

- `point`
  - [in] Number of a graphical object anchor point.
- `new_price`
  - [in] New value for the price coordinate of the specified graphical object anchor point.

**Return Value**

- `true` - success, `false` - cannot change the price coordinate.

**Example:**

```cpp
//--- example for CChartObject::Price
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    double price;
    //--
    for(int i=0;i<object.NumPoints();i++)
    {
        //--- get price of the chart object point
        double point_price=object.Price(i);
    }
```
if(point_price!=price)
{
    //--- set price for the chart object point
    object.Price(i,price);
}
}
**Color (Get Method)**

Gets the line color of the graphical object.

```cpp
color  Color() const
```

**Return Value**

Line color of the graphical object attached to the class instance. If there is no object attached, it returns CLR_NONE.

**Color (Set Method)**

Sets the line color of the graphical object.

```cpp
bool  Color(
    color  new_color  // new color
)
```

**Parameters**

`new_color`

[in] New value of a graphical object line color.

**Return Value**

true - success, false - cannot change the color.

**Example:**

```cpp
//--- example for CChartObject::Color
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- get color of chart object
    color  object_color=object.Color();
    if(object_color!=clrRed)
    {
        //--- set color of chart object
        object.Color(clrRed);
    }
}
```
Style (Get Method)

Gets the line style of the graphical object.

```cpp
enum ENUM_LINE_STYLE

RETURN_VALUE Style() const;
```

**Return Value**

Line style of the graphical object attached to the class instance. If there is no attached object, it returns **WRONG_VALUE**.

Style (Set Method)

Sets the line style of the graphical object.

```cpp
bool Style(
    ENUM_LINE_STYLE new_style // style
);
```

**Parameters**

`new_style`

[in] New value of the graphical object line style.

**Return Value**

true - success, false - cannot change the style.

**Example:**

```cpp
///--- example for CChartObject::Style
#include <ChartObjects\ChartObject.mqh>
///---
void OnStart()
{
    CChartObject object;
    ///--- get style of chart object
    ENUM_LINE_STYLE style=object.Style();
    if(style!=STYLE_SOLID)
    {
        //--- set style of chart object
        object.Style(STYLE_SOLID);
    }
}
```
**Width (Get Method)**

Gets the line width of the graphical object.

```cpp
int Width() const
```

**Return Value**

The line width of the graphical object attached to an instance of the class. If there is no attached object, it returns -1.

**Width (Set Method)**

Sets the line width of the graphical object.

```cpp
bool Width(int new_width) // thickness
```

**Parameters**

- `new_width`
  - [in] New value of the graphical object line width.

**Return Value**

true - success, false - cannot change the width.

**Example:**

```cpp
//--- example for CChartObject::Width
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- get width of chart object
    int width=object.Width();
    if(width!=1)
    {
        //--- set width of chart object
        object.Width(1);
    }
}
```
Background (Get Method)

Gets the flag for drawing a graphical object on the background.

```cpp
bool Background() const
```

Return Value

Flag for drawing the graphical object, attached to an instance of the class, on the background. If there is no attached object, returns false.

Background (Set Method)

Sets the flag for drawing a graphical object on the background.

```cpp
bool Background( bool background // value of the flag )
```

Parameters

`background`

[in] New value of the flag for drawing a graphical object on the background.

Return Value

true - success, false - cannot change the flag.

Example:

```cpp
//--- example for CChartObject::Background
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- get background flag of chart object
    bool background_flag=object.Background();
    if (!background_flag)
    {
        //--- set background flag of chart object
        object.Background(true);
    }
}
```
**Selected (Get Method)**

Gets the flag indicating that a graphical object is selected. In other words - if the graphical object is selected or not.

```cpp
bool Selected() const
```

**Return Value**

The state that the object, attached to an instance of the class, is selected. If there is no attached object, returns false.

**Selected (Set Method)**

Sets the flag indicating that the graphical object is selected.

```cpp
bool Selected(bool selected) // value of the flag
```

**Parameters**

*selected*

[in] New value of the flag indicating that a graphical object is selected.

**Return Value**

true - success, false - cannot change the flag.

**Example:**

```cpp
//--- example for CChartObject::Selected
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- get the "selected" flag of chart object
    bool selected_flag=object.Selected();
    if(selected_flag)
    {
        //--- set the "selected" flag of chart object
        object.Selected(false);
    }
}
```
Selectable (Get Method)

Gets the flag indicating an ability of a graphical object to be selected. In other words - if the graphical object can be selected or not.

```cpp
bool Selectable() const
```

**Return Value**

Flag indicating the ability of the graphical object, attached to an instance of the class, to be selected. If there is no attached object, returns false.

Selectable (Set Method)

Sets the flag indicating the ability of a graphical object to be selected.

```cpp
bool Selectable(
    bool selectable // value of the flag
)
```

**Parameters**

`selectable`

[in] New value of the flag indicating an ability of a graphical object to be selected.

**Return Value**

true - success, false - cannot change the flag.

**Example:**

```cpp
//--- example for CChartObject::Selectable
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //--- get the "selectable" flag of chart object
    bool selectable_flag=object.Selectable();
    if(selectable_flag)
    {
        //--- set the "selectable" flag of chart object
        object.Selectable(false);
    }
}
```
Description (Get Method)

Gets a description (text) of a graphical object.

```cpp
string Description() const
```

Return Value

Description (text) of the graphical object attached to an instance of the class. If there is no attached object, it returns NULL.

Description (Set Method)

Sets the description (text) of the graphical object.

```cpp
bool Description(string text) // text
```

Parameters

text

[in] New description (text) of a graphical object.

Return Value

true - success, false - cannot change the description (text).

Example:

```cpp
//--- example for CChartObject::Description
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- get description of chart object
    string description=object.Description();
    if(description=="")
    {
        //--- set description of chart object
        object.Description("MyObject");
    }
}
```
Tooltip (Get Method)

Gets the tooltip text of a graphical object.

```cpp
string Tooltip() const
```

**Return Value**

The text of a tooltip of the graphical object attached to an instance of the class. If there is no attached object, it returns NULL.

Tooltip (Set Method)

Sets the text of the tooltip of a graphical object.

```cpp
bool Tooltip(
    string new_tooltip // new text of a tooltip
)
```

**Parameters**

`new_tooltip`

**Return Value**

true - success, false - cannot change the tooltip.

**Note:**

If the property is not set, then the tooltip generated automatically by the terminal is shown. A tooltip can be disabled by setting the \"\n\" (line feed) value.
**Timeframes (Get Method)**

Gets visibility flags of a graphical object.

```cpp
int Timeframes() const
```

**Return Value**

Visibility flags of the graphical object attached to an instance of the class. If there is no attached object, it returns 0.

**Timeframes (Set Method)**

Sets visibility flags of a graphical object.

```cpp
bool Timeframes(
    int new_timeframes // visibility flags
)
```

**Parameters**

`new_timeframes`

[in] New visibility flags of the graphical object.

**Return Value**

true - success, false - cannot change the flags of visibility.

**Example:**

```cpp
//--- example for CChartObject::Timeframes
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- get timeframes of chart object
    int timeframes=object.Timeframes();
    if(!(timeframes&OBJ_PERIOD_H1))
    {
        //--- set timeframes of chart object
        object.Timeframes(timeframes|OBJ_PERIOD_H1);
    }
}
```
**Z_Order (Get Method)**

Gets the graphical object priority for receiving an event of mouse clicking on a chart (CHARTEVENT_CLICK).

```c
long Z_Order() const
```

**Return Value**

Priority of a graphical object, attached to the class instance. If there is no object attached, it returns 0.

**Z_Order (Set Method)**

Sets the graphical object priority for receiving an event of mouse clicking on a chart (CHARTEVENT_CLICK).

```c
bool Z_Order(
    long value // graphical object priority
)
```

**Parameters**

value

[in] New value of priority of a graphical object for receiving the event CHARTEVENT_CLICK.

**Return Value**

true - success, false - cannot change the priority.

**Note**

Z_Order property manages a priority when handling clicks on graphical objects. By setting the value greater than 0 (default value), you can increase the object priority when handling mouse clicks.
CreateTime

Gets the graphical object creation time.

```cpp
datetime CreateTime() const
```

Return Value

Creation time of the graphical object attached to the instance of the class. If there is no attached object, it returns 0.

Example:

```cpp
#include <ChartObjects\ChartObject.mqh>

void OnStart()
{
    CChartObject object;
    //--- get create time of chart object
    datetime create_time=object.CreateTime();
}
```
LevelsCount (Get Method)

Gets the number of levels of a graphical object.

```cpp
int LevelsCount() const
```

Return Value

Number of levels of the graphical object attached to an instance of the class. If there is no attached object, it returns 0.

LevelsCount (Set Method)

Sets the number of levels of the graphical object.

```cpp
bool LevelsCount(
    int levels // number of levels
)
```

Parameters

levels

[in] The new number of levels of the graphical object.

Return Value

true - success, false - cannot change the number of levels.

Example:

```cpp
//--- example for CChartObject::LevelsCount
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- get levels count of chart object
    int levels_count=object.LevelsCount();
    //--- set levels count of chart object
    object.LevelsCount(levels_count+1);
}
```
**LevelColor (Get Method)**

Gets the line color of the specified level of a graphical object.

```cpp
color LevelColor(int level) const
```

**Parameters**

- **level**
  
  [in] Number of graphical object level.

**Return Value**

Line color of the specified level of the graphical object attached to the instance of the class. If there is no attached object or the object does not have the specified level, it returns CLR_NONE.

**LevelColor (Set Method)**

Sets the line color of the specified level of the graphical object.

```cpp
bool LevelColor(int level, color new_color)
```

**Parameters**

- **level**
  
  [in] Number of graphical object level.

- **new_color**
  
  [in] New line color of the specified level of a graphical object.

**Return Value**

- true - success, false - cannot change the color.

**Example:**

```
//--- example for CChartObject::LevelColor
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //---
    for(int i=0;i<object.LevelsCount();i++)
    {
        //--- get level color of chart object
        color level_color=object.LevelColor(i);
        if(level_color!=clrRed)
```

© 2000-2021, MetaQuotes Ltd
```c
{
    //--- set level color of chart object
    object.LevelColor(i, clrRed);
}
```
**LevelStyle (Get Method)**

Gets the line style of the specified level of a graphical object.

```cpp
ENUM_LINE_STYLE LevelStyle(
    int level // level number
) const
```

**Parameters**

- **level**
  - [in] Number of graphical object level.

**Return Value**

- Line style of the specified level of the graphical object attached to an instance of the class. If there is no attached object or the object does not have the specified level, it returns WRONG_VALUE.

**LevelStyle (Set Method)**

Sets the line style of the specified level of the graphic object.

```cpp
int LevelStyle(
    int level, // level number
    ENUM_LINE_STYLE style // line style
)
```

**Parameters**

- **level**
  - [in] Number of graphical object level.

- **style**
  - [in] New line style of the specified level of a graphical object.

**Return Value**

- true - success, false - cannot change the style.

**Example:**

```cpp
//--- example for CChartObject::LevelStyle
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //---
    for(int i=0;i<object.LevelsCount();i++)
    {
        //--- get level style of chart object
        ENUM_LINE_STYLE level_style=object.LevelStyle(i);
        if(level_style!=STYLE_SOLID)
```
{  
    //--- set level style of chart object
    object.LevelStyle(i, STYLE_SOLID);
    
    }
}
LevelWidth (Get Method)

Gets the line width of the specified level of a graphical object.

```cpp
int LevelWidth(
    int level // level number
) const
```

**Parameters**

- `level`
  - [in] Number of graphical object level.

**Return Value**

Line width of the specified level of the graphical object attached to the instance of the class. If there is no attached object or the object does not have the specified level, it returns -1.

LevelWidth (Set Method)

Sets the line width of the specified level of the graphical object.

```cpp
bool LevelWidth(
    int level, // level number
    int new_width // new width
)
```

**Parameters**

- `level`
  - [in] Number of graphical object level.
- `new_width`
  - [in] New line width of the specified level of a graphical object.

**Return Value**

- `true` - success, `false` - cannot change the width.

**Example:**

```cpp
//--- example for CChartObject::LevelWidth
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--
    for(int i=0;i<object.LevelsCount();i++)
    {
        //--- get level width of chart object
        int level_width=object.LevelWidth(i);
        if(level_width!=1)
```
{  //--- set level width of chart object  
  object.LevelWidth(i, 1);  
}
**LevelValue (Get Method)**

Gets the value of the specified level of a graphical object.

```cpp
double LevelValue(const int level) // level number
```

**Parameters**

- **level**
  - [in] Number of a graphical object level.

**Return Value**

The value of the specified level of a graphical object that is bound to an instance of the class. If there is no bound object or the object has no level specified, returns `EMPTY_VALUE`.

---

**LevelValue (Set Method)**

Sets the value of the specified level of the graphical object.

```cpp
bool LevelValue(int level, double new_value) // level number, new value
```

**Parameters**

- **level**
  - [in] Number of a graphical object level.
- **new_value**
  - [in] New value of the specified level of a graphical object.

**Return Value**

`true` - successful, `false` - cannot change the value.

---

**Example:**

```cpp
//--- example for CChartObject::LevelValue
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //---
    for(int i=0;i<object.LevelsCount();i++)
    {
        //--- get level value of chart object
        double level_value=object.LevelValue(i);
        if(level_value!=0.1*i)
```
```plaintext
{
    //--- set level value of chart object
    object.LevelValue(i, 0.1*i);
}
```
**LevelDescription (Get Method)**

Gets a description (text) of the level of a graphical object.

```cpp
string LevelDescription(
    int level       // level number
) const
```

**Parameters**

- **level**
  - [in] Number of a graphical object level.

**Return Value**

Description (text) of the specified level of a graphical object that is bound to an instance of the class. Returns NULL if there is no bound object or the object has no specified level.

**LevelDescription (Set Method)**

Sets the description (text) of the specified graphical object level.

```cpp
bool LevelDescription(
    int level,     // level number
    string text     // text
)
```

**Parameters**

- **level**
  - [in] Number of a graphical object level.
- **text**
  - [in] New value of description (text) of the specified graphical object level.

**Return Value**

- **true** - success, **false** - cannot change the description (text).

**Example:**

```cpp
//--- example for CChartObject::LevelDescription
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--
    for(int i=0;i<object.LevelsCount();i++)
    {
        //-- get level description of chart object
        string level_description=object.LevelDescription(i);
        if(level_description=="")
```

© 2000-2021, MetaQuotes Ltd
{  
   //--- set level description of chart object
   object.LevelDescription(i,"Level_"+IntegerToString(i));
}
}
GetInteger

Provides simplified access to the functions of API MQL5 `ObjectGetInteger()` to receive values of integer properties (of bool, char, uchar, short, ushort, int, uint, long, ulong, datetime, color types) of a graphical object bound to a class instance. There are two versions of the function call:

Getting a property value without checking the correctness

```cpp
long GetInteger(
    ENUM_OBJECT_PROPERTY_INTEGER prop_id,  // integer property ID
    int modifier=-1  // modifier
) const
```

**Parameters**

- `prop_id`  
  [in] ID of the graphical object double property.

- `modifier=-1`  
  [in] Modifier (index) of a double property.

**Return Value**

Value of an integer property - success, 0 - cannot receive an integer property.

Getting a property value verifying the correctness of the operation

```cpp
bool GetInteger(
    ENUM_OBJECT_PROPERTY_INTEGER prop_id,  // integer property ID
    int modifier,  // modifier
    long& value    // link to a variable
) const
```

**Parameters**

- `prop_id`  
  [in] ID of a graphical object integer property.

- `modifier`  
  [in] Modifier (index) of an integer property.

- `value`  
  [out] Link to a variable to place an integer property value.

**Return Value**

true - success, false - cannot get an integer property.

**Example:**

```cpp
//--- example for CChartObject::GetInteger
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
```
```c
{
    CChartObject object;
    //--- get color of chart object by easy method
    printf("Objects color is %s", ColorToString(object.GetInteger(OBJPROP_COLOR), true));
    //--- get color of chart object by classic method
    long color_value;
    if (!object.GetInteger(OBJPROP_COLOR, 0, color_value))
    {
        printf("Get integer property error %d", GetLastError());
        return;
    }
    else
    {
        printf("Objects color is %s", color_value);
    }
    for (int i = 0; i < object.LevelsCount(); i++)
    {
        //--- get levels width by easy method
        printf("Level %d width is %d", i, object.GetInteger(OBJPROP_LEVELWIDTH, i));
        //--- get levels width by classic method
        long width_value;
        if (!object.GetInteger(OBJPROP_LEVELWIDTH, i, width_value))
        {
            printf("Get integer property error %d", GetLastError());
            return;
        }
        else
        {
            printf("Level %d width is %d", i, width_value);
        }
    }
}
SetInteger

Provides simplified access to the functions of API MQL5 ObjectSetInteger() to change integer properties (of type bool, char, uchar, short, ushort, int, uint, long, ulong, datetime, color types) of a graphical object bound to class instance. There are two versions of the function call:

**Setting a property value that does not require a modifier**

```cpp
bool SetInteger(
    ENUM_OBJECT_PROPERTY_INTEGER prop_id, // integer property ID
    long value // value
)
```

**Parameters**

**Setting a property value indicating the modifier**

```cpp
bool SetInteger(
    ENUM_OBJECT_PROPERTY_INTEGER prop_id, // integer property ID
    int modifier, // modifier
    long value // value
)
```

**Parameters**

- `modifier`: [in] Modifier (index) of an integer property.

**Return Value**

- `true` - success, `false` - cannot change the integer property.

**Example:**

```cpp
#include <ChartObjects\ChartObject.mqh>

void OnStart()
{
    //--- set new color of chart object
}```
if(!object.SetInteger(OBJPROP_COLOR, clrRed))
{
    printf("Set integer property error %d", GetLastError());
    return;
}
for(int i=0;i<object.LevelsCount();i++)
{
    //--- set levels width
    if(!object.SetInteger(OBJPROP_LEVELWIDTH,i,i))
    {
        printf("Set integer property error %d", GetLastError());
        return;
    }
}
GetDouble

Provides simplified access to the functions of API MQL5 ObjectGetDouble() to receive double values (of float and double types) of a graphical object bound to a class instance. There are two versions of the function call:

Getting a property value without checking the correctness

```cpp
double GetDouble(
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id, // integer property ID
    int modifier=-1 // modifier
) const
```

**Parameters**

- `prop_id`
  - [in] ID of the graphical object double property.
- `modifier`
  - [in] Modifier (index) of a double property.

**Return Value**

Value of a double property - success, **EMPTY_VALUE** - cannot receive a double property.

Getting a property value in verifying the correctness of such treatment

```cpp
bool GetDouble(
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id, // double property ID
    int modifier, // modifier
    double& value // link to a variable
) const
```

**Parameters**

- `prop_id`
  - [in] ID of a graphical object double property.
- `modifier`
  - [in] Modifier (index) of a double property.
- `value`
  - [out] Link to a variable to place a double property value.

**Return Value**

true - success, false - cannot get a double property.

**Example:**

```cpp```
```cpp
//--- example for CChartObject::GetDouble
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
```
```cpp```
```cpp
{  
    CChartObject object;  
    //---  
    for(int i=0;i<object.LevelsCount();i++)  
    {  
        //--- get levels value by easy method  
        printf("Level %d value=%f",i,object.GetDouble(OBJPROP_LEVELVALUE,i));  
        //--- get levels value by classic method  
        double value;  
        if(!object.SetDouble(OBJPROP_LEVELVALUE,i,value))  
        {  
            printf("Get double property error %d",GetLastError());  
            return;  
        }  
        else  
            printf("Level %d value=%f",i,value);  
    }  
}
```
SetDouble

Provides simplified access to the functions of API MQL5 ObjectSetDouble() to change double properties (of float and double types) of a graphical object bound to a class instance. There are two versions of a function call:

Setting a property value that does not require a modifier

```cpp
bool SetDouble(
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id,  // double property ID
    double value                           // value
)
```

Parameters

- `value` [in] New value of a changed double property.

Setting a property value indicating the modifier

```cpp
bool SetDouble(
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id,  // double property ID
    int modifier,                          // modifier
    double value                           // value
)
```

Parameters

- `modifier` [in] Modifier (index) of a double property.
- `value` [in] New value of a changed double property.

Return Value

- true - success, false - cannot change the double feature.

Example:

```cpp
//--- example for CChartObject::SetDouble
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    CChartObject object;
    //---
```
for(int i=0;i<object.LevelsCount();i++)
{
    //--- set level value of chart object
    if(!object.SetDouble(OBJPROP_LEVELVALUE, i, 0.1*i))
    {
        printf("Set double property error %d", GetLastError());
        return;
    }
}
**GetString**

Provides simplified access to the functions of API MQL5 `ObjectGetString()` for string property values of a graphical object bound to a class instance. There are two versions of a function call:

### Getting a property value without checking the correctness

```c
string GetString(
    ENUM_OBJECT_PROPERTY_STRING prop_id,       // string property ID
    int modifier=-1                               // modifier
) const
```

**Parameters**

- `prop_id` ([in]) ID of graphical object string property.
- `modifier` ([in]) Modifier (index) of a string property.

**Return Value**

- Value of a string property - success, "" - cannot receive a string property.

### Getting a property value verifying the correctness of such treatment

```c
bool GetString(
    ENUM_OBJECT_PROPERTY_STRING prop_id,       // string property ID
    int modifier,                               // modifier
    string& value                               // link to a variable
) const
```

**Parameters**

- `prop_id` ([in]) ID of graphical object string property.
- `modifier` ([in]) Modifier (index) of a string property.
- `value` ([out]) Link to a variable to place a string property value.

**Return Value**

- `true` - successful, `false` - cannot get a string property.

**Example:**

```c
//--- example for CChartObject::GetString
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
```

© 2000-2021, MetaQuotes Ltd
CChartObject object;
string value;

//--- get name of chart object by easy method
printf("Object name is '%s'",object.GetString(OBJPROP_NAME));

//--- get name of chart object by classic method
if(!object.GetString(OBJPROP_NAME,0,value))
{
    printf("Get string property error %d",GetLastError());
    return;
}
else
    printf("Object name is '%s'",value);

for(int i=0;i<object.LevelsCount();i++)
{
    //--- get levels description by easy method
    printf("Level %d description is '%s'",i,object.GetString(OBJPROP_LEVELTEXT,i));
    //--- get levels description by classic method
    if(!object.GetString(OBJPROP_LEVELTEXT,i,value))
    {
        printf("Get string property error %d",GetLastError());
        return;
    }
    else
        printf("Level %d description is '%s'",i,value);
}
}
**SetString**

Provides simplified access to the functions of API MQL5 `ObjectSetString()` for changing string properties of a graphical object bound to a class instance. There are two versions of a function call:

### Setting a property value that does not require a modifier

```cpp
bool SetString(
    ENUM_OBJECT_PROPERTY_STRING prop_id, // string property ID
    string value                       // value
)
```

**Parameters**

- `prop_id`  
  - [in] ID of a graphical object string property.
- `value`  
  - [in] New value of a changed string property.

### Setting a property value indicating the modifier

```cpp
bool SetString(
    ENUM_OBJECT_PROPERTY_STRING prop_id, // string property ID
    int modifier,  // modifier
    string value   // value
)
```

**Parameters**

- `prop_id`  
  - [in] ID of a graphical object string property.
- `modifier`  
  - [in] Modifier (index) of a string property.
- `value`  
  - [in] New value of a changed string property.

**Return Value**

- true - success, false - cannot change a string property.

**Example:**

```cpp
//--- example for CChartObject::SetString
#include <ChartObjects\ChartObject.mqh>
//--
void OnStart()
{
    CChartObject object;
    //--- set new name of chart object
    if(!object.SetString(OBJPROP_NAME,"MyObject"))
```
{  
    printf("Set string property error %d", GetLastError());  
    return;  
}

for(int i=0;i<object.LevelsCount();i++)  
{  
    //--- set levels description  
    if(!object.SetString(OBJPROP_LEVELTEXT,i,"Level_"+IntegerToString(i)))  
    {  
        printf("Set string property error %d", GetLastError());  
        return;  
    }  
}  

**Save**

Saves parameters of the object in the file.

```cpp
virtual bool Save(
    int  file_handle  // file handle
)
```

**Parameters**

- **file_handle**
  - [in] Handle of the file previously opened using the function `FileOpen(...)`.  

**Return Value**

- true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CChartObject::Save
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    int file_handle;
    CChartObject object=new CChartObject;
    //--- set object parameters
    //--- . . .
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!object.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
}
```
Load

Loads the parameters of the object from the file.

```cpp
virtual bool Load(
    int file_handle  // file handle
);
```

Parameters

- **file_handle**
  - [in] handle of the file previously opened using the function FileOpen (...).

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CChartObject::Load
#include <ChartObjects\ChartObject.mqh>
//---
void OnStart()
{
    int file_handle;
    CChartObject object;
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!object.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use object
    //--- . . .
}
```
Type

Gets the graphical object type ID.

```cpp
virtual int Type() const
```

Return Value

Object type ID (0x8888 for `CChartObject`).

Example:

```cpp
#include <ChartObjects\ChartObject.mqh>

void OnStart()
{
    CChartObject object;
    //--- get object type
    int type=object.Type();
}
```
**Line Objects**

A group of "Lines" graphical objects.

This section contains the technical details of working with a group of classes of "Lines" graphical objects and a description of the relevant components of the MQL5 Standard Library.

CChartObjectVLine

CChartObjectVLine is a class for simplified access to "Vertical Line" graphical object properties.

Description

CChartObjectVLine class provides access to "Vertical Line" object properties.

Declaration

```cpp
class CChartObjectVLine : public CChartObject
```

Title

```cpp
#include <ChartObjects\ChartObjectsLines.mqh>
```

Inheritance hierarchy

- **CObject**
  - **CChartObject**

Create

Creates “Vertical Line” graphical object.

```c
bool Create(
    long  chart_id,   // chart identifier
    string name,     // object name
    int   window,     // chart window
    datetime time     // time coordinate
)
```

**Parameters**

- `chart_id`  
  [in] Chart identifier (0 - current chart).

- `name`  
  [in] A unique name of the object to create.

- `window`  
  [in] Chart window number (0 - main window).

- `time`  
  [in] Time coordinate of the anchor point.

**Return Value**

- true - successful, false - error.
**Type**

Returns graphical object type identifier.

```
int Type() const
```

**Return Value**

Object type identifier (OBJ_LINE for `CChartObject::VLine`).
CChartObjectHLine

CChartObjectHLine is a class for simplified access to "Horizontal Line" graphical object properties.

Description

CChartObjectHLine class provides access to "Horizontal Line" object properties.

Declaration

```cpp
class CChartObjectHLine : public CChartObject
```

Title

```cpp
#include <ChartObjects\ChartObjectsLines.mqh>
```

Inheritance hierarchy

- CObject
  - CChartObject

Create

Creates "Horizontal Line" graphical object.

```c
bool Create(
    long   chart_id,  // chart identifier
    string name,    // object name
    long   window,   // chart window
    double price    // price coordinate
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **price**
  - [in] Price coordinate of the anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```
int Type() const
```

Return Value

Object type identifier (OBJ_HLINE for CChartObjectHLine).
**CChartObjectTrend**

CChartObjectTrend is a class for simplified access to "Trend Line" graphical object properties.

**Description**

CChartObjectTrend class provides access to "Trend Line" object properties.

**Declaration**

```cpp
class CChartObjectTrend : public CChartObject
```

**Title**

```
#include <ChartObjects\ChartObjects\Lines.mqh>

Create

Creates "Trend Line" graphical object.

```cpp
bool Create(
    long chart_id,  // chart identifier
    string name,    // object name
    int window,     // chart window
    datetime time1, // 1st time coordinate
    double price1,  // 1st price coordinate
    datetime time2, // 2nd time coordinate
    double price2   // 2nd price coordinate
)
```

Parameters

- `chart_id`
  
  [in] Chart identifier (0 - current chart).

- `name`
  
  [in] A unique name of the object to create.

- `window`
  
  [in] Chart window number (0 - main window).

- `time1`
  
  [in] Time coordinate of the first anchor point.

- `price1`
  
  [in] Price coordinate of the first anchor point.

- `time2`
  
  [in] Time coordinate of the second anchor point.

- `price2`
  
  [in] Price coordinate of the second anchor point.

Return Value

- `true` - successful, `false` - error.
RayLeft (Get Method)

Gets the value of “Ray Left” property.

```cpp
bool RayLeft() const
```

Return Value

The value of “Ray Left” property assigned to the class instance. If there is no object assigned, it returns false.

RayLeft (Set Method)

Sets new flag value for the “Ray Left” property.

```cpp
bool RayLeft(
    bool ray    // flag
)
```

Parameters

`ray`

Return Value

true - successful, false - cannot change flag.
RayRight (Get Method)

Gets the value of “Ray Right” property.

```cpp
bool RayRight() const
```

Return Value

The value of “Ray Right” property, assigned to the class instance. If there is no object assigned, it returns false.

RayRight (Set Method)

Sets new flag value for the “Ray Right” property.

```cpp
bool RayRight(
    bool ray // flag
)
```

Parameters

- `ray`

Return Value

- true - successful, false - cannot change flag.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle    // file handle
)
```

**Parameters**

- `file_handle`
  
  [in] handle of a file opened previously using the `FileOpen(...)` function.

**Return Value**

- true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`
  
  [in] handle of file opened previously using the `FileOpen(...)` function.

**Return Value**

- `true` - successful, `false` - error.
### Type

Returns graphical object type identifier.

```c
int Type() const
```

**Return Value**

Object type identifier (OBJ_TREND for `CChartObjectTrend`).
CChartObjectTrendByAngle

CChartObjectTrendByAngle is a class for simplified access to "Trend Line by Angle" graphical object properties.

Description

CChartObjectTrendByAngle class provides access to "Trend Line by Angle" object properties.

Declaration

```cpp
class CChartObjectTrendByAngle : public CChartObjectTrend
```

Title

```cpp
#include <ChartObjects\ChartObjectsLines.mqh>
```

Inheritance hierarchy

```
CObject
    CChartObject
        CChartObjectTrend
            CChartObjectTrendByAngle
```

Direct descendants

```
CChartObjectGannLine

Create

Creates "Trend Line by Angle" graphical object.

```cpp
bool Create(
    long  chart_id,  // chart identifier
    string name,     // object name
    long  window,    // chart window
    datetime time1,  // 1st time coordinate
    double price1,   // 1st price coordinate
    datetime time2,  // 2nd time coordinate
    double price2    // 2nd price coordinate
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **time1**
  - [in] Time coordinate of the first anchor point.

- **price1**
  - [in] Price coordinate of the first anchor point.

- **time2**
  - [in] Time coordinate of the second anchor point.

- **price2**
  - [in] Price coordinate of the second anchor point.

Return Value

- true - successful, false - error.
**Angle (Get Method)**

Gets the value of "Angle" property.

```cpp
double Angle() const
```

Return Value

The value of "Angle" property assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

**Angle (Set Method)**

Sets new value for the "Angle" property.

```cpp
bool Angle(
    double angle // angle
)
```

Parameters

- `angle`

Return Value

- true - successful, false - cannot change the property.
Type

Returns graphical object type identifier.

```c
int Type() const
```

Return Value

Object type identifier (OBJ_TRENDBYANGLE for `CChartObjectTrendByAngle`).
CChartObjectCycles

CChartObjectCycles is a class for simplified access to "Cyclic Lines" graphical object properties.

Description

CChartObjectCycles provides access to "Cyclic Lines" object properties.

Declaration

```cpp
class CChartObjectCycles : public CChartObject
```

Title

```cpp
#include <ChartObjects\ChartObjectsLines.mqh>
```

Inheritance hierarchy

- **CObject**
  - **CChartObject**
    - CChartObjectCycles

Create

Creates "Cyclic Lines" graphical object.

```cpp
bool Create(
    long chart_id,    // chart identifier
    string name,     // object name
    long window,     // chart window
    datetime time1,  // 1st time coordinate
    double price1,   // 1st price coordinate
    datetime time2,  // 2nd time coordinate
    double price2    // 2nd price coordinate
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **time1**
  - [in] Time coordinate of the first anchor point.

- **price1**
  - [in] Price coordinate of the first anchor point.

- **time2**
  - [in] Time coordinate of the second anchor point.

- **price2**
  - [in] Price coordinate of the second anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```c
int Type() const
```

Return Value

Object type identifier (OBJ_CYCLES for `ChartObjectCycles`).

    double price2, // price coordinate of the second anchor point
    datetime time3, // time coordinate of the third anchor point
    double price3 // price coordinate of the third anchor point
)
```

Parameters

- `chart_id`
  - [in] Chart ID (0 - current chart).
- `name`
  - [in] A unique name of the object to create.
- `window`
  - [in] Chart window number (0 - main window).
- `time1`
  - [in] Time coordinate of the first anchor point.
- `price1`
  - [in] Price coordinate of the first anchor point.
- `time2`
  - [in] Time coordinate of the second anchor point.
- `price2`
  - [in] Price coordinate of the second anchor point.
- `time3`
  - [in] Time coordinate of the third anchor point.
- `price3`
  - [in] Price coordinate of the third anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```
int Type() const
```

Return Value

Object type identifier (OBJ_CHANNEL for ChartObjectChannel).
CChartObjectRegression

CChartObjectRegression is a class for simplified access to "Linear Regression Channel" graphical object properties.

Description

CChartObjectRegression class provides access to "Linear Regression Channel" object properties.

Declaration

```cpp
class CChartObjectRegression : public CChartObjectTrend
```

Title

```cpp
#include <ChartObjects\ChartObjectsChannels.mqh>
```

Inheritance hierarchy

Parameters

- `chart_id` [in] Chart identifier (0 - current chart).
- `name` [in] A unique name of the object to create.
- `window` [in] Chart window number (0 - main window).
- `time1` [in] Time coordinate of the first anchor point.
- `time2` [in] Time coordinate of the second anchor point.

Return Value

true - successful, false - error.
Type

Returns graphical object type identifier.

```c
int Type() const
```

Return Value

Object type identifier (OBJ_REGRESSION for `CChartObjectRegression`).
CChartObjectStdDevChannel

CChartObjectStdDevChannel is a class for simplified access to "Standard Deviation Channel" graphical object properties.

Description

CChartObjectStdDevChannel class provides access to "Standard Deviation Channel" object properties.

Declaration

```cpp
class CChartObjectStdDevChannel : public CChartObjectTrend
```

Title

Create

Creates "Standard Deviation Channel" graphical object.

```c
bool Create(
  long chart_id, // chart identifier
  string name,  // object name
  int window,   // chart window
  datetime tim1, // first time coordinate
  datetime tim2, // second time coordinate
  double deviation // deviation
)
```

**Parameters**

- `chart_id`
  - [in] Chart identifier (0 - current chart).
- `name`
  - [in] A unique name of the object to create.
- `window`
  - [in] Chart window number (0 - main window).
- `tim1`
  - [in] Time coordinate of the first anchor point.
- `tim2`
  - [in] Time coordinate of the second anchor point.
- `deviation`
  - [in] Numerical value for "Deviation" property.

**Return Value**

- true - successful, false - error.
Deviation (Get Method)

Gets "Deviation" property value.

```cpp
double Deviation() const
```

**Return Value**

Value of "Deviation" property assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

Deviation (Set Method)

Sets "Deviation" property value.

```cpp
bool Deviation(
    double deviation // deviation
)
```

**Parameters**

`deviation`

[in] New value for "Deviation" property.

**Return Value**

true - successful, false - cannot change the property.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- `file_handle`  
  [in] handle of file opened previously using the FileOpen(...) function.

Return Value

- true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

Parameters

- `file_handle`  
  [in] handle of file opened previously using the FileOpen(...) function.

Return Value

- true - successful, false - error.
**Type**

Returns graphical object type identifier.

```c
int Type() const
```

**Return Value**

Object type identifier (OBJ_STDDEVCHANNEL for `ChartObjectStdDevChannel`).
CChartObjectPitchfork

CChartObjectPitchfork is a class for simplified access to "Andrew's Pitchfork" graphical object properties.

Description

CChartObjectPitchfork class provides access to "Andrew's Pitchfork" object properties.

Declaration

```cpp
#include <ChartObjects\ChartObjectsChannels.mqh>
```

Inheritance hierarchy

**CObject**
- **CChartObject**
  - **CChartObjectTrend**
    - **CChartObjectPitchfork**

Object types, Graphic objects
Create

Creates “Andrew's Pitchfork” graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name,  // object name
    long window,  // chart window
    datetime time1, // time coordinate of the first anchor point
    double price1, // price coordinate of the first anchor point
    datetime time2, // time coordinate of the second anchor point
    double price2, // price coordinate of the second anchor point
    datetime time3, // time coordinate of the third anchor point
    double price3 // price coordinate of the third anchor point
)
```

Parameters

- `chart_id`
  - [in] Chart identifier (0 - current chart).
- `name`
  - [in] Unique name of the object to create.
- `window`
  - [in] Chart window number (0 - main window).
- `time1`
  - [in] Time coordinate of the first anchor point.
- `price1`
  - [in] Price coordinate of the first anchor point.
- `time2`
  - [in] Time coordinate of the second anchor point.
- `price2`
  - [in] Price coordinate of the second anchor point.
- `time3`
  - [in] Time coordinate of the third anchor point.
- `price3`
  - [in] Price coordinate of the third anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```
int Type() const
```

Return Value

Object type identifier (OBJ_PITCHFORK for ChartObjectPitchfork).
Gann Tools

A group “Gann Tools” graphical objects.

This section contains the technical details of working with a group of classes of “Gann Tools” graphical objects and the description of the relevant components of the MQL5 Standard Library.

Object types, Graphic objects
Create

Creates “Gann Line” graphical object.

```cpp
bool Create(
    long chart_id,  // chart identifier
    string name,   // object name
    int window,    // chart window
    datetime timel, // first time coordinate
    double price1, // first price coordinate
    datetime time2, // second time coordinate
    double ppb // pips per bar
)
```

Parameters

- `chart_id`  
  [in] Chart identifier (0 - current chart).

- `name`  
  [in] A unique name of the object to create.

- `window`  
  [in] Chart window number (0 - main window).

- `timel`  
  [in] Time coordinate of the first anchor point.

- `price1`  
  [in] Price coordinate of the first anchor point.

- `time2`  
  [in] Time coordinate of the second anchor point.

- `ppb`  
  [in] Pips per bar.

Return Value

- true - successful, false - error.
PipsPerBar (Get Method)

Gets the value of “Pips per bar” property.

```cpp
double PipsPerBar() const
```

Return Value

Value of “Pips per bar” property of the object assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

PipsPerBar (Set Method)

Sets new value for “Pips per bar” property.

```cpp
bool PipsPerBar double ppb // pips per bar
```

Parameters

- `ppb`
  - `[in]` New value for “Pips per bar” property.

Return Value

- `true` - successful, `false` - cannot change the property.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- `file_handle`
  - [in] handle of the binary file already opened using the `FileOpen(...)` function

Return Value

- true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

Parameters

- `file_handle`  
  [in] handle of the binary file already opened using the FileOpen(...) function

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Object type identifier (OBJ_GANNLINE for CChartObjectGannLine).
CChartObjectGannFan

CChartObjectGannFan is a class for simplified access to “Gann Fan” graphical object properties.

Description

CChartObjectGannFan class provides access to “Gann Fan” object properties.

Declaration

```cpp
class CChartObjectGannFan : public CChartObjectTrend
```

Title

```
#include <ChartObjects\ChartObjectsGann.mqh>
```

Inheritance hierarchy

Create

Creates “Gann Fan” graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name,   // object name
    int window,    // chart window
    datetime time1, // first time coordinate
    double price1, // first price coordinate
    datetime time2, // second time coordinate
    double ppb     // pips per bar
)
```

Parameters

- `chart_id` [in] Chart identifier (0 - current chart).
- `name` [in] A unique name of the object to create.
- `window` [in] Chart window number (0 - base window).
- `time1` [in] Time coordinate of the first anchor point.
- `price1` [in] Price coordinate of the first anchor point.
- `time2` [in] Time coordinate of the second anchor point.
- `ppb` [in] Pips per bar.

Return Value

- `true` - successful, `false` - error.
PipsPerBar (Get Method)

Gets the value of “Pips per bar” property.

```cpp
double PipsPerBar() const
```

Return Value

Value of “Pips per bar” property of the object assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

PipsPerBar (Set Method)

Sets new value for “Pips per bar” property.

```cpp
bool PipsPerBar(
    double ppb // pips per bar
)
```

Parameters

`ppb`

[in] New value for “Pips per bar” property.

Return Value

true - successful, false - cannot change the property.
Downtrend (Get Method)

Gets the value of "Downtrend" flag.

```cpp
bool Downtrend() const
```

Return Value

Value of the "Downtrend" flag of the object assigned to the class instance. If there is no object assigned, it returns false.

Downtrend (Set Method)

Sets new value of "Downtrend" property.

```cpp
bool Downtrend(
    bool downtrend  // flag value
)
```

Parameters

downtrend

Return Value

true - successful, false - cannot change the flag.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`
  - [in] handle of the binary file already opened using the FileOpen(...) function.

**Return Value**

- true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`
  
  [in] handle of the binary file already opened using the FileOpen(...) function.

**Return Value**

- true - successful, false - error.
Type

Returns graphical object type identifier.

```
virtual int Type() const
```

Return Value

Object type identifier (OBJ_GANNFAN for `CChartObjectGannFan`).
CChartObjectGannGrid

CChartObjectGannGrid is a class for simplified access to "Gann Grid" graphical object properties.

Description

CChartObjectGannGrid class provides access to "Gann Grid" object properties.

Declaration

```cpp
class CChartObjectGannGrid : public CChartObjectTrend
```

Title

```cpp
#include <ChartObjects\ChartObjectsGann.mqh>
```

Inheritance hierarchy

- CObject
  - CChartObject
    - CChartObjectTrend
      - CChartObjectTrend
        - CChartObjectGannGrid

Object types, Graphic objects
## Create

Creates “Gann Grid” graphical object.

```c
bool Create(
    long chart_id, // chart identifier
    string name,   // object name
    int window,    // chart window
    datetime timel, // first time coordinate
    double price1, // first price coordinate
    datetime time2, // second time coordinate
    double ppb     // pips per bar
)
```

### Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **timel**
  - [in] Time coordinate of the first anchor point.

- **price1**
  - [in] Price coordinate of the first anchor point.

- **time2**
  - [in] Time coordinate of the second anchor point.

- **ppb**
  - [in] Pips per bar.

### Return Value

- true - successful, false - error.
PipsPerBar (Get Method)

Gets the value of “Pips per bar” property.

```cpp
double PipsPerBar() const
```

Return Value

Value of “Pips per bar” property of the object assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

PipsPerBar (Set Method)

Sets new value for “Pips per bar” property.

```cpp
bool PipsPerBar(
    double ppb // Pips per bar
)
```

Parameters

ppb

[in] New value for “Pips per bar” property.

Return Value

true - successful, false - cannot change the property.
Downtrend (Get Method)

Gets the value of "Downtrend" property.

```cpp
bool Downtrend() const
```

Return Value

Value of "Downtrend" property of the object assigned to the class instance. If there is no object assigned, it returns false.

Downtrend (Set Method)

Sets new value of "Downtrend" property.

```cpp
bool Downtrend(
    bool downtrend // flag value
);
```

Parameters

downtrend

Return Value

true - successful, false - cannot change the property.
Save

Saves object parameters to file.

```c++
virtual bool Save(
    int file_handle  // file handle
)
```

**Parameters**

- `file_handle`
  
  [in] handle of the binary file already opened using the FileOpen(...) function.

**Return Value**

- `true` - successful, `false` - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

**Parameters**

- `file_handle`
  - [in] handle of the binary file already opened using the FileOpen(...) function.

**Return Value**

- true - successful, false - error.
**Type**

Returns graphic object type identifier.

```
virtual int Type() const
```

**Return Value**

Object type identifier (OBJ_GANNGRID for CChartObjectGannGrid).
Fibonacci Tools

A group of “Fibonacci Tools” graphical objects.

Create

Creates “Fibonacci Retracement” graphical object.

```c
bool Create(
    long chart_id, // chart identifier
    string name, // object name
    int window, // chart window
    datetime time1, // first time coordinate
    double price1, // first price coordinate
    datetime time2, // second time coordinate
    double price2 // second price coordinate
)
```

Parameters

- `chart_id` [in] Chart identifier (0 - current chart).
- `name` [in] A unique name of the object to create.
- `window` [in] Chart window number (0 - main window).
- `time1` [in] Time coordinate of the first anchor point.
- `price1` [in] Price coordinate of the first anchor point.
- `time2` [in] Time coordinate of the second anchor point.
- `price2` [in] Price coordinate of the second anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_FIBO for CChartObjectFibo).
CChartObjectFiboTimes

CChartObjectFiboTimes is a class for simplified access to "Fibonacci Time Zones" graphical object properties.

Description

CChartObjectFiboTimes class provides access to "Fibonacci Time Zones" object properties.

Declaration

```cpp
class CChartObjectFiboTimes : public CChartObject
```

Title

```cpp
#include <ChartObjs\ChartObjsFibo.mqh>
```

Inheritance hierarchy

- CObject
- CChartObject
- CChartObjectFiboTimes

Create

Creates “Fibonacci Fan” graphical object.

```c
bool Create(
    long  chart_id,  // chart identifier
    string name,     // object name
    int  window,     // chart window
    datetime  time1, // first time coordinate
    double  price1,  // first price coordinate
    datetime  time2, // second time coordinate
    double  price2   // second price coordinate
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **time1**
  - [in] Time coordinate of the first anchor point.

- **price1**
  - [in] Price coordinate of the first anchor point.

- **time2**
  - [in] Time coordinate of the second anchor point.

- **price2**
  - [in] Price coordinate of the second anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_FIBOFAN for CChartObjectFibFan).
**CChartObjectFiboArc**

CChartObjectFiboArc is a class for simplified access to "Fibonacci Arc" graphical object properties.

**Description**

CChartObjectFiboArc class provides access to "Fibonacci Arc" object properties.

**Declaration**

```cpp
class CChartObjectFiboArc : public CChartObject
```

**Title**

```cpp
#include <ChartObjects\ChartObjectsFibo.mqh>
```

**Inheritance hierarchy**

- `CObject`
  - `CChartObject`
    - `CChartObjectFiboArc`

Object types, Graphic objects
Create

Creates "Fibonacci Arc" graphical object.

```cpp
bool Create(
    long chart_id,       // chart identifier
    string name,         // object name
    int window,          // chart window
    datetime time1,      // first time coordinate
    double price1,       // first price coordinate
    datetime time2,      // second time coordinate
    double price2,       // second price coordinate
    double scale         // scale
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **time1**
  - [in] Time coordinate of the first anchor point.

- **price1**
  - [in] Price coordinate of the first anchor point.

- **time2**
  - [in] Time coordinate of the second anchor point.

- **price2**
  - [in] Price coordinate of the second anchor point.

- **scale**
  - [in] Scale.

Return Value

- true - successful, false - error.
**Scale (Get Method)**

Gets the value of “Scale” property.

```cpp
double Scale() const
```

**Return Value**

Value of “Scale” property of the object assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

**Scale (Set Method)**

Sets new value for “Scale” property.

```cpp
bool Scale(
    double scale  // scale
)
```

**Parameters**

scale

[in] New value for “Scale” property.

**Return Value**

true - successful, false - cannot change the property.
**Ellipse (Get Method)**

Gets the value of “Ellipse” flag.

```cpp
bool Ellipse() const
```

**Return Value**

Value of “Ellipse” flag of the object assigned to the class instance. If there is no object assigned, it returns false.

**Ellipse (Set Method)**

Sets “Ellipse” flag value.

```cpp
bool Ellipse(
    bool ellipse // flag value
)
```

**Parameters**

- `ellipse`
  

**Return Value**

true - successful, false - cannot change the property.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle  // file handle
);
```

Parameters

- `file_handle`
  - [in] handle of the binary file already opened using the FileOpen(...) function.

Return Value

- `true` - successful, `false` - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(int file_handle) // file handle
```

Parameters

- `file_handle`  
  [in] handle of the binary file already opened using the FileOpen(...) function.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```
virtual int Type() const  
```

Return Value

Object type identifier (OBJ_FIBOARC for CChartObjectFiboArc).
CChartObjectFiboChannel

CChartObjectFiboChannel is a class for simplified access to "Fibonacci Channel" graphical object properties.

Description

CChartObjectFiboChannel class provides access to "Fibonacci Channel" object properties.

Declaration

class CChartObjectFiboChannel : public CChartObjectTrend

    datetime time2, // second time coordinate
    double price2, // second price coordinate
    datetime time3, // third time coordinate
    double price3 // third price coordinate
)
```

Parameters

- `chart_id` [in] Chart identifier (0 - current chart).
- `name` [in] A unique name of the object to create.
- `window` [in] Chart window number (0 - main window).
- `time1` [in] Time coordinate of the first anchor point.
- `price1` [in] Price coordinate of the first anchor point.
- `time2` [in] Time coordinate of the second anchor point.
- `price2` [in] Price coordinate of the second anchor point.
- `time3` [in] Time coordinate of the third anchor point.
- `price3` [in] Price coordinate of the third anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_FIBOCHANNEL for ChartObjectFiboChannel).
CChartObjectFiboExpansion

CChartObjectFiboExpansion is a class for simplified access to "Fibonacci Expansion" graphical object properties.

Description

CChartObjectFiboExpansion class provides access to "Fibonacci Expansion" object properties.

Declaration

```cpp

Create

Creates “Fibonacci Expansion” graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name, // object name
    int window, // chart window
    datetime timel, // first time coordinate
    double price1, // first price coordinate
    datetime time2, // second time coordinate
    double price2, // second price coordinate
    datetime time3, // third time coordinate
    double price3 // third price coordinate
)
```

Parameters

- `chart_id`:[in] Chart identifier (0 - current chart).
- `name`:[in] A unique name of the object to create.
- `window`:[in] Chart window number (0 - main window).
- `timel`:[in] Time coordinate of the first anchor point.
- `price1`:[in] Price coordinate of the first anchor point.
- `time2`:[in] Time coordinate of the second anchor point.
- `price2`:[in] Price coordinate of the second anchor point.
- `time3`:[in] Time coordinate of the third anchor point.
- `price3`:[in] Price coordinate of the third anchor point.

Return Value

- `true` - successful, `false` - error.
Type
Returns graphical object type identifier.

 virtual int Type() const

Return Value
Object type identifier (OBJ_EXPANSION for CChartObjectFiboExpansion).

Object types, Graphic objects
Create

Creates "Correcting Wave" graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name,   // object name
    int window,    // chart window
    datetime time1, // first time coordinate
    double price1, // first price coordinate
    datetime time2, // second time coordinate
    double price2, // second price coordinate
    datetime time3, // third time coordinate
    double price3  // third price coordinate
)
```

**Parameters**

- `chart_id`
  - [in] Chart identifier (0 - current chart).
- `name`
  - [in] A unique name of the object to create.
- `window`
  - [in] Chart window number (0 - main window).
- `time1`
  - [in] Time coordinate of the first anchor point.
- `price1`
  - [in] Price coordinate of the first anchor point.
- `time2`
  - [in] Time coordinate of the second anchor point.
- `price2`
  - [in] Price coordinate of the second anchor point.
- `time3`
  - [in] Time coordinate of the third anchor point.
- `price3`
  - [in] Time coordinate of the third anchor point.

**Return Value**

- `true` - successful, `false` - error.
**Degree (Get Method)**

Gets the value of "Degree" property.

```cpp
ENUM_ELLIOT_WAVE_DEGREE Degree() const
```

**Return Value**

Value of "Degree" property of the object assigned to the class instance. If there is no object assigned, it returns WRONG_VALUE.

**Degree (Set Method)**

Sets new value for "Degree" property.

```cpp
bool Degree(
    ENUM_ELLIOT_WAVE_DEGREE degree  // property value
)
```

**Parameters**

- `degree`
  
  [in] New value for "Degree" property.

**Return Value**

true - successful, false - cannot change the property.
**Lines (Get Method)**

Gets the value of "Lines" property.

```cpp
bool Lines() const
```

**Return Value**

Value of "Lines" property of the object assigned to the class instance. If there is no object assigned, it returns false.

**Lines (Set Method)**

Sets new value for "Lines" property.

```cpp
bool Lines(
    bool lines // flag value
)
```

**Parameters**

- `lines`  

**Return Value**

- true - successful, false - cannot change the flag.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`
  - `[in]` handle of the binary file already opened using the FileOpen(...) function.

**Return Value**

- `true` - successful, `false` - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

Parameters

`file_handle`

[in] handle of the binary file already opened using the FileOpen(...) function.

Return Value

true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_ELLIOTWAVE3 for `CChartObjectElliottWave3`).
CChartObjectElliottWave5

CChartObjectElliottWave5 is a class for simplified access to "Impulse Wave" graphical object properties.

Description

CChartObjectElliottWave5 class provides access to "Impulse Wave" object properties.

Declaration

```cpp
class CChartObjectElliottWave5 : public CChartObjectElliottWave3
```

Title

```
#include <ChartObjects\ChartObjectsElliott.mqh>
```

Create

Creates "Impulse Wave" graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name,  // object name
    int window,   // chart window
    datetime timel, // first time coordinate
    double price1, // first price coordinate
    datetime time2, // second time coordinate
    double price2, // second price coordinate
    datetime time3, // third time coordinate
    double price3, // third price coordinate
    datetime time4, // fourth time coordinate
    double price4, // fourth price coordinate
    datetime time5 // fifth time coordinate
    double price5 // fifth price coordinate
)
```

**Parameters**

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **timel**
  - [in] Time coordinate of the first anchor point.

- **price1**
  - [in] Price coordinate of the first anchor point.

- **time2**
  - [in] Time coordinate of the second anchor point.

- **price2**
  - [in] Price coordinate of the second anchor point.

- **time3**
  - [in] Time coordinate of the third anchor point.

- **price3**
  - [in] Price coordinate of the third anchor point.

- **time4**
  - [in] Time coordinate of the fourth anchor point.

- **price4**
  - [in] Price coordinate of the fourth anchor point.

- **time5**
  - [in] Time coordinate of the fifth anchor point.

- **price5**
  - [in] Price coordinate of the fifth anchor point.
Standard Library

price4
[in] Price coordinate of the fourth anchor point.

time5
[in] Time coordinate of the fifth anchor point.

price5
[in] Price coordinate of the fifth anchor point.

Return Value

true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_ELLiotWAVE5 for `ChartObjectElliottWave5`).
Shape Objects

A group of “Shapes” graphical objects.

This section contains the technical details of working with a group of classes of “Shapes” graphical objects and a description of the relevant components of the MQL5 Standard Library.

Create

Creates “Rectangle” graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name,  // object name
    long window,  // chart window
    datetime timel, // first time coordinate
    double price1, // first price coordinate
    datetime timel2, // second time coordinate
    double price2  // second price coordinate
)
```

Parameters

- `chart_id` [in] Chart identifier (0 - current chart).
- `name` [in] A unique name of the object to create.
- `window` [in] Chart window number (0 - main window).
- `price1` [in] Price coordinate of the first anchor point.
- `time2` [in] Time coordinate of the second anchor point.
- `price2` [in] Price coordinate of the second anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
int Type() const
```

Return Value

Object type identifier (OBJ_RECTANGLE for `CChartObjectRectangle`).
**CChartObjectTriangle**

CChartObjectTriangle is a class for simplified access to “Triangle” graphical object properties.

**Description**

CChartObjectTriangle class provides access to “Triangle” object properties.

**Declaration**

```cpp
class CChartObjectTriangle : public CChartObject

Create

Creates "Triangle" graphical object.

```cpp
bool Create(
    long chart_id,  // chart identifier
    string name,    // object name
    long window,    // chart window
    datetime time1, // first time coordinate
    double price1,  // first price coordinate
    datetime time2, // second time coordinate
    double price2,  // second price coordinate
    datetime time3, // third time coordinate
    double price3   // third price coordinate
)
```

Parameters

- `chart_id`:
  - [in] Chart identifier (0 - current chart).

- `name`:
  - [in] A unique name of the object to create.

- `window`:
  - [in] Chart window number (0 - main window).

- `time1`:
  - [in] Time coordinate of the first anchor point.

- `price1`:
  - [in] Price coordinate of the first anchor point.

- `time2`:
  - [in] Time coordinate of the second anchor point.

- `price2`:
  - [in] Price coordinate of the second anchor point.

- `time3`:
  - [in] Time coordinate of the third anchor point.

- `price3`:
  - [in] Price coordinate of the third anchor point.

Return Value

- true - successful, false - error.
Type

Returns graphical object type identifier.

```
int Type() const
```

Return Value

Object type identifier (OBJ_TRIANGLE for `ChartObjectTriangle`).
CChartObjectEllipse

CChartObjectEllipse is a class for simplified access to "Ellipse" graphical object properties.

Description

CChartObjectEllipse class provides access to "Ellipse" object properties.

Declaration

```cpp
class CChartObjectEllipse : public CChartObject
```

See also

Object types, Graphic objects
Create

Creates “Ellipse” graphical object.

```cpp
bool Create(
    long  chart_id,  // chart identifier
    string name,     // object name
    int   window,    // chart window
    datetime time1,  // first time coordinate
    double price1,  // first price coordinate
    datetime time2,  // second time coordinate
    double price2,  // second price coordinate
    datetime time3,  // third time coordinate
    double price3   // third price coordinate
)
```

### Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **time1**
  - [in] Time coordinate of the first anchor point.

- **price1**
  - [in] Price coordinate of the first anchor point.

- **time2**
  - [in] Time coordinate of the second anchor point.

- **price2**
  - [in] Price coordinate of the second anchor point.

- **time3**
  - [in] Time coordinate of the third anchor point.

- **price3**
  - [in] Price coordinate of the third anchor point.

### Return Value

- true - successful, false - error.
**Type**

Returns graphical object type identifier.

```c
int Type() const
```

**Return Value**

Object type identifier (OBJ_ELLIPSE for ChartObjectEllipse).
Arrow Objects

Group for Arrows graphical objects.

This section contains the technical details of working with a group of classes of “Arrow” graphical objects and a description of the relevant components of the MQL5 Standard Library. In essence, the arrow is a certain icon which is associated with a specific code. There are two types of “Arrow” graphical object to display icons on the charts:

- “Arrow” object, which allows you to specify the code of the icon displayed by the object.
- Group of objects to display a certain type of icons (corresponding to a certain fixed code).

Class for working with arrows displaying arbitrary code icons

<table>
<thead>
<tr>
<th>Class name</th>
<th>Name of the arrow object</th>
</tr>
</thead>
<tbody>
<tr>
<td>CChartObjectArrow</td>
<td>Arrow</td>
</tr>
</tbody>
</table>

Classes for working arrows displaying a fixed code icon

<table>
<thead>
<tr>
<th>Class name</th>
<th>Name of the arrow object</th>
</tr>
</thead>
<tbody>
<tr>
<td>CChartObjectArrowCheck</td>
<td>Check</td>
</tr>
<tr>
<td>CChartObjectArrowDown</td>
<td>Arrow Up</td>

**CChartObjectArrow**

CChartObjectArrow is a class for simplified access to "Arrow" graphical object properties.

**Description**

CChartObjectArrow class provides access to common properties of "Arrow" objects to all of its descendants.

**Declaration**

```cpp
class CChartObjectArrow : public CChartObject
```

**Title**

```
#include <ChartObjects\ChartObjectsArrows.mqh>
```

**Inheritance hierarchy**

- CObject
  - CChartObject
    - CChartObjectArrow

**Direct descendants**

- CChartObjectArrowCheck, CChartObjectArrowDown, CChartObjectArrowLeftPrice,
  CChartObjectArrowRightPrice, CChartObjectArrowStop, CChartObjectArrowThumbDown,
  CChartObjectArrowThumbUp, CChartObjectArrowUp

Object types, Methods of objects binding, Graphic objects
Create

Creates "Arrow" graphical object.

```cpp
bool Create(
    long  chart_id,   // chart ID
    string name,      // object Name
    int   window,     // chart Window
    datetime time,    // time
    double price,     // price
    char  code        // arrow code
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique object name.

- **window**
  - [in] Chart window number (0 - main window).

- **time**

- **price**
  - [in] Price coordinate.

- **code**
  - [in] "Arrow" code (Wingdings).

Return Value

- true - success, false - error.

Example:

```cpp
//--- example for CChartObjectArrow::Create
#include <ChartObjects\ChartObjectsArrows.mqh>
//--
void OnStart()
{
    CChartObjectArrow arrow;
    //--- set object parameters
    double price=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    if(!arrow.Create(0,"Arrow",0,TimeCurrent(),price,181))
    {
        //--- arrow create error
        printf("Arrow create: Error %d!",GetLastError());
        //---
    }
}
```
return;
}

//--- use arrow
//--- . . .
}
ArrowCode (Get Method)

Gets “Arrow” symbol code.

```cpp
char ArrowCode() const
```

Return Value

“Arrow” symbol code of the object assigned to the class instance. If there is no object assigned, it returns 0.

ArrowCode (Set Method)

Sets symbol code for “Arrow”

```cpp
bool ArrowCode(
    char code // code value
)
```

Parameters

code

[in] New value for “arrow” code (Wingdings).

Return Value

true - success, false - cannot change the code.

Example:

```cpp
//--- example for CChartObj ectArrow::ArrowCode
#include <ChartObjects\ChartObjectsArrows.mqh>
//--
void OnStart()
{
    CChartObjectArrow arrow;
    char code=181;
    //--- set object parameters
    double price=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    if(!arrow.Create(0,"Arrow",0,TimeCurrent(),price,code))
    {
        //--- arrow create error
        printf("Arrow create: Error %d!",GetLastError());
        //---
        return;
    }
    //--- change the code of arrow
    //--- . . .
    //--- get code of arrow
    if(arrow.ArrowCode()!=code)
    {
        //--- set code of arrow
```
arrow.ArrowCode(code);
}

//--- use arrow
//--- . . .
Anchor (Get Method)

Gets anchor type of the "Arrow" object

```cpp
enum ArrowAnchor Anchor() const
```

Return Value

Anchor type of the "Arrow" object assigned to the class instance (to the chart). If there is no object assigned, it returns WRONG_VALUE.

Anchor (Set Method)

Sets anchor type for the "Arrow" object

```cpp
bool Anchor(
    enum ArrowAnchor anchor // anchor type
)
```

Parameters

anchor

[in] New anchor type value

Return Value

ture - successful, false - cannot change the anchor type.

Example:

```cpp
//-- example for CChartObject::Anchor
#include <ChartObjects\ChartObjectsArrows.mqh>
//--
void OnStart()
{
    CChartObjectArrow arrow;
    enum ArrowAnchor anchor=ANCHOR_BOTTOM;
    //-- set object parameters
    double price=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    if(!arrow.Create(0,"Arrow",0,TimeCurrent(),price,181))
    {
        //-- arrow create error
        printf("Arrow create: Error %d",GetLastError());
        //--
        return;
    }
    //-- get anchor of arrow
    if(arrow.Anchor()!=anchor)
    {
        //-- set anchor of arrow
        arrow.Anchor(anchor);
    }
```
//--- use arrow
//--- . . .
}

Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
);
```

**Parameters**

- `file_handle`  
  - `[in]` handle of file opened previously using the `FileOpen(...)` function.

**Return Value**

- `true` - successful, `false` - error.

**Example:**

```cpp
//-- example for CChartObjectArrow::Save
#include <ChartObjects\ChartObjectsArrows.mqh>
//--
void OnStart()
{
    int file_handle;
    CChartObjectArrow arrow;
    //-- set object parameters
    double price=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    if(!arrow.Create(0,"Arrow",0,TimeCurrent(),price,181))
    {
        //--- arrow create error
        printf("Arrow create: Error %d!",GetLastError());
        //---
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!arrow.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError);
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
}
```
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle    // file handle
)
```

**Parameters**

- **file_handle**
  
  [in] handle of file previously opened using the FileOpen(...) function.

**Return Value**

- true - success, false - error.

**Example:**

```cpp
//--- example for CChartObjectArrow::Load
#include <ChartObjects\ChartObjectsArrows.mqh>
//--
void OnStart()
{
    int file_handle;
    CChartObjectArrow arrow;
    //--- open file
    file_handle = FileOpen("MyFile.bin", FILE_READ|FILE_BIN|FILE_ANSI);
    if (file_handle>=0)
    {
        if (!arrow.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!\n", GetLastError());
            FileClose(file_handle);
            //---
            return;
        }
    }
    FileClose(file_handle);
    //--- use arrow
    //--- . . .
}
```
Type

Returns graphical object type identifier.

```
virtual int Type() const
```

Return Value

Object type identifier (for example, OBJ_ARROW for CChartObjectArrow)

Example:

```
#include <ChartObjects\ChartObjectsArrows.mqh>

void OnStart()
{
    CChartObjectArrow arrow;
    //--- get arrow type
    int type=arrow.Type();
}
```
Arrows with fixed code

“Arrows with fixed code” are classes for simplified access to the properties of the following graphical objects:

<table>
<thead>
<tr>
<th>Class name</th>
<th>Arrow object name</th>
</tr>
</thead>
<tbody>
<tr>
<td>CChartObjectArrowCheck</td>
<td>“Arrow Check”</td>
</tr>
<tr>
<td>CChartObjectArrowDown</td>
<td>“Arrow Down”</td>
</tr>
<tr>
<td>CChartObjectArrowUp</td>
<td>“Arrow Up”</td>
</tr>
<tr>
<td>CChartObjectArrowStop</td>
<td>“Arrow Stop”</td>
</tr>
<tr>
<td>CChartObjectArrowThumbDown</td>
<td>“Good” (&quot;Thumbs up&quot;)</td>
</tr>
<tr>
<td>CChartObjectArrowThumbUp</td>
<td>“Bad” (&quot;Thumbs down&quot;)</td>
</tr>
<tr>
<td>CChartObjectArrowLeftPrice</td>
<td>“Left price” arrow</td>
</tr>
<tr>
<td>CChartObjectArrowRightPrice</td>
<td>“Right price” arrow</td>
</tr>
</tbody>
</table>

Description

“Arrows with fixed code” classes provide access to the object properties.

Declarations

```cpp
class CChartObjectArrowCheck : public CChartObjectArrow;
class CChartObjectArrowDown : public CChartObjectArrow;
class CChartObjectArrowUp : public CChartObjectArrow;
class CChartObjectArrowStop : public CChartObjectArrow;
class CChartObjectArrowThumbDown : public CChartObjectArrow;
class CChartObjectArrowThumbUp : public CChartObjectArrow;
class CChartObjectArrowLeftPrice : public CChartObjectArrow;
class CChartObjectArrowRightPrice : public CChartObjectArrow;
```

Title

```xml
<ChartObjects\ChartObjectsArrows.mqh>
```

Object types, Methods of object binding, Graphic objects
## Create

Defines the "Arrow with fixed code" graphical object.

```cpp
bool Create(
    long  chart_id,   // chart ID
    string name,      // object Name
    int   window,     // chart Window
    datetime time,    // time
    double price       // price
)
```

### Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] Unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **time**

- **price**
  - [in] Price coordinate.

### Return Value

- true - successful, false - error.

### Example:

```cpp
//--- example for CChartObjectArrowCheck::Create
//--- example for CChartObjectArrowDown::Create
//--- example for CChartObjectArrowUp::Create
//--- example for CChartObjectArrowStop::Create
//--- example for CChartObjectArrowThumbDown::Create
//--- example for CChartObjectArrowThumbUp::Create
//--- example for CChartObjectArrowLeftPrice::Create
//--- example for CChartObjectArrowRightPrice::Create
#include <ChartObjects\ChartObjectsArrows.mqh>
//---
void OnStart()
{
    //--- for example, take CChartObjectArrowCheck
    CChartObjectArrowCheck arrow;
    //--- set object parameters
    double price=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    if(!arrow.Create(0,"ArrowCheck",0,TimeCurrent(),price))
```
{
    //--- arrow create error
    printf("Arrow create: Error %d!", GetLastError());
    //---
    return;
}
//--- use arrow
//--- . . .
}
**ArrowCode**

Prohibits "Arrow" symbol code changes.

```c
bool ArrowCode(
    char code    // code value
)
```

**Parameters**

- **code**
  - [in] Any value

**Return Value**

Always false.

**Example:**

```c
#include <ChartObjects\ChartObjectsArrows.mqh>

//--- void OnStart()
{
    //--- for example, take CChartObjectArrowCheck
    CChartObjectArrowCheck arrow;
    //--- set object parameters
    double price=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    if(!arrow.Create(0,"ArrowCheck",0,TimeCurrent(),price))
        //--- arrow create error
        printf("Arrow create: Error %d",GetLastError());
        //---
        return;
}
//--- set code of arrow
if(!arrow.ArrowCode(181))
    //--- it is not error
    printf("Arrow code can not be changed");
//--- use arrow
//--- . . .
```
**Type**

Returns graphical object type identifier

```
virtual int Type() const
```

**Return Value**

Object type identifier:

- `CChartObjectArrowCheck - OBJ_ARROW_CHECK`
- `CChartObjectArrowDown - OBJ_ARROW_DOWN`
- `CChartObjectArrowUp - OBJ_ARROW_UP`
- `CChartObjectArrowStop - OBJ_ARROW_STOP`
- `CChartObjectArrowThumbDown - OBJ_ARROW_THUMB_DOWN`
- `CChartObjectArrowThumbUp - OBJ_ARROW_THUMB_UP`
- `CChartObjectArrowLeftPrice - OBJ_ARROW_LEFT_PRICE`
- `CChartObjectArrowRightPrice - OBJ_ARROW_RIGHT_PRICE`

**Example:**

```cpp
#include <ChartObjects\ChartObjectsArrows.mqh>

void OnStart()
{
    //--- for example, take CChartObjectArrowCheck
    CChartObjectArrowCheck arrow;
    //--- get arrow type
    int type=arrow.Type();
}
```
Control Objects

A group of “Object Controls” graphical objects.

See also

Object types, Object properties, Methods of object binding, Graphic objects
Create

Creates "Text" graphical object.

```c
bool Create(
    long chart_id,  // chart identifier
    string name,    // object name
    int window,     // chart window
    datetime time,  // time coordinate
    double price    // price coordinate
)
```

Parameters

- `chart_id` [in] Chart identifier (0 - current chart).
- `name` [in] A unique name of the object to create.
- `window` [in] Chart window number (0 - main window).
- `time` [in] Time coordinate of the anchor point.
- `price` [in] Price coordinate of the anchor point.

Return Value

- true - successful, false - error.
**Angle (Get Method)**

Gets the value of “Angle” property.

```c++
double Angle() const
```

**Return Value**

Value of “Angle” property of the object assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

**Angle (Set Method)**

Sets a value for “Angle” property.

```c++
bool Angle(
    double angle // property value
)
```

**Parameters**

- `angle`
  

**Return Value**

- true - successful, false - cannot change the property.
Font (Get Method)

Gets the value of “Font” property.

```cpp
string Font() const
```

Return Value

Value of “Font” property of the object assigned to the class instance. If there is no object assigned, it returns "".

Font (Set Method)

Sets new value for “Font” property.

```cpp
bool Font(
    string font  // property value
)
```

Parameters

`font`

Return Value

true - success, false - cannot change the property.
**FontSize (Get Method)**

**Get** the value of “Font size” property.

```cpp
int FontSize() const
```

**Return Value**

Value of “FontSize” property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**FontSize (Set Method)**

Sets new value for “Font size” property.

```cpp
bool FontSize(
    int size  // property value
)
```

**Parameters**

`size`

- **[in]** New value for “Font size” property.

**Return Value**

- true - successful, false - cannot change the property.
Anchor (Get Method)

Gets the value of “Anchor” property.

```cpp
enum AnchorPoint Anchor() const
```

Return Value

Value of “Anchor” property of the object assigned to the class instance. If there is no object assigned, it returns WRONG_VALUE.

Anchor (Set Method)

Sets new value for “Anchor” property.

```cpp
bool Anchor(
    enum AnchorPoint anchor // property value
)
```

Parameters

anchor

Return Value

true - success, false - cannot change the property.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- **file_handle**
  - [in] handle of the binary file already opened by the `FileOpen` function.

Return Value

- true - success, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`

  [in] handle of the binary file already opened by the [FileOpen](#) function.

**Return Value**

- true - successful, false - error.
**Type**

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Object type identifier (OBJ_TEXT for `CChartObjectText`).
CChartObjectLabel

CChartObjectLabel is a class for simplified access to "Label" graphical object properties.

Description

CChartObjectLabel class provides access to "Label" object properties.

Declaration

```cpp
class CChartObjectLabel : public CChartObjectText
```

Title

```cpp
#include <ChartObjects\ChartObjects\txtControls.mqh>
```

Inheritance hierarchy

- CObject
  - CChartObject
    - CChartObjectText
      - CChartObjectLabel

Direct descendants

- CChartObjectEdit, CChartObjectRectLabel

Angle, Angle, Font, Font, FontSize, FontSize, Anchor, Anchor, Create

See also

Object types, Object properties, Chart angle, Methods of Object Binding, Graphic objects
Create

Creates "Label" graphical object.

bool Create(
    long chart_id,    // chart identifier
    string name,      // object name
    int window,       // chart window
    int X,            // X coordinate
    int Y             // Y coordinate
);

Parameters

chart_id
    [in] Chart identifier (0 - current chart).

name
    [in] A unique name of the object to create.

window
    [in] Chart window number (0 - main window).

X
    [in] X coordinate.

Y
    [in] Y coordinate.

Return Value

ture - successful, false - error.
X_Distance (Get Method)

Gets the value of “X_Distance” property.

```cpp
int X_Distance() const
```

Return Value

Value of “X_Distance” property of the object assigned to the class instance. If there is no object assigned, it returns 0.

X_Distance (Set Method)

Sets new value for “X_Distance” property.

```cpp
bool X_Distance(
    int X // property value
)
```

Parameters

X

[in] New value for “X_Distance” property.

Return Value

true - successful, false - cannot change the property.
**Y_Distance (Get Method)**

**Y_Distance** (Get Method) gets the value of "Y_Distance" property.

```cpp
int Y_Distance() const
```

**Return Value**

Value of "Y_Distance" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**Y_Distance (Set Method)**

**Y_Distance** (Set Method) sets new value for "Y_Distance" property.

```cpp
bool Y_Distance(
    int Y  // property value
)
```

**Parameters**

`Y`

[in] New value for "Y_Distance" property.

**Return Value**

true - successful, false - cannot change the property.
X_Size

Gets the value of "X_Size" property.

```
int X_Size() const
```

Return Value

Value of "X_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.
**Y_Size**

Gets the value of "Y_Size" property.

```cpp
int Y_Size() const
```

**Return Value**

Value of "Y_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.
**Corner (Get Method)**

Gets the value of “Corner” property.

```cpp
ENUM_BASE_CORNER  Corner() const
```

**Return Value**

Value of “Corner” property of the object assigned to the class instance. If there is no object assigned, it returns WRONG_VALUE.

**Corner (Set Method)**

Sets new value for “Corner” property.

```cpp
bool  Corner(
    ENUM_BASE_CORNER  corner  // property value
)
```

**Parameters**

`corner`

**Return Value**

true - successful, false - cannot change the property.
Time

Prohibits changes of the time coordinate.

```cpp
bool Time(
    datetime time // any value
)
```

Parameters

time

Return Value

always false.
Price

Prohibits changes of the price coordinate.

```cpp
bool Price(
    double price  // any value
)
```

Parameters

price

Return Value

always false.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

file_handle

[in] handle of the binary file already opened by `FileOpen` function.

Return Value

true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(int file_handle) { // file handle
}
```

**Parameters**

- `file_handle`
  - `[in]` handle of the binary file already opened by FileOpen function.

**Return Value**

- `true` - successful, `false` - error.
**Type**

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Object type identifier (OBJ_LABEL for ChartObjectLabel).
CChartObjectEdit

CChartObjectEdit is a class for simplified access to "Edit" graphical object properties.

Description

CChartObjectEdit class provides access to "Edit" object properties.

Declaration

class CChartObjectEdit : public CChartObjectLabel

Title

#include <ChartObjects\ChartObjects\txtControls.mqh>

Inheritance hierarchy

CObject
  CChartObject
    CChartObjectText
      CChartObjectLabel
        CChartObjectEdit

Direct descendants
  CChartObjectButton

Create

Creates "Edit" graphical object.

```cpp
bool Create(
    long chart_id,  // chart identifier
    string name,    // object name
    int window,     // chart window
    int X,          // X coordinate
    int Y,          // Y coordinate
    int sizeX,      // X size
    int sizeY       // Y size
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **X**
  - [in] X coordinate.

- **Y**
  - [in] Y coordinate.

- **sizeX**
  - [in] X size.

- **sizeY**

Return Value

- true - successful, false - error.
**TextAlign (Get method)**

Gets the value of "TextAlign" property (text alignment mode).

```
ENUM_ALIGN_MODE TextAlign() const
```

**Return Value**

Value of "TextAlign" property of the object assigned to the class instance.

---

**TextAlign (Set method)**

Sets the value of "TextAlign" property (text alignment mode).

```
bool TextAlign(
    ENUM_ALIGN_MODE align // property value
)
```

**Parameters**

- `align`
  
  [in] New value of "TextAlign" property.

**Return Value**

- true - success, false - cannot change the property.
**X_Size**

Sets the value for "X_Size" property.

```cpp
bool X_Size(
    int size // property value
)
```

**Parameters**

- `size`
  
  [in] New value for "X_Size" property.

**Return Value**

- true - success, false - cannot change the property.
Y_Size

Sets the value for "Y_Size" property.

```cpp
bool Y_Size(
    int size    // property value
)
```

Parameters

size

[in] New value for "Y_Size" property.

Return Value

true - success, false - cannot change the property.
**BackColor (Get Method)**

Gets the value of "BackColor" property.

```cpp
color BackColor() const
```

**Return Value**

Value of "BackColor" property of the object assigned to the class instance. If there is no object assigned, it returns CLR_NONE.

**BackColor (Set Method)**

Sets the value for "BackColor" property.

```cpp
bool BackColor(
    color new_color  // property value
)
```

**Parameters**

*new_color*

**Return Value**

true - success, false - cannot change the property.
**BorderColor (Get Method)**

Gets the value of "Border Color" property.

```
color BorderColor() const
```

**Return Value**

Value of "Border Color" property of the object assigned to the class instance. If there is no object assigned, it returns CLR_NONE.

**BorderColor (Set Method)**

Sets new value for "Border Color" property.

```
bool BorderColor(
    color new_color // new property value
)
```

**Parameters**

new_color

\[\text{in}\] New value for "Border Color" property.

**Return Value**

true - success, false - cannot change the property.
ReadOnly (Get Method)

Gets the value of "Read Only" property.

```cpp
bool ReadOnly() const
```

Return Value

Value of "Read Only" property of the object assigned to the class instance. If there is no object assigned, it returns false.

ReadOnly (Set Method)

Sets the value for "Read Only" property.

```cpp
bool ReadOnly(
    const bool flag // new property value
)
```

Parameters

flag

[In] New value for "Read Only" property (true means text editing is disabled).

Return Value

true - success, false - cannot change the property.
**Angle**

Prohibits changes of the "Angle" property.

```cpp
bool Angle(
    double angle  // any value
)
```

**Parameters**

- `angle`
  - `[in]` Any value of double type.

**Return Value**

- `always false`. 
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- `file_handle`

  [in] handle of the binary file already opened by `FileOpen` function.

Return Value

- true - success, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

`file_handle`

[in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

true - success, false - error.
Type

Returns graphical object type identifier.

virtual int Type() const

Return Value

Object type identifier (OBJ>Edit for CChartObjectEdit).
**CChartObjectButton**

CChartObjectButton is a class for simplified access to “Button” graphical object properties.

**Description**

CChartObjectButton class provides access to “Button” object properties.

**Declaration**

```cpp
class CChartObjectButton : public CChartObjectEdit
```

**Title**

```cpp
#include <ChartObjects\ChartObjects\QtControls.mqh>
```

**Inheritance hierarchy**

- **CObject**
- **CChartObject**
  - **CChartObjectText**
    - **CChartObjectLabel**
    - **CChartObjectEdit**
    - **CChartObjectButton**

**Direct descendants**

- **CChartObjectPanel**

**State (Get Method)**

Gets the value of "State" property.

```
bool State() const
```

**Return Value**

Value of "State" property of the object assigned to the class instance. If there is no object assigned, it returns false.

**State (Set Method)**

Sets new value for "State" property.

```
bool State(
    bool state // property value
)
```

**Parameters**

`X`

**Return Value**

true - success, false - cannot change the property.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle  // file handle
)
```

**Parameters**

- `file_handle`
  
  [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- `true` - successful, `false` - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

**Parameters**

- `file_handle`
  - [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- `true` - successful, `false` - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_BUTTON for CChartObjectButton).
CChartObjectSubChart

CChartObjectSubChart is a class for simplified access to "Chart" graphical object properties.

Description

CChartObjectSubChart class provides access to "Chart" object properties.

Declaration

class CChartObjectSubChart : public CChartObject

See also

- Object types, Object properties, Chart angle, Graphic objects
Create

Creates "SubChart" graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name,   // object name
    int window,    // chart window
    int X,         // X coordinate
    int Y,         // Y coordinate
    int sizeX,     // X size
    int sizeY      // Y size
)
```

Parameters

`chart_id`
- [in] Chart identifier (0 - current chart).

`name`
- [in] A unique name of the object to create.

`window`
- [in] Chart window number (0 - main window).

`X`
- [in] X coordinate.

`Y`
- [in] Y coordinate.

`sizeX`
- [in] X size.

`sizeY`

Return Value

true - successful, false - error.
**X_Distance (Get Method)**

Gets the value of "X_Distance" property.

```c
int X_Distance() const
```

**Return Value**

Value of "X_Distance" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**X_Distance (Set Method)**

Sets new value for "X_Distance" property.

```c
bool X_Distance(
    int X  // property value
)
```

**Parameters**

* X  
  [in] New value for "X_Distance" property.

**Return Value**

true - successful, false - cannot change the property.

**Y_Distance (Get Method)**

Gets the value of “Y_Distance” property.

```cpp
int Y_Distance() const
```

**Return Value**

Value of “Y_Distance” property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**Y_Distance (Set Method)**

Sets new value for “Y_Distance” property.

```cpp
bool Y_Distance(
    int Y // property value
)
```

**Parameters**

Y

[in] New value for “Y_Distance” property.

**Return Value**

true - successful, false - cannot change the property.
Corner (Get Method)

Gets the value of "Corner" property.

```cpp
ENUM_BASE_CORNER Corner() const
```

Return Value

Value of "Corner" property of the object assigned to the class instance. If there is no object assigned, it returns WRONG_VALUE.

Corner (Set Method)

Sets new value for "Corner" property.

```cpp
bool Corner(
    ENUM_BASE_CORNER corner // property value
)
```

Parameters

corner

Return Value

true - successful, false - cannot change the property.
**X_Size (Get Method)**

Gets the value of "X_Size" property.

```cpp
int X_Size() const
```

**Return Value**

Value of "X_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**X_Size (Set Method)**

Sets new value for "X_Size" property.

```cpp
bool X_Size(
    int X  // property value
)
```

**Parameters**

- **X**
  
  [in] New value for "X_Size" property.

**Return Value**

- true - successful, false - cannot change the property.
**Y_Size (Get Method)**

Gets the value of "Y_Size" property.

```cpp
int Y_Size() const
```

**Return Value**

Value of "Y_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**Y_Size (Set Method)**

Sets new value for "Y_Size" property.

```cpp
bool Y_Size(
    int Y // property value
)
```

**Parameters**

Y

[in] New value for "Y_Size" property.

**Return Value**

true - successful, false - cannot change the property.
Symbol (Get Method)

Gets the value of “Symbol” property.

```cpp
string Symbol() const
```

Return Value

Value of “Symbol” property of the object assigned to the class instance. If there is no object assigned, it returns “”.

Symbol (Set Method)

Sets new value for “Symbol” property.

```cpp
bool Symbol(
    string symbol // symbol
)
```

Parameters

- `symbol`

Return Value

- true - successful, false - cannot change the property.
**Period (Get Method)**

Gets the value of "Period" property.

```cpp
int Period() const
```

**Return Value**

Value of "Period" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**Period (Set Method)**

Sets new value for "Period" property.

```cpp
bool Period(
    int period    // period
)
```

**Parameters**

- `period`
  

**Return Value**

- true - successful, false - cannot change the property.
**Scale (Get Method)**

Gets the value of “Scale” property.

```cpp
double Scale() const
```

**Return Value**

Value of “Scale” property of the object assigned to the class instance. If there is no object assigned, it returns `EMPTY_VALUE`.

**Scale (Set Method)**

Sets new value for “Scale” property.

```cpp
bool Scale(
    double scale  // property value
)
```

**Parameters**

- `scale`

  [in] New value for “Scale” property.

**Return Value**

- true - successful, false - cannot change the property.
DateScale (Get Method)

Gets the value of “DateScale” flag.

```cpp
bool DateScale() const
```

Return Value

Value of “DateScale” flag of the object assigned to the class instance. If there is no object assigned, it returns false.

DateScale (Set Method)

Sets new value for “DateScale” property.

```cpp
bool DateScale(
    bool scale  // flag value
)
```

Parameters

scale

[in] New value for “DateScale” flag.

Return Value

true - successful, false - cannot change the flag.
**PriceScale (Get Method)**

Gets the value of "PriceScale" flag.

```cpp
bool PriceScale() const
```

**Return Value**

Value of "PriceScale" flag of the object assigned to the class instance. If there is no object assigned, it returns false.

**PriceScale (Set Method)**

Sets new value for "PriceScale" flag.

```cpp
bool PriceScale(
    bool scale // flag value
)
```

**Parameters**

`scale`

**Return Value**

true - successful, false - cannot change the flag.
Time

Prohibits changes of the time coordinate.

```mql5
bool Time(
    datetime time  // any value
)
```

Parameters

- `time`
  [in]

Return Value

- always false.
**Price**

Prohibits changes of the price coordinate.

```c
bool Price(
    double price   // any value
)
```

**Parameters**

- `price` [in]

**Return Value**

- always false.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`
  - [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`
  - [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- `true` - successful, `false` - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_CHART for `CChartObjectSubChart`).
CChartObjectBitmap

CChartObjectBitmap is a class for simplified access to "Bitmap" graphical object properties.

Description

CChartObjectBitmap class provides access to "Bitmap" object properties.

Declaration

```cpp
class CChartObjectBitmap : public CChartObject
```

Title

```cpp
#include <ChartObjects\ChartObjectsBmpControls.mqh>
```

Inheritance hierarchy

- CObject
  - CChartObject
    - CChartObjectBitmap

Object types, Object properties, Graphic objects
Create

Creates "Bitmap" graphical object.

```cpp
bool Create(
    long chart_id, // chart identifier
    string name,   // object name
    int window,    // chart window
    datetime time, // time coordinate
    double price   // price coordinate
)
```

Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **time**
  - [in] Time coordinate of the anchor point.

- **price**
  - [in] Price coordinate of the anchor point.

Return Value

- true - successful, false - error.
**BmpFile (Get Method)**

Gets the value of "BmpFile" property.

```cpp
string BmpFile() const
```

Return Value

Value of "BmpFile" property of the object assigned to the class instance. If there is no object assigned, it returns false.

**BmpFile (Set Method)**

Sets new value for "BmpFile" property.

```cpp
bool BmpFile(
    string name // property value
)
```

Parameters

name

Return Value

true - successful, false - cannot change the property.
X_Offset (Get Method)

Gets the value of “X_Offset” property (the upper left corner) of the CChartObjectBitmap graphical object.

```cpp
int X_Offset() const
```

Return Value

Value of “X_Offset” property of the object assigned to the class instance. If there is no object assigned, it returns 0.

X_Offset (Set Method)

Sets new value for “X_Offset” property (the upper left corner) of the CChartObjectBitmap graphical object. The value is set in pixels relative to the upper left corner of the original image.

```cpp
bool X_Offset(
    int X    // property value
)
```

Parameters

X

Return Value

true - successful, false - cannot change the property.
Y_Offset (Get Method)

Gets the value of "Y_Offset" property (the upper left corner) of the CChartObjectBitmap graphical object.

```cpp
int Y_Offset() const
```

Return Value

Value of "Y_Offset" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

Y_Offset (Set Method)

Sets new value for "Y_Offset" property (the upper left corner) of the CChartObjectBitmap graphical object. The value is set in pixels relative to the upper left corner of the original image.

```cpp
bool Y_Offset(int Y) // property value
```

Parameters

Y

Return Value

true - successful, false - cannot change the property.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

**Parameters**

`file_handle`

[in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

**Parameters**

- `file_handle` [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- true - successful, false - error.
Type

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

Return Value

Object type identifier (OBJ_BITMAP for CChartObjectBitmap).
CChartObjectBmpLabel

CChartObjectBmpLabel is a class for simplified access to "Bitmap Label" graphical object properties.

Description

CChartObjectBmpLabel class provides access to "Bitmap Label" object properties.

Declaration

```cpp
class CChartObjectBmpLabel : public CChartObject
```

Title

```cpp
#include <ChartObjects\ChartObjectsBmpControls.mqh>
```

Inheritance hierarchy

- CObject
  - CChartObject
    - CChartObjectBmpLabel

## Create

Creates "BmpLabel" graphical object.

```c
bool Create(
    long chart_id,   // chart identifier
    string name,    // object name
    int window,     // chart window
    int X,          // X coordinate
    int Y           // Y coordinate
);
```

### Parameters

- **chart_id**
  - [in] Chart identifier (0 - current chart).

- **name**
  - [in] A unique name of the object to create.

- **window**
  - [in] Chart window number (0 - main window).

- **X**
  - [in] X coordinate.

- **Y**
  - [in] Y coordinate.

### Return Value

- `true` - successful, `false` - error.
**X_Distance (Get Method)**

Gets the value of "X_Distance" property.

```cpp
int X_Distance() const
```

**Return Value**

Value of "X_Distance" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**X_Distance (Set Method)**

Sets new value for "X_Distance" property.

```cpp
bool X_Distance(
    int X  // property value
)
```

**Parameters**

X

[in] New value for "X_Distance" property.

**Return Value**

true - successful, false - cannot change the property.
**Y_Distance (Get Method)**

Gets the value of "Y_Distance" property.

```cpp
int Y_Distance() const
```

**Return Value**

Value of "Y_Distance" property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**Y_Distance (Set Method)**

Sets new value for "Y_Distance" property.

```cpp
bool Y_Distance(
    int Y // property value
)
```

**Parameters**

Y

[in] New value for "Y_Distance" property.

**Return Value**

true - successful, false - cannot change the property.
**X_Offset (Get Method)**

Gets the value of “X_Offset” property (the upper left corner) of the *CCartObjectBmpLabel* graphical object.

```cpp
int X_Offset() const
```

**Return Value**

Value of “X_Offset” property of the object assigned to the class instance. If there is no object assigned, it returns 0.

**X_Offset (Set Method)**

Sets new value for “X_Offset” property (the upper left corner) of the *CChartObjectBitmap* graphical object. The value is set in pixels relative to the upper left corner of the original image.

```cpp
bool X_Offset(
    int X // property value
)
```

**Parameters**

- `X`

**Return Value**

- true - successful, false - cannot change the property.
Y_Offset (Get Method)

Gets the value of “Y_Offset” property (the upper left corner) of the `CCartObjectBmpLabel` graphical object.

```cpp
int Y_Offset() const
```

Return Value

Value of “Y_Offset” property of the object assigned to the class instance. If there is no object assigned, it returns 0.

Y_Offset (Set Method)

Sets new value for “Y_Offset” property (the upper left corner) of the `CCartObjectBmpLabel` graphical object. The value is set in pixels relative to the upper left corner of the original image.

```cpp
bool Y_Offset(
    int Y // property value
)
```

Parameters

`Y`

Return Value

true - successful, false - cannot change the property.
Corner (Get Method)

Gets the value of “Corner” property.

```cpp
  ENUM_BASE_CORNER Corner() const
```

Return Value

Value of “Corner” property of the object assigned to the class instance. If there is no object assigned, it returns WRONG_VALUE.

Corner (Set Method)

Sets new value for “Corner” property.

```cpp
  bool Corner(
    ENUM_BASE_CORNER corner  // property value
  )
```

Parameters

corner

Return Value

true - successful, false - cannot change the property.
**X_Size**

Gets the value of "X_Size" property.

```c
int X_Size() const
```

**Return Value**

Value of "X_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.
Y_Size

Gets the value of "Y_Size" property.

```c
int Y_Size() const
```

Return Value

Value of "Y_Size" property of the object assigned to the class instance. If there is no object assigned, it returns 0.
BmpFileOn (Get Method)

Gets the value of “BmpFileOn” property.

```cpp
string BmpFileOn() const
```

**Return Value**

Value of “BmpFileOn” property of the object assigned to the class instance. If there is no object assigned, it returns “”.

BmpFileOn (Set Method)

Sets new value for “BmpFileOn” property.

```cpp
bool BmpFileOn(
    string name  // file name
)
```

**Parameters**

name

**Return Value**

true - successful, false - cannot change the property.
**BmpFileOff (Get Method)**

Gets the value of "BmpFileOff" property.

```csharp
string BmpFileOff() const
```

**Return Value**

Value of "BmpFileOff" property of the object assigned to the class instance. If there is no object assigned, it returns "".

**BmpFileOff (Set Method)**

Sets new value for "BmpFileOff" property.

```csharp
bool BmpFileOff(
    string name // file name
)
```

**Parameters**

- `name`

**Return Value**

true - successful, false - cannot change the property.
State (Get Method)

Gets the value of “State” property.

```cpp
bool State() const
```

Return Value

Value of “State” property of the object assigned to the class instance. If there is no object assigned, it returns false.

State (Set Method)

Sets new value for “State” property.

```cpp
bool State(
    bool state // property value
)
```

Parameters

state

Return Value

true - successful, false - cannot change the property.
### Time

Prohibits changes of the time coordinate.

```cpp
bool Time(
    datetime time // any value
)
```

#### Parameters

- `time`
  - `[in]` Any value of datetime type.

#### Return Value

- `always false.`
Price

Prohibits changes of the price coordinate.

```cpp
bool Price(
    double price // any value
)
```

Parameters

price

Return Value

always false.
**Save**

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle     // file handle
)
```

**Parameters**

- `file_handle`  
  [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- `true` - successful, `false` - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

- `file_handle`
  - [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- true - successful, false - error.
**Type**

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Object type identifier (OBJ_BITMAP_LABEL for `CChartObjectBmpLabel`).
CChartObjectRectLabel

CChartObjectRectLabel is a class for simplified access to "Rectangle Label" graphical object properties.

Description

CChartObjectRectLabel class provides access to "Rectangle Label" object properties.

Declaration

```cpp
class CChartObjectRectLabel : public CChartObjectLabel
```

Title

```cpp
#include <ChartObjects\ChartObjectsTxtControls.mqh>
```

Inheritance hierarchy

- CObject
  - CChartObject
    - CChartObjectText
      - CChartObjectLabel
        - CChartObjectRectLabel

Create

Creates the “CChartObjectRectLabel” graphic object.

```cpp
bool Create(
    long chart_id,  // chart ID
    string name,    // object name
    int window,     // chart window
    int X,          // X coordinate
    int Y,          // Y coordinate
    int sizeX,      // horizontal size
    int sizeY       // vertical size
)
```

Parameters

`chart_id`
- [in] Chart identifier (0 - current chart).

`name`
- [in] A unique name of the object to create.

`window`
- [in] Chart window number (0 - main window).

`X`
- [in] X coordinate.

`Y`
- [in] Y coordinate.

`sizeX`
- [in] Horizontal size.

`sizeY`
- [in] Vertical size.

Return Value

true - successful, false - error.
X_Size

Sets the value of "X_Size" property.

bool X_Size(
    int size  // property value
)

Parameters

size
    [in] New horizontal size property value.

Return Value

true - successful, false - cannot change the property.

Note

To get the values of "X_Size" and "Y_Size" properties, use the X_Size and Y_Size methods of the parent CChartObjectLabel class.
**Y_Size**

Sets the value of "Y_Size" property.

```c
bool Y_Size(
    int size       // property value
)
```

**Parameters**

size

[in] New vertical size property value.

**Return Value**

true - successful, false - cannot change the property.

**Note**

To get the values of "X_Size" and "Y_Size" properties, use the \texttt{X_Size} and \texttt{Y_Size} methods of the parent \texttt{CChartObjectLabel} class.
**BackColor**

Gets the background color property value.

```c++
color BackColor() const
```

**Return Value**

Background color property value of the object assigned to the class instance. If there is no object assigned, it returns 0.

**BackColor**

Sets the background color property value.

```c++
bool BackColor(
    color new_color // property value
)
```

**Parameters**

* new_color
  
  [in] New background color property value.

**Return Value**

true - successful, false - cannot change the property.
Angle

Prohibits changing the slope angle property.

```cpp
bool Angle(
    double angle // any value
)
```

**Parameters**

`angle`

**Return Value**

Always false.
BorderType

Gets border type property value.

```cpp
int BorderType() const
```

Return Value

Border type property value of the object assigned to the class instance. If there is no object assigned, it returns 0.

BorderType

Sets border type property value.

```cpp
bool BorderType(
    int type  // property value
)
```

Parameters

- `type`
  - [in] New border type property value.

Return Value

- true - successful, false - cannot change the property.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle   // file handle
)
```

**Parameters**

- `file_handle`  
  [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

**Parameters**

- `file_handle`  
  [in] handle of the binary file already opened by `FileOpen` function.

**Return Value**

- `true` - successful, `false` - error.
**Type**

Returns graphical object type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Object type identifier (OBJ_RECTANGLE_LABEL for `CChartObjectRectangleLabel`).
Custom graphics

This section provides tools for working with custom graphics.

Their use greatly facilitates plotting custom charts, drawings and visualization of data.

There are individual classes for creating graphical objects and primitives, for drawing various types of pie charts and curves. Various options for displaying objects are implemented: changing the style and color of lines, filling, working with series of data on the chart, etc.

<table>

**CCanvas**

CCanvas is a class for simplified creation of custom images.

**Description**

CCanvas provides creation of a graphical resource (with or without binding to a chart object) and drawing graphic primitives.

**Declaration**

```cpp
class CCanvas
```

**Title**

```cpp
#include <Canvas\Canvas.mqh>
```

**Inheritance hierarchy**

CCanvas

**Direct descendants**

CChartCanvas, CFImageCanvas

Attach

Gets the graphical resource from an OBJ_BITMAP_LABEL object and attaches it to an instance of the CCanvas class.

```cpp
bool Attach(
    const long chart_id, // chart identifier
    const string objname, // object name
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA // color processing method
)
```

Creates a graphical resource for an OBJ_BITMAP_LABEL object and attaches it to an instance of the CCanvas class.

```cpp
bool Attach(
    const long chart_id, // chart identifier
    const string objname, // object name
    const int width, // image width in pixels
    const int height, // image height in pixels
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA // color processing method
)
```

Parameters

- `chart_id` [out] Chart identifier.
- `objname` [in] Name of the graphical object.
- `width` [in] Image width in the resource.
- `height` [in] Image height in the resource.
- `clrfmt=COLOR_FORMAT_XRGB_NOALPHA` [in] Alpha channel processing method. The alpha channel is ignored by default.

Return Value

- `true` - if successful, `false` - if failed to attach the object.
## Arc

Draws an arc of an ellipse inscribed in a rectangle with corners at \((x_1, y_1)\) and \((x_2, y_2)\). The arc boundaries are clipped by lines from the center of the ellipse, which extend to two points with coordinates \((x_3, y_3)\) and \((x_4, y_4)\).

```c
void Arc(
    int x1,  // X coordinate of the upper left corner of the rectangle
    int y1,  // Y coordinate of the upper left corner of the rectangle
    int x2,  // X coordinate of the bottom right corner of the rectangle
    int y2,  // Y coordinate of the bottom right corner of the rectangle
    int x3,  // X coordinate of the first point to find the arc boundaries
    int y3,  // Y coordinate of the first point to find the arc boundaries
    int x4,  // X coordinate of the second point to find the arc boundaries
    int y4,  // Y coordinate of the second point to find the arc boundaries
    const uint clr  // color
);
```

### Parameters

- **x1**
  
  \([\text{in}]\) X coordinate of the top left corner forming the rectangle.

- **y1**
  
  \([\text{in}]\) Y coordinate of the top left corner forming the rectangle.

- **x2**
  
  \([\text{in}]\) X coordinate of the bottom right corner forming the rectangle.

- **y2**
  
  \([\text{in}]\) Y coordinate of the bottom right corner forming the rectangle.

- **x3**
  
  \([\text{in}]\) X coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

- **y3**
  
  \([\text{in}]\) Y coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

- **x4**
  
  \([\text{in}]\) X coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

- **y4**
  
  \([\text{in}]\) Y coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

- **clr**
  
  \([\text{in}]\) Color in ARGB format. Use the `ColorToARGB()` function to convert a color into the ARGB format.
Draws an arc of an ellipse with center at point \((x,y)\), inscribed in rectangle, with radii \(rx\) and \(ry\). The arc boundaries are cropped from the ellipse center using rays formed by angles \(fi3\) and \(fi4\).

```c
void Arc(
    int x,  // X coordinate of the ellipse center
    int y,  // Y coordinate of the ellipse center
    int rx, // ellipse radius on the X axis
    int ry, // ellipse radius on the Y axis
    int fi3, // angle of ray from ellipse center, which defines the first boundary of the arc
    int fi4, // angle of ray from ellipse center, which defines the second boundary of the arc
    const uint clr  // color
);
```

Draws an arc of an ellipse with center at point \((x,y)\), inscribed in rectangle, with radii \(rx\) and \(ry\), and also returns the coordinates of the arc boundaries. The arc boundaries are cropped from the ellipse center using rays formed by angles \(fi3\) and \(fi4\).

```c
void Arc(
    int x,  // X coordinate of the ellipse center
    int y,  // Y coordinate of the ellipse center
    int rx, // ellipse radius on the X axis
    int ry, // ellipse radius on the Y axis
    int fi3, // angle of ray from ellipse center, which defines the first boundary of the arc
    int fi4, // angle of ray from ellipse center, which defines the second boundary of the arc
    int& x3, // X coordinate of the first arc boundary
    int& y3, // Y coordinate of the first arc boundary
    int& x4, // X coordinate of the second arc boundary
    int& y4, // Y coordinate of the second arc boundary
    const uint clr  // color
);
```

**Parameters**

- **x**
  - [in] X coordinate of the ellipse center.

- **y**
  - [in] Y coordinate of the ellipse center.

- **rx**
  - [in] Ellipse radius on the X axis, in pixels.

- **ry**
  - [in] Ellipse radius on the Y axis, in pixels.

- **fi3**
  - [in] Angle in radians, which defines the first boundary of the arc.

- **fi4**
  - [in] Angle in radians, which defines the second boundary of the arc.
Angle in radians, which defines the second boundary of the arc.

\[ x_3 \]

Variable to get the X coordinate of the first arc boundary.

\[ y_3 \]

Variable to get the Y coordinate of the first arc boundary.

\[ x_4 \]

Variable to get the X coordinate of the second arc boundary.

\[ y_4 \]

Variable to get the Y coordinate of the second arc boundary.

\[ clr \]

Color in ARGB format. Use the `ColorToARGB()` function to convert a color into the ARGB format.

Examples of calling the class methods:

```cpp
#include <Canvas\Canvas.mqh>
CCanvas canvas;

void OnStart()
{
    int Width=600;
    int Height=400;
    if(!canvas.CreateBitmapLabel(0,0,"CirclesCanvas",30,30,Width,Height))
    {
        Print("Error creating canvas: ",GetLastError());
    }
    canvas.Erase(clrWhite);
    canvas.Rectangle(215-190,215-120,215+190,215+120,clrGray);
    canvas.Arc(215,215, 190,120,M_PI_4,2*M_PI-M_PI_4,clrRed);
    int x1,y1,x2,y2;
    canvas.Arc(215,215, 190,120,2*M_PI-M_PI_4,2*M_PI+M_PI_4,x1,y1,x2,y2,clrGreen);
    canvas.CircleAA(x1,y1,3,clrRed);
    canvas.CircleAA(x2,y2,3,clrBlue);
    canvas.Update();
}
```
Pie

Draws a filled sector of an ellipse inscribed in a rectangle with corners at \((x_1,y_1)\) and \((x_2,y_2)\). The sector boundaries are clipped by lines from the center of the ellipse, which extend to two points with coordinates \((x_3,y_3)\) and \((x_4,y_4)\).

```cpp
void Pie(
    int x1, // X coordinate of the upper left corner of the rectangle
    int y1, // Y coordinate of the upper left corner of the rectangle
    int x2, // X coordinate of the bottom right corner of the rectangle
    int y2, // Y coordinate of the bottom right corner of the rectangle
    int x3, // X coordinate of the first point to find the arc boundaries
    int y3, // Y coordinate of the first point to find the arc boundaries
    int x4, // X coordinate of the second point to find the arc boundaries
    int y4, // Y coordinate of the second point to find the arc boundaries
    const uint clr, // line color
    const uint fill_clr // fill color
);
```

Parameters

\(x_1\)

[in] X coordinate of the top left corner forming the rectangle.

\(y_1\)

[in] Y coordinate of the top left corner forming the rectangle.

\(x_2\)

[in] X coordinate of the bottom right corner forming the rectangle.

\(y_2\)

[in] Y coordinate of the bottom right corner forming the rectangle.

\(x_3\)

[in] X coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

\(y_3\)

[in] Y coordinate of the first point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

\(x_4\)

[in] X coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

\(y_4\)

[in] Y coordinate of the second point, to which a line from the rectangle center is drawn in order to obtain the arc boundary.

\(clr\)

[in] Border color of the sector in the ARGB format.

\(fill\_clr\)
[in] Fill color of the sector in the ARGB format. Use the `ColorToARGB()` function to convert a color into the ARGB format.

Draws a filled sector of an ellipse with center at point (x,y), inscribed in rectangle, with radii rx and ry. The sector boundaries are cropped from the ellipse center by rays formed by angles fi3 and fi4.

```c
void Pie(
    int x, // X coordinate of the ellipse center
    int y, // Y coordinate of the ellipse center
    int rx, // ellipse radius on the X axis
    int ry, // ellipse radius on the Y axis
    int fi3, // angle of ray from ellipse center, which defines the first
    int fi4, // angle of ray from ellipse center, which defines the second
    const uint clr, // line color
    const uint fill_clr // fill color
);
```

Draws a filled sector of an ellipse with center at point (x,y), inscribed in rectangle, with radii rx and ry, and also returns the coordinates of the arc boundaries. The sector boundaries are cropped from the ellipse center by rays formed by angles fi3 and fi4.

```c
void Pie(
    int x, // X coordinate of the ellipse center
    int y, // Y coordinate of the ellipse center
    int rx, // ellipse radius on the X axis
    int ry, // ellipse radius on the Y axis
    int fi3, // angle of ray from ellipse center, which defines the first
    int fi4, // angle of ray from ellipse center, which defines the second
    int& x3, // X coordinate of the first arc boundary
    int& y3, // Y coordinate of the first arc boundary
    int& x4, // X coordinate of the second arc boundary
    int& y4, // Y coordinate of the second arc boundary
    const uint clr, // line color
    const uint fill_clr // fill color
);
```

**Parameters**

- **x**
  - [in] X coordinate of the ellipse center.

- **y**
  - [in] Y coordinate of the ellipse center.

- **rx**
  - [in] Ellipse radius on the X axis, in pixels.

- **ry**
  - [in] Ellipse radius on the X axis, in pixels.
fi3 
[in] Angle in radians, which defines the first boundary of the arc.

fi4 
[in] Angle in radians, which defines the second boundary of the arc.

x3 
[out] Variable to get the X coordinate of the first arc boundary.

y3 
[out] Variable to get the Y coordinate of the first arc boundary.

x4 
[out] Variable to get the X coordinate of the second arc boundary.

y4 
[out] Variable to get the Y coordinate of the second arc boundary.

clr 
[in] Border color of the sector in the ARGB format.

fill_clr 
[in] Fill color of the sector in the ARGB format. Use the ColorToARGB() function to convert a color into the ARGB format.

Examples of calling the class methods:

```c
#include <Canvas\Canvas.mqh>
CCanvas canvas;

void OnStart()
{
    int Width=600;
    int Height=400;

    //--- create canvas
    if(!canvas.CreateBitmapLabel(0,0,"CirclesCanvas",30,30,Width,Height))
    {
        Print("Error creating canvas: ",GetLastError());
    }

    //--- clear canvas
    canvas.Erase(clrWhite);

    //--- draw rectangle
    canvas.Rectangle(215-190,215-120,215+190,215+120,clrGray);

    //--- draw first pie
    canvas.Pie(215,215, 190,120,M_PI_4,2*M_PI-M_PI_4,ColorToARGB(clrBlue),ColorToARGB(clrRed));

    //--- draw second pie
    canvas.Pie(215,215, 190,120,2*M_PI-M_PI_4,2*M_PI+M_PI_4,ColorToARGB(clrGreen),ColorToARGB(clrGreen));

    //--- show updated canvas
    canvas.Update();
}
DebugBreak();
}
FillPolygon

Draws a filled polygon.

```c
void FillPolygon(
    int& x,        // array with the X coordinates of polygon points
    int& y,        // array with the Y coordinates of polygon points
    const uint clr  // color
);
```

Parameters

- **x**
  - [in] Array of the X coordinates of the polygon points.

- **y**
  - [in] Array of the Y coordinates of the polygon points.

- **clr**
  - [in] Color in ARGB format.
**FillEllipse**

Draws a filled ellipse inscribed in a rectangle with the specified coordinates.

```c
void FillPolygon(
    int x1,       // X coordinate of the upper left corner of the rectangle
    int y1,       // Y coordinate of the upper left corner of the rectangle
    int x2,       // X coordinate of the bottom right corner of the rectangle
    int y2,       // Y coordinate of the bottom right corner of the rectangle
    const uint clr  // ellipse color
);
```

**Parameters**

- **x1**
  
  [in] X coordinate of the top left corner forming the rectangle.

- **y1**
  
  [in] Y coordinate of the top left corner forming the rectangle.

- **x2**
  
  [in] X coordinate of the bottom right corner forming the rectangle.

- **y2**
  
  [in] Y coordinate of the bottom right corner forming the rectangle.

- **clr**
  
  [in] Color in ARGB format.
GetDefaultColor

Returns a predefined color by its index.

```cpp
static uint GetDefaultColor(
    const uint i // index
);
```

**Parameters**

- `i`
  - [in] Index to get the color.

**Return Value**

- Color.
ChartObjectName

Receives the name of a bound chart object.

```cpp
string ChartObjectName();
```

Return Value

- the name of a bound chart object
Circle

Draws a circle

```c
void Circle(
    int x,       // X coordinate
    int y,       // Y coordinate
    int r,       // radius
    const uint clr // color
);
```

Parameters

- **x**
  - [in] X coordinate of the center of the circle.

- **y**
  - [in] Y coordinate of the center of the circle.

- **r**
  - [in] Circle radius.

- **clr**
  - [in] Color in ARGB format.
CircleAA

Draws a circle using antialiasing algorithm

```c
void CircleAA(
    const int x,       // X coordinate
    const int y,       // Y coordinate
    const double r,    // radius
    const uint clr     // color
);`

Parameters

- `x` [in] X coordinate of the center of the circle.
- `y` [in] Y coordinate of the center of the circle.
- `r` [in] Circle radius.
- `clr` [in] Color in ARGB format.
**CircleWu**

Draws a circle using Wu's anti-aliasing algorithm

```c
void CircleWu(
    const int x,       // X coordinate
    const int y,       // Y coordinate
    const double r,    // radius
    const uint clr     // color
);
```

**Parameters**

- `x`  
  [in] X coordinate of the center of the circle.

- `y`  
  [in] Y coordinate of the center of the circle.

- `r`  
  [in] Circle radius.

- `clr`  
  [in] Color in ARGB format.
Create

Creates a graphical resource without binding to a chart object.

```cpp
virtual bool Create(
    const string name, // name
    const int width,   // width
    const int height,  // height
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA // format
);
```

**Parameters**

- **name**
  - [in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

- **width**
  - [in] Width (size along X axis) in pixels.

- **height**
  - [in] Height (size along Y axis) in pixels.

- **clrfmt=COLOR_FORMAT_XRGB_NOALPHA**
  - [in] Color processing method. See [ResourceCreate()](#) function description to learn more about color processing methods.

**Return Value**

- true - successful, otherwise - false
## CreateBitmap

Creates a graphical resource bound to a chart object.

1. Creates a graphical resource in the main window of the current chart.

```cpp
bool CreateBitmap(
    const string name,       // name
    const datetime time,     // time
    const double price,      // price
    const int width,         // width
    const int height,        // height
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA  // format
);
```

2. Creates a graphical resource using a chart ID and a subwindow number.

```cpp
bool CreateBitmap(
    const long chart_id,     // chart ID
    const int subwin,        // subwindow number
    const string name,       // name
    const datetime time,     // time
    const double price,      // price
    const int width,         // width
    const int height,        // height
    ENUM_COLOR_FORMAT  clrfmt=COLOR_FORMAT_XRGB_NOALPHA // format
);
```

### Parameters

- **chart_id**
  
  [in] Chart ID for creating an object.

- **subwin**
  
  [in] Chart subwindow number for creating an object.

- **name**
  
  [in] Chart object name and a basis for a graphical resource name.

- **time**
  
  [in] Chart object anchor point time coordinate.

- **price**
  
  [in] Chart object anchor point price coordinate.

- **width**
  
  [in] Graphical resource width (size along X axis) in pixels.

- **height**
  

- **clrfmt**
  
  [in] Initial color format.
[in] Color processing method. See ResourceCreate() function description to learn more about color processing methods.

Return Value

true - successful, otherwise - false

Note

If the first function version is used, the object is created in the main window of the current chart. Object size coincides with the size of a graphical resource.
CreateBitmapLabel

Creates a graphical resource bound to a chart object.

1. Creates a graphical resource in the main window of the current chart.

```cpp
bool CreateBitmapLabel(
    const string name, // name
    const int x, // X coordinate
    const int y, // Y coordinate
    const int width, // width
    const int height, // height
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA // format
);
```

2. Creates a graphical resource using a chart ID and a subwindow number.

```cpp
bool CreateBitmapLabel(
    const long chart_id, // chart ID
    const int subwin, // subwindow number
    const string name, // name
    const int x, // X coordinate
    const int y, // Y coordinate
    const int width, // width
    const int height, // height
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA // format
);
```

Parameters

- `chart_id`
  - [in] Chart ID for creating an object.

- `subwin`
  - [in] Chart subwindow number for creating an object.

- `name`
  - [in] Chart object name and a basis for a graphical resource name.

- `x`
  - [in] Chart object anchor point X coordinate.

- `y`
  - [in] Chart object anchor point Y coordinate.

- `width`
  - [in] Graphical resource width (size along X axis) in pixels.

- `height`
  - [in] Graphical resource height (size along Y axis) in pixels.

- `clrfmt=COLOR_FORMAT_XRGB_NOALPHA`
[in] Color processing method. See ResourceCreate() function description to learn more about color processing methods.

Return Value

true - successful, otherwise - false

Note

If the first function version is used, the object is created in the main window of the current chart.

Object size coincides with the size of a graphical resource.
Destroy

Destroys a graphical resource.

```cpp
void Destroy();
```

Note

If a graphical resource has been bound to a chart object, the latter is deleted.
Ellipse

Draws an ellipse using two points.

```c
void Ellipse(
    int x1,       // X coordinate
    int y1,       // Y coordinate
    int x2,       // X coordinate
    int y2,       // Y coordinate
    const uint clr  // color
);
```

**Parameters**

- **x1**
  - [in] X coordinate of the first point forming an ellipse.

- **y1**
  - [in] Y coordinate of the first point forming an ellipse.

- **x2**
  - [in] X coordinate of the second point forming an ellipse.

- **y2**
  - [in] Y coordinate of the second point forming an ellipse.

- **clr**
  - [in] Color in ARGB format.
EllipseAA

Draws an ellipse based on two points using anti-aliasing algorithm.

```c
void EllipseAA(  
    int x1,       // X coordinate  
    int y1,       // Y coordinate  
    int x2,       // X coordinate  
    int y2,       // Y coordinate  
    const uint clr // color
);
```

**Parameters**

- `x1`
  - [in] X coordinate of the first point forming an ellipse.
- `y1`
  - [in] Y coordinate of the first point forming an ellipse.
- `x2`
  - [in] X coordinate of the second point forming an ellipse.
- `y2`
  - [in] Y coordinate of the second point forming an ellipse.
- `clr`
  - [in] Color in ARGB format.
**EllipseWu**

Draws an ellipse based on two points using Wu's anti-aliasing algorithm.

```c
void EllipseWu(
    int x1,       // X coordinate
    int y1,       // Y coordinate
    int x2,       // X coordinate
    int y2,       // Y coordinate
    const uint clr // color
);
```

**Parameters**

- **x1**
  - [in] X coordinate of the first point forming an ellipse.
- **y1**
  - [in] Y coordinate of the first point forming an ellipse.
- **x2**
  - [in] X coordinate of the second point forming an ellipse.
- **y2**
  - [in] Y coordinate of the second point forming an ellipse.
- **clr**
  - [in] Color in ARGB format.
Erase

Erases or fills with the specified color.

```cpp
void Erase(
    const uint clr=0    // color
);
```

Parameters

- `clr=0`  
  [in] Color in ARGB format.
**Fill**

Fills an area.

```c
void Fill(
    int x,  // X coordinate
    int y,  // Y coordinate
    const uint clr  // color
);
```

**Parameters**

- **x**
  - [in] X coordinate of filling starting point.

- **y**
  - [in] Y coordinate of filling starting point.

- **clr**
  - [in] Color in ARGB format.
FillCircle

Draws a filled circle.

```cpp
void FillCircle(
    int x, // X coordinate
    int y, // Y coordinate
    int r, // radius
    const uint clr // color
);
```

**Parameters**

- `x`
  - [in] X coordinate of a filled circle center.

- `y`
  - [in] Y coordinate of a filled circle center.

- `r`
  - [in] Filled circle radius.

- `clr`
  - [in] Color in ARGB format.
FillRectangle

Draws a filled rectangle.

```c
void FillRectangle(
    int  x1,  // X coordinate
    int  y1,  // Y coordinate
    int  x2,  // X coordinate
    int  y2,  // Y coordinate
    const uint clr  // color
);
```

Parameters

x1  
[in] X coordinate of the first point forming a rectangle.

y1  
[in] Y coordinate of the first point forming a rectangle.

x2  
[in] X coordinate of the second point forming a rectangle.

y2  
[in] Y coordinate of the second point forming a rectangle.

clr  
[in] Color in ARGB format.
FillTriangle

Draws a filled triangle.

```c
void FillTriangle(
    int   x1,  // X coordinate
    int   y1,  // Y coordinate
    int   x2,  // X coordinate
    int   y2,  // Y coordinate
    int   x3,  // X coordinate
    int   y3,  // Y coordinate
    const uint clr  // color
);
```

Parameters

- **x1**
  - [in] X coordinate of the triangle's first corner.
- **y1**
  - [in] Y coordinate of the triangle's first corner.
- **x2**
  - [in] X coordinate of the triangle's second corner.
- **y2**
  - [in] Y coordinate of the triangle's second corner.
- **x3**
  - [in] X coordinate of the triangle's third corner.
- **y3**
  - [in] Y coordinate of the triangle's third corner.
- **clr**
  - [in] Color in ARGB format.
FontAngleGet

Receives font slope angle.

```c
uint FontAngleGet();
```

Return Value

font slope angle
FontAngleSet

Sets font slope angle.

```cpp
bool FontAngleSet(
    uint angle // angle
);
```

**Parameters**

angle

**Return Value**

true - successful, otherwise - false
FontFlagsGet

Receives font flags.

```c
uint FontFlagsGet();
```

Return Value

- `font flags`
FontFlagsSet

Sets font flags.

```plaintext
bool FontFlagsSet(
    uint flags // flags
);
```

Parameters

flags

[in] Font creation flags. See TextSetFont() function description to learn more about the flags.

Return Value

true - successful, otherwise - false
FontGet

Receives the current font parameters.

```c
void FontGet(
    string& name,  // name
    int& size,     // size
    uint& flags,   // flags
    uint& angle,   // slope angle
);
```

Parameters

- **name**
  - [out] Reference to the variable for returning a font name.

- **size**
  - [out] Reference to the variable for returning a font size.

- **flags**
  - [out] Reference to the variable for returning font flags.

- **angle**
  - [out] Reference to the variable for returning a font slope angle.
FontNameGet

Receives font name.

```cpp
string FontNameGet();
```

Return Value

font name
FontNameSet

Sets font name.

```cpp
bool FontNameSet(
    string name // name
);
```

Parameters

name

[in] Font name. For example, "Arial".

Return Value

true - successful, otherwise - false
FontSet

Sets the current font.

```c
bool FontSet(
    const string name, // name
    const int size,   // size
    const uint flags=0, // flags
    const uint angle=0 // angle
);
```

Parameters

name

[in] Font name. For example, "Arial".

size

[in] Font size. See TextSetFont() function description to learn more about setting a size.

flags=0

[in] Font creation flags. See TextSetFont() function description to learn more about the flags.

angle=0

Return Value

true - successful, otherwise - false
FontSizeGet

Receives font size.

```c
int FontSizeGet();
```

Return Value

font size
**FontSizeSet**

Sets font size.

```c
bool FontSizeSet(
    int size // size
);
```

**Parameters**

`size`

[in] Font size. See [TextSetFont()](#) function description to learn more about setting a size.

**Return Value**

true - successful, otherwise - false
**Height**

Receives the height of a graphical resource.

```c
int Height();
```

**Return Value**

height of a graphical resource
Line

Draws a segment of a freehand line.

```c
void Line(
    int    x1,       // X coordinate
    int    y1,       // Y coordinate
    int    x2,       // X coordinate
    int    y2,       // Y coordinate
    const uint clr    // color
);
```

**Parameters**

- **x1**
  - [in] X coordinate of the segment's first point.

- **y1**
  - [in] Y coordinate of the segment's first point.

- **x2**
  - [in] X coordinate of the segment's second point.

- **y2**
  - [in] Y coordinate of the segment's second point.

- **clr**
  - [in] Color in ARGB format.
LineAA

Draws a segment of a freehand line using antialiasing algorithm.

```c
void LineAA(
    const int x1,       // X coordinate
    const int y1,       // Y coordinate
    const int x2,       // X coordinate
    const int y2,       // Y coordinate
    const uint clr,     // color
    const uint style=UINT_MAX // line style
);
```

Parameters

- **x1**
  - [in] X coordinate of the segment's first point.
- **y1**
  - [in] Y coordinate of the segment's first point.
- **x2**
  - [in] X coordinate of the segment's second point.
- **y2**
  - [in] Y coordinate of the segment's second point.
- **clr**
  - [in] Color in ARGB format.
- **style=UINT_MAX**
  - [in] Line style is one of `ENUM_LINE_STYLE` enumeration's values or a custom value.
LineWu

Draws a segment of a freehand line using Wu's anti-aliasing algorithm.

```cpp
void LineWu(
    const int x1,  // X coordinate
    const int y1,  // Y coordinate
    const int x2,  // X coordinate
    const int y2,  // Y coordinate
    const uint clr, // color
    const uint style=UINT_MAX // line style
);
```

**Parameters**

- **x1**
  - [in] X coordinate of the segment's first point.

- **y1**
  - [in] Y coordinate of the segment's first point.

- **x2**
  - [in] X coordinate of the segment's second point.

- **y2**
  - [in] Y coordinate of the segment's second point.

- **clr**
  - [in] Color in ARGB format.

- **style=UINT_MAX**
  - [in] Line style is one of `ENUM_LINE_STYLE` enumeration's values or a custom value.
LineHorizontal

Draws a segment of a horizontal line.

```c
void LineHorizontal(
    int x1,    // X coordinate
    int x2,    // X coordinate
    int y,     // Y coordinate
    const uint clr // color
);
```

Parameters

x1

[in] X coordinate of the segment's first point.

x2

[in] X coordinate of the segment's second point.

y

[in] Segment's Y coordinate.

clr

[in] Color in ARGB format.
LineVertical

Draws a segment of a vertical line.

```c
void LineVertical(
    int x,       // X coordinate
    int y1,      // Y coordinate
    int y2,      // Y coordinate
    const uint clr  // color
);
```

**Parameters**

- `x`  
  [in] Segment's X coordinate.

- `y1`  
  [in] Y coordinate of the segment's first point.

- `y2`  
  [in] Y coordinate of the segment's second point.

- `clr`  
  [in] Color in ARGB format.
LineStyleSet

Sets the line style.

```cpp
void LineStyleSet(
    const uint style // style
);
```

Parameters

- `style`
  
  [in] Line style.

Note

The input parameter can have any of ENUM_LINE_STYLE enumeration values. Besides, it is possible to create a custom line drawing style.
LineThick

Draws a segment of a freehand line having a specified width using antialiasing algorithm.

```c
void LineThick(
    const int x1, // X coordinate of the segment's first point
    const int y1, // Y coordinate of the segment's first point
    const int x2, // X coordinate of the segment's second point
    const int y2, // Y coordinate of the segment's second point
    const uint clr, // color
    const int size, // line width
    const uint style, // line style
    ENUM_LINE_END end_style // line ends style
);
```

Parameters

x1
  [in] X coordinate of the segment's first point.

y1
  [in] Y coordinate of the segment's first point.

x2
  [in] X coordinate of the segment's second point.

y2
  [in] Y coordinate of the segment's second point.

clr
  [in] Color in ARGB format.

size
  [in] Line width.

style
  [in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

end_style
  [in] Line style is one of the ENUM_LINE_END enumeration's values

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINE_END_ROUND</td>
<td>Line ends are rounded.</td>
</tr>
<tr>
<td>LINE_END_BUTT</td>
<td>Line ends are cut.</td>
</tr>
<tr>
<td>LINE_END_SQUARE</td>
<td>A line ends in a filled rectangle.</td>
</tr>
</tbody>
</table>
LineThickVertical

Draws a vertical segment of a freehand line having a specified width using antialiasing algorithm.

```cpp
void LineThickVertical(
    const int x, // X coordinate of the segment
    const int y1, // Y coordinate of the segment's first point
    const int y2, // Y coordinate of the segment's second point
    const uint clr, // color
    const int size, // line width
    const uint style, // line style
    ENUM_LINE_END end_style // line ends style
);
```

Parameters

- `x`  
  [in] Segment's X coordinate.

- `y1`  
  [in] Y coordinate of the segment's first point.

- `y2`  
  [in] Y coordinate of the segment's second point.

- `clr`  
  [in] Color in ARGB format.

- `size`  
  [in] Line width.

- `style`  
  [in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

- `end_style`  
  [in] Line style is one of the ENUM_LINE_END enumeration's values.
LineThickHorizontal

Draws a horizontal segment of a freehand line having a specified width antialiasing.

```cpp
void LineThickHorizontal(
    const int x1,          // X coordinate of the segment's first point
    const int x2,          // X coordinate of the segment's second point
    const int y,           // Y coordinate of the segment
    const uint clr,        // color
    const int size,        // line width
    const uint style,      // line style
    ENUM_LINE_END end_style  // line ends style
)
```

**Parameters**

- **x1**
  
  [in] X coordinate of the segment's first point.

- **x2**
  
  [in] X coordinate of the segment's second point.

- **y**
  
  [in] Segment's Y coordinate.

- **clr**
  
  [in] Color in ARGB format.

- **size**
  
  [in] Line width.

- **style**
  
  [in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

- **end_style**
  
  [in] Line style is one of the ENUM_LINE_END enumeration's values.
LoadFromFile

Reads an image from a BMP file.

```cpp
bool LoadFromFile(
    const string filename // file name
);
```

Parameters

filename

[in] File name (including "BMP" extension).

Return Value

true - successful, otherwise - false
PixelGet

Receives color of the point with the specified coordinates.

```c
uint PixelGet(
    const int x,  // X coordinate
    const int y   // Y coordinate
);
```

Parameters

- `x`
  - [in] Point's X coordinate.
- `y`
  - [in] Point's Y coordinate.

Return Value

Point color in ARGB format.
PixelSet

Sets color of the point with the specified coordinates.

```cpp
void PixelSet(
    const int x, // X coordinate
    const int y, // Y coordinate
    const uint clr // color
);
```

**Parameters**

- `x`  
  - [in] Point's X coordinate.

- `y`  
  - [in] Point's Y coordinate.

- `clr`  
  - [in] Color in ARGB format.
PixelSetAA

Draws a point using antialiasing algorithm.

```cpp
void PixelSetAA(
    const double x,  // X coordinate
    const double y,  // Y coordinate
    const uint clr   // color
);
```

**Parameters**

- `x`  
  [in] Point's X coordinate.

- `y`  
  [in] Point's Y coordinate.

- `clr`  
  [in] Color in ARGB format.
Polygon

Draws a polygon.

```cpp
void Polygon(
    int& x[], // array of X coordinates
    int& y[], // array of Y coordinates
    const uint clr // color
);
```

Parameters

- `x[]`
  - [in] Array of X coordinates of a polygon points.

- `y[]`

- `clr`
  - [in] Color in ARGB format.
**PolygonAA**

Draws a polygon using antialiasing algorithm.

```cpp
void PolygonAA(
    int& x[], // array of X coordinates
    int& y[], // array of Y coordinates
    const uint clr, // color
    const uint style=UINT_MAX // line style
);
```

**Parameters**

- `x[]`
  - [in] Array of X coordinates of a polygon points.

- `y[]`

- `clr`
  - [in] Color in ARGB format.

- `style=UINT_MAX`
  - [in] Line style is one of [ENUM_LINE_STYLE] enumeration's values or a custom value.
**PolygonWu**

Draws a polygon using Wu's anti-aliasing algorithm.

```cpp
void PolygonWu(
    int& x[],          // array of X coordinates
    int& y[],          // array of Y coordinates
    const uint clr,    // color
    const uint style=UINT_MAX  // line style
);
```

**Parameters**

- `x[]`
  - [in] Array of X coordinates of a polygon points.

- `y[]`

- `clr`
  - [in] Color in ARGB format.

- `style=UINT_MAX`
  - [in] Line style is one of `ENUM_LINE_STYLE` enumeration's values or a custom value.
**PolygonThick**

**Draws a polygon with a specified width using antialiasing algorithm.**

```cpp
void PolygonThick(
    const int& x[],  // array with the X coordinates of polygon points
    const int& y[],  // array with the Y coordinates of polygon points
    const uint clr,   // color
    const int size,   // line width
    const uint style, // line style
    ENUM_LINE_END end_style  // line ends style
)
```

**Parameters**

*x[]*

[**in**] Array of X coordinates of polygon points.

*y[]*

[**in**] Array of Y coordinates of polygon points.

*clr*

[**in**] Color in ARGB format.

*size*

[**in**] Line width.

*style*

[**in**] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

*end_style*

[**in**] Line style is one of the ENUM_LINE_END enumeration's values.
PolygonSmooth

Draws a polygon with a specified width consecutively using two antialiasing algorithms. First, individual segments are smoothed based on Bezier curves. Then, the raster antialiasing algorithm is applied to the polygon built from these segments to improve the rendering quality.

```cpp
void PolygonSmooth(
    int& x[], // array with the X coordinates of polygon points.
    int& y[], // array with the Y coordinates of polygon points.
    const uint clr, // color
    const int size, // line width
    ENUM_LINE_STYLE style=STYLE_SOLID, // line style
    ENUM_LINE_END end_style=LINE_END_ROUND, // line ends style
    double tension=0.5, // antialiasing parameter value
    double step=10 // length of approximation lines
)
```

**Parameters**

x[]

- **[in]** Array of X coordinates of polygon points.

y[]

- **[in]** Array of Y coordinates of polygon points.

clr

- **[in]** Color in ARGB format.

size

- **[in]** Line width.

style=STYLE_SOLID

- **[in]** Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

double tension=0.5

- **[in]** Smoothing parameter value.

end_style=LINE_END_ROUND

- **[in]** Line style is one of the ENUM_LINE_END enumeration's values.

double step=10

- **[in]** Length of approximating lines.
Polyline

Draws a polyline.

```c
void Polyline(
    int& x[],  // array of X coordinates
    int& y[],  // array of Y coordinates
    const uint clr  // color
);
```

Parameters

- `x[]`

- `y[]`

- `clr`
  - [in] Color in ARGB format.
PolylineSmooth

Draws a polyline with a specified width consecutively using two antialiasing algorithms. First, individual line segments are smoothed based on Bezier curves. Then, the raster antialiasing algorithm is applied to the polyline built from these segments to improve the rendering quality.

```cpp
void PolylineSmooth(
    const int& x[],       // array with the X coordinates of polyline
    const int& y[],       // array with the Y coordinates of polyline
    const uint clr,       // color
    const int size,       // line width
    ENUM_LINE_STYLE style=STYLE_SOLID, // line style
    ENUM_LINE_END end_style=LINE_END_ROUND, // line ends style
    double tension=0.5,   // antialiasing parameter value
    double step=10        // approximation step
)
```

Parameters

- `&x[]` 

- `&y[]` 

- `clr` 
  [in] Color in ARGB format.

- `size` 
  [in] Line width.

- `style=STYLE_SOLID` 
  [in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

- `end_style=LINE_END_ROUND` 
  [in] Line style is one of the ENUM_LINE_END enumeration's values.

- `tension=0.5` 
  [in] Smoothing parameter value.

- `step=10` 
PolylineThick

Draws a polyline with a specified width using an antialiasing algorithm.

```cpp
void PolylineThick(  
    const int &x[],   // array with the X coordinates of polyline points
    const int &y[],   // array with the Y coordinates of polyline points
    const uint clr,   // color
    const int size,   // line width
    const uint style, // line style
    ENUM_LINE_END end_style // line ends style
)
```

**Parameters**

- `&x[]`  

- `&y[]`  

- `clr`  
  [in] Color in ARGB format.

- `size`  
  [in] Line width.

- `style`  
  [in] Line style is one of the ENUM_LINE_STYLE enumeration's values or a custom value.

- `end_style`  
  [in] Line style is one of the ENUM_LINE_END enumeration's values.
PolylineWu

Draws a polyline using Wu’s anti-aliasing algorithm.

```cpp
void PolylineWu(
    int& x[], // array of X coordinates
    int& y[], // array of Y coordinates
    const uint clr, // color
    const uint style=UINT_MAX // line style
);
```

**Parameters**

- `x[]`  

- `y[]`  

- `clr`  
  [in] Color in ARGB format.

- `style=UINT_MAX`  
  [in] Line style is one of `ENUM_LINE_STYLE` enumeration's values or a custom value.
PolylineAA

Draws a polyline using antialiasing algorithm.

```c
void PolylineAA(
    int& x[],   // array of X coordinates
    int& y[],   // array of Y coordinates
    const uint clr,   // color
    const uint style=UINT_MAX  // line style
);
```

**Parameters**

- **x[]**

- **y[]**

- **clr**
  - [in] Color in ARGB format.

- **style=UINT_MAX**
  - [in] Line style is one of **ENUM_LINE_STYLE** enumeration's values or a custom value.
Rectangle

Draws a rectangle using two points.

```c
void Rectangle(
    int x1,       // X coordinate
    int y1,       // Y coordinate
    int x2,       // X coordinate
    int y2,       // Y coordinate
    const uint clr // color
);
```

Parameters

- `x1`  
  [in] X coordinate of the first point forming a rectangle.

- `y1`  
  [in] Y coordinate of the first point forming a rectangle.

- `x2`  
  [in] X coordinate of the second point forming a rectangle.

- `y2`  
  [in] Y coordinate of the second point forming a rectangle.

- `clr`  
  [in] Color in ARGB format.
Resize

Resizes a graphical resource.

```cpp
bool Resize(
    const int width,  // width
    const int height  // height
);
```

Parameters

- **width**
  - [in] New width of a graphical resource.

- **height**

Return Value

- true - successful, otherwise - false

Note

When resizing, the previous image is not saved.
ResourceName

Receives the name of a graphical resource.

```c
string ResourceName();
```

Return Value

name of a graphical resource
**TextHeight**

Receives the text height.

```cpp
int TextHeight(
    const string text    // text
);
```

**Parameters**

- `text`

**Return Value**

- text height in pixels

**Note**

The current font is used for measuring the text.
TextOut

Displays text.

```c
void TextOut(
    int x,  // X coordinate
    int y,  // Y coordinate
    string text,  // text
    const uint clr,  // color
    uint alignment=0  // alignment
);
```

**Parameters**

- **x**

- **y**

- **text**
  - [in] Text to be displayed.

- **clr**
  - [in] Color in ARGB format.

- **alignment=0**
  - [in] Text anchoring method. See [TextOut()](#) function description to learn more about anchoring methods.

**Note**

The current font is used to display the text.
TextSize

Receives the text size.

```c
void TextSize(
    const string text,  // text
    int& width,        // width
    int& height        // height
);
```

**Parameters**

- **text**

- **width**
  - [out] Reference to the variable for returning a text width.

- **height**
  - [out] Reference to the variable for returning a text height.

**Note**

The current font is used to measure the text.
**TextWidth**

Receives the text width.

```c
int TextWidth(
    const string text  // text
);
```

**Parameters**

*text*

**Return Value**

text height in pixels

**Note**

The current font is used to measure the text.
**TransparentLevelSet**

Sets transparency level.

```cpp
void TransparentLevelSet(
    const uchar value // value
);
```

**Parameters**

- `value` [in] New value of the transparency level.

**Note**

0 stands for full transparency, while 255 - for full opacity.

Setting a transparency level affects all that was previously drawn. The specified transparency level does not affect further constructions.
Triangle

Draws a triangle.

```c
void Triangle(
    int   x1,   // X coordinate
    int   y1,   // Y coordinate
    int   x2,   // X coordinate
    int   y2,   // Y coordinate
    int   x3,   // X coordinate
    int   y3,   // Y coordinate
    const uint clr   // color
);
```

Parameters

- **x1**
  - [in] X coordinate of the triangle's first corner.

- **y1**
  - [in] Y coordinate of the triangle's first corner.

- **x2**
  - [in] X coordinate of the triangle's second corner.

- **y2**
  - [in] Y coordinate of the triangle's second corner.

- **x3**
  - [in] X coordinate of the triangle's third corner.

- **y3**
  - [in] Y coordinate of the triangle's third corner.

- **clr**
  - [in] Color in ARGB format.
TriangleAA

Draws a triangle using antialiasing algorithm.

```c
void TriangleAA(
    const int x1,       // X coordinate
    const int y1,       // Y coordinate
    const int x2,       // X coordinate
    const int y2,       // Y coordinate
    const int x3,       // X coordinate
    const int y3,       // Y coordinate
    const uint clr,     // color
    const uint style=UINT_MAX  // line style
);
```

**Parameters**

- `x1`  
  [in] X coordinate of the triangle's first corner.

- `y1`  
  [in] Y coordinate of the triangle's first corner.

- `x2`  
  [in] X coordinate of the triangle's second corner.

- `y2`  
  [in] Y coordinate of the triangle's second corner.

- `x3`  
  [in] X coordinate of the triangle's third corner.

- `y3`  
  [in] Y coordinate of the triangle's third corner.

- `clr`  
  [in] Color in ARGB format.

- `style=UINT_MAX`  
  [in] Line style is one of `ENUM_LINE_STYLE` enumeration's values or a custom value.
TriangleWu

Draws a triangle using Wu's anti-aliasing algorithm.

```c
void TriangleWu(
    const int x1,       // X coordinate
    const int y1,       // Y coordinate
    const int x2,       // X coordinate
    const int y2,       // Y coordinate
    const int x3,       // X coordinate
    const int y3,       // Y coordinate
    const uint clr,     // color
    const uint style=UINT_MAX  // line style
);
```

Parameters

- `x1` [in] X coordinate of the triangle's first corner.
- `y1` [in] Y coordinate of the triangle's first corner.
- `x2` [in] X coordinate of the triangle's second corner.
- `y2` [in] Y coordinate of the triangle's second corner.
- `x3` [in] X coordinate of the triangle's third corner.
- `y3` [in] Y coordinate of the triangle's third corner.
- `clr` [in] Color in ARGB format.
- `style=UINT_MAX` [in] Line style is one of `ENUM_LINE_STYLE` enumeration's values or a custom value.
Update

Displays changes on the screen.

```cpp
void Update(const bool redraw=true // flag );
```

Parameters

`redraw=true`

Flag of a chart redrawing necessity.
Width

Receives the width of a graphical resource.

```c
int Width();
```

Return Value

- graphical resource width
CChartCanvas

Base class for implementing classes, which are used for drawing charts and their elements.

Description

This class includes methods for working with the basic elements of any chart: coordinate axes and their marks, chart legend, grid, background, etc. Here you can customize the options for displaying elements: visibility, text color, etc.

Declaration

```c++
class CChartCanvas : public CCanvas
```

Title

```c
#include <Canvas\Charts\ChartCanvas.mqh>
```

Inheritance hierarchy

```
CCanvas
   CChartCanvas
```

Direct descendants

```
CHistogramChart, CLineChart, CPieChart
```

</tbody>
</table>

Methods inherited from class `CCanvas`

Standard Library

`TextOut`, `TextWidth`, `TextHeight`, `TextSize`, `GetDefaultColor`, `TransparentLevelSet`, `LoadFromFile`, `LineStyleGet`, `LineStyleSet`
ColorBackground (Get method)

Returns the background color.

```cpp
uint ColorBackground() {
    // background color
}
```

Return Value

Background color.

ColorBackground (Set method)

Sets the background color.

```cpp
void ColorBackground(
    const uint value, // background color
) {
    // background color
}
```

Parameters

- `value`
  - [in] Background color.
ColorBorder (Get method)

Returns the border color.

```c
uint ColorBorder()
```

Return Value

Border color.

ColorBorder (Set method)

Sets the border color.

```c
void ColorBorder(
    const uint value, // border color
)
```

Parameters

value

[in] Border color.
**ColorText (Get method)**

Returns the text color.

```c
uint ColorText()
```

**Return Value**

Text color.

**ColorText (Set method)**

Sets the text color.

```c
void ColorText(
    const uint value,  // text color
)
```

**Parameters**

`value`

ColorGrid (Get method)

Returns the grid color.

```c
uint ColorGrid()
```

Return Value

Grid color.

ColorGrid (Set method)

Sets the grid color.

```c
void ColorGrid(
    const uint value,  // grid color
)
```

Parameters

- `value`
MaxData (Get method)

Returns the maximum amount of data (series) allowed.

```csharp
uint MaxData()
```

Return Value

The maximum amount of data (series).

MaxData (Set method)

Sets the maximum amount of data (series) allowed.

```csharp
void MaxData(
    const uint value,  // amount of data
)
```

Parameters

`value`

[in] The maximum amount of data (series).
MaxDescrLen (Get method)

Returns the maximum length of the descriptors.

```c
uint MaxDescrLen()
```

Return Value

The value of the maximum length of the descriptors.

MaxDescrLen (Set method)

Sets the maximum length of the descriptors.

```c
void MaxDescrLen(
    const uint value,  // maximum length
)
```

Parameters

value

[in] The value of the maximum length of the descriptors.
ShowFlags (Get method)

Returns the visibility flag of the chart elements.

```csharp
bool ShowFlags()
```

Return Value

Value of the visibility flag of the chart elements.

ShowFlags (Set method)

Sets the visibility flag of the chart elements.

```csharp
void ShowFlags(
    const uint flags, // flag
)
```

Parameters

flags

[in] Value of the visibility flag of the chart elements.
**IsShowLegend**

Returns and sets the visibility flag of the legend on the chart.

```cpp
bool IsShowLegend()
```

**Return Value**

- `true` if the legend is visible, otherwise `false`. 
IsShowScaleLeft

Returns the visibility flag of the scale of values on the left.

```
bool IsShowScaleLeft()
```

Return Value

true if the scale of values is visible, otherwise — false.
IsShowScaleRight

Returns the visibility flag of the scale of values on the right.

```cpp
bool IsShowScaleRight()
```

Return Value

true if the scale of values is visible, otherwise — false.
**IsShowScaleTop**

Returns the visibility flag of the scale of values at the top.

```cpp
bool IsShowScaleTop()
```

**Return Value**

true if the scale of values is visible, otherwise — false.
IsShowScaleBottom

Returns the visibility flag of the scale of values at the bottom.

```cpp
bool IsShowScaleBottom()
```

**Return Value**

true if the scale of values is visible, otherwise — false.
IsShowGrid

Returns the visibility flag of the grid on the chart.

```c
bool IsShowGrid()
```

Return Value

true if the grid is visible, otherwise – false.
IsShowDescriptors

Returns the visibility flag of the descriptors on the chart.

```
bool IsShowDescriptors()
```

**Return Value**

true if the descriptors are visible, otherwise — false.
**IsShowPercent**

Returns the visibility flag of the percentages on the chart.

```cpp
bool IsShowPercent()
```

**Return Value**

- true if the percentages are visible, otherwise — false.
**VScaleMin (Get method)**

Returns the minimum on the vertical scale of values.

```cpp
double VScaleMin()
```

**Return Value**

The minimum value on the vertical scale.

**VScaleMin (Set method)**

Sets the minimum on the vertical scale of values.

```cpp
void VScaleMin(
    const double value,  // value on the vertical scale
)
```

**Parameters**

- `value`
  
  [in] The minimum value.
**VScaleMax**

Returns the maximum on the vertical scale of values.

```cpp
double VScaleMax()
```

**Return Value**

The maximum value on the vertical scale.

**VScaleMax**

Sets the maximum on the vertical scale of values.

```cpp
void VScaleMax(
    const double value,  // value on the vertical scale
)
```

**Parameters**

value

[in] The maximum value.
**NumGrid**

Returns the number of vertical scale divisions when plotting the chart grid.

```c
uint NumGrid()
```

**Return Value**

- The number of divisions.

**NumGrid**

Sets the number of vertical scale divisions when plotting the chart grid.

```c
void NumGrid(
    const uint value,  // number of divisions
)
```

**Parameters**

- **value**
  - [in] The number of divisions.
**DataOffset**

Returns the data offset value.

```c
int DataOffset()
```

**Return Value**

Data offset.

**DataOffset**

Sets the data offset value.

```c
void DataOffset(
    const int value,  // offset
)
```

**Parameters**

- `value`  
  [in] Data offset.
**DataTotal**

Returns the total number of data series on the chart.

```mql
uint DataTotal()
```

**Return Value**

The number of series.
**DrawDescriptors**

Virtual method for drawing descriptors.

```cpp
virtual void DrawDescriptors()
```
DrawData

Virtual method for drawing data series at the specified index.

```cpp
virtual void DrawData(
    const uint idx=0, // index
)
```

**Parameters**

`idx=0`

[in] Index of the series.
Create

Virtual method that creates a graphical resource.

```cpp
virtual bool Create(
    const string name,     // resource name
    const int width,       // width
    const int height,      // height
    ENUM_COLOR_FORMAT clrfmt  // format
);
```

**Parameters**

- **name**
  - [in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

- **width**
  - [in] Width (size along X axis) in pixels.

- **height**
  - [in] Height (size along Y axis) in pixels.

- **clrfmt**
  - [in] Color processing method. See the `ResourceCreate()` function description to learn more about color processing methods.

**Return Value**

- true if successful, otherwise — false.
AllowedShowFlags

Sets the set of allowed visibility flags for chart elements.

```c
void AllowedShowFlags(
    const uint flags,  // flags
)
```

Parameters

flags

ShowLegend

Sets the visibility flag value for the legend (FLAG_SHOW_LEGEND).

```cpp
void ShowLegend(
    const bool flag, // flag value
)
```

**Parameters**

`flag`

[in] Flag value:

- true — the legend becomes visible.
- false — the legend becomes invisible.
ShowScaleLeft

Sets the visibility flag value for the left scale (FLAG_SHOW_SCALE_LEFT).

```cpp
void ShowScaleLeft(
    const bool flag, // flag value
)
```

Parameters

flag

[in] Flag value:

- true — the left scale becomes visible.
- false — the left scale becomes invisible.
ShowScaleRight

Sets the visibility flag value for the right scale (FLAG_SHOW_SCALE_RIGHT).

```cpp
void ShowScaleRight(
    const bool flag,  // flag value
)
```

Parameters

`flag`

[in] Flag value:

- true — the right scale becomes visible.
- false — the right scale becomes invisible.
ShowScaleTop

Sets the visibility flag value for the top scale (FLAG_SHOW_SCALE_TOP).

```cpp
void ShowScaleTop(
    const bool flag,  // flag value
)
```

Parameters

flag

[in] Flag value:

- true — the top scale becomes visible.
- false — the top scale becomes invisible.
ShowScaleBottom

Sets the visibility flag value for the bottom scale (FLAG_SHOW_SCALE_BOTTOM).

```cpp
void ShowScaleBottom(
    const bool flag,  // flag value
)
```

**Parameters**

*flag*

[In] Flag value:

- true — the bottom scale becomes visible.
- false — the bottom scale becomes invisible.
ShowGrid

Sets the visibility flag value for the grid (FLAG_SHOW_GRID).

```cpp
void ShowGrid(
    const bool flag, // flag value
)
```

Parameters

`flag`

[in] Flag value:

- true — the grid becomes visible.
- false — the grid becomes invisible.
ShowDescriptors

Sets the visibility flag value for the descriptors (FLAG_SHOW_DESCRIPTORS).

```cpp
void ShowDescriptors(
    const bool flag,  // flag value
)
```

Parameters

flag

[in] Flag value:

- true — the descriptor becomes visible.
- false — the descriptor becomes invisible.
ShowValue

Sets the visibility flag for the values (FLAG_SHOW_VALUE).

```c
void ShowValue(
    const bool flag,  // flag value
)
```

Parameters

`flag`

[in] Flag value:

- true — the value becomes visible.
- false — the value becomes invisible.
ShowPercent

Sets the visibility flag value for the percentages (FLAG_SHOW_PERCENT).

```cpp
void ShowPercent(
   const bool flag,  // flag value
)
```

**Parameters**

- **flag**
  
  [in] Flag value:
  
  - true — the percentage becomes visible.
  - false — the percentage becomes invisible.
LegendAlignment

Sets the text alignment for the legend.

```cpp
void LegendAlignment(
    const ENUM_ALIGNMENT value,  // flag
)
```

**Parameters**

`value`

[in] Takes one of the values of the ENUM_ALIGNMENT enumeration:

- ALIGNMENT_LEFT — alignment to the left.
- ALIGNMENT_TOP — alignment to the top.
- ALIGNMENT_RIGHT — alignment to the right.
- ALIGNMENT_BOTTOM — alignment to the bottom.
Accumulative

Sets the value accumulation flag for the series.

```cpp
void Accumulative(
    const bool flag=true, // flag value
)
```

**Parameters**

*flag=true*

[in] Flag value:

- true — the current value of the series is replaced by the sum of all previous values.
- false — the standard mode for drawing series.
VScaleParams

Sets the parameters for the vertical scale of values.

```c
void VScaleParams(
    const double max,  // maximum
    const double min,  // minimum
    const uint grid,   // number of divisions
)
```

Parameters

- **max**
  - [in] The minimum value.

- **min**
  - [in] The maximum value.

- **grid**
  - [in] The number of scale divisions.
DescriptorUpdate

Updates the value of the series descriptor (at the specified position).

```cpp
bool DescriptorUpdate(
    const uint  pos,  // index
    const string descr, // value
)
```

Parameters

`pos`

[in] Index of the series — the serial number of its addition, starting with 0.

`descr`

[in] Descriptor value.

Return Value

true if successful, otherwise — false.
ColorUpdate

Updates the series colors (at the specified position).

```cpp
bool ColorUpdate(
    const uint pos, // index
    const uint clr, // color
)
```

Parameters

`pos`

[in] Index of the series — the serial number of its addition, starting with 0.

`clr`

[in] Color value.

Return Value

true if successful, otherwise — false.
ValuesCheck

Auxiliary virtual method, performs internal calculations for plotting the chart.

```cpp
virtual void ValuesCheck()
```
Redraw

Virtual method for redrawing the chart.

```cpp
virtual void Redraw()
```
DrawBackground

Virtual method for redrawing the background.

```cpp
virtual void DrawBackground()
```
DrawLegend

Virtual method for redrawing the legend.

```cpp
virtual void DrawLegend()
```
DrawLegendVertical

Draws a vertical legend.

```c
int DrawLegendVertical(
    const int w, // width
    const int h, // height
)
```

**Parameters**

- `w`  
  - [in] The maximum width of the text in the legend.
- `h`  
  - [in] The maximum height of the text in the legend.

**Return Value**

Width of the legend in pixels.
DrawLegendHorizontal

Draws a horizontal legend.

```cpp
int DrawLegendHorizontal(const int w, //
                          const int h, //
                      }
```

**Parameters**

- `w`
  
  [in] The maximum width of the text in the legend.

- `h`
  
  [in] The maximum height of the text in the legend.

**Return Value**

Height of the legend in pixels.
CalcScales

Virtual method for calculating the coordinates of labels for the scale of values.

```cpp
virtual void CalcScales()
```
DrawScales

Virtual method for redrawing the all scales of values.

```cpp
virtual void DrawScales()
```
**DrawScaleLeft**

Virtual method for redrawing the left scale of values.

```cpp
virtual int DrawScaleLeft(
    const bool draw, // flag
)
```

**Parameters**

- `draw`  
  [in] Flag that indicates if the scale needs to be redrawn.

**Return Value**

- Width of the scale of values.
**DrawScaleRight**

Virtual method for redrawing the right scale of values.

```cpp
virtual int DrawScaleRight(
    const bool draw,  // flag
)
```

**Parameters**

* draw

  [in] Flag that indicates if the scale needs to be redrawn.

**Return Value**

Width of the scale of values.
DrawScaleTop

Virtual method for redrawing the top scale of values.

```cpp
virtual int DrawScaleTop(
    const bool draw,  // flag
)
```

**Parameters**

*draw*

[in] Flag that indicates if the scale needs to be redrawn.

**Return Value**

Height of the scale of values.
DrawScaleBottom

Virtual method for redrawing the bottom scale of values.

```cpp
virtual int DrawScaleBottom(
    const bool draw,  // flag
)
```

**Parameters**

draw

[in] Flag that indicates if the scale needs to be redrawn.

**Return Value**

Height of the scale of values.
**DrawGrid**

Virtual method for redrawing the grid.

```
virtual void DrawGrid()
```
DrawChart

Virtual method for redrawing the chart.

```cpp
virtual void DrawChart()
```
**CHistogramChart**

Class for plotting histograms.

**Description**

All methods for working with the plotting of histograms are implemented in this class. They can be used to set the column width and for configuring the work with data series. The methods for working with gradient filling of histogram columns are included, which allow to visualize the data more clearly.

The code of the above figure is provided below.

**Declaration**

```cpp
class CHistogramChart : public CChartCanvas
```

**Title**

```cpp
#include <Canvas\Charts\HistogramChart.mqh>
```

**Inheritance hierarchy**

```
CCanvas
    CChartCanvas
        CHistogramChart
```

                }
                chart.SeriesAdd(arr,"Item"+IntegerToString(j));
            }
        }
    }
    //--- play with values
    while(!IsStopped())
    { int i=rand()%5;
        int j=rand()%10;
        k=rand()%3000-1000;
        chart.ValueUpdate(i,j,k);
        Sleep(200);
    }
//--- finish
    chart.Destroy();
    return(0);
}
Gradient

Sets the flag indicating whether the gradient fill of the histogram columns will be applied.

```cpp
void Gradient(const bool flag=true, // flag value
              )
```

**Parameters**

`flag=true`

Flag value: true if the gradient fill is enabled, otherwise — false.
BarGap

Set the value of the histogram offset from the origin.

```c
void BarGap(
    const uint value, // offset
)
```

**Parameters**

- `value`

  [in] Value of the histogram offset.
BarMinSize

Sets the minimum width of the histogram columns.

```cpp
void BarMinSize(
    const uint value,   // minimum width
)
```

Parameters

- `value`
  - [in] The minimum width.
BarBorder

Sets the flag indicating the need to draw the border for each column.

```c
void BarBorder(
    const uint value, // flag
)
```

Parameters

`value`

[in] Flag value:

- true — borders will be drawn
- false — borders will not be drawn
Create

Virtual method that creates a graphical resource.

```cpp
virtual bool Create(
    const string name,  // name
    const int width,   // width
    const int height,  // height
    ENUM_COLOR_FORMAT clrfmt  // format
)
```

**Parameters**

*name*

[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

*width*

[in] Width (size along X axis) in pixels.

*height*

[in] Height (size along Y axis) in pixels.

*clrfmt*

[in] Color processing method. See the ResourceCreate() function description to learn more about color processing methods.

**Return Value**

true if successful, otherwise — false.
**SeriesAdd**

Adds a new data series.

```c++
bool SeriesAdd(
    const double& value[], // values
    const string& descr,   // label
    const uint clr,         // color
)
```

**Parameters**

*value[]*

*descr*

[in] Series label.

*clr*

[in] Series display color.

**Return Value**

true if successful, otherwise — false.
SeriesInsert

Inserts data series to the chart.

```cpp
bool SeriesInsert(
    const uint pos,   // index
    const double& value[], // values
    const string descr, // label
    const uint clr,    // color
)
```

**Parameters**

- `pos`  
  [in] Index for insertion.
- `value[]`  
- `descr`  
  [in] Series label.
- `clr`  
  [in] Series display color.

**Return Value**

- true if successful, otherwise — false.
SeriesUpdate

Updates data series on the chart.

```cpp
bool SeriesUpdate(
    const uint pos,   // index
    const double &value[], // values
    const string descr, // label
    const uint clr,    // color
)
```

**Parameters**

*pos*

[in] Index of the series — the serial number of its addition, starting with 0.

*value[]*

[in] New values for the data series.

*descr*

[in] Series label.

*clr*

[in] Series display color.

**Return Value**

true if successful, otherwise false.
**SeriesDelete**

Deletes data series from the chart.

```cpp
bool SeriesDelete(
    const uint pos,  // index
);
```

**Parameters**

*pos*

[in] Index of the series — the serial number of its addition, starting with 0.

**Return Value**

true if successful, otherwise — false.
ValueUpdate

Updates the specified value in the specified series.

```cpp
bool ValueUpdate(
    const uint series, // index of the series
    const uint pos,    // index of the element
    double value,      // value
)
```

**Parameters**

- `series`  
  [in] Index of the series — the serial number of its addition, starting with 0.

- `pos`  
  [in] Index of element in the series.

- `value`  
  [in] New value.

**Return Value**

true if successful, otherwise — false.
DrawData

Virtual method that plots a histogram for the specified series.

```cpp
virtual void DrawData(
    const uint index,  // index
)
```

**Parameters**

`index`

[in] Index of the series — the serial number of its addition, starting with 0.
DrawBar

Draws a histogram column as a filled rectangle.

```c
void DrawBar(
    const int x,   // X coordinate
    const int y,   // Y coordinate
    const int w,   // width
    const int h,   // height
    const uint clr, // color
)
```

Parameters

`x`

[in] X coordinate of the top left point of the rectangle.

`y`

[in] Y coordinate of the top left point of the rectangle.

`w`

[in] The width of the rectangle.

`h`

[in] The height of the rectangle.

`clr`

[in] The color of the rectangle.
GradientBrush

Creates a brush for the gradient fill.

```cpp
void GradientBrush(
  const int size,    // size
  const uint fill_clr, // fill color
)
```

Parameters

- `size`
  - [in] Brush thickness

- `fill_clr`
  - [in] Fill color
CLineChart

A class for plotting curves.

Description

The methods included in this class are designed for working with curves on the chart. It features the ability to fill the area limited by the plotted curve.

The code of the above figure is provided below.

Declaration

```cpp
class CLineChart : public CChartCanvas
```

Title

```cpp
#include <Canvas\Charts\LineChart.mqh>
```

Inheritance hierarchy

- CCanvas
  - CChartCanvas
    - CLineChart

Class methods

**Methods inherited from class CCanvas**

**Methods inherited from class CChartCanvas**

- ColorBackground, ColorBackground, ColorBorder, ColorBorder, ColorText, ColorText, ColorGrid, ColorGrid, MaxData, MaxData, MaxDescrLen, MaxDescrLen, AllowedShowFlags, ShowFlags, ShowFlags, IsShowLegend, IsShowScaleLeft, IsShowScaleRight, IsShowScaleTop, IsShowScaleBottom, IsShowGrid, IsShowDescriptors, IsShowPerCent, ShowLegend, ShowLegend, ShowLegend, ShowLegend, ShowScaleRight, ShowScaleTop, ShowScaleBottom, ShowGrid, ShowDescriptors, ShowValue, ShowPerCent, LegendAlignment, Accumulative, VScaleMin, VScaleMin, VScaleMax, VScaleMax, NumGrid, NumGrid, VScaleParams, DataOffset, DataOffset, DataTotal, DescriptorUpdate, ColorUpdate

**Example**

---

© 2000-2021, MetaQuotes Ltd
//--- create chart
CLineChart chart;
//--- create chart
if (chart.CreateBitmapLabel("Sample Histogram Chart", 10, 10, 600, 450))
{
    Print("Error creating line chart: ", GetLastError());
    return(-1);
}
if (Accumulative)
{
    chart.Accumulative();
    chart.VScaleParams(20*k*10, -10*k*10, 20);
}
else
    chart.VScaleParams(20*k, -10*k, 15);
chart.ShowScaleTop(false);
chart.ShowScaleRight(false);
chart.ShowLegend();
chart.Filled();
for (int j=0; j<5; j++)
{
    for (int i=0; i<10; i++)
    {
        k=-k;
        if (k>0)
            arr[i]=k*(i+10-j);
        else
            arr[i]=k*(i+10-j)/2;
    }
    chart.SeriesAdd(arr, "Item" + IntegerToString(j));
}
//--- play with values
while (!IsStopped())
{
    int i=rand()%5;
    int j=rand()%10;
    k=rand()%3000-1000;
    chart.ValueUpdate(i, j, k);
    Sleep(200);
}
//--- finish
    chart.Destroy();
    return(0);
}
Filled

Sets the flag indicating whether it is necessary to fill the area under the curve defined by the data series.

```cpp
void Filled(
    const bool flag=true, // flag
)
```

Parameters

`flag=true`

[in] Flag value:

- true – fill the area under the curve
- false – do not fill the area under the curve
Create

Virtual method that creates a graphical resource.

```cpp
virtual bool Create(
    const string name,  // name
    const int width,    // width
    const int height,   // height
    ENUM_COLOR_FORMAT clrfmt  // format
);  
```

**Parameters**

*name*  
[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

*width*  
[in] Width (size along X axis) in pixels.

*height*  
[in] Height (size along Y axis) in pixels.

*clrfmt*  
[in] Color processing method. See the ResourceCreate() function description to learn more about color processing methods.

**Return Value**

true if successful, otherwise — false.
SeriesAdd

Adds a new data series.

```c
bool SeriesAdd(
    const double& value[], // values
    const string descr,    // label
    const uint clr,        // color
)
```

Parameters

value[]

descr

[in] Series label.

clr

[in] Series display color.

Return Value

ture if successful, otherwise — false.
SeriesInsert

Inserts data series to the chart.

```c
bool SeriesInsert(
    const uint pos,   // index
    const double& value[], // values
    const string descr, // label
    const uint clr,    // color
)
```

**Parameters**

- `pos`  
  [in] Index for insertion.

- `value[]`  

- `descr`  
  [in] Series label.

- `clr`  
  [in] Series display color.

**Return Value**

true if successful, otherwise — false.
SeriesUpdate

Updates data series on the chart.

```cpp
bool SeriesUpdate(
    const uint pos, // index
    const double& value[], // values
    const string descr, // label
    const uint clr, // color
)
```

Parameters

- **pos**
  - [in] Index of the series — the serial number of its addition, starting with 0.
- **value[]**
  - [in] New values for the data series.
- **descr**
  - [in] Series label.
- **clr**
  - [in] Series display color.

Return Value

- true if successful, otherwise — false.
SeriesDelete

Deletes data series from the chart.

```cpp
bool SeriesDelete(  
    const uint pos,  // index
)
```

Parameters

`pos`

[in] Index of the series — the serial number of its addition, starting with 0.

Return Value

true if successful, otherwise — false.
ValueUpdate

Updates the specified value in the specified series.

```cpp
bool ValueUpdate(
    const uint series,  // index of the series
    const uint pos,     // index of the element
    double value        // value
)
```

Parameters

**series**

[in] Index of the series — the serial number of its addition, starting with 0.

**pos**

[in] Index of element in the series.

**value**

[in] New value.

Return Value

true if successful, otherwise — false.
DrawChart

Virtual method which draws a curve and all its elements.

```cpp
virtual void DrawChart()
```
**DrawData**

Virtual method which draws a curve for the specified series.

```cpp
virtual void DrawData(
    const uint index, // index
)
```

**Parameters**

`index`

[in] Index of the series — the serial number of its addition, starting with 0.
CalcArea

Calculates the area under the curve defined by the data series.

```cpp
double CalcArea(
    const uint index,  // index
)
```

Parameters

- **index**
  - [in] Index of the series — the serial number of its addition, starting with 0.

Return Value

- *Area of the figure limited by the curve which is defined by the data series.*
CPieChart

Class for plotting pie charts.

The code of the above figure is provided below.

Description

The methods included in this class are designed for full-scale operation with pie charts, from the creating a graphical resource to designing labels to segments.

Declaration

```cpp
class CPieChart : public CChartCanvas
```

Title

```cpp
#include <Canvas\Charts\PieChart.mqh>
```

Inheritance hierarchy

- CCanvas
  - CChartCanvas
    - CPieChart

Methods inherited from class CCanvas

Methods inherited from class CChartCanvas

ColorBackground, ColorBackground, ColorBorder, ColorBorder, ColorText, ColorText, ColorGrid, ColorGrid, MaxData, MaxData, MaxDescrLen, MaxDescrLen, AllowedShowFlags, ShowFlags, ShowFlags, IsShowLegend, IsShowScaleLeft, IsShowScaleRight, IsShowScaleTop, IsShowScaleBottom, IsShowGrid, IsShowDescriptors, IsShowPercent, ShowLegend, ShowScaleLeft, ShowScaleRight, ShowScaleTop, ShowScaleBottom, ShowGrid, ShowDescriptors, ShowValue, ShowPercent, LegendAlignment, Accumulative, VScaleMin, VScaleMin, VScaleMax, VScaleMax, NumGrid, NumGrid, VScaleParams, DataOffset, DataOffset, DataTotal, DescriptorUpdate, ColorUpdate

Example
#include <Canvas\Charts\PieChart.mqh>

int OnStart(void)
{
    //--- check
    if(Width<=0 || Height<=0)
    {
        Print("Too simple.");
        return(-1);
    }

    //--- create chart
    CPieChart pie_chart;
    if(!pie_chart.CreateBitmapLabel("PieChart",10,10,Width,Height))
    {
        Print("Error creating pie chart: ",GetLastError());
        return(-1);
    }
    pie_chart.ShowPercent();

    //--- draw
    for(uint i=0;i<30;i++)
    {
        pie_chart.ValueAdd(100*(i+1),"Item "+IntegerToString(i));
        Sleep(10);
    }
    Sleep(2000);

    //--- disable legend
    pie_chart.LegendAlignment(ALIGNMENT_LEFT);
    Sleep(2000);

    //--- disable legend
    pie_chart.LegendAlignment(ALIGNMENT_RIGHT);
    Sleep(2000);

    //--- disable legend
    pie_chart.LegendAlignment(ALIGNMENT_TOP);
Sleep(2000);
    //--- disable legend
    pie_chart.ShowLegend(false);
    Sleep(2000);
    //--- disable percentage
    pie_chart.ShowPercent(false);
    Sleep(2000);
    //--- disable descriptors
    pie_chart.ShowDescriptors(false);
    Sleep(2000);
    //--- enable all
    pie_chart.ShowLegend();
    pie_chart.ShowValue();
    pie_chart.ShowDescriptors();
    Sleep(2000);
    //--- or like this
    pie_chart.ShowFlags(FLAG_SHOW_LEGEND|FLAG_SHOW_DESCRIPTORS|FLAG_SHOW_PERCENT);
    uint total=pie_chart.DataTotal();
    //--- play with values
    for (uint i=0;i<total && !IsStopped();i++)
    {
        pie_chart.ValueUpdate(i,100*(rand() %10+1));
        Sleep(1000);
    }
    //--- play with colors
    for (uint i=0;i<total && !IsStopped();i++)
    {
        pie_chart.ColorUpdate(i%total,RandomRGB());
        Sleep(1000);
    }
    //--- rotate
    while (!IsStopped())
    {
        pie_chart.DataOffset(pie_chart.DataOffset()+1);
        Sleep(200);
    }
    //--- finish
    pie_chart.Destroy();
    return(0);
}

//+------------------------------------------------------------------+
//| Random RGB color                                                 |
//+------------------------------------------------------------------+
uint RandomRGB(void)
{
    return(XRGB(rand()%255,rand()%255,rand()%255));
}
Create
Virtual method that creates a graphical resource.

```cpp
virtual bool Create(
    const string name,   // name
    const int width,     // width
    const int height,    // height
    ENUM_COLOR_FORMAT clrfmt,  // format
)
```

Parameters

name
[in] Basis for a graphical resource name. A resource name is generated during the creation by adding a pseudorandom string.

width
[in] Width (size along X axis) in pixels.

height
[in] Height (size along Y axis) in pixels.

clrfmt
[in] Color processing method. See the ResourceCreate() function description to learn more about color processing methods.

Return Value

true if successful, otherwise — false.
**SeriesSet**

Sets a series of values that will be shown on the pie chart.

```cpp
bool SeriesSet(
    const double& value[], // values
    const string& text[], // labels
    const uint& clr[],     // color
)
```

**Parameters**

- `value[]`  
  [in] Array of values.

- `text[]`  

- `clr[]`  

**Return Value**

- true if successful, otherwise — false.
### ValueAdd

Adds a new value to the pie chart (to the end).

```cpp
bool ValueAdd(
    const double value, // value
    const string descr, // label
    const uint clr,  // color
)
```

**Parameters**

- `value`  
  [in] Value.

- `descr`  
  [in] Value label.

- `clr`  
  [in] Value color.

**Return Value**

- true if successful, otherwise — false.
ValueInsert

Inserts a new value to the pie chart (at the specified position).

```c
bool ValueInsert(
    const uint pos,   // index
    const double value, // value
    const string descr, // label
    const uint clr,    // color
)
```

Parameters

- `pos`
  - [in] Index for insertion.

- `value`
  - [in] Value.

- `descr`
  - [in] Value label.

- `clr`
  - [in] Value color.

Return Value

- `true` if successful, otherwise `false`.
ValueUpdate

Updates the value on the pie chart (at the specified position).

```cpp
bool ValueUpdate(
    const uint pos,  // index
    const double value,  // value
    const string descr,  // label
    const uint clr,  // color
)
```

Parameters

- **pos**
  - [in] Index of the value — the serial number of its addition, starting with 0.
- **value**
  - [in] Value.
- **descr**
  - [in] Value label.
- **clr**
  - [in] Value color.

Return Value

true if successful, otherwise — false.
ValueDelete

Removes a value from the pie chart (at the specified position).

```cpp
bool ValueDelete(
    const uint pos,  // index
)
```

Parameters

pos

[in] Index of the value — the serial number of its addition, starting with 0.

Return Value

true if successful, otherwise — false.
DrawChart

Virtual method which draws a pie chart and all its elements.

```cpp
virtual void DrawChart()
```
DrawPie

Draws a segment of the pie chart, which corresponds to a specified value.

```cpp
void DrawPie(
    double fi3, // angle of ray from pie chart center, which defines the first boundary of the arc
    double fi4, // angle of ray from pie chart center, which defines the second boundary of the arc
    int idx, // index
    CPoint& p[], // array of reference points (x, y) for plotting the segments.
    const uint clr, // color of the segment
)
```

**Parameters**

- **fi3**
  - [in] Angle in radians, which defines the first boundary of the arc.

- **fi4**
  - [in] Angle in radians, which defines the second boundary of the arc.

- **idx**
  - [in] Index of the value the segment corresponds to.

- **p[]**
  - [in] Array of reference points (x, y) for plotting the segments.

- **clr**
  - [in] Color of the segment.
LabelMake

Generates a segment label based on its value and the original label.

```cpp
string LabelMake(
    const string text,   // label
    const double value,  // value
    const bool to_left,  // flag
)
```

**Parameters**

`text`
- [in] Label

`value`
- [in] Value.

`to_left`
- [in] Defines the order of the label layout:
  - `true` — label, then value.
  - `false` — value, then label.

**Return Value**

Label of the segment.
3D graphics

The section features the classes for the three-dimensional graphics development. The classes are based on the functions for working with DirectX. CCanvas3D is a base class containing the methods for managing camera and lighting, as well as featuring the manager of graphic resources - textures, shaders, vertex buffers, indexes and shader parameters.

To start working with the library, simply read the article How to create 3D graphics using DirectX in MetaTrader 5.

Besides, there are the classes of the scene base objects, such as a box, a three-dimensional surface on user data and an arbitrary grid.
CCanvas3D

CCanvas3D is a class for simplified creation and visualization of 3D objects on a chart.

Description

CCanvas3D greatly simplifies creation and visualization of large amounts of data in the form of animated 3D graphics. The class contains the methods for managing camera and lighting, as well as features the resource manager for creating graphic resources: textures, shaders, vertex buffers, indexes, and shader parameters.

Besides, the library contains the classes of the scene base objects, such as a box, a three-dimensional surface on user data, or an arbitrary grid.

A video card should support DX 11 and Shader Model 5.0 for the functions to work.

Declaration

class CCcanvas

</tbody>
</table>
AmbientColorGet

Gets the color and intensity of the ambient all-round lighting.

```c
void AmbientColorGet(
    DXColor &ambient_color  // all-round lighting color and intensity
);
```

**Parameters**

`&ambient_color`

[out] All-round lighting color.

**Return Value**

No

**Note**

Intensity is stored in the alpha channel of the DXColor structure.
**AmbientColorSet**

Sets the color and intensity of the ambient all-round lighting.

```cpp
void AmbientColorSet(
    const DXColor &ambient_color  // all-round lighting color and intensity
);
```

**Parameters**

- `&ambient_color`
  - [in] All-round lighting color.

**Return Value**

- No

**Note**

Intensity is set in the alpha channel of the DXColor structure.
## Attach

Gets the graphical resource from an `OBJ_BITMAP_LABEL` object and attaches it to an instance of the `CCanvas` class.

```cpp
bool Attach(
    const long chart_id, // chart ID
    const string objname, // object name
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA // color handling method
)
```

Creates a graphical resource for an `OBJ_BITMAP_LABEL` object and attaches it to an instance of the `CCanvas` class.

```cpp
bool Attach(
    const long chart_id, // chart ID
    const string objname, // object name
    const int width, // image width in pixels
    const int height, // image height in pixels
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA // color handling method
)
```

### Parameters

- `chart_id`
  - [in] Chart ID.

- `objname`
  - [in] Name of the graphical object.

- `width`

- `height`

- `clrfmt=COLOR_FORMAT_XRGB_NOALPHA`
  - [in] Color handling method. See `ResourceCreate()` function description to learn more about color handling methods.

### Note

- true - if successful, false - if failed to add a graphic object.
Create

Creates a graphic resource for rendering a 3D scene without binding to a chart object.

```cpp
virtual bool Create(
    const string name,       // graphical object name
    const int width,         // width
    const int height,        // height
    ENUM_COLOR_FORMAT clrfmt=COLOR_FORMAT_XRGB_NOALPHA   // color format
);
```

**Parameters**

- `name [in]` Graphical object name.
- `clrfmt=COLOR_FORMAT_XRGB_NOALPHA [in]` Color handling method. See `ResourceCreate()` function description to learn more about color handling methods.

**Note**

- `true` - if a resource is created, otherwise `- false`. 
Destroy

Destroys a graphic resource and releases a graphic 3D context.

```cpp
virtual void Destroy()
```

Return Value

No

Note

If a graphical resource has been bound to a chart object, the latter is deleted.
DXContext

 Gets the graphic context handle.

    int DXContext()

Return Value

 Graphic context handle.
DXDispatcher

Gets the resource dispatcher handle.

```
CDXDispatcher* DXDispatcher()
```

Return Value

Resource dispatcher handle.
**InputScene**

*Gets the pointer to the buffer of scene parameters.*

```cpp
CDXInput* InputScene()
```

**Return Value**

*Pointer to the buffer of scene parameters.*
**LightColorGet**

Gets the color and intensity of a directed light source.

```c
void LightColorGet(
    DXColor &light_color   // directional lighting color and intensity
);
```

**Parameters**

- `&light_color`
  
  [out] Directional lighting color and intensity.

**Return Value**

None.

**Note**

Intensity is stored in the alpha channel of the DXColor structure.
LightColorSet

Sets the color and intensity of a directed light source.

```cpp
void LightColorSet(
    const DXColor &light_color  // directional lighting color and intensity
);
```

Parameters

`&light_color`

[in] Directional lighting color and intensity.

Return Value

None.

Note

Intensity is set in the alpha channel of the DXColor structure.
**LightDirectionGet**

**Gets** the direction of a directed light source.

```cpp
void LightDirectionGet(
    DXVector3 &light_direction  // direction vector
);
```

**Parameters**

- `&light_direction`
  - [out] Direction vector.

**Return Value**

None.
LightDirectionSet

Sets the direction of a directed light source.

```cpp
void LightDirectionSet(
    const DXVector3 light_direction // direction vector
);
```

**Parameters**

- `light_direction`
  - [in] Direction vector.

**Return Value**

- None.
# ObjectAdd

Adds an object to a 3D scene for subsequent rendering.

```c
bool ObjectAdd(
    CDXObject *object  // pointer to the object
);
```

## Parameters

* `*object`  
  [in] Pointer to an instance of the class derived from the CDXObject abstract class.

## Return Value

true - if successful, false - if failed to add a 3D graphic object.
ProjectionMatrixGet

Gets a 3D scene projection matrix to a 2D frame.

```cpp
void ProjectionMatrixGet(
    DXMatrix &projection_matrix  // projection matrix
);
```

Parameters

`&projection_matrix`

[out] Projection matrix.

Return Value

None.
ProjectionMatrixSet

Calculates and sets a 3D coordinate projection matrix to a 2D frame.

```c
void ProjectionMatrixSet(
    float fov,  // field of view
    float aspect_ratio,  // frame aspect ratio
    float z_near,  //
    float z_far   //
);
```

Parameters

- `fov`
  [in] Field of view width in radians to create a scene projection.

- `aspect_ratio`
  [in] 2D frame aspect ratio.

- `z_near`
  [in] Distance to the near clipping plane.

- `z_far`
  [in] Distance to the far clipping plane.

Return Value

None.

Note

2D frame displays only projections of 3D objects falling into the specified field of view and located between the near and far clipping planes.
Render

Renders all scene objects in the frame inner buffer for subsequent display.

```cpp
bool Render(
    uint flags,  // combination of flags
    uint background_color=0  // background color
);
```

Parameters

- **flags**
  - `[in]` Combination of flags that sets the rendering mode. Possible values:
    - DX_CLEAR_COLOR - clear the image buffer using `background_color`.
    - DX_CLEAR_DEPTH - clear the depth buffer.

- **background_color=0**
  - `[in]` 3D scene background color.

Return Value

- `true` - if successful, `false` - if failed to render.

Note

Calling `Render()` does not update a scene on a chart. Instead, it only updates the inner buffer of the image. The `Update()` method should be explicitly called to render the updated frame.

`Render()` features the `RenderBegin` and `RenderEnd()` calls.
RenderBegin

Prepares a graphic context for rendering a new frame.

```cpp
virtual bool RenderBegin(
    uint flags,         // combination of flags
    uint background_color=0   // background color
);
```

**Parameters**

- **flags**
  - [in] Combination of flags that sets the rendering mode. Possible values:
    - DX_CLEAR_COLOR - clear the image buffer using `background_color`.
    - DX_CLEAR_DEPTH - clear the depth buffer.

- **background_color=0**
  - [in] 3D scene background color.

**Return Value**

- true - if successful, false - if failed to update shader inputs.
RenderEnd

Copies a rendered frame to the inner buffer and updates a chart image if necessary.

```cpp
virtual bool RenderEnd(
    bool redraw=false  // update flag
);
```

Parameters

`redraw=false`

[in] Flag of a chart redrawing necessity.

Return Value

true - successful, otherwise - false.
ViewMatrixGet

Returns a 3D scene view matrix.

```cpp
void ViewMatrixGet(
    DXMatrix &view_matrix  // view matrix
);
```

Parameters

`&view_matrix`

[out] View matrix setting the camera position and direction in 3D space.

Return Value

None.
ViewMatrixSet

Sets a 3D scene view matrix.

```cpp
void ViewMatrixSet(
    const DXMatrix &view_matrix  // view matrix
);
```

Parameters

- `&view_matrix`  
  - `[in]` View matrix setting the camera position and direction in 3D space.

Return Value

- None.
ViewPositionSet

Sets a viewpoint on a 3D scene.

```cpp
void ViewPositionSet(
    const DXVector3 &position       // viewpoint position
);
```

Parameters

[position]

[in] Setting a viewpoint position on a 3D scene.

Return Value

None.

Note

Setting a viewpoint position using ViewPositionSet() changes the view matrix obtained in ViewMatrixGet().
ViewRotationSet

Sets the direction of a gaze at a 3D scene.

```c
void ViewRotationSet(
    const DXVector3 &rotation // vector of turning angles
);
```

Parameters

- `&rotation`
  - [in] Vector setting Euler angles to calculate the direction of a gaze at a 3D scene.

Return Value

- None.

Note

Setting the gaze direction using ViewRotationSet() changes the view matrix obtained in ViewMatrixGet().
**ViewTargetSet**

Sets the coordinates of the point a gaze is directed at.

```cpp
void ViewTargetSet(
    const DXVector3 &target    // target coordinates
);
```

**Parameters**

- `&target`  
  
  [in] Coordinates of the point a gaze is directed at.

**Return Value**

None.

**Note**

Used to fix the gaze at one scene point when moving the viewpoint.

Setting a new target coordinate using `ViewRotationSet()` changes the view matrix obtained in `ViewMatrixGet()`.

`ViewTargetSet()` is used together with `ViewUpDirectionSet()` to define the gaze direction.
ViewUpDirectionSet

Sets the direction of the upper frame border in 3D space.

```cpp
void ViewUpDirectionSet(
    const DXVector3 &up_direction  // top direction
);
```

Parameters

`up_direction`

[in] Direction of the upper part of the frame in 3D space.

Return Value

None.

Note

Setting a new direction using ViewUpDirectionSet() changes the view matrix obtained in ViewMatrixGet().

ViewUpDirectionSet() is used together with ViewTargetSet() to define the gaze direction.
CChart

CChart is a class for simplified access to "Chart" graphic object properties.

Description

CChart class provides access to "Chart" object properties.

Declaration

```cpp
class CChart : public CObject
```

Title

```cpp
#include <Charts\Chart.mqh>
```

Inheritance hierarchy

- CObject
  - CChart

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Compare**
ChartID

Returns identifier of the chart.

```cpp
long ChartID() const
```

Return Value

Chart identifier assigned to the chart class instance. If there is no chart assigned, it returns -1.
**Mode (Get Method)**

Gets the value of "Mode" property (bars, candles, or line).

```
enum chart_mode
{
    bars, candles, line
}
```

**Return Value**

Value of "Mode" property of the object assigned to the class instance. If there is no chart assigned, it returns **WRONG_VALUE**.

**Mode (Set Method)**

Sets new value for "Mode" property (bars, candles, or line).

```
bool Mode(
    enum chart_mode mode // chart mode
)
```

**Parameters**

`mode`

[in] Chart mode (candles, bars or line) of **ENUM_CHART_MODE** enumeration.

**Return Value**

true - successful, false - cannot change the mode.
Foreground (Get Method)

Gets the value of "Foreground" property.

```cpp
bool Foreground() const
```

Return Value

Value of "Foreground" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

Foreground (Set Method)

Sets new value for "Foreground" property.

```cpp
bool Foreground(
    bool foreground // flag value
)
```

Parameters

`foreground`

[in] New value for "Foreground" property.

Return Value

true - successful, false - cannot change the property.
### Shift (Get Method)

Gets the value of "Shift" property.

```cpp
bool Shift() const
```

**Return Value**

Value of "Shift" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

### Shift (Set Method)

Sets new value for "Shift" property.

```cpp
bool Shift(
    bool shift // flag value
)
```

**Parameters**

- `shift`

**Return Value**

- true - successful, false - cannot change the property.
**ShiftSize (Get Method)**

Gets the value of "ShiftSize" property (in percents).

```cpp
double ShiftSize() const
```

**Return Value**

Value of "ShiftSize" property of the chart assigned to the class instance. If there is no chart assigned, it returns `EMPTY_VALUE`.

**ShiftSize (Set Method)**

Sets new value for "Shift" property (in percents).

```cpp
bool ShiftSize(
    double shift_size  // property value
)
```

**Parameters**

- `shift_size`

**Return Value**

- true - successful, false - cannot change the property.
**AutoScroll (Get Method)**

Gets the value of "AutoScroll" property.

```
bool AutoScroll() const
```

**Return Value**

Value of "AutoScroll" property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

**AutoScroll (Set Method)**

Sets new value for "AutoScroll" property.

```
bool AutoScroll(
    bool autoscroll  // flag value
)
```

**Parameters**

`autoscroll`

**Return Value**

true - successful, false - cannot change the property.
**Scale (Get Method)**

Gets the value of “Scale” property.

```cpp
int Scale() const
```

**Return Value**

Value of “Scale” property of the chart assigned to the class instance. If there is no chart assigned, it returns 0.

**Scale (Set Method)**

Sets new value for “Scale” property.

```cpp
bool Scale(
    int scale // property value
)
```

**Parameters**

scale

- [in] New value for “Scale” property.

**Return Value**

- true - successful, false - cannot change the property.
ScaleFix (Get Method)

Gets the value of “ScaleFix” property (fixed chart scale or not).

```cpp
bool ScaleFix() const
```

Return Value

Value of “ScaleFix” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ScaleFix (Set Method)

Sets new value for “ScaleFix” property.

```cpp
bool ScaleFix(
    bool scale_fix  // property value
)
```

Parameters

`scale_fix`

Return Value

true - successful, false - cannot change the property.
**ScaleFix_11 (Get Method)**

Gets the value of “ScaleFix_11” property (chart scale is 1:1, or not).

```cpp
bool ScaleFix_11() const
```

**Return Value**

Value of “ScaleFix_11” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

**ScaleFix_11 (Set Method)**

Sets new value for “ScaleFix_11” property.

```cpp
bool ScaleFix_11(
    string scale_11  // property value
)
```

**Parameters**

`scale_11`

[in] New value for “ScaleFix_11” property.

**Return Value**

true - successful, false - cannot change the property.
**FixedMax (Get Method)**

Gets the value of "FixedMax" property (fixed maximal price).

```cpp
double FixedMax() const
```

**Return Value**

Value of "FixedMax" property of the chart assigned to the class instance. If there is no chart assigned, it returns `EMPTY_VALUE`.

**FixedMax (Set Method)**

Sets the new value for "FixedMax" property.

```cpp
bool FixedMax(
    double max // fixed maximum
)
```

**Parameters**

*max*

[in] New value for "FixedMax" property.

**Return Value**

true - successful, false - cannot change the property.
FixedMin (Get Method)

Gets the value of "FixedMin" property (fixed minimal price).

```cpp
double FixedMin() const
```

Return Value

Value of "FixedMin" property of the chart assigned to the class instance. If there is no chart assigned, it returns `EMPTY_VALUE`.

FixedMin (Set Method)

Sets new value for "FixedMin" property.

```cpp
bool FixedMax(
    double min // fixed minimum
)
```

Parameters

- `max`

Return Value

- `true` - successful, `false` - cannot change the property.
**PointsPerBar (Get Method)**

Gets the value of "PointsPerBar" property (in points per bar).

```cpp
double PointsPerBar() const
```

**Return Value**

Value of "PointsPerBar" property of the chart assigned to the class instance. If there is no chart assigned, it returns `EMPTY_VALUE`.

**PointsPerBar (Set Method)**

Sets new value for "PointsPerBar" property.

```cpp
bool PointsPerBar(
    double ppb // scale
)
```

**Parameters**

- `ppb`
  - `[in]` New scale (in points per bar).

**Return Value**

- true - successful, false - cannot change the scale.
**ScalePPB (Get Method)**

Gets the value of “ScalePPB” property (scale is “point per bar” or not).

```cpp
bool ScalePPB() const
```

**Return Value**

Value of “ScalePPB” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

**ScalePPB (Set Method)**

Sets new value for “ScalePPB” property.

```cpp
bool ScalePPB(
    bool scale_ppb // flag value
)
```

**Parameters**

`scale_ppb`

[in] New value for “ScalePPB” property.

**Return Value**

true - successful, false - cannot change the property.
ShowOHLC (Get Method)

Gets the value of “ShowOHLC” property.

```cpp
bool ShowOHLC() const
```

Return Value

Value of “ShowOHLC” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowOHLC (Set Method)

Sets new value for “ShowOHLC” property.

```cpp
bool ShowOHLC(
    bool show // property value
)
```

Parameters

`show`

Return Value

true - success, false - cannot change the property.
ShowLineBid (Get Method)

Gets the value of “ShowLineBid” property.

```cpp
bool ShowLineBid() const
```

Return Value

Value of “ShowLineBid” property of the char, assigned to the class instance. If there is no chart assigned, it returns false.

ShowLineBid (Set Method)

Sets new value for “ShowLineBid” property.

```cpp
bool ShowLineBid(
    bool show // property value
)
```

Parameters

`show`

Return Value

true - successful, false - cannot change the property.
ShowLineAsk (Get Method)

Gets the value of “ShowLineAsk” property.

```cpp
bool ShowLineAsk() const
```

Return Value

Value of “ShowLineAsk” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowLineAsk (Set Method)

Sets new value for “ShowLineAsk” property.

```cpp
bool ShowLineAsk(
    bool show  // property value
)
```

Parameters

- `show`
  

Return Value

true - successful, false - cannot change the property.
ShowLastLine (Get Method)

Gets the value of “ShowLastLine” property.

```cpp
bool ShowLastLine() const
```

Return Value

Value of “ShowLastLine” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowLastLine (Set Method)

Sets new value for “ShowLastLine” property.

```cpp
bool ShowLastLine(
    bool show // property value
)
```

Parameters

`show`

    [in] New value for “ShowLastLine” property.

Return Value

    true - successful, false - cannot change the property.
ShowPeriodSep (Get Method)

Gets the value of “ShowPeriodSep” property (show period separators).

```cpp
bool ShowPeriodSep() const
```

Return Value

Value of “ShowPeriodSep” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowPeriodSep (Set Method)

Sets new value for “ShowPeriodSep” property.

```cpp
bool ShowPeriodSep(
    bool show // property value
)
```

Parameters

- `show`
  

Return Value

- true - successful, false - cannot change the property.
ShowGrid (Get Method)

Gets the value of “ShowGrid” property.

```cpp
bool ShowGrid() const
```

Return Value

Value of “ShowGrid” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowGrid (Set Method)

Sets new value for “ShowGrid” property.

```cpp
bool ShowGrid(
    bool show // property value
)
```

Parameters

`show`

Return Value

true - successful, false - cannot change the property.
ShowVolumes (Get Method)

Gets the value of “ShowVolumes” property.

```cpp
bool ShowVolumes() const
```

Return Value

Value of “ShowVolumes” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowVolumes (Set Method)

Sets new value for “ShowVolumes” property.

```cpp
bool ShowVolumes(bool show)
```

Parameters

- `show`  

Return Value

- true - successful, false - cannot change the property.
ShowObjectDescr (Get Method)

Gets the value of “ShowObjectDescr” property (show description for graphic objects).

```cpp
bool ShowObjectDescr() const
```

Return Value

Value of “ShowObjectDescr” property of the chart assigned to the class instance. If there is no chart assigned, it returns false.

ShowObjectDescr (Set Method)

Sets new value for “ShowObjectDescr” property.

```cpp
bool ShowObjectDescr(
    bool show  // property value
)
```

Parameters

- **show**
  - [in] New value for “ShowObjectDescr” property.

Return Value

- true - successful, false - cannot change the property.
ShowDateScale

Sets new value for "ShowDateScale" property.

```cpp
bool ShowDateScale(
    bool show      // property value
)
```

Parameters

- `show`

  [in] New value for "ShowDateScale" property.

Return Value

- true - successful, false - cannot change the property.
ShowPriceScale

Sets new value for "ShowPriceScale" property.

```cpp
bool ShowPriceScale(
    bool show    // property value
)
```

Parameters

`show`

Return Value

true - successful, false - cannot change the property.
ColorBackground (Get Method)

Gets the value of “ColorBackground” property (background color of the chart).

```cpp
color ColorBackground() const
```

Return Value

Value of “ColorBackground” property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorBackground (Set Method)

Sets new value for “ColorBackground” property.

```cpp
bool ColorBackground(
    color new_color  // color
)
```

Parameters

new_color

Return Value

true - successful, false - cannot change the color.
**ColorForeground (Get Method)**

Gets the value of "ColorForeground" property (color of axes, scale and OHLC strings of the chart).

```cpp
color ColorForeground() const
```

**Return Value**

Value of "ColorForeground" property of the chart assigned to the class instance. If there is no chart assigned, it returns **CLR_NONE**.

**ColorForeground (Set Method)**

Sets new value for "ColorForeground" property (for axes, scale, and OHLC string).

```cpp
bool ColorForeground(
    color new_color   // color
)
```

**Parameters**

- `new_color`
  
  [in] New color for axes, scale and OHLC string.

**Return Value**

- true - successful, false - cannot change the color.
ColorGrid (Get Method)

Gets the value of "ColorGrid" property (color of the grid).

```cpp
color ColorGrid() const
```

Return Value

Value of "ColorGrid" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorGrid (Set Method)

Sets new value for "ColorGrid" property.

```cpp
bool ColorGrid(
    color new_color  // color
)
```

Parameters

`new_color`

Return Value

true - successful, false - cannot change the color.
ColorBarUp (Get Method)

Gets the value of "ColorBarUp" property (color for bullish bars, their shadow, and candle body outlines).

```cpp
color ColorBarUp() const
```

Return Value

Value of "ColorBarUp" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorBarUp (Set Method)

Sets new value for "ColorBarUp" property.

```cpp
bool ColorBarUp(
    color new_color  // color
)
```

Parameters

new_color

[in] New color for bullish bars, their shadow and candle body outlines.

Return Value

true - successful, false - cannot change the color.
ColorBarDown (Get Method)

Gets the value of "ColorBarDown" property (color for bearish bars, their shadow, and candle body outlines).

```cpp
color ColorBarDown() const
```

Return Value

Value of "ColorBarDown" property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorBarDown (Set Method)

Sets new value for "ColorBarDown" property.

```cpp
bool ColorBarDown(
    color new_color  // color
)
```

Parameters

new_color

[in] New color for bearish bars, their shadow, and candle body outlines.

Return Value

true - successful, false - cannot change the color.
**ColorCandleBull (Get Method)**

Gets the value of "ColorCandleBull" property (body color of the bullish candle).

```cpp
color ColorCandleBull() const
```

**Return Value**

Value of "ColorCandleBull" property of the chart assigned to the class instance. If there is no chart assigned, it returns `CLR_NONE`.

**ColorCandleBull (Set Method)**

Sets new value for "ColorCandleBull" property.

```cpp
bool ColorCandleBull(
    color new_color  // color
)
```

**Parameters**

- `new_color`  
  - [in] New color of the bullish candle body.

**Return Value**

- `true` - successful, `false` - cannot change the color.
**ColorCandleBear (Get Method)**

Gets the value of “ColorCandleBear” property (body color of the bearish candle).

```cpp
    color    ColorCandleBear() const
```

**Return Value**

Value of “ColorCandleBear” property of the chart assigned to the class instance. If there is no chart assigned, it returns **CLR_NONE**.

**ColorCandleBear (Set Method)**

Sets new value for “ColorCandleBear” property.

```cpp
    bool    ColorCandleBear(
        color    new_color  // color
    )
```

**Parameters**

`new_color`

- [in] New color of the bearish candle body.

**Return Value**

- true - successful, false - cannot change the color.
ColorChartLine (Get Method)

Gets the value of “ColorChartLine” property (color for line chart and Doji candles).

```
color ColorChartLine() const
```

Return Value

Value of “ColorChartLine” property of the chart assigned to the class instance. If there is no chart assigned, it returns CLR_NONE.

ColorChartLine (Set Method)

Sets new value for “ColorChartLine” property.

```
bool ColorChartLine(
    color new_color  // color
)
```

Parameters

`new_color`

[in] New color of the chart lines and Doji candles.

Return Value

true - successful, false - cannot change the color.
**ColorVolumes (Get Method)**

**Gets** the value of “ColorVolumes” property (color for volumes and levels of opened positions).

```cpp
    color ColorVolumes() const
```

**Return Value**

Value of “ColorVolumes” property of the chart assigned to the class instance. If there is no chart assigned, it returns `CLRNONE`.

**ColorVolumes (Set Method)**

**Sets** new value for “ColorVolumes” property.

```cpp
    bool ColorVolumes(
        color new_color   // color
    )
```

**Parameters**

`new_color`

- `[in]` New color of the volumes and open position levels.

**Return Value**

- `true` - successful, `false` - cannot change the color.
**ColorLineBid (Get Method)**

Gets the value of "ColorLineBid" property (color of Bid line).

```
  color  ColorLineBid() const
```

**Return Value**

Value of "ColorLineBid" property of the chart assigned to the class instance. If there is no chart assigned, it returns `CLR_NONE`.

**ColorLineBid (Set Method)**

Sets new value for "ColorLineBid" property.

```
  bool  ColorLineBid(  
                    color  new_color  // color
  )
```

**Parameters**

`new_color`

- `[in]` New color for Bid line.

**Return Value**

- `true` - successful, `false` - cannot change the color.
**ColorLineAsk (Get Method)**

Gets the value of "ColorLineAsk" property (color of Ask line).

```cpp
    color ColorLineAsk() const
```

**Return Value**

Value of "ColorLineAsk" property of the chart assigned to the class instance. If there is no chart assigned, it returns **CLR_NONE**.

**ColorLineAsk (Set Method)**

Sets new value for "ColorLineAsk" property.

```cpp
    bool ColorLineAsk(
        color new_color // color
    )
```

**Parameters**

- `new_color`
  - [in] New color for Ask line.

**Return Value**

true - successful, false - cannot change the color.
**ColorLineLast (Get Method)**

Gets the value of "ColorLineLast" property (color of the last deal price line).

```cpp
    color ColorLineLast() const
```

**Return Value**

Value of "ColorLineLast" property of the chart assigned to the class instance. If there is no chart assigned, it returns `CLR_NONE`.

**ColorLineLast (Set Method)**

Sets new value for "ColorLineLast" property.

```cpp
    bool ColorLineLast(
        color new_color  // color
    )
```

**Parameters**

`new_color`

- [in] New color of the last deal price line.

**Return Value**

- true - successful, false - cannot change the color.
**ColorStopLevels (Get Method)**

Gets the value of "ColorStopLevels" property (color of the SL and TP levels).

```cpp
color ColorStopLevels() const
```

**Return Value**

Value of "ColorStopLevels" property of the chart assigned to the class instance. If there is no chart assigned, it returns `CLR_NONE`.

**ColorStopLevels (Set Method)**

Sets new value for "ColorStopLevels" property.

```cpp
bool ColorStopLevels(
    color new_color   // color
)
```

**Parameters**

`new_color`

[in] New color of the Stop Loss and Take Profit price levels.

**Return Value**

true - successful, false - cannot change the color.
VisibleBars

Gets total number of visible chart bars.

```cpp
int VisibleBars() const
```

Return Value

Gets total number of visible bars of the chart assigned to the class instance. If there is no chart assigned, it returns 0.
WindowsTotal

Gets total number of chart windows, including the chart indicator subwindows.

```cpp
int WindowsTotal() const
```

Return Value

Total number of windows, including the chart indicator subwindows, assigned to the class instance. If there is no chart assigned, it returns 0.
WindowIsVisible

Gets visibility flag of the specified chart subwindow.

```cpp
bool WindowIsVisible(
    int num // subwindow
) const
```

**Parameters**

- `num`  
  [in] Subwindow number (0 means main window).

**Return Value**

Returns visibility flag of the specified chart subwindow assigned to the chart instance. If there is no chart assigned, it returns false.
WindowHandle

Gets window handle of the chart (HWND).

```c
int WindowHandle() const
```

Return Value

Window handle of the chart assigned to the chart instance. If there is no chart assigned, it returns `INVALID_HANDLE`. 
FirstVisibleBar

Gets the number of the first visible bar of the chart.

```cpp
int FirstVisibleBar() const
```

Return Value

Number of the first visible bar of the chart assigned to the class instance. If there is no chart assigned, it returns -1.
**WidthInBars**

Gets chart width in bars.

```cpp
int WidthInBars() const
```

**Return Value**

Width in chart bars of the chart assigned to the class instance. If there is no chart assigned, it returns 0.
WidthInPixels

Gets chart width in pixels.

```
int WidthInPixels() const
```

Return Value

Width in pixels of the chart assigned to the chart instance. If there is no chart assigned, it returns 0.
HeightInPixels

Gets window height in pixels.

```c
int HeightInPixels(
    int num // subwindow
) const
```

**Parameters**

`num`

[In] Checked subwindow number (0 means main window).

**Return Value**

Window height in pixels of the chart assigned to the class instance. If there is no chart assigned, it returns 0.
## PriceMin

Gets window minimal price.

```cpp
double PriceMin(
    int num // subwindow
) const
```

### Parameters

- `num`
  
  [in] Subwindow number (0 means main window).

### Return Value

Window minimal price value of the chart assigned to the class instance. If there is not chart assigned, it returns **EMPTY VALUE**.
**PriceMax**

Gets window maximal price.

```cpp
double PriceMax(
    int num // subwindow
) const
```

**Parameters**

- `num`

  [in] Subwindow number (0 means main window).

**Return Value**

Window maximal price value of the chart assigned to the class instance. If there is not chart assigned, it returns **EMPTY_VALUE**.
**Attach**

Assigns the current chart to the class instance.

```cpp
void Attach()
```

**Attach**

Assigns the specified chart to the class instance.

```cpp
void Attach(
    long chart  // chart identifier
)
```

**Parameters**

*chart*

[in] Identifier of the assigned chart.
FirstChart

Assigns the first chart of the client terminal to the class instance.

```c
void FirstChart()
```
NextChart

Assigns the next chart (following the already assigned one) to the class instance.

```c
void NextChart()
```
Open

Opens chart with specified parameters and assigns it to the class instance.

```c
long Open(
    const string symbol_name, // symbol
    ENUM_TIMEFRAMES timeframe // period
)
```

Parameters

**symbol_name**

[in] Chart symbol. `NULL` means the symbol of the current chart (to which an expert is attached).

**timeframe**

[in] Chart timeframe (from `ENUM_TIMEFRAMES` enumeration). 0 means the current timeframe.

Return Value

chart identifier.
**Detach**

Detaches chart from the class instance.

```cpp
void Detach()
```
Close

Closes chart assigned to the class instance.

    void Close()
BringToTop

Show chart on top of other charts.

```cpp
bool BringToTop() const
```

Return Value

true - successful, false - error.
EventObjectCreate

Sets a flag to send notifications of events of a graphical object creation.

```cpp
bool EventObjectCreate(
    bool flag  // flag
)
```

Parameters

*flag*

[in] New value of a flag to send notifications of events of a graphical object creation.

Return Value

true - successful, false - cannot change the flag.
EventObjectDelete

Sets a flag to send notifications of events of a graphical object deletion.

```
bool EventObjectDelete(
    bool flag  // flag
);
```

Parameters

```
flag
```

[in] New value of a flag to send notifications of events of a graphical object deletion.

Return Value

```
true - successful, false - cannot change the flag.
```
**IndicatorAdd**

Adds an indicator with the specified handle into a specified chart window.

```c
bool IndicatorAdd(
    int sub_win // number of the subwindow
    int handle // handle of the indicator
);
```

### Parameters

**sub_win**

[in] The number of the chart subwindow. 0 means the main chart window. If the number of a non-existing window is specified, a new window will be created.

**handle**

[in] The handle of the indicator.

### Return Value

The function returns true in case of success, otherwise it returns false. In order to obtain information about the error, call the `GetLastError()` function.

### See also

- `IndicatorDelete()`, `IndicatorsTotal()`, `IndicatorName()`.
**IndicatorDelete**

Removes an indicator with a specified name from the specified chart window.

```cpp
bool IndicatorDelete(
  int sub_win // number of the subwindow
  const string name // short name of the indicator
);
```

**Parameters**

`sub_win`

[in] Number of the chart subwindow. 0 denotes the main chart subwindow.

`const name`

[in] The short name of the indicator which is set in the `INDICATOR_SHORTNAME` property with the `IndicatorSetString()` function. To get the short name of an indicator, use the `IndicatorName()` function.

**Return Value**

Returns true in case of successful deletion of the indicator. Otherwise it returns false. To get error details, use the `GetLastError()` function.

**Note**

If two indicators with identical short names exist in the chart subwindow, the first one in a row will be deleted.

If other indicators on this chart are based on the values of the indicator that is being deleted, such indicators will also be deleted.

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions `iCustom()` and `IndicatorCreate()`. If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

Deletion of an indicator from a chart does not mean that its calculation part will be deleted from the terminal memory. To release the indicator handle, use the `IndicatorRelease()` function.

The indicator's short name should be formed correctly. It will be written to the `INDICATOR_SHORTNAME` property using the `IndicatorSetString()` function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the `IndicatorDelete()` function is identified by the short name.

**See also**

`IndicatorAdd()`, `IndicatorsTotal()`, `IndicatorName()`, `iCustom()`, `IndicatorCreate()`, `IndicatorSetString()`. 
IndicatorsTotal

Returns the number of all indicators applied to the specified chart window.

```c
int IndicatorsTotal(
    long chart_id,  // chart identifier
    int sub_win     // number of the subwindow
);
```

Parameters

- `chart_id`  
  [in] Chart identifier. 0 denotes the main chart.

- `sub_win`  
  [in] Number of the chart subwindow. 0 denotes the main chart window.

Return Value

The number of indicators in the specified chart window. To get error details, use the `GetLastError()` function.

Note

The function allows going searching through all the indicators attached to the chart. The number of all the windows of the chart can be obtained from the `CHART WINDOWS TOTAL` property using the `GetInteger()` function.

See also

- `IndicatorAdd()`, `IndicatorDelete()`, `IndicatorsTotal()`, `iCustom()`, `IndicatorCreate()`, `IndicatorSetString()`.
**IndicatorName**

Returns the short name of the indicator by the index in the indicators list on the specified chart window.

```cpp
string IndicatorName(
    int sub_win   // number of the subwindow
    int index     // index of the indicator in the list of indicators added to the chart subwindow
);
```

**Parameters**

- **sub_win**
  - [in] Number of the chart subwindow. 0 denotes the main chart window.

- **index**
  - [in] Index of the indicator in the list of indicators. The numeration of indicators start with zero, i.e. the first indicator in the list has the 0 index. To obtain the number of indicators in the list, use the `IndicatorsTotal()` function.

**Return Value**

The short name of the indicator which is set in the `INDICATOR_SHORTNAME` property with the `IndicatorSetString()` function. To get error details, use the `GetLastError()` function.

**Note**

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions `iCustom()` and `IndicatorCreate()`. If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

The indicator's short name should be formed correctly. It will be written to the `INDICATOR_SHORTNAME` property using the `IndicatorSetString()` function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the `IndicatorDelete()` function is identified by the short name.

**See also**

`IndicatorAdd()`, `IndicatorDelete`, `IndicatorsTotal`, `iCustom()`, `IndicatorCreate()`, `IndicatorSetString()`. 
Navigate

Shifts the chart.

```cpp
bool Navigate(
    ENUM_CHART_POSITION position, // position
    int shift=0 // shift
)
```

Parameters

position

[in] Chart position (from ENUM_CHART_POSITION enumeration), relative to which a shift is performed.

shift=0

[in] Number of bars to shift.

Return Value

true - successful, false - cannot shift the chart.
Symbol

Gets chart symbol name.

```cpp
string Symbol() const
```

Return Value

Symbol name of the chart, assigned to the class instance. If there is no chart assigned, it returns "".
Period

Gets period of the chart.

```cpp
enum_timeframes Period() const
```

Return Value

Period of the chart (from `enum_timeframes`) assigned to the class instance. If there is no chart assigned, it returns 0.
Redraw

Redraws chart assigned to the class instance.

```cpp
void Redraw()
```
GetInteger

The function returns the value of the corresponding chart property. The chart property should be of the integer type. There are two variants of the function.

1. Immediately returns the property value.

```c
long GetInteger(
    ENUM_CHART_PROPERTY_INTEGER prop_id,  // property identifier
    int sub_window=0  // subwindow number
) const
```

2. If successful, puts the value of property to the specified variable of integer type, passed by reference as last parameter.

```c
bool GetInteger(
    ENUM_CHART_PROPERTY_INTEGER prop_id,  // property identifier
    int sub_window,  // subwindow number
    long& value  // link to the variable
) const
```

Parameters

prop_id
- [in] Property identifier (ENUM_CHART_PROPERTY_INTEGER enumeration).

sub_window
- [in] Chart subwindow number.

value
- [in] Link to the variable that receives the value of the requested property.

Return Value

Value of property of the chart assigned to the class instance. If there is not any chart assigned, it returns -1.

For the second variant, the function returns true, if this property is maintained and the value has been placed into the value variable, otherwise it returns false. To read more about the error, call GetLastError().
### SetInteger

Sets new value for the property of the integer type.

```cpp
bool SetInteger(
    ENUM_CHARTPROPERTYINTEGER prop_id, // property identifier
    long value // value
)
```

#### Parameters

**prop_id**

- **[in]** Chart property identifier (from `ENUM_CHARTPROPERTYINTEGER` enumeration).

**value**

- **[in]** New value of the property.

#### Return Value

- `true` - successful, `false` - cannot change the integer property.
GetDouble

The function returns the value of the corresponding chart property. The object property should be of the double type. There are two variants of the function.

1. Immediately returns the property value.

```cpp
double GetDouble(
    ENUM_CHARTPROPERTYDOUBLE prop_id, // property identifier
    int sub_window=0 // subwindow number
) const
```

2. If successful, puts the value of property to the specified variable of double type, passed by reference as last parameter.

```cpp
bool GetDouble(
    ENUM_CHARTPROPERTYDOUBLE prop_id, // property identifier
    int sub_window, // subwindow number
    double& value // link to the variable
) const
```

Parameters

- **prop_id**:
  - [in] Chart property identifier (from ENUM_CHARTPROPERTYDOUBLE enumeration).

- **sub_window**:
  - [in] Chart subwindow number.

- **value**:
  - [in] Variable of the double type that received the value of the requested property.

Return Value

Value of property of the chart assigned to the class instance. If there is not any chart assigned, it returns EMPTY_VALUE.

For the second variant the function, it returns true if the property value is received, otherwise returns false. To read more about the error, call GetLastError().
### SetDouble

Sets new value for the chart property of the double type.

```c
bool SetDouble(
    ENUM_CHART_PROPERTY_DOUBLE prop_id,  // property identifier
    double value                           // new value
)
```

**Parameters**

- **prop_id**
  - [in] Chart property identifier (from `ENUM_CHART_PROPERTY_DOUBLE` enumeration).

- **value**
  - [in] New value for the property.

**Return Value**

- `true` - successful, `false` - cannot change the double property.
**GetString**

The function returns the value of the corresponding chart property. The chart property should be of the string type. There are two variants of the function.

1. Immediately returns the property value.

```cpp
string GetString(
    ENUM_CHARTPROPERTY_STRING prop_id // property identifier
) const
```

2. If successful, puts the value of property to the specified variable of string type, passed by reference as last parameter.

```cpp
bool GetString(
    ENUM_CHARTPROPERTY_STRING prop_id, // property identifier
    string& value // link to the variable
) const
```

**Parameters**

- **prop_id**
  - [in] Chart property identifier (from `ENUM_CHART_PROPERTY_STRING` enumeration).

- **value**
  - [in] Link to the variable that receives the value of the requested property.

**Return Value**

Value of a chart property assigned to the class instance. If there is no chart assigned, it returns "".

For the second variant, the function returns true, if this property is maintained and the value has been placed into the value variable, otherwise it returns false. To read more about the **error**, call `GetLastError()`.
**SetString**

Sets new value for the chart property of the string type.

```c
bool SetString(  
    ENUM_CHARTPROPERTY_STRING prop_id,  // property identifier  
    string value  // value
);
```

**Parameters**

- *prop_id*  
  [in] Chart property identifier (from `ENUM_CHARTPROPERTY_STRING` enumeration).

- *value*  
  [in] New value for the property.

**Return Value**

- `true` - successful, `false` - cannot change the string property.
SetSymbolPeriod

Changes symbol and period of the chart assigned to the class instance.

```cpp
bool SetSymbolPeriod(const string symbol_name, // symbol
                     ENUM_TIMEFRAMES timeframe); // period
```

**Parameters**

- **symbol_name**
  
  [in] New chart symbol. **NULL** means the symbol of the current chart (to which an expert is attached).

- **timeframe**
  
  [in] New chart timeframe (from ENUM_TIMEFRAMES enumeration). 0 means the current chart timeframe.

**Return Value**

true - successful, false - cannot change the property.
ApplyTemplate

Applies specified template to the chart.

```cpp
bool ApplyTemplate(
    const string filename  // template
)
```

Parameters

`filename`

[in] File name of the template.

Return Value

true - successful, false - cannot apply the template.
**ScreenShot**

Creates a screenshot of the specified chart in its current state in .gif format.

```c
bool ScreenShot(
    string    filename,    // file name
    int       width,       // width
    int       height,      // height
    ENUM_ALIGN_MODE align_mode=ALIGN_RIGHT // align type
) const
```

**Parameters**

- **filename**
  - [in] File name for screenshot.
- **width**
  - [in] Screenshot width in pixels.
- **height**
  - [in] Screenshot height in pixels.
- **align_mode=ALIGN_RIGHT**
  - [in] Align mode, if screenshot is narrow.

**Return Value**

- true - successful, false - error.
WindowOnDropped

Gets chart subwindow number corresponding to the object (expert or script) drop point.

```cpp
int WindowOnDropped() const
```

Return Value

Chart subwindow number of the object drop point. 0 means main chart window.
**PriceOnDropped**

Gets price coordinate corresponding to the object (expert or script) drop point.

```cpp
double PriceOnDropped() const
```

**Return Value**

Price coordinate of the object drop point.
TimeOnDropped

Gets time coordinate corresponding to the object (expert or script) drop point.

```
const datetime TimeOnDropped()
```

Return Value

Time coordinate of the object drop point.
**XOnDropped**

Gets X coordinate corresponding to the object (expert or script) drop point.

```c
int XOnDropped() const
```

**Return Value**

X coordinate of the object drop point.
**YOnDropped**

Gets Y coordinate corresponding to the object (expert or script) drop point.

```cpp
int YOnDropped() const
```

**Return Value**

Y coordinate of the object drop point.
Save

Saves object parameters to file.

```cpp
virtual bool Save(
    int file_handle  // file handle
)
```

**Parameters**

`file_handle`

[in] handle of the binary file already opened by `FileOpen(...)` function.

**Return Value**

true - successful, false - error.
Load

Loads object parameters from file.

```cpp
virtual bool Load(  
    int file_handle  // file handle
)
```

**Parameters**

- `file_handle`
  
  [in] handle of the binary file already opened by `FileOpen(...)` function.

**Return Value**

- true - successful, false - error.
Type

Returns type identifier.

```
virtual int Type() const
```

Return Value

Type identifier (0x1111 for CChart).
The graphics library contains classes and global functions for quick plotting of custom charts. The library provides convenient ready-made solutions for building axes, curves, as well as the methods for quick access to changing common properties of a custom chart.

To start working with the library, simply read the article Visualize this! MQL5 graphics library similar to 'plot' of R language.

The graphics library is placed to the `Include\Graphics` folder of the terminal's working directory.

GraphPlot

Functions for quick curve plotting.

Version for plotting a single curve using Y coordinates.

```cpp
string GraphPlot(
    const double &y[],            // Y coordinates
    ENUM_CURVE_TYPE type=CURVE_POINTS  // curve type
)
```

Note

Y array indices are used as X coordinates for the curve.

Version for plotting a single curve using X and Y coordinates

```cpp
string GraphPlot(
    const double &x[],            // X coordinates
    const double &y[],            // Y coordinates
    ENUM_CURVE_TYPE type=CURVE_POINTS  // curve type
)
```

Version for plotting two curves using X and Y coordinates

```cpp
string GraphPlot(
    const double &x1[],            // X coordinates
    const double &y1[],            // Y coordinates
    const double &x2[],            // X coordinates
    const double &y2[],            // Y coordinates
    ENUM_CURVE_TYPE type=CURVE_POINTS  // curve type
)
```

Version for plotting three curves using X and Y coordinates

```cpp
string GraphPlot(
    const double &x1[],            // X coordinates
    const double &y1[],            // Y coordinates
    const double &x2[],            // X coordinates
    const double &y2[],            // Y coordinates
    const double &x3[],            // X coordinates
    const double &y3[],            // Y coordinates
    ENUM_CURVE_TYPE type=CURVE_POINTS  // curve type
)
```
### Version for plotting a curve using CPoint2D points coordinates

```
string GraphPlot(
    const CPoint2D &points[], // curve coordinates
    ENUM_CURVE.Type type=CURVE_POINTS // curve type
)
```

### Version for plotting two curves using CPoint2D points coordinates

```
string GraphPlot(
    const CPoint2D &points1[], // curve coordinates
    const CPoint2D &points2[], // curve coordinates
    ENUM_CURVE.Type type=CURVE_POINTS // curve type
)
```

### Version for plotting three curves using CPoint2D points coordinates

```
string GraphPlot(
    const CPoint2D &points1[], // curve coordinates
    const CPoint2D &points2[], // curve coordinates
    const CPoint2D &points3[], // curve coordinates
    ENUM_CURVE.Type type=CURVE_POINTS // curve type
)
```

### Version for plotting a curve using the pointer to CurveFunction

```
string GraphPlot(
    CurveFunction function, // pointer to the function
    const double from, // initial value of the argument
    const double to, // final value of the argument
    const double step, // increment by the argument
    ENUM_CURVE.Type type=CURVE_POINTS // curve type
)
```

### Version for plotting two curves using the pointers to the CurveFunction functions

```
string GraphPlot(
    CurveFunction function1, // pointer to the function
    CurveFunction function2, // pointer to the function
    const double from, // initial value of the argument
    const double to, // final value of the argument
    const double step, // increment by the argument
    ENUM_CURVE.Type type=CURVE_POINTS // curve type
)
```
Version for plotting three curves using the pointers to the CurveFunction functions

```cpp
string GraphPlot(
    CurveFunction function1,       // pointer to the function
    CurveFunction function2,       // pointer to the function
    CurveFunction function3,       // pointer to the function
    const double from,             // initial value of the argument
    const double to,               // final value of the argument
    const double step,             // increment by the argument
    ENUM_CURVE_TYPE type=CURVE_POINTS // curve type
)
```

Parameters

- `x[]`
  - [in] X coordinates.
- `y[]`
  - [in] Y coordinates.
- `x1[]`
  - [in] X coordinates for the first curve.
- `y1[]`
  - [in] Y coordinates for the first curve.
- `x2[]`
  - [in] X coordinates for the second curve.
- `y2[]`
  - [in] Y coordinates for the second curve.
- `x3[]`
  - [in] X coordinates for the third curve.
- `y3[]`
  - [in] Y coordinates for the third curve.
- `points[]`
  - [in] Coordinates of the curve dots.
- `points1[]`
  - [in] Coordinates of the first curve dots.
- `points2[]`
  - [in] Coordinates of the second curve dots.
- `points3[]`
  - [in] Coordinates of the third curve dots.
function
  [in] Pointer to the CurveFunction function.

function1
  [in] Pointer to the first function.

function2
  [in] Pointer to the second function.

function3
  [in] Pointer to the third function.

from
  [in] Corresponds to the first X coordinate.

to
  [in] Corresponds to the last X coordinate.

step
  [in] Parameter for calculating the X coordinates.

type=CURVE_POINTS
  [in] Curve type.

Return Value

  Name of a graphical resource.
CAxis

CAxis is an auxiliary graphics library class for working with the coordinate axes.

Description

The CAxis class receives and stores various parameters of the coordinate axes. The class implements the ability to auto scale the coordinate axes dynamically.

Declaration

```cpp
class CAxis
```

Title

```cpp
#include <Graphics\Axis.mqh>
```

<tr>
<td>SelectAxisScale</td>
<td>Auto scale the axis.</td>
</tr>
</tbody>
</table>
AutoScale (Get method)

Returns the flag defining the need for auto-scale.

```cpp
bool AutoScale()
```

Return Value

The flag value.

Note

- true — perform auto-scaling.
- false — do not perform auto-scaling.

AutoScale (Set method)

Sets the flag defining the need for auto-scale.

```cpp
void AutoScale(
    const bool auto // flag value
)
```

Parameters

auto

[in]

Note

- true — perform auto-scaling.
- false — do not perform auto-scaling.
**Min (Get method)**

Returns the minimum axis value.

```c
double Min()
```

**Return Value**

Minimum axis value.

**Min (Set method)**

Sets the minimum axis value.

```c
void Min(
    const double min  // minimum value
)
```

**Parameters**

- `min`
**Max (Get method)**

Returns the maximum axis value.

```cpp
double Max()
```

Return Value

Maximum axis value.

**Max (Set method)**

Sets the maximum axis value.

```cpp
void Max(
    const double max // maximum value
)
```

Parameters

- `max`
Step (Get method)

Return the step value by axis.

```c
double Step()
```

Return Value

Step value.
Name (Get method)

Returns the axis name.

```cpp
string Name()
```

Return Value

Axis name.

Name (Set method)

Sets the axis name.

```cpp
void Name(
    const string name // axis name
)
```

Parameters

name

[in] Axis name.
**Color (Get method)**

Returns the axis color.

```cpp
color Color()
```

**Return Value**

Axis color.

**Color (Set method)**

Sets the axis color.

```cpp
void Color(
    const color clr  // axis color
)
```

**Parameters**

- `clr`
ValuesSize (Get method)

Returns the size of the axis numbers.

```cpp
int ValuesSize()
```

Return Value

Size of the axis numbers.

ValuesSize (Set method)

Sets the size of the axis numbers.

```cpp
void ValuesSize(
    const int size // size of the axis numbers
)
```

Parameters

`size`

[in] Size of the axis numbers
ValuesWidth (Get method)

Returns the maximum allowed length in pixels for displaying the axis numbers.

\[
\text{int ValuesWidth()}
\]

Return Value

Length of the axis numbers in pixels.

Note

If a length in pixels for a specified number exceeds the maximum allowed display length, it is truncated and ends in dots.

ValuesWidth (Set method)

Sets the maximum allowed length in pixels for displaying the axis numbers.

\[
\text{void ValuesWidth(}
\text{\quad const int width} \quad \text{// maximum allowed length in pixels}
\text{)}
\]

Parameters

\[width\]

[in] Maximum allowed length of the axis numbers.

Note

If a length in pixels for a specified number exceeds the maximum allowed display length, it is truncated and ends in dots.
ValuesFormat (Get method)

Returns the format of the axis numbers.

```cpp
string ValuesFormat()
```

Return Value

Number format.

ValuesFormat (Set method)

Sets the format of the axis numbers.

```cpp
void ValuesFormat(
    const string format  // format of the axis numbers
)
```

Parameters

format

ValuesDateTimeMode (Get method)

Get the format of converting a date into a string.

```c
int ValuesDateTimeMode()
```

Return Value

Format of converting a date into a string.

ValuesDateTimeMode (Set method)

Set the format of converting a date into a string.

```c
void ValuesDateTimeMode(
    const int mode   // format of converting a date into a string
)
```

Parameters

mode

[in] Conversion format.

Note

Find out more about the formats of converting a date into a string in the `TimeToString()` function description.
ValuesFunctionFormat (Get method)

Get the pointer to the function defining the format of displaying values on the axis.

```cpp
DoubleToStringFunction ValuesFunctionFormat()
```

Return Value

Pointer to the function defining the format of displaying values on the axis.

ValuesFunctionFormat (Set method)

Set the pointer to the function defining the format of displaying values on the axis.

```cpp
void ValuesFunctionFormat(  
    DoubleToStringFunction func  // function for converting numerical values into a string  
)
```

Parameters

`func`

[in] Custom function for converting numerical values into a string.

Example:

The format of displaying X axis values has been changed using the following code:
```c
#include <Graphics\DateAxisGraphic.mqh>

//--- array for store values
double arrX[];
double arrY[];

//--- Custom function for create values on X-axis
string TimeFormat(double x, void *cbdata)
{
    return (TimeToString((datetime)arrX[ArraySize(arrX)-(int)x-1]));
}

void OnStart()
{
    MqlRates rates[];
    CopyRates(Symbol(), Period(), 0, 100, rates);
    ArraySetAsSeries(rates, true);
    int size=ArraySize(rates);
    ArrayResize(arrX, size);
    ArrayResize(arrY, size);
    for(int i=0; i<size; ++i)
    {
        arrX[i]=(double)rates[i].time;
        arrY[i]=rates[i].close;
    }

    //--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0, "DateAxisGraphic", 0, 30, 30, 780, 380))
    {
        graphic.Attach(0, "DateAxisGraphic");
    }

    //--- create curve
    CCurve *curve=graphic.CurveAdd(arrY, CURVE_LINES);

    //--- gets the X-axis
    CAxis *xAxis=graphic.XAxis();

    //--- sets the X-axis properties
    xAxis.AutoScale(false);
    xAxis.Type(AXIS_TYPE_CUSTOM);
    xAxis.ValuesFunctionFormat(TimeFormat);
    xAxis.DefaultStep(20.0);

    //--- plot
    graphic.CurvePlotAll();
    graphic.Update();
}
```
ValuesFunctionFormatCBData (Get method)

Get the pointer to the object that may contain additional data on converting axis values.

```c
void* ValuesFunctionFormatCBData()
```

Return Value

The pointer to the object that may contain additional data on converting axis values.

ValuesFunctionFormatCBData (Set method)

Set the pointer to the class object that may contain additional data on converting axis values.

```c
void ValuesFunctionFormatCBData(
    void* cbdata  // pointer to the class object
)
```

Parameters

- `cbdata`
  - `[in]` Pointer to any class object containing additional data on converting axis values
NameSize (Get method)

Returns the font size of the axis name.

```cpp
int NameSize()
```

Return Value

Font size of the axis name.

NameSize (Set method)

Sets the font size of the axis name.

```cpp
void NameSize(
    const int size  // font size of the axis name
)
```

Parameters

size

[in] Font size of the axis name.
**ZeroLever (Get method)**

Returns the "zero lever" value.

```cpp
double ZeroLever()
```

**Return Value**

"Zero lever".

**Note**

The value is used to define when the axis scale range should be expanded to include a zero value.

**ZeroLever (Set method)**

Sets the "zero lever" value.

```cpp
void ZeroLever(
    const double value  // "zero lever" value
)
```

**Parameters**

value

[in] "Zero lever" value.

**Note**

The value is used to define when the axis scale range should be expanded to include a zero value.
**DefaultStep (Get method)**

Returns the initial step value by axis

```cpp
double DefaultStep()
```

**Return Value**

Step by axis.

**DefaultStep (Set method)**

Sets the initial step value by axis

```cpp
void DefaultStep(const double value // step by axis
)
```

**Parameters**

`value`

[in] Initial step value by axis.
**MaxLabels (Get method)**

Returns the maximum allowed amount of numbers displayed on the axis.

```cpp
double MaxLabels()
```

**Return Value**

*Maximum amount of numbers on the axis.*

**MaxLabels (Set method)**

Sets the maximum allowed amount of numbers displayed on the axis.

```cpp
void MaxLabels(
    const double value  // maximum number
)
```

**Parameters**

`value`

*[in]* Maximum allowed amount of numbers displayed on the axis
MinGrace (Get method)

Returns the “tolerance” applied to the axis minimum.

```cpp
double MinGrace()
```

Return Value

“Tolerance” value for the axis minimum.

Note

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MinGrace is equal to 0.1, then 10% of the axis length (or 1.2) is subtracted from the minimum value. As a result, the axis covers the interval from 2.8 to 16.0.

MinGrace (Set method)

Sets the “tolerance” applied to the axis minimum.

```cpp
void MinGrace(
    const double value  // "tolerance" value
)
```

Parameters

value

[in] “Tolerance” applied to the axis minimum.

Note

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MinGrace is equal to 0.1, then 10% of the axis length (or 1.2) is subtracted from the minimum value. As a result, the axis covers the interval from 2.8 to 16.0.
MaxGrace (Get method)

Returns the “tolerance” applied to the axis maximum.

```c
double MaxGrace()
```

**Return Value**

“Tolerance” value for the axis maximum.

**Note**

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MaxGrace is equal to 0.1, then 10% of the axis length (or 1.2) is added to the maximum value. As a result, the axis covers the interval from 4.0 to 17.2.

MaxGrace (Set method)

Sets the “tolerance” applied to the axis maximum.

```c
void MaxGrace(
    const double value    // "tolerance" value
)
```

**Parameters**

- `value`
  
  [in] “Tolerance” value applied to the axis maximum.

**Note**

This value is expressed as part of the overall axial length. For example, suppose that the axis values are located within 4.0 to 16.0, then its length is 12.0. If MinGrace is equal to 0.1, then 10% of the axis length (or 1.2) is subtracted from the minimum value. As a result, the axis covers the interval from 2.8 to 16.0.
SelectAxisScale

Auto scale the axis.

```c
void SelectAxisScale()
```
**CColorGenerator**

CColorGenerator class is an auxiliary graphics library class for working with the color palette.

**Description**

The CColorGenerator class contains the initial color palette used for curves by default (if a color is not specified by a user).

If all colors from the initial palette are used already, new colors are automatically generated and the palette is refilled.

**Declaration**

```cpp
class CColorGenerator
```

**Title**

```cpp
#include <Graphics\ColorGenerator.mqh>
```

**Class methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Next</td>
<td>Returns the next color from the palette</td>
</tr>
<tr>
<td>Reset</td>
<td>Resets the generator</td>
</tr>
</tbody>
</table>
Next

Returns the next color from the palette.

```c
uint Next()
```

Return Value

Color.

Note

If all colors from the palette have already been passed through, new colors are automatically generated in order to replace the old ones in the palette.
Reset

Resets the generator.

```c
void Reset()
```
CCurve

The CCurve class works with the properties of the curves generated on the chart.

Description

The CCurve class sets, installs and receives the coordinates and various properties of the curves when working with the CGraphic class.

There are three curve plotting modes: dots, lines and histogram. Separate parameters are implemented for each plotting mode in the class.

Declaration

```cpp
class CCurve : public CObject
```

Title

```cpp
#include <Graphics\Curve.mqh>
```

Inheritance hierarchy

- CObject
- CCurve

</tr>
</tbody>
</table>

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Compare
Type

Return the curve type.

| ENUM_CURVE_TYPE | Type() |

Return Value

Curve type.
Name

Returns the curve name.

```
string Name()
```

Return Value

Curve name.
Color

Returns the curve color.

```c
uint Color()
```

Return Value

Curve color.
**XMax**

Returns the maximum value of the X function (real numbers only).

```c
double XMax()
```

**Return Value**

Maximum real number among all the function arguments.
**XMin**

Returns the minimum value of the X function (real numbers only).

```
    double XMin()
```

**Return Value**

```
    Minimum real number among all the function arguments.
```
YMax

Returns the maximum value of the Y function (real numbers only).

double YMax()

Return Value

Maximum value of the Y function (real numbers only).
YMin

Returns the minimum value of the Y function (real numbers only).

```
double YMin()
```

Return Value

Minimum value of the Y function (real numbers only).
Size

Returns the number of dots defining the curve.

```c
int Size()
```

Return Value

Number of dots defining the curve.
**PointsSize (Get method)**

Returns the linear size (in pixels) of dots used in plotting the curve.

```c
int PointsSize()
```

**Return Value**

Size of dots defining the curve in pixels.

**PointsSize (Set method)**

Sets the linear size (in pixels) of dots used in plotting the curve.

```c
void PointsSize(
    const int size // dot size in pixels
)
```

**Parameters**

- `size`
  - `[in]` Linear size (in pixels) of dots used in plotting the curve.
PointsFill (Get method)

Returns a flag determining if a filling for dots defining a curve should be performed.

```c
bool PointsFill() {
    // code...
}
```

Return Value

The flag value.

Note

true — perform a filling
false — do not perform a filling

PointsFill (Set method)

Sets a flag determining if a filling for dots defining a curve should be performed.

```c
void PointsFill(const bool fill) // flag value
```

Parameters

fill

[in] Flag value.

Note

true — perform a filling
false — do not perform a filling
**PointsColor (Get method)**

Returns the dot filling color.

```c
uint PointsColor ()
```

**Return Value**

Color of filling dots defining the curve.

**PointsColor (Set method)**

Sets the dot filling color

```c
void PointsColor(
    const uint clr  //dot filling color
)
```

**Parameters**

`clr`

[in] Color of filling dots defining the curve.
**GetX**

Gets X values of all curve dots to the array.

```c
void GetX(
    double& x[]    // array for writing X values
)
```

**Parameters**

`x[]`

[out] Array for getting X values of all curve dots.

**Note**

Each curve dot is defined by a couple of X and Y values. These values are not coordinates in pixels for drawing in the `Graphic` class.
GetY

Gets Y values of all curve dots to the array.

```c
void GetY(
    double& y[]       // array for writing Y values
)
```

Parameters

- `y[]`
  - `[out]` Array for getting Y values of all curve dots.

Note

Each curve dot is defined by a couple of X and Y values. These values are not coordinates in pixels for drawing in the Graphic class.
**LinesStyle (Get method)**

Returns a line style when plotting a curve using lines.

```c
ENUM_LINE_STYLE LinesStyle()
```

Return Value

Line style.

**LinesStyle (Set method)**

Sets a line style when plotting a curve using lines.

```c
void LinesStyle ( ENUM_LINE_STYLE style // line style )
```

**Parameters**

- `style`
  - `[in]` Line style.
LinesIsSmooth (Get method)

Returns a flag defining if smoothing should be done when plotting a curve by lines.

```cpp
bool LinesIsSmooth()
```

Return Value

Flag value

Note

true — perform smoothing
false — do not perform smoothing

LinesIsSmooth (Set method)

Sets a flag defining if smoothing should be done when plotting a curve by lines.

```cpp
void LinesIsSmooth(
    const bool smooth   // flag value
)
```

Parameters

smooth

[in] Flag value

Note

true — perform smoothing
false — do not perform smoothing
LinesSmoothTension (Get method)

Returns the curve smoothing parameter when drawing using lines.

```cpp
double LinesSmoothTension()
```

Return Value

Smoothing parameter value

Note

The 'tension' value is within the (0.0; 1.0] range.

LinesSmoothTension (Set method)

Sets the curve smoothing parameter when drawing using lines.

```cpp
void LinesSmoothTension(
    const double tension // parameter value
)
```

Parameters

tension

[in] Smoothing parameter value.

Note

The 'tension' value is within the (0.0; 1.0] range.
**LinesSmoothStep (Get method)**

Returns the length of the approximating lines for smoothing when plotting by lines.

```cpp
double LinesSmoothStep()
```

**Return Value**

Length of approximating lines in pixels.

**LinesSmoothStep (Set method)**

Sets the length of the approximating lines for smoothing when plotting by lines.

```cpp
void LinesSmoothStep(const double step  // line length)
```

**Parameters**

- **step**
  
  [in] Length of approximating lines
LinesEndStyle (Set method)

Get the flag indicating lines end plotting style when using lines to plot a curve.

```c
ENUM_LINE_END LinesEndStyle()
```

Return Value

A value of the flag indicating lines end plotting style when using lines to plot a curve.

LinesEndStyle (Get method)

Set the flag indicating lines end plotting style when using lines to plot a curve.

```c
void LinesEndStyle(
    ENUM_LINE_END end_style // flag value
)
```

Parameters

- `end_style`

  [in] A value of the flag indicating line end plotting style when using lines to plot a curve.
### LinesWidth (Get method)

Get lines width when plotting a curve using lines.

```c
int LinesWidth()
```

**Return Value**

Lines width.

### LinesWidth (Set method)

Set lines width when plotting a curve using lines.

```c
void LinesWidth(const int width) // lines width
```

**Parameters**

- `width`
  
  [in] Lines width when plotting a curve using lines.

**Example:**

A line width has been changed using the following code:
```csharp
#include <Graphics\Graphic.mqh>

void OnStart()
{
    double x[] = {-100,-40,-10,20,30,40,50,60,70,80,120};
    double y[] = {-5,4,-10,23,17,18,-9,13,17,4,9};

    //--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"ThickLineGraphic",0,30,30,780,380))
    {
        graphic.Attach(0,"ThickLineGraphic");
    }

    //--- create curve
    CCurve *curve=graphic.CurveAdd(x,y,CURVE_LINES);

    //--- sets the curve properties
    curve.LinesSmooth(true);
    curve.LinesStyle(STYLE_DASH);
    curve.LinesEndStyle(LINE_END_ROUND);
    curve.LinesWidth(10);

    //--- plot
    graphic.CurvePlotAll();
    graphic.Update();
}
```
HistogramWidth (Get method)

Returns the width of columns when plotting using a histogram.

```c
int HistogramWidth()
```

Return Value

Column width in pixels.

HistogramWidth (Set method)

Sets the width of columns when plotting using a histogram.

```c
void HistogramWidth(
    const int width // column width
)
```

Parameters

width

[in] Column width in pixels.
**CustomPlotCBData (Get method)**

Get the pointer to the object to be used in the custom curve plotting mode.

```c
void* CustomPlotCBData()
```

**Return Value**

Pointer to the object for the custom curve plotting mode.

**CustomPlotCBData (Set method)**

Set the pointer to the object to be used in the custom curve plotting mode.

```c
void CustomPlotCBData(
    void* cbdata  // pointer to the object
)
```

**Parameters**

`cbdata`

[in] The pointer to the object to be used in the custom curve plotting mode
CustomPlotFunction (Get method)

Get the pointer to the function implementing the custom curve plotting mode.

```cpp
PlotFunction CustomPlotFunction();
```

Return Value

Pointer to the function implementing the custom curve plotting mode.

CustomPlotFunction (Set method)

Set the pointer to the function implementing the custom curve plotting mode.

```cpp
void CustomPlotFunction(
    PlotFunction func // pointer to the function
);
```

Parameters

- `func`
  
  [in] Pointer to the function implementing the custom curve plotting mode

Example:

This curve consisting of bars is built using the following code:
```cpp
#include <Graphics\Graphic.mqh>
//+------------------------------------------------------------------+
//| Class CCandle                                                    |

```cpp
//--- sets the graphic properties
    graphic.YAxis().Max((int)max);
    graphic.YAxis().Min((int)min);
//--- plot
    graphic.CurvePlotAll();
    graphic.Update();
```
PointsType (Get method)

Get the flag pointing at the type of dots used when plotting a dotted curve.

```c
ENUM_POINT_TYPE PointsType()
```

Return Value

A value of the flag indicating a type of dots.

PointsType (Set method)

Set the flag pointing at the type of dots used when plotting a dotted curve.

```c
void PointsType( 
    ENUM_POINT_TYPE type // flag value
)
```

Parameters

`type`

[in] A value of the flag pointing at the type of dots used when plotting a dotted curve.
StepsDimension (Get method)

Get the value indicating the dimension used in step-type curve rendering.

```c
int StepsDimension()
```

Return Value

Dimension used in step-type curve rendering.

StepsDimension (Set method)

Set the value indicating the dimension used in step-type curve rendering.

```c
void StepsDimension(const int dimension // dimension )
```

Parameters

- `dimension`
  - [in] Dimension (0 or 1).

Note

- 0 — x (the horizontal line is followed by the vertical one).
- 1 — y (the vertical line is followed by the horizontal one).
**TrendLineCoefficients (Get method)**

Get trend line ratios for writing them into an array.

```cpp
double& TrendLineCoefficients()
```

**Return Value**

Trend line ratios.

**TrendLineCoefficients (Set method)**

Set trend line ratios for writing them into an array.

```cpp
void TrendLineCoefficients(
    double& coefficients[]  // array for writing ratios
)
```

**Parameters**

`coefficients[]`

[out] Array for writing ratios.
**TrendLineColor (Get method)**

Get a color of a trend line for a curve.

```cpp
uint TrendLineColor()
```

**Return Value**

Color of the trend line.

**TrendLineColor (Set method)**

Set a color of a trend line for a curve.

```cpp
void TrendLineColor(
    const uint clr // trend line color
)
```

**Parameters**

- `clr`  
  - [in] Line color
**TrendLineVisible (Get method)**

Get the trend line visibility flag.

```cpp
bool TrendLineVisible()
```

**Return Value**

A value of the flag that specifies if a trend line is visible.

**TrendLineVisible (Set method)**

Set the trend line visibility flag.

```cpp
void TrendLineVisible(
    const bool visible // flag value
)
```

**Parameters**

visible

[in] A value of the trend line visibility flag.

**Example:**

Below is the code of the mentioned trend line and its plotting on the chart:
//+------------------------------------------------------------------+
//|                                             Trend
//|                        Copyright 2016, MetaQuotes Software Corp. |
//|                                             https://www.mql5.com |
//+------------------------------------------------------------------+
#include <Graphics\Graphic.mqh>
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
    double x[]={12.0,11.5,11.0,12.0,10.5,10.0,9.0,8.5,10.0,8.5,10.0,8.0,9.5,10.0,15.0};
    double y[]={130.0,165.0,150.0,150.0,140.0,198.0,220.0,215.0,225.0,190.0,170.0,160.0};
//--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"TrendLineGraphic",0,30,30,780,380))
    {
        graphic.Attach(0,"TrendLineGraphic");
    }
//--- create curve
    CCurve *curve=graphic.CurveAdd(x,y, CURVE_POINTS);
//--- sets the curve properties
    curve.TrendLineVisible(true);
    curve.TrendLineColor(ColorToARGB(clrRed));
//--- plot
    graphic.CurvePlotAll();
    graphic.Update();
}
Update

Update the curve coordinates.

The version for working by Y coordinate. Passed array indexes are used as X coordinates here.

```cpp
void Update(
    const double& y[] // Y coordinates
)
```

This version uses X and Y coordinates.

```cpp
void Update(
    const double& x[], // X coordinates
    const double& y[]  // Y coordinates
)
```

The version for working with CPoint2D points.

```cpp
void Update(
    const CPoint2D& points[] // Curve coordinates
)
```

The version for working with a pointer to the CurveFunction function.

```cpp
void Update(
    CurveFunction function, // pointer to the function describing a curve
    const double from,       // initial value of the function argument
    const double to,         // final value of the function argument
    const double step        // argument increment
)
```

Parameters

- `x[]`
  - [in] X coordinates.

- `y[]`
  - [in] Y coordinates.

- `points[]`
  - [in] Curve coordinates.

- `function`
  - [in] A pointer to the function describing a curve

- `from`
  - [in] Initial value of the function argument

- `to`
  - [in] End value of the function argument

- `step`
  - [in] Argument increment
Visible (Get method)

Get the flag defining if a function is visible on the chart.

```cpp
void Visible(
    const bool visible  //
)
```

Return Value

A value of the flag defining a function visibility on the chart.

Visible (Set method)

Set the flag defining if a function is visible on the chart.

```cpp
void Visible(
    const bool visible  // flag value
)
```

Parameters

visible

[in] A value of the flag defining a function visibility on the chart.
## CGraphic

CGraphic is a base class for creating custom charts.

### Description

The CGraphic class provides numerous aspects of working with custom charts. The class stores the main chart elements, sets their parameters and performs plotting. Also, the class stores the curves for the chart and provides various display options.

### Declaration

```cpp
class CGraphic
```

### Title

```cpp
#include <Graphics\Graphic.mqh>
```

</tbody>
</table>
Create

Creates a graphical resource bound to a chart object.

```cpp
bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // sub-window index
    const int x1,    // x1 coordinate
    const int y1,    // y1 coordinate
    const int x2,    // x2 coordinate
    const int y2     // y1 coordinate
)
```

Parameters

- **chart**
  
  [in] Chart ID.

- **name**
  
  [in] Name.

- **subwin**
  
  [in] Sub-window index.

- **x1**
  
  [in] X1 coordinate.

- **y1**
  
  [in] Y1 coordinate.

- **x2**
  
  [in] X2 coordinate.

- **y2**
  
  [in] Y2 coordinate.
Destroy

Removes a chart and destroys a graphical resource.

```c
void Destroy()
```
**Update**

Displays implemented changes.

```c
void Update(
    const bool redraw=true  // flag
)
```

**Parameters**

- `redraw=true`
  - [in] Flag value
**ChartObjectName**

Gets the name of an object bound to a chart.

```plaintext
string ChartObjectName()
```

**Return Value**

Name of an object bound to a chart.
**ResourceName**

Receives the name of a graphical resource.

```cpp
string  ResourceName()
```

**Return Value**

Name of a graphical resource.
**XAxis**

Returns the pointer to the X axis.

```
CAxis *XAxis()
```

**Return Value**

Pointer to the X axis.
YAxis

Returns the pointer to the Y axis.

CAxis *YAxis()

Return Value

Pointer to the Y axis.
**GapSize (Get method)**

Returns the size of indents between the chart elements.

```cpp
int GapSize()
```

**Return Value**

Indent size in pixels.

**GapSize (Set method)**

Sets the size of indents between the chart elements.

```cpp
void GapSize(
    const int size  // indent size
)
```

**Parameters**

`size`

[in] Indent size in pixels.
BackgroundColor (Get method)

Returns the background color.

```cpp
color setBackgroundColor()
```

BackgroundColor (Set method)

Sets the background color.

```cpp
void setBackgroundColor(
    const color clr  // background color
)
```

Parameters

- `clr` ([in] Background color.)
BackgroundMain (Get method)

Returns a chart header

```cpp
string BackgroundMain()
```

BackgroundMain (Set method)

Sets a chart header text.

```cpp
void BackgroundMain(
    const string main       // header text
)
```

Parameters

- `main`
  - `[in]` Chart header text
BackgroundMainSize (Get method)

Returns the header size.

```c
int BackgroundMainSize()
```

Return Value

Header font size.

BackgroundMainSize (Set method)

Sets the header size.

```c
void BackgroundMainSize(
    const int size  // header size
)
```

Parameters

`size`

**BackgroundMainColor (Get method)**

Returns the header color.

```
  clr  BackgroundMainColor()
```

**Return Value**

Header color.

**BackgroundMainColor (Set method)**

Sets the header color.

```
  void  BackgroundMainColor(
      const clr  clr  // header color
  )
```

**Parameters**

- `clr`
  - [in] Header color.
BackgroundSub (Get method)

Returns the sub-header.

```cpp
string BackgroundSub()
```

**Return Value**

Sub-header text.

BackgroundSub (Set method)

Sets the sub-header text.

```cpp
void BackgroundSub (Set method)
{
    const string sub // sub-header text
}
```

**Parameters**

- `sub`
  
  [in] Sub-header text.
BackgroundSubSize (Get method)

Returns the sub-header font size

```cpp
int BackgroundSubSize()
```

BackgroundSubSize (Get method)

Sets the sub-header size

```cpp
void BackgroundSubSize(
    const int size // sub-header font size
)
```

Parameters

- `size`
  
    [in] Sub-header font size
BackgroundSubColor (Get method)

Returns the sub-header color.

```cpp
color BackgroundSubColor()
```

BackgroundSubColor (Set method)

Sets the sub-header color.

```cpp
void BackgroundSubColor(
    const color clr // sub-header color
)
```

Parameters

- `clr`
  - [in] Sub-header color.
**GridLineColor (Get method)**

Returns the grid line color

```cpp
color GridLineColor()
```

**Return Value**

Grid line color.

**GridLineColor (Set method)**

Sets the grid line color.

```cpp
void GridLineColor(
   const color clr   // line color
)
```

**Parameters**

- `clr`
  
GridBackgroundColor (Get method)

Returns the grid background color

```cpp
color GridBackgroundColor()
```

Return Value

Grid background color

GridBackgroundColor (Set method)

Sets the grid background color

```cpp
void GridBackgroundColor(
    const color clr  // grid background color
)
```

Parameters

- `clr`
  - [in] Grid background color
GridCircleRadius (Get method)

Returns radius of dots in the grid nodes.

```cpp
int GridCircleRadius() // Get method
```

Return Value

Dot radius in pixels.

GridCircleRadius (Set method)

Sets the dot radius in the grid nodes.

```cpp
void GridCircleRadius(
    const int r // radius
)
```

Parameters

- `r`
  - `[in]` Dot radius in pixels.
GridCircleColor (Get method)

Returns color of dots in the grid nodes.

```
color GridCircleColor()
```

Return Value

Dot color.

GridCircleColor (Set method)

Sets the dot color in the grid nodes.

```
void GridCircleColor(
    const color clr  // dot color
)
```

Parameters

*clr*

[in] Dot color.
GridHasCircle (Get method)

Returns the flag defining whether the dots in the grid nodes should be displayed.

```cpp
bool GridHasCircle()
```

Return Value

The flag value.

Note

- true — display the dots
- false — do not display the dots

GridHasCircle (Set method)

Sets the flag defining whether the dots in the grid nodes should be displayed.

```cpp
void GridHasCircle(
    const bool has
)
```

Parameters

- `has`
  - [in] Flag value.

Note

- true — display the dots
- false — do not display the dots
GridAxisLineColor (Get method)

Get the value of a real chart axes color.

```c
uint GridAxisLineColor()
```

Return Value

Color of real chart axes.

GridAxisLineColor (Set method)

Set the value of a real chart axes color.

```c
void GridAxisLineColor(
    const uint clr  // chart axes color
)
```

Parameters

clr

**HistoryNameWidth (Get method)**

Returns the maximum allowed length for displaying a curve name.

```cpp
int HistoryNameWidth();
```

**Return Value**

Maximum length in pixels.

**Note**

If the curve name exceeds the maximum allowed length, it is truncated and dots are added to its end.

**HistoryNameWidth (Set method)**

Sets the maximum allowed length for displaying a curve name.

```cpp
void HistoryNameWidth(
    const int width // maximum length
);
```

**Parameters**

- `width`
  

**Note**

If the curve name exceeds the maximum allowed length, it is truncated and dots are added to its end.
HistoryNameSize (Get method)

Returns the font size of the curve name.

```c
int HistoryNameSize()
```

Return Value

Font size of the curve name.

HistoryNameSize (Set method)

Sets the font size of the curve name.

```c
void HistoryNameSize (Set method)
{
    const int size  // name font size
}
```

Parameters

- **size**
  
  [in] Name font size.
HistorySymbolSize (Get method)

Returns a size of a chart's notational convention symbols

```cpp
int HistorySymbolSize()
```

Return Value

Size of notational convention symbols

HistorySymbolSize (Set method)

Sets a size of a chart's notational convention symbols

```cpp
void HistorySymbolSize(
    const int size    // symbol size
)
```

Parameters

- `size`  
  - [in] Size of notational convention symbols.
TextAdd

Adds a text to a chart.

Version for working with X and Y coordinates

```c
void TextAdd(
    const int x,       // X coordinate
    const int y,       // Y coordinate
    const string text, // text
    const uint clr,    // color
    const uint alignment=0 // alignment
)
```

Version for CPoint

```c
void TextAdd(
    const CPoint &point, // point coordinate
    const string text,  // text
    const uint clr,     // color
    const uint alignment=0 // alignment
)
```

Parameters

- `x`  
  [in] X coordinate.

- `y`  
  [in] Y coordinate.

- `&point`  
  [in] Point coordinate.

- `text`  

- `clr`  
  [in] Color.

- `alignment=0`  
LineAdd

Adds a line to a chart.

This version uses X and Y coordinates

```c
void LineAdd(
    const int x1,     // x1 coordinate
    const int y1,     // y1 coordinate
    const int x2,     // x2 coordinate
    const int y2,     // y2 coordinate
    const uint clr,   // color
    const uint style  // style
)
```

Version for CPoint

```c
void LineAdd2(
    const CPoint &point1, // first point coordinate
    const CPoint &point2, // second point coordinate
    const uint clr,       // color
    const uint style      // style
)
```

Parameters

x1
    [in] X1 coordinate.

y1
    [in] Y1 coordinate.

x2
    [in] X2 coordinate.

y2
    [in] Y2 coordinate.

&point1
    [in] First point coordinate.

&point2
    [in] Second point coordinate.

clr
    [in] Color.

style
    [in] Style.
**CurveAdd**

Create and add a new curve to the chart.

This version uses the Y coordinate (a curve color is set automatically)

```cpp
CCurve* CurveAdd{
    const double y[], // Y coordinates
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
}
```

**Note**

Y array indices are used as X coordinates for the curve.

This version uses the X and Y coordinates (a curve color is set automatically)

```cpp
CCurve* CurveAdd{
    const double x[], // X coordinates
    const double y[], // Y coordinates
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
}
```

The version for working with CPoint2D dots (curve color is set automatically)

```cpp
CCurve* CurveAdd{
    const CPoint2D points[], // dot coordinates
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
}
```

Version for working with the pointer to the CurveFunction function (curve color is set automatically)

```cpp
CCurve* CurveAdd{
    CurveFunction function, // pointer to the function
    const double from, // initial value of the argument
    const double to, // final value of the argument
    const double step, // increment by the argument
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
}
```
Version for working by Y coordinate (a curve color is set by a user)

```cpp
CCurve* CurveAdd(
    const double& y[], // Y coordinates
    const uint clr, // curve color
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
)
```

**Note**

Y array indices are used as X coordinates for the curve.

This version uses the X and Y coordinates (a curve color is set by a user)

```cpp
CCurve* CurveAdd(
    const double& x[], // X coordinates
    const double& y[], // Y coordinates
    const uint clr, // curve color
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
)
```

The version for working with CPoint2D dots (curve color is set by a user)

```cpp
CCurve* CurveAdd(
    const CPoint2D& points[], // dot coordinates
    const uint clr, // curve color
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
)
```

Version for working with the pointer to the CurveFunction function (curve color is set by a user)

```cpp
CCurve* CurveAdd(
    CurveFunction function, // pointer to the function
    const double from, // initial value of the argument
    const double to, // final value of the argument
    const double step, // increment by the argument
    const uint clr, // curve color
    ENUM_CURVE_TYPE type, // curve type
    const string name=NULL // curve name
)
```
Parameters

\$x[]\$
  [in] X coordinate.

\$y[]\$
  [in] Y coordinate.

\$points[]\$
  [in] Coordinates of dots.

\$function\$
  [in] Pointer to the function.

\$from\$
  [in] Initial value of the argument.

\$to\$
  [in] Final value of the argument.

\$step\$
  [in] Increment by the argument.

\$type\$
  [in] Curve type.

\$name=NULL\$
  [in] Curve name.

\$clr\$
  [in] Curve color.

Return Value

Pointer to the created curve.
CurvePlot

Displays the previously created curve with a specified index.

```cpp
bool CurvePlot(const int index) // index
```

Parameters

**index**

[in] Curve index

Return Value

true - successful, otherwise - false.
CurvePlotAll

Displays all curves previously added to a chart.

```csharp
bool CurvePlotAll()
```

Return Value

- `true` - successful, otherwise - `false`. 
CurveGetByIndex

Gets the curve by a specified index.

```cpp
CCurve* CurveGetByIndex(
    const int index  // curve index
)
```

**Parameters**

- `index`
  
  [in] Curve index.

**Return Value**

Pointer to the curve with a specified index.
CurveGetByName

Gets a curve by a specified name.

CCurve* CurveGetByName(
    const string name       // curve name
)

Parameters

name
    [in] Curve name.

Return Value

Pointer to the first found curve having a specified name.
CurveRemoveByIndex

Remove a curve by a specified index.

```cpp
bool CurveRemoveByIndex{
const int index  // curve index
}
```

**Parameters**

index

[in] Index of the curve to be removed.

**Return Value**

true — successful, otherwise — false.
CurveRemoveByName

Remove a curve by a specified name.

```cpp
bool CurveRemoveByName(const string name) // curve name
```

**Parameters**

- **name**
  
  [in] Name of the curve to be removed.

**Return Value**

- true — successful, otherwise — false.
CurvesTotal

Get the number of curves for the given chart.

```cpp
int CurvesTotal()
```

Return Value

- Number of curves.

Note

All curves on the current chart are considered regardless of drawing and visibility style.
**MarksToAxisAdd**

Add a scale mark (ticks) to the specified chart axis.

```cpp
bool MarksToAxisAdd(
    const double &marks[],       // tick coordinates
    const int mark_size,          // tick size
    ENUM_MARK_POSITION position,  // tick location
    const int dimension=0         // dimension
)
```

**Parameters**

- `&marks[]`
  [in] Tick coordinates
- `mark_size`
  [in] Tick size
- `position`
  [in] Tick location
- `dimension=0`
  [in] 0 — adding to X axis,
        1 — adding to Y axis

**Return Value**

- `true` - successful, otherwise `false`.  

© 2000-2021, MetaQuotes Ltd
**MajorMarkSize (Get method)**

Returns the size of the scale's ticks on the coordinate axes.

```cpp
int MajorMarkSize()
```

**MajorMarkSize (Set method)**

Returns the size of the scale's ticks on the coordinate axes.

```cpp
void MajorMarkSize(
    const int size // tick size
)
```

**Parameters**

- `size`
  
**FontSet**

Sets the current font parameters.

```cpp
bool FontSet(
    const string name,   // name
    const int size,  // size
    const uint flags=0, // flags
    const uint angle=0  // angle
)
```

**Parameters**

- `name`  
  [in] Name.
- `size`  
  [in] Size.
- `flags=0`  
- `angle=0`  

**Return Value**

- `true` - successful, otherwise - `false`. 
FontGet

Gets the current font parameters.

```c
void FontGet(
    string &name,    // name
    int &size,      // size
    uint &flags,    // flags
    uint &angle    // angle
)
```

**Parameters**

- `&name`
  - [out] Name.
- `&size`
  - [out] Size.
- `&flags`
  - [out] Flags.
- `&angle`
  - [out] Angle.
Attach

The version for getting a graphical resource from the OBJ_BITMAP_LABEL object and binding it to the CGraphic class instance:

```cpp
bool Attach(
    const long chart_id, // chart ID
    const string objname  // graphical object name
);
```

The version for creating a graphical resource for the OBJ_BITMAP_LABEL object and binding it to the CGraphic class instance:

```cpp
bool Attach(
    const long chart_id, // chart ID
    const string objname, // graphical object name
    const int width,     // image width
    const int height      // image height
);
```

**Parameters**

- **chart_id**
  
  [in] Chart ID.

- **objname**
  
  [in] Name of the graphical object.

- **width**
  
  [in] Image width in the resource.

- **height**
  
  [in] Image height in the resource.

**Return Value**

- true — successful, false — failed to bind the object.
CalculateMaxMinValues

Calculate (re-calculate) minimum and maximum chart values on both axes.

```cpp
void CalculateMaxMinValues()
```
**Height**

Get a chart height in pixels.

```
int Height()
```

**Return Value**

Chart height in pixels.
**IndentDown (Get method)**

Get a chart indent from the lower border.

```c
int IndentDown()
```

**Return Value**

Indent size in pixels.

**IndentDown (Set method)**

Set a chart indent from the lower border.

```c
void IndentDown(
    const int down       // indent size
)
```

**Parameters**

`down`

- [in] Indent size in pixels.
**IndentLeft (Get method)**

Get a chart indent from the left border.

```cpp
int IndentLeft()
```

**Return Value**

Indent size in pixels.

**IndentLeft (Set method)**

Set a chart indent from the left border.

```cpp
void IndentLeft(
    const int left  // indent size
)
```

**Parameters**

- `left`
  - [in] Indent size in pixels.
**IndentRight (Get method)**

Get a chart indent from the right border.

```
int IndentRight()
```

**Return Value**

Indent size in pixels.

**IndentRight (Set method)**

Set a chart indent from the right border.

```
void IndentRight(const int right // indent size)
```

**Parameters**

`right`

[in] Indent size in pixels.
IndentUp (Get method)

Get a chart indent from the upper border.

```cpp
int IndentUp()
```

**Return Value**

Indent size in pixels.

IndentUp (Set method)

Set a chart indent from the upper border.

```cpp
void IndentUp(
    const int up  // indent size
)
```

**Parameters**

`up`

[in] Indent value in pixels.
Redraw

Redraw the chart.

```cpp
bool Redraw(
    const bool rescale=false  // flag value
)
```

Parameters

`rescale=false`

[in] The flag indicating if a chart should be re-scaled.

Return Value

true - successful, otherwise - false.
**ResetParameters**

Reset the chart redrawing parameters.

```cpp
void ResetParameters()
```
ScaleX

Scale the value by X axis.

```cpp
virtual int ScaleX(
    double x     // value by X axis
)
```

Parameters

- `x`
  - [in] Real value by X axis.

Return Value

- A value in pixels.

Note

- Scale a real value to pixels for displaying on the chart.
**ScaleY**

Scale the value by Y axis.

```cpp
virtual int ScaleY(
    double y // value by Y axis
)
```

**Parameters**

`y`

[in] Real value by Y axis.

**Return Value**

A value in pixels.

**Note**

Scale a real value to pixels for displaying on the chart.
**SetDefaultParameters**

Set the chart parameters to default values.

```cpp
void SetDefaultParameters()
```
Width

Get the chart width in pixels.

```cpp
int Width()
```

Return Value

Chart width in pixels.
Technical Indicators and Timeseries

This section contains the technical details of the technical indicator and timeseries classes and description of the corresponding components of the standard MQL5 library.

The use of the technical indicator and timeseries classes will save time in developing applications (scripts, Expert Advisors).

The MQL5 Standard Library (in terms of technical indicators and timeseries) is located in the working directory of the terminal in the Include\Indicators folder.

**CSpreadBuffer**

CSpreadBuffer is a class for simplified access to spreads of the bars in the history.

**Description**

The CSpreadBuffer class provides a simplified access to spreads of the bars in the history.

**Declaration**

```cpp
class CSpreadBuffer: public CArrayInt
```

**Title**

```cpp
#include <Indicators\TimeSeries.mqh>
```

**Inheritance hierarchy**

- **CObject**
- **CArray**
  - **CArrayInt**
    - **CSpreadBuffer**

SearchGreatOrEqual, SearchLessOrEqual, SearchFirst, SearchLast, SearchLinear
Size
Sets buffer size.

```cpp
void Size(
    const int size // size
)
```

Parameters
size
SetSymbolPeriod

Sets symbol and period.

```c
void SetSymbolPeriod(
    const string    symbol,  // symbol
    const ENUM_TIMEFRAMES period  // period
)
```

Parameters

`symbol`

`period`

At

Gets the buffer element.

```c
int At(
    const int index // index
) const
```

**Parameters**

- `index`
  - [in] Index of buffer element.

**Return Value**

Buffer element with the specified index.
Refresh

Updates the buffer.

virtual bool Refresh()

Return Value

ture - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) element of the buffer.

```
virtual bool RefreshCurrent()
```

Return Value

- true - successful, false - cannot update the buffer.
CTimeBuffer

CTimeBuffer is a class for simplified access to opening times of the bars in the history.

Description

The CTimeBuffer class provides a simplified access to opening times of the bars in the history.

Declaration

```cpp
class CTimeBuffer: public CArrayLong
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

```
CObject
    CArray
        CArrayLong
            CTimeBuffer
```

Size

Sets buffer size.

```c
void Size(
    const int size  // size
)
```

**Parameters**

- `size`  
**SetSymbolPeriod**

Sets symbol and period.

```cpp
void SetSymbolPeriod(
    const string symbol,  // symbol
    const ENUM_TIMEFRAMES period  // period
)
```

**Parameters**

`symbol`

`period`

At

Gets the buffer element.

```c
long At(
    const int index   // index
) const
```

**Parameters**

- `index`
  - [in] Index of buffer element.

**Return Value**

Buffer element with the specified index.
Refresh

Updates the buffer.

virtual bool Refresh() 

Return Value

true - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

**Return Value**

- true - successful, false - cannot update the buffer.
CTickVolumeBuffer

CTickVolumeBuffer is a class for simplified access to tick volumes of bars in the history.

Description

The CTickVolumeBuffer class provides a simplified access to tick volumes of bars in the history.

Declaration

```cpp
class CTickVolumeBuffer: public CArrayLong
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayLong
      - CTickVolumeBuffer

Size

Sets buffer size.

```cpp
void Size(
    const int size   // size
)
```

**Parameters**

`size`

SetSymbolPeriod

Sets symbol and period.

```cpp
void SetSymbolPeriod(
    const string symbol, // symbol
    const ENUM_TIMEFRAMES period // period
)
```

Parameters

**symbol**

**period**

At

Gets the buffer element.

```c
long At(
    const int index  // index
) const
```

**Parameters**

*index*

[in] Index of buffer element.

**Return Value**

Buffer element with the specified index.
Refresh

Updates the buffer.

```cpp
virtual bool Refresh()
```

**Return Value**

- true - successful, false - cannot update the buffer.
**RefreshCurrent**

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

**Return Value**

- true - successful, false - cannot update the buffer.
CRealVolumeBuffer

CRealVolumeBuffer is a class for simplified access to real volumes of bars in the history.

Description

CTickVolumeBuffer class provides a simplified access to real volumes of bars in the history.

Declaration

```cpp
class CRealVolumeBuffer: public CArrayLong
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
- CArray
  - CArrayLong
    - CRealVolumeBuffer

Size

Sets buffer size.

```c
void Size(
    const int size  // size
)
```

**Parameters**

`size`

SetSymbolPeriod

Sets symbol and period.

```cpp
void SetSymbolPeriod(
    const string symbol,  // symbol
    const ENUM_TIMEFRAMES period  // period
)
```

Parameters

symbol

period

At

Gets the buffer element.

```c
long At(
    const int  index       // index
) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.
**Refresh**

Updates the buffer.

```
virtual bool Refresh()
```

**Return Value**

- true - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

Return Value

- true - successful, false - cannot update the buffer.
CDoubleBuffer

CDoubleBuffer is a base class for simplified access to data buffers of double type.

Description

The CDoubleBuffer class provides a simplified access to the data of the buffer of double type.

Declaration

```cpp
class CDoubleBuffer: public CArrayDouble
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- **CObject**
- **CArray**
  - **CArrayDouble**

```

Parameters

symbol

period

At

Gets the buffer element.

```c
double At(
    const int index  // index
) const
```

Parameters

`index`

[in] Index of buffer element.

Return Value

Buffer element with the specified index.
Refresh

Updates the buffer.

```cpp
virtual bool Refresh();
```

**Return Value**

- true - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

**Return Value**

- true - successful, false - cannot update the buffer.
**COpenBuffer**

COpenBuffer is a class for simplified access to open prices of bars in the history.

**Description**

COpenBuffer class provides a simplified access to open prices of bars in the history.

**Declaration**

```cpp
class COpenBuffer: public CDoubleBuffer
```

**Title**

```cpp
#include <Indicators\TimeSeries.mqh>
```

**Refresh**

Updates the buffer.

```cpp
virtual bool Refresh()
```

**Return Value**

- true - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

Return Value

- true - successful, false - cannot update the buffer.
**CHighBuffer**

CHighBuffer is a class for simplified access to high prices of bars in the history.

**Description**

CHighBuffer class provides a simplified access to high prices of bars in the history.

**Declaration**

```cpp
class CHighBuffer: public CDoubleBuffer
```

**Title**

```cpp
#include <Indicators\TimeSeries.mqh>
```

**Inheritance hierarchy**

- CObject
  - CArray
    - CArrayDouble

**Methods inherited from class CDoubleBuffer**
- Size, At, SetSymbolPeriod
Refresh

Updates the buffer.

```cpp
virtual bool Refresh()
```

Return Value

- true - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

Return Value

- true - successful, false - cannot update the buffer.
CLowBuffer

CLowBuffer is a class for simplified access to low prices of bars in the history.

Description

The CLowBuffer class provides a simplified access to low prices of bars in the history.

Declaration

```
class CLowBuffer: public CDoubleBuffer
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

```
Refresh

Updates the buffer.

```cpp
virtual bool Refresh();
```

Return Value

true - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

Return Value

- `true` - successful, `false` - cannot update the buffer.
CCloseBuffer

CCloseBuffer is a class for simplified access to close prices of bars in the history.

Description

CCloseBuffer class provides a simplified access to close prices of bars in the history.

Declaration

```cpp
class CCloseBuffer : public CDoubleBuffer
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayDouble
      - CDoubleBuffer

Methods inherited from class CDoubleBuffer

- Size, At, SetSymbolPeriod
Refresh

Updates the buffer.

```cpp
virtual bool Refresh()
```

Return Value

- true - successful, false - cannot update the buffer.
**RefreshCurrent**

Updates the current (zeroth) element of the buffer.

```cpp
virtual bool RefreshCurrent()
```

**Return Value**

- true - successful, false - cannot update the buffer.
CIndicatorBuffer

CIndicatorBuffer is a class for simplified access to the data of the indicator's buffer.

Description

CIndicatorBuffer class provides the simplified access to the data buffer of technical indicator.

Declaration

```cpp
class CIndicatorBuffer : public CDoubleBuffer
```

Title

```cpp
#include <Indicators\Indicator.mqh>
```

Inheritance hierarchy

- CObject
- CArray
  - CArrayDouble
    - CDoubleBuffer
      - CIndicatorBuffer

Size, At, SetSymbolPeriod
### Offset

Gets offset of the buffer.

```c
int Offset() const
```

**Return Value**

Buffer offset.

### Offset

Sets offset of the buffer.

```c
void Offset(
    const int offset  // offset
);
```

**Parameters**

- `offset`
Name

Gets the name of the buffer.

```cpp
string Name() const
```

Return Value

Name of the buffer.

Name

Sets the name of the buffer.

```cpp
void Name(
    const string name // name
}
```

Parameters

name

[in] New name of the buffer.
At

Gets buffer element.

```cpp
double At(
    int  index  // index
) const
```

Parameters

index

[in] Index of buffer element.

Return Value

Buffer element with the specified index.
Refresh

Updates the whole buffer.

```cpp
bool Refresh(
    const int handle,   // indicator handle
    const int num       // buffer number
)
```

Parameters

- **handle**
  - [in] Handle of the indicator.

- **num**
  - [in] Buffer index of the indicator.

Return Value

- true - successful, false - cannot update the buffer.
RefreshCurrent

Updates the current (zeroth) buffer element.

```cpp
bool RefreshCurrent(
    const int handle,  // handle of the indicator
    const int num      // buffer number
);
```

Parameters
handle
- [in] Handle of the indicator.

num
- [in] Indicator buffer number.

Return Value
true - successful, false - cannot update the buffer.
CSeries

CSeries is a base class for an access to the timeseries data of the Standard Library.

Description

CSeries class provides the simplified access to all the MQL5 API general functions related to working with the series data for all its descendants (timeseries and indicator classes).

Declaration

```
class CSeries: public CArrayObj
```

Title

```
#include <Indicators\Series.mqh>
```

Inheritance hierarchy

- CObject
- CArray
  - CArrayObj
  - CSeries

Direct descendants

- CIndicator, CiRealVolume, CiSpread, CiTickVolume, CiTime, CPriceSeries

Name

Gets the name of timeseries or indicator.

```cpp
string Name() const
```

Return Value

The name of timeseries or indicator.
BuffersTotal

Gets the number of buffers of timeseries or indicator.

```cpp
int BuffersTotal() const
```

Return Value

The number of buffers of timeseries or indicator.

Note

The timeseries has only one buffer.
Timeframe

Gets the timeframe flag of timeseries or indicator.

```c
int Timeframe() const
```

Return Value

The timeframe flag of timeseries or indicator.

Note

It is generated as the object visibility flags.
Symbol

Gets the symbol of timeseries or indicator.

```
string Symbol() const
```

Return Value

The symbol of timeseries or indicator.
Period

Gets the period of timeseries or indicator.

```
ENUM_TIMEFRAMES  Period() const
```

Return Value

The period (value of `ENUM_TIMEFRAMES` enumeration) of timeseries or indicator.
RefreshCurrent

Sets a flag to constantly update the current values of timeseries or indicator.

```csharp
string RefreshCurrent(
    const bool flag       // value
)
```

Parameters

*flag*

Return Value

None.
BufferSize

Returns the amount of data available in timeseries buffer or indicator buffer.

```c
int BufferSize() const
```

Return Value

Amount of data available in timeseries buffer or indicator buffer.
BufferResize

Sets buffer size of timeseries or indicator.

```cpp
virtual bool BufferResize(
    const int size // size
)
```

**Parameters**

`size`
- [in] New size of the buffers.

**Return Value**

`true` - successful, otherwise - `false`.

**Note**

All the timeseries or indicator buffers have the same `size`. 
Refresh

Updates the data of timeseries or indicator.

```c
virtual void Refresh(
    const int flags // flags
)
```

Parameters

`flags`

[in] Timeframes to update (flag).
PeriodDescription

Gets the string representation of the specified `ENUM_TIMEFRAMES` enumeration.

```cpp
string PeriodDescription(
    const int val=0     // value
)
```

**Parameters**

`val=0`

[in] Value to convert.

**Return Value**

The string representation of the specified `ENUM_TIMEFRAMES` enumeration.

**Note**

If the value is not specified or equal to zero, the timeframe of timeseries or indicator is transformed into a string.
CPriceSeries

CPriceSeries is a base class for access to the price data.

Description

CPriceSeries class provides the simplified access to MQL5 API general functions for working with price data to all its descendants.

Declaration

```cpp
class CPriceSeries: public CSeries
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj
      - CSeries
        - CPriceSeries

Direct descendants

- CiClose, CiHigh, CiLow, CiOpen

Methods inherited from class CSeries
   Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent
**BufferResize**

Sets the series buffer size.

```cpp
virtual void BufferResize(
    const int size   // size
)
```

**Parameters**

`size`

**Return Value**

true - successful, otherwise - false.
**GetData**

Gets the specified series buffer element.

```cpp
double GetData(
    const int index  // index
) const
```

**Parameters**

- **index**
  - [in] Index of a buffer element.

**Return Value**

The series buffer element, or `EMPTY_VALUE`. 
Refresh

Updates the timeseries data

```cpp
virtual void Refresh(
    const int flags=OBJ_ALL_PERIODS   // flags
)
```

Parameters

- `flags=OBJ_ALL_PERIODS`
  - `[in]` Timeframe flags.
MinIndex

Gets the index of minimal value in the specified range.

```cpp
virtual int MinIndex{
    const int start, // size
    const int count  // number
} const
```

Parameters

**start**

[in] Search range initial index.

**count**

[in] Search range size (number of elements).

Return Value

The index of minimal value of a series buffer in the specified range, or -1.
MinValue

Gets the minimal value in the specified range.

```cpp
virtual double MinValue(
    const int start,  // size
    const int count,  // number
    int& index        // reference
) const
```

**Parameters**

- **start**
  - [in] Search range initial index.

- **count**
  - [in] Search range size (number of elements).

- **index**
  - [out] Reference to the variable for placing the found element's index value.

**Return Value**

The minimal value of the series buffer in the specified range, or `EMPTY_VALUE`.

**Note**

The index of the found element is stored by index reference.
MaxIndex

Gets the index of maximal value in the specified range.

```cpp
virtual int MaxIndex(
    const int start, // index
    const int count   // number
) const
```

**Parameters**

- `start`  
  
  `[in]` Search range initial index.

- `count`  
  
  `[in]` Search range size (number of elements).

**Return Value**

The index of the maximal value of the series buffer in the specified range, or -1.
**MaxValue**

Gets the maximal value in the specified range.

```cpp
virtual double MaxValue(
    const int start,  // size
    const int count,  // amount
    int& index         // reference
) const
```

**Parameters**

- `start`  
  
  [in] Search range initial index.

- `count`  
  
  [in] Search range size (number of elements).

- `index`  
  
  [out] Reference to the variable for placing the found element's index value.

**Return Value**

The maximal value of a series buffer in the specified range, or `EMPTY_VALUE`.

**Note**

The index of the found element is stored by index reference.
CIndicator

CIndicator is a base class for technical indicator classes of the MQL5 standard library.

Description

The CIndicator class provides the simplified access for all of its descendants to general MQL5 API technical indicator functions.

Declaration

```cpp
class CIndicator: public CSeries
```

Title

```cpp
#include <Indicators\Indicator.mqh>
```

Inheritance hierarchy

Attributes

Finding Min/Max Values

**Minimum**
- Gets the index of minimal value in a specified range.

**MinValue**
- Gets the minimal value in a specified range.

**Maximum**
- Gets the index of maximal value in a specified range.

**MaxValue**
- Gets the maximal value in a specified range.

Conversion of Enumerations

**MethodDescription**
- Converts `ENUM_MA_METHOD` into a string

**PriceDescription**
- Converts `ENUM_APPLIED_PRICE` into a string

**VolumeDescription**
- Converts `ENUM_APPLIED_VOLUME` into a string

Working with chart

**AddToChart**
- Adds an indicator to the chart

**DeleteFromChart**
- Deletes an indicator from the chart

Methods inherited from class CObject

- Prev, Prev, Next, Next, **Compare**

Methods inherited from class CArray

- Step, Step, Total, **Available**, Max, IsSorted, **SortMode**, Clear, Sort

Methods inherited from class CArrayObj

- **FreeMode**, **FreeMode**, **Type**, Save, Load, **createElement**, Reserve, Resize, Shutdown, Add, AddArray, Insert, InsertArray, AssignArray, At, Update, Shift, Detach, Delete, DeleteRange, Clear, CompareArray, InsertSort, **Search**, **SearchGreat**, **SearchLess**, **SearchGreatOrEqual**, **SearchLessOrEqual**, **SearchFirst**, **SearchLast**

Methods inherited from class CSeries

- **Name**, **BuffersTotal**, **BufferSize**, **Timeframe**, Symbol, Period, **PeriodDescription**, **RefreshCurrent**
Handle

Gets the indicator's handle.

```cpp
int Handle() const
```

Return Value

Handle of the indicator.
Status

Gets the status of the indicator.

```cpp
string Status() const
```

Return Value

The status of indicator creation.
**FullRelease**

Sets a flag to release the handle.

```cpp
void FullRelease(
    const bool flag=true // flag
)
```

**Parameters**

*flag*

Create

Creates the indicator of the specified type with the specified parameters.

```cpp
bool Create(
    const string symbol,   // symbol
    const ENUM_TIMEFRAMES period, // period
    const ENUM_INDICATOR type,    // type
    const int num_params,   // number of parameters
    const MqlParam& params[],  // array of parameters
)
```

**Parameters**

- `symbol`
  - [in] Indicator symbol.

- `period`

- `type`
  - [in] Indicator type ([ENUM_INDICATOR] enumeration).

- `num_params`
  - [in] Number of indicator's parameters.

- `params`
  - [in] Reference to the parameters array for the indicator.

**Return Value**

- `true` - successful, `false` - cannot create the indicator.
BufferResize

Sets the sizes of the indicator buffers.

```cpp
virtual bool BufferResize(const int size);  // size
```

**Parameters**

- `size`:
  

**Return Value**

- `true` - successful, otherwise `false`.

**Note**

All the indicator buffers have the same size.
BarsCalculated

Returns the amount of calculated data for the indicator.

```c
int BarsCalculated() const;
```

Return Value

Returns the amount of calculated data in the indicator buffer, or -1 in the case of error (data is not calculated yet).
**GetData**

Gets the specified element of the specified buffer of the indicator. `Refresh()` should be called for working with recent data before using the method.

```cpp
double GetData(
    const int buffer_num,   // buffer number
    const int index         // index
) const
```

**Parameters**

- **buffer_num**
  - [in] Indicator buffer number.

- **index**
  - [in] Indicator buffer element index.

**Return Value**

- `value` - success, `EMPTY_VALUE` - cannot receive the data.

**GetData**

Gets the data from the indicator's buffer by starting position and number.

```cpp
int GetData(
    const int start_pos,   // position
    const int count,       // number
    const int buffer_num,  // buffer number
    double& buffer{}       // array
) const
```

**Parameters**

- **start_pos**
  - [in] Starting position of the indicator buffer.

- **count**
  - [in] Number of indicator buffer elements.

- **buffer_num**
  - [in] Number of the indicator buffer.

- **buffer**
  - [in] Reference to the array for storing data.

**Return Value**

- Number of the indicator values received from the specified indicator buffer - success, otherwise -1.

**GetData**

Gets the data from the indicator buffer by start time and number.
```cpp
int GetData(
    const datetime start_time,  // starting time
    const int count,            // amount
    const int buffer_num,       // buffer number
    double& buffer[]            // array
) const

Parameters

start_time
  [in] Indicator buffer element starting time.

count
  [in] Number of indicator buffer elements.

buffer_num
  [in] Number of the indicator buffer.

buffer
  [in] Reference to the array for storing data.

Return Value

Number of the indicator values received from the specified buffer, otherwise -1.

GetData

Gets the data from the indicator buffer by start and end time.

```cpp
int GetData(
    const datetime start_time,  // start time
    const datetime stop_time,   // end time
    const int buffer_num,       // number of buffer
    double& buffer[]            // array
) const

Parameters

start_time
  [in] Indicator buffer initial element time.

stop_time
  [in] Indicator buffer end element time.

buffer_num
  [in] Number of the indicator buffer.

buffer
  [in] Reference to the array for storing data.

Return Value

Number of the indicator values received from the specified buffer - success, otherwise -1.
Refresh

Updates the indicator data. It is recommended calling the method before using `GetData()`.

```cpp
virtual void Refresh{
    int flags=OBJ_ALL_PERIODS     // flags
}
```

Parameters

`flags=OBJ_ALL_PERIODS`

Minimum

Minimum

Returns the index of minimal element of the specified buffer in a specified range.

```c
int Minimum(
    const int buffer_num,  // buffer number
    const int start,      // starting index
    const int count       // number
) const
```

Parameters

- `buffer_num` [in] Buffer number to search the value in.
- `start` [in] Search range initial index.
- `count` [in] Search range size (number of elements).

Return Value

Index of the minimal element of the specified buffer in a specified range.
**MinValue**

Returns the value of minimal element of the specified buffer in a specified range.

```cpp
double MinValue(
    const int buffer_num,  // buffer number
    const int start,       // starting index
    const int count,       // number
    int& index             // reference
) const
```

**Parameters**

- **buffer_num**
  - [in] Buffer number to search the value in.

- **start**
  - [in] Search range initial index.

- **count**
  - [in] Search range size (number of elements).

- **index**
  - [out] Reference to the variable for storing the found element index value.

**Return Value**

The value of the minimal element of the specified buffer in a specified range.

**Note**

The index of the found element is stored by index reference.
**Maximum**

Returns the index of maximal element of the specified buffer in a specified range.

```c
int Maximum(
    const int buffer_num,  // buffer number
    const int start,       // starting index
    const int count        // number
)
```

**Parameters**

- `buffer_num`
  - [in] Buffer number to search the value in.

- `start`
  - [in] Search range initial index.

- `count`
  - [in] Search range size (number of elements).

**Return Value**

Index of the maximal element of the specified buffer in a specified range.
MaxValue

Returns the value of maximal element of the specified buffer in a specified range.

```cpp
double MaxValue(
    const int buffer_num,  // buffer number
    const int start,       // starting index
    const int count,       // number
    int& index             // reference
) const
```

**Parameters**

**buffer_num**

[in] Buffer number to search the value in.

**start**

[in] Search range initial index.

**count**

[in] Search range size (number of elements).

**index**

[out] Reference to the variable for storing the found element index value.

**Return Value**

The value of the maximal element of the specified buffer in a specified range.

**Note**

The index of maximal buffer element is stored by index reference.
MethodDescription

Converts `ENUM_MA_METHOD` enumeration value to a string.

```cpp
string MethodDescription(const int val // value ) const
```

**Parameters**

- `val`  
  
  [in] Conversion value.

**Return Value**

The string corresponding to `ENUM_MA_METHOD` enumeration value.
PriceDescription

Converts `ENUM_APPLIED_PRICE` enumeration value to a string.

```cpp
string PriceDescription(const int val) const
```

**Parameters**

`val`

[in] Conversion value.

**Return Value**

The string corresponding to `ENUM_APPLIED_PRICE` enumeration value.
VolumeDescription

Converts `ENUM_APPLIED_VOLUME` enumeration value to a string.

```cpp
string VolumeDescription(  
    const int val // value  
) const
```

**Parameters**

`val`

[in] Conversion value.

**Return Value**

The string corresponding to `ENUM_APPLIED_VOLUME` enumeration value.
**AddToChart**

Adds the indicator to the chart.

```cpp
bool AddToChart(
    const long chart,  // chart ID
    const int subwin   // subwindow index
)
```

**Parameters**

- `chart`  
  [in] Chart ID.

- `subwin`  
  [in] Chart subwindow index.

**Return Value**

- `true` - successful, `false` - cannot add the indicator to the chart.
DeleteFromChart

Deletes the indicator from the chart.

```cpp
bool DeleteFromChart(  
    const long chart, // chart ID  
    const int subwin   // subwindow index
)
```

**Parameters**

- `chart`
  - `[in]` Chart ID.
- `subwin`
  - `[in]` Chart subwindow index.

**Return Value**

- true - successful, false - cannot remove the indicator from the chart.
### CIndicators

The CIndicators is a class for collecting instances of timeseries and technical indicators classes.

#### Description

CIndicators class provides creation of the technical indicators class instances, their storage and management (data synchronization, handle and memory management).

#### Declaration

```cpp
class CIndicators: public CArrayObj
```

#### Title

```cpp
#include <Indicators\Indicators.mqh>
```

#### Class Methods by Groups

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create</td>
<td>Creates an indicator</td>
</tr>
<tr>
<td>Refresh</td>
<td>Updates indicator data</td>
</tr>
</tbody>
</table>
Create

Creates the indicator of the specified type with the specified parameters.

```c
CIndicator* Create(
    const string symbol,       // symbol name
    const ENUM_TIMEFRAMES period,  // period
    const ENUM_INDICATOR type,    // type
    const int count,            // number of parameters
    const MqlParam& params       // parameters array
)
```

Parameters

- **symbol**
  - [in] Indicator symbol name.

- **period**
  - [in] Indicator timeframe (ENUM_TIMEFRAMES enumeration value).

- **type**
  - [in] Indicator type (ENUM_INDICATOR enumeration value).

- **count**
  - [in] Number of parameters for the indicator.

- **params**
  - [in] Reference to the parameters array for the indicator.

Return Value

Reference to the created indicator - successful, NULL - cannot create the indicator.
Refresh

Updates data for all timeseries and technical indicators in the collection.

```cpp
int Refresh()
```

Return Value

Updated timeframe flags (formed as object visibility flags).
Timeseries classes

This group of chapters contains technical details of timeseries classes of the MQL5 Standard Library and descriptions of all its key components.

<table>

CiSpread

CiSpread is a class designed for access to spreads of the bars in the history.

Description

CiSpread class provides an access to spread historical data.

Declaration

```cpp
class CiSpread: public CSeries
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj
      - CSeries
        - CiSpread

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent
Create

Creates a timeseries with the specified parameters for access to the spreads history.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period  // period
)
```

Parameters

- **symbol**
  - [in] Timeseries symbol.
- **period**
  - [in] Timeseries timeframe ([ENUM_TIMEFRAMES](#) enumeration value).

Return Value

- true - successful, false - cannot create the timeseries.
BufferResize

Sets size of the buffer series.

```c
virtual void BufferResize(
    int size  // size
)
```

Parameters

- `size`
**GetData**

Gets the specified element of timeseries buffer.

```c
int GetData(
    int index // index
) const
```

**Parameters**

*index*

- [in] Index of the buffer element.

**Return Value**

The timeseries buffer element, or 0.

**GetData**

Gets the element of timeseries by starting position and number of elements.

```c
int GetData(
    int start_pos, // position
    int count, // number
    int& buffer // array
) const
```

**Parameters**

*start_pos*

- [in] Starting position of a timeseries buffer.

*count*

- [in] Number of timeseries buffer elements.

*buffer*

- [in] Reference to the array for storing the data.

**Return Value**

- >=0 - successful, -1 - cannot receive the data.

**GetData**

Gets data from a timeseries buffer by initial time and number.

```c
int GetData(
    datetime start_time, // starting time
    int count, // number
    int& buffer // array
) const
```

**Parameters**

*start_time*
**GetData**

Gets the data from a timeseries buffer by start and stop times.

```c
int GetData(
    datetime start_time,  // starting time
    datetime stop_time,   // stop time
    int& buffer,          // array
) const
```

**Parameters**

- **start_time**
  - [in] Starting time of a timeseries buffer element.

- **stop_time**
  - [in] Stop time of a timeseries buffer element.

- **buffer**
  - [in] Reference to the array for storing data.

**Return Value**

- \( \geq 0 \) - successful, -1 - cannot receive the data.
Refresh

Updates the data of timeseries.

```cpp
virtual void Refresh(
    int flags // flags
)
```

**Parameters**

*flags*

[In] Timeframe flags.
CiTime

CiTime is a class designed for access to open times of the bars in the history.

Description

CiTime class provides an access to open times of the bars in the history.

Declaration

```cpp
class CiTime: public CSeries
```

Title

```
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj
      - CSeries
        - CiTime

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent
Create

Creates a timeseries with the specified parameters for access to the opening times of the bars in the history.

```csharp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period  // period
)
```

Parameters

- **symbol**
  - [in] Timeseries symbol.

- **period**
  - [in] Timeseries timeframe ([`ENUM_TIMEFRAMES`](#) enumeration value).

Return Value

- true - successful, false - cannot create timeseries.
BufferResize

Sets series buffer sizes.

```cpp
virtual void BufferResize(
    int size       // size
)
```

**Parameters**

- `size`
**GetData**

Gets the specified element of a timeseries buffer.

```c
datetime GetData(  
    int index    // index  
) const
```

**Parameters**

*index*

[in] Index of the buffer element.

**Return Value**

The timeseries buffer element, or 0.

**GetData**

Gets the data from a timeseries buffer by starting position and number.

```c
int GetData(  
    int start_pos,    // position  
    int count,        // number  
    long& buffer      // array  
) const
```

**Parameters**

*start_pos*

[in] Starting position of timeseries.

*count*

[in] Number of timeseries buffer elements.

*buffer*

[in] Reference to the array for storing data.

**Return Value**

>=0 - successful, -1 - cannot receive data.

**GetData**

Gets the data from timeseries buffer by starting time and number.

```c
int GetData(  
    datetime start_time,  // starting time  
    int count,            // number  
    long& buffer          // array  
) const
```

**Parameters**

*start_time*
**GetData**

Gets the data from a timeseries buffer by starting and stop times.

```c
int GetData(
    datetime start_time,  // starting time
    datetime stop_time,   // stop time
    long& buffer          // array
    ) const
```

**Parameters**

- `start_time`:

- `stop_time`:

- `buffer`:
  [in] Reference to the array for storing data

**Return Value**

>=0 - successful, -1 - cannot receive data.
Refresh

Updates the data of timeseries.

```cpp
virtual void Refresh(
    int flags  // flags
)
```

Parameters

- **flags**
  - `[in]` Timeframe flags.
CiTickVolume

CiTickVolume is a class designed for access to tick volumes of the bars in the history.

Description

CiTickVolume class provides an access to tick volumes of the bars in the history.

Declaration

```cpp
class CiTickVolume: public CSeries
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj
      - CSeries
        - CiTickVolume

Methods inherited from class CObject

Prev, Prev, Next, Next, Compare

Methods inherited from class CSeries

Name, BuffersTotal, BufferSize, Timeframe, Symbol, Period, PeriodDescription, RefreshCurrent
Create

Creates a timeseries with the specified parameters for access to the tick volumes of the bars in the history.

```cpp
bool Create(
    string symbol,    // symbol
    ENUM_TIMEFRAMES period   // period
)
```

Parameters

symbol

period

Return Value

true - successful, false - cannot create a timeseries.
**BufferResize**

Sets size of the series buffer.

```cpp
virtual void BufferResize(
    int size  // size
)
```

**Parameters**

- `size`
GetData

Gets the specified timeseries buffer element.

```c
long GetData(
    int index       // index
) const
```

**Parameters**

- `index`
  - [in] Index of the buffer element.

**Return Value**

The timeseries buffer element, or 0.

GetData

Gets the data from the timeseries buffer by starting position and number.

```c
int GetData(
    int start_pos,   // position
    int count,        // number
    long& buffer      // array
) const
```

**Parameters**

- `start_pos`
  - [in] Starting position of a timeseries buffer.
- `count`
  - [in] Number of timeseries buffer elements.
- `buffer`
  - [in] Reference to the array for storing the data.

**Return Value**

  >=0 - successful, -1 - cannot receive data.

GetData

Gets the data from a timeseries buffer by starting time and number.

```c
int GetData(
    datetime start_time, // starting time
    int count,           // number
    long& buffer         // array
) const
```

**Parameters**

- `start_time`
**GetData**

Gets the data from a timeseries buffer by starting and stop times.

```c
int GetData(
    datetime start_time,    // starting time
    datetime stop_time,     // stop time
    long& buffer             // array
) const
```

**Parameters**

- **start_time**
  - [in] Time of the timeseries buffer initial element.

- **stop_time**
  - [in] Time of the timeseries buffer end element.

- **buffer**
  - [in] Reference to the array for storing data

**Return Value**

- $\geq 0$ - successful, -1 - cannot receive data.
Refresh

Updates the data of timeseries.

```cpp
virtual void Refresh(
    int flags   // flags
)
```

**Parameters**

flags

CiRealVolume

CiRealVolume is a class designed for access to real volumes of the bars in the history.

Description

CiRealVolume class provides an access to real volumes of the bars in the history.

Declaration

```cpp
class CiRealVolume: public CSeries
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

Create

Creates a timeseries with the specified parameters for access to the real volumes of the bars in the history.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period  // period
)
```

Parameters

- **symbol**
  - [in] Timeseries symbol.

- **period**

Return Value

- true - successful, false - cannot create a timeseries.
BufferResize

Sets a series buffer size.

```cpp
virtual void BufferResize(
    int size,     // size
)
```

### Parameters

- **size**
GetData

Gets the specified series buffer element.

```c
datetime GetData(
    int  index  // index
) const
```

Parameters

`index`
- [in] Buffer element index.

Return Value

Series buffer element, or 0.

GetData

Gets the data from timeseries buffer by starting position and number.

```c
int GetData(
    int  start_pos,  // position
    int  count,       // number
    long& buffer      // array
) const
```

Parameters

`start_pos`
- [in] Starting position of timeseries buffer.

`count`
- [in] Number of timeseries buffer elements.

`buffer`
- [in] Reference to the data storage array.

Return Value

`>=0` - successful, `-1` - cannot receive data.

GetData

Gets the data from timeseries buffer by starting time and number.

```c
int GetData(
    datetime start_time,  // starting time
    int  count,           // number
    long& buffer          // array
) const
```

Parameters

`start_time`
- [in] Starting time.

\( \text{count} \)
[in] Number of timeseries buffer elements.

\( \text{buffer} \)
[in] Reference to the data storage array.

**Return Value**

\( \geq 0 \) - successful, \(-1\) - cannot receive data.

### GetData

Gets the element of timeseries by starting and stop times.

```c
int GetData(
    datetime start_time, // starting time
    datetime stop_time, // stop time
    long& buffer        // target array
) const
```

**Parameters**

\( \text{start\_time} \)
[in] Starting time.

\( \text{stop\_time} \)
[in] Stop time.

\( \text{buffer} \)
[in] Reference to the target array for data

**Return Value**

\( \geq 0 \) if successful, \(-1\) in the case of error.
Refresh

Updates the data of timeseries.

```cpp
virtual void Refresh(
    int flags  // flags
)
```

Parameters

- `flags`
  
CiOpen

CiOpen is a class designed for access to open prices of the bars in the history.

Description

CiOpen class provides an access to open prices of the bars in the history.

Declaration

```cpp
class CiOpen: public CPriceSeries
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
- CArray
- CArrayObj
- CSeries
- CPriceSeries
- CiOpen

Create

Creates a timeseries with the specified parameters for access to the open prices of the bars in the history.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period  // period
)
```

**Parameters**

- `symbol`
  - [in] Timeseries symbol.

- `period`

**Return Value**

- true - successful, false - cannot create a timeseries.
**GetData**

Gets the element of timeseries by starting position and number.

```c
int GetData(
    int start_pos, // starting position
    int count,     // number
    double& buffer // array
) const
```

**Parameters**

- `start_pos`  
  [in] Starting position of timeseries buffer.

- `count`  
  [in] Number of timeseries buffer elements.

- `buffer`  
  [in] Reference to the data storage array.

**Return Value**

- >=0 · successful, -1 · cannot receive data.

**GetData**

Gets data from the timeseries buffer by starting time and number.

```c
int GetData(
    datetime start_time, // starting time
    int count,           // number
    double& buffer       // array
) const
```

**Parameters**

- `start_time`  

- `count`  
  [in] Number of timeseries buffer elements.

- `buffer`  
  [in] Reference to the data storage array.

**Return Value**

- >=0 · successful, -1 · cannot receive data.
int GetData(
    datetime start_time, // starting time
    datetime stop_time, // stop time
    double& buffer // array
) const

Parameters

start_time

stop_time

buffer
    [in] Reference to the data storage array.

Return Value

>=0 - successful, -1 - cannot receive data.
CiHigh

CiHigh is a class designed for access to high prices of the bars in the history.

Description

CiHigh class provides an access to high prices of the bars in the history.

Declaration

```cpp
class CiHigh : public CPriceSeries
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Create

Creates a timeseries with the specified parameters for access to the high prices of the bars in the history.

```cpp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period // period
)
```

Parameters

symbol

period

Return Value

true - successful, false - cannot create a timeseries.
**GetData**

Gets data from the timeseries buffer by starting position and number.

```c
int GetData(
    int start_pos,  // position
    int count,      // number
    double* buffer  // array
) const
```

**Parameters**

- **start_pos**
  
  [in] Starting position of a timeseries buffer.

- **count**
  
  [in] Number of timeseries buffer elements.

- **buffer**
  
  [in] Reference to the data storage array.

**Return Value**

- `>=0` - successful, `-1` - cannot receive data.

**GetData**

Gets data from the timeseries buffer by starting time and number.

```c
int GetData(
    datetime start_time,  // starting time
    int count,            // number
    double* buffer        // array
) const
```

**Parameters**

- **start_time**
  

- **count**
  
  [in] Number of timeseries buffer elements.

- **buffer**
  
  [in] Reference to the data storage array.

**Return Value**

- `>=0` - successful, `-1` - cannot receive data.

**GetData**

Gets data from the timeseries buffer by starting and stop times.
```c
int GetData(
    datetime start_time, // starting time
    datetime stop_time,   // stop time
    double& buffer        // array
) const
```

**Parameters**

**start_time**

**stop_time**

**buffer**

[in] Reference to the data storage array.

**Return Value**

`>=0` - successful, `-1` - cannot receive data.
CiLow

CiLow is a class designed for access to low prices of the bars in the history.

Description

CiLow class provides an access to low prices of the bars in the history.

Declaration

```cpp
class CiLow: public CPriceSeries
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj

Methods inherited from class CPriceSeries
  BufferResize, MinIndex, MinValue, MaxIndex, MaxValue, GetData, Refresh
Create

Creates a timeseries with the specified parameters for access to the low prices of the bars in the history.

```csharp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period  // period
)
```

Parameters

symbol

period

Return Value

true - successful, false - cannot create the timeseries.
GetData

Gets the element of timeseries by starting position and number of elements.

```c
int GetData(
    int start_pos,    // position
    int count,        // number
    double *buffer    // array
) const
```

**Parameters**

- `start_pos`  
  [in] Starting position of a timeseries buffer.

- `count`  
  [in] Number of timeseries buffer elements.

- `buffer`  
  [in] Reference to the data storage array.

**Return Value**

- `>=0` - successful, 
- `1` - cannot receive data.

GetData

Gets the data from a timeseries buffer by starting time and number.

```c
int GetData(
    datetime start_time, // starting time
    int count,           // number
    double *buffer       // array
) const
```

**Parameters**

- `start_time`  

- `count`  
  [in] Number of timeseries buffer elements.

- `buffer`  
  [in] Reference to the data storage array.

**Return Value**

- `>=0` - successful, 
- `1` - cannot receive data.

GetData

Gets data from the timeseries buffer by starting and stop times.
```c
int GetData(
    datetime start_time, // starting time
    datetime stop_time,  // stop time
    double& buffer       // array
) const
```

**Parameters**

- **start_time**
- **stop_time**
- **buffer**
  - [in] Reference to the data storage array

**Return Value**

- \( \geq 0 \) - successful, \( -1 \) - cannot receive data.
CiClose

CiClose is a class designed for access to close prices of the bars in the history.

Description

CiClose class provides an access to close prices of the bars in the history.

Declaration

```cpp
class CiClose: public CPriceSeries
```

Title

```cpp
#include <Indicators\TimeSeries.mqh>
```

Inheritance hierarchy

-CObject
  -CArray
    -CArrayObj

Create

Creates a timeseries with the specified parameters for access to the closing prices of the bars in the history.

```cpp
bool Create(
    string symbol,     // symbol
    ENUM_TIMEFRAMES period // period
)
```

Parameters

- **symbol**
  

- **period**
  

Return Value

- true - successful, false - cannot create the timeseries.
**GetData**

Gets data from a timeseries buffer by starting position and number.

```c
int GetData(
    int start_pos,   // position
    int count,       // number
    double* buffer,  // array
) const
```

**Parameters**

- `start_pos`  
  [in] Starting position of a timeseries buffer.

- `count`  
  [in] Number of timeseries buffer elements.

- `buffer`  
  [in] Reference to the data storage array.

**Return Value**

- `>=0` - successful, `-1` - cannot receive data.

---

**GetData**

Gets data from a timeseries buffer by starting time and number.

```c
int GetData(
    datetime start_time,  // starting time
    int count,             // number
    double* buffer,        // array
) const
```

**Parameters**

- `start_time`  

- `count`  
  [in] Number of a timeseries buffer element.

- `buffer`  
  [in] Reference to the data storage array.

**Return Value**

- `>=0` - successful, `-1` - cannot receive data.

---

**GetData**

Gets data from a timeseries buffer by starting and stop times.
int GetData(
    datetime start_time,  // starting time
    datetime stop_time,   // stop time
    double& buffer        // array
) const

Parameters

start_time

stop_time

buffer
    [in] Reference to the data storage array.

Return Value

>=0 - successful, -1 - cannot receive data.
Main and Auxiliary Classes of Technical Indicators and Timeseries

This group of chapters contains technical details of the main and auxiliary classes of technical indicators and timeseries, as well as descriptions of the appropriate components of the MQL5 Standard Library.

MaPeriod

Returns the averaging period.

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use \texttt{Refresh()} and \texttt{GetData()} to update and get the indicator values.

\begin{verbatim}
bool Create(
    string symbol,    // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period      // averaging period
)
\end{verbatim}

\textbf{Parameters}

- \textit{symbol}
  

- \textit{period}
  
  [in] Timeframe (\texttt{ENUM\_TIMEFRAMES} enumeration value).

- \textit{ma\_period}
  

\textbf{Return Value}

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element of the main line by the specified index.

```c
double Main(  
    int index  // index
)
```

Parameters

`index`

[in] Main line buffer element index.

Return Value

Main line buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Plus

Returns the buffer element of the +DI line by the specified index.

```c
double Plus(
    int index  // index
)
```

Parameters

`index`

[in] +DI line buffer element index.

Return Value

The buffer element of the +DI line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Minus

Returns the buffer element of the -DI line by the specified index.

```c
double Minus(int index) // index
```

Parameters

- `index` - [in] -DI line buffer element index.

Return Value

The buffer element of the -DI line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
default int Type() const
```

Return Value

Indicator type (IND_ADX for CiADX).
CiADXWilder

CiADXWilder is a class intended for using the technical indicator Average Directional Index by Welles Wilder.

Description

CiADXWilder class provides the creation, configuration, and access to the data of the Average Directional Index by Welles Wilder.

Declaration

```csharp
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

```
CObject
  CArray
    CArrayObj

MaPeriod

Returns the averaging period.

```c
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,       // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period        // averaging period
)
```

Parameters

**symbol**
- [in] Symbol.

**period**

**ma_period**

Return Value

true - successful, false - cannot create the indicator.
Main

Returns the buffer element of the main line by the specified index.

```cpp
double Main(
    int index // index
)
```

**Parameters**

- `index` [in] Main line buffer element index.

**Return Value**

- Main line buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Plus

Returns the buffer element of the +DI line by the specified index.

```cpp
double Plus(
    int index // index
)
```

**Parameters**

- `index`
  - [in] +DI line buffer element index.

**Return Value**

The buffer element of the +DI line by the specified index, or `EMPTY_VALUE` if there is no correct data.
**Minus**

Returns the buffer element of the -DI line by the specified index.

```c
double Minus(
    int index  // index
)
```

**Parameters**

- `index`
  
  [in]  -DI line buffer element index.

**Return Value**

The buffer element of the -DI line by the specified index, or **EMPTY_VALUE** if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_ADXW for CiADXWilder).
CiBands

CiBands is a class intended for using the Bollinger Bands® technical indicator.

Description

CiBands class provides the creation, configuration, and access to the data of the Bollinger Bands indicator.

Declaration

```cpp
class CiBands: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CActive
    - CSeries
      - CIndicator
        - CiBands

```

Return Value

Returns the horizontal shift value, defined at the indicator creation.
Deviation

Returns the deviation.

```cpp
double Deviation() const
```

Return Value

Returns the deviation, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,       // symbol
    ENUM_TIMEFRAMES period, // period
    int ma_period,       // averaging period
    int ma_shift,        // shift
    double deviation,   // deviation
    int applied          // applied price, handle
)
```

Parameters

- **symbol**
  

- **period**
  

- **ma_period**
  

- **ma_shift**
  
  [in] Horizontal shift of the indicator.

- **deviation**
  
  [in] Deviation.

- **applied**
  
  [in] Price type or handle to apply.

Return Value

- true - successful, false - cannot create the indicator.
Base

Returns the buffer element of the base line by the specified index.

```cpp
double Base(
    int index     // index
)
```

**Parameters**

`index`

- [in] Base line buffer element index.

**Return Value**

The buffer element of the base line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Upper

Returns the buffer element of the upper line by the specified index.

```c
double Upper(
    int index  // index
)
```

Parameters

- `index` [in] Upper line buffer element index.

Return Value

The buffer element of the upper line of the specified index, or `EMPTY_VALUE` if there is no correct data.
Lower

Returns the buffer element of the lower line by the specified index.

```c
double Lower(
    int index // index
)
```

**Parameters**

- **index**
  - [in] Lower line buffer element index.

**Return Value**

The buffer element of the lower line by the specified index, or **EMPTY_VALUE** if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_BANDS for CiBands).
CiEnvelopes

CiEnvelopes is a class intended for using the Envelopes technical indicator.

Description

CiEnvelopes class provides the creation, configuration, and access to the data of the Envelopes indicator.

Declaration

```cpp
class CiEnvelopes: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj
      - CSeries
        - CIndicator
          - CiEnvelopes

**MaPeriod**

Returns the averaging period.

```cpp
int MaPeriod() const
```

**Return Value**

Returns the averaging period, defined at the indicator creation.
MaShift

Returns the horizontal shift of the indicator.

```c
int MaShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.
MaMethod

Returns the averaging method.

\[
\text{enum} \ MA\ _\text{METHOD} \ MaMethod() \ const
\]

Return Value

Returns the averaging method, defined at the indicator creation (\text{ENUM\_MA\_METHOD} enumeration value).
Deviation

Returns the value of deviation.

    double Deviation() const

Return Value

    Returns the value of deviation, defined at the indicator creation.
**Applied**

Returns the price type or handle to apply.

```
int Applied() const
```

**Return Value**

*Price type or handle to apply, defined at the indicator creation.*
Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```cpp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    int ma_shift, // shift
    ENUM_MA_METHOD ma_method, // averaging method
    int applied, // price type, handle
    double deviation // deviation
)
```

**Parameters**

- `symbol`
  - [in] Symbol.

- `period`

- `ma_period`

- `ma_shift`
  - [in] Price axis shift.

- `ma_method`

- `applied`
  - [in] Object (price type or handle) to apply.

- `deviation`
  - [in] Deviation.

**Return Value**

- true - successful, false - cannot create the indicator.
Upper

Returns the buffer element of the upper line by the specified index.

```c
double Upper(
    int index   // index
)
```

**Parameters**

`index`

[in] Upper line buffer element index.

**Return Value**

The buffer element of the upper line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Lower

Returns the buffer element of the lower line by the specified index.

```cpp
double Lower(
    int index  // index
)
```

**Parameters**

- `index`
  - `[in]` Lower line buffer element index.

**Return Value**

The buffer element of the lower line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```c
virtual int Type() const
```

Return Value

Indicator type (`IND_ENVELOPES` for CiEnvelopes).
CiIchimoku

CiIchimoku is a class intended for using the Ichimoku Kinko Hyo technical indicator.

Description

CiIchimoku class provides the creation, setup, and access to the data of the Ichimoku Kinko Hyo indicator.

Declaration

```cpp
class CiIchimoku: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

TenkanSenPeriod

Returns the TenkanSen period.

```c
int TenkanSenPeriod() const
```

Return Value

Returns the TenkanSen period, defined at the indicator creation.
KijunSenPeriod

Returns the KijunSen period.

```cpp
int KijunSenPeriod() const
```

Return Value

Returns the KijunSen period, defined at the indicator creation.
SenkouSpanBPeriod

Returns the SenkouSpanB period.

```cpp
int SenkouSpanBPeriod() const
```

Return Value

Returns the SenkouSpanB period, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```csharp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int tenkan_sen, // period of TenkanSen
    int kijun_sen, // period of KijunSen
    int senkou_span_b // period of SenkouSpanB
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **tenkan_sen**
  - [in] Period of TenkanSen.

- **kijun_sen**

- **senkou_span_b**
  - [in] Period of SenkouSpanB.

Return Value

- true - successful, false - cannot create the indicator.
TenkanSen

Returns the buffer element of the TenkanSen line by the specified index.

double TenkanSen(
    int index  // index
)

Parameters

index

Return Value

The buffer element of the TenkanSen line by the specified index, or EMPTY_VALUE if there is no correct data.
KijunSen

Returns the buffer element of the KijunSen line by the specified index.

```c
double KijunSen(
    int    index   // index
)
```

**Parameters**

`index`

**Return Value**

The buffer element of the KijunSen line of the specified index, or `EMPTY_VALUE` if there is no correct data.
**SenkouSpanA**

Returns the buffer element of the SenkouSpanA line by the specified index.

```c
double SenkouSpanA(
    int index  // index
)
```

**Parameters**

`index`
- `[in]` SenkouSpanA line buffer element index.

**Return Value**

The buffer element of the SenkouSpanA line of the specified index, or `EMPTY_VALUE` if there is no correct data.
**SenkouSpanB**

Returns the buffer element of the SenkouSpanB line by the specified index.

```c
double SenkouSpanB(
    int index     // index
)
```

**Parameters**

- **index**
  - [in] SenkouSpanB line buffer element index.

**Return Value**

The buffer element of the SenkouSpanB line of the specified index, or **EMPTY_VALUE** if there is no correct data.
**ChinkouSpan**

Returns the buffer element of the ChinkouSpan line by the specified index.

```c
double ChinkouSpan(
    int index       // index
)
```

**Parameters**

- **index**
  - [in] ChinkouSpan line buffer element index.

**Return Value**

The buffer element of the ChinkouSpan line of the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```
virtual int Type() const
```

Return Value

Indicator type (IND_ICHIMOKU for Ichimoku).
CiMA

CiMA is a class intended for using the Moving Average technical indicator.

Description

CiMA class provides the creation, setup, and access to the data of the Moving Average indicator.

Declaration

```cpp
class CiMA: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

- `CObject`
- `CArray`
- `CArrayObj`
- `CSeries`
- `CIndicator`
- `CiMA`

MaPeriod

Returns the averaging period.

```
    int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
**MaShift**

Returns the horizontal shift of the indicator.

```cpp
int MaShift() const
```

**Return Value**

Returns the horizontal shift value, defined at the indicator creation.
MaMethod

Returns the averaging method.

| ENUM_MA_METHOD | MaMethod() | const |

Return Value

Returns the averaging method (value of ENUM_MA_METHOD enumeration), defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
### Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```c++
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    int ma_shift, // shift
    ENUM_MA_METHOD ma_method, // averaging method
    int applied // price type, handle
)
```

**Parameters**

- **symbol**
  

- **period**
  

- **ma_period**
  

- **ma_shift**
  
  [in] Horizontal shift.

- **ma_method**
  

- **applied**
  
  [in] Price type or handle to apply.

**Return Value**

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

`index`

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_MA for CiMA).
CiSAR

CiSAR is a class intended for using the Parabolic Stop And Reverse System technical indicator.

Description

CiSAR class provides the creation, setup, and access to the data of the Parabolic Stop And Reverse System indicator.

Declaration

```cpp
class CiSAR: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>

**SarStep**

Returns the step of price increment.

```cpp
double SarStep() const
```

**Return Value**

The step of price increment, defined at the indicator creation.
**Maximum**

Returns the maximum value of the step.

```cpp
double Maximum() const
```

**Return Value**

The maximum value of the step, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    double step, // step
    double maximum // coefficient
)
```

Parameters

- **symbol**
  - [in] Symbol.
- **period**
- **step**
  - [in] Step for the velocity increasing.
- **maximum**
  - [in] Price following coefficient.

Return Value

- true - successful, false - cannot change the indicator.
**Main**

Returns the buffer element by the specified index.

```
double Main(
    int index     // index
)
```

**Parameters**

- `index`  
  - [in] Buffer element index.

**Return Value**

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_SAR for CiSAR).
CiStdDev

CiStdDev is a class intended for using the Standard Deviation technical indicator.

Description

CiStdDev class provides the creation, setup, and access to the data of the Standard Deviation indicator.

Declaration

```cpp
class CiStdDev: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>
```

MaPeriod

Returns the averaging period.

```
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
**MaShift**

Returns the horizontal shift of the indicator.

```c
int MaShift() const
```

**Return Value**

Returns the horizontal shift value, defined at the indicator creation.
**MaMethod**

Returns the averaging method.

| ENUM_MA_METHOD | MaMethod() const |

**Return Value**

Returns the averaging method (value of `ENUM_MA_METHOD` enumeration), defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```c
int Applied() const
```

Return Value

*Price type or handle to apply, defined at the indicator creation.*
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,   // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period,  // averaging period
    int ma_shift,   // shift
    ENUM_MA_METHOD ma_method, // averaging method
    int applied     // price type, handle
)
```

Parameters

symbol

period

ma_period

ma_shift

[in] Horizontal shift.

ma_method

applied

[in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

- `index`  
  - [in] Buffer element index.

Return Value

- Buffer element by the specified index if successful, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (`IND_STDDEV` for CStdDev).
**CiDEMA**

CiDEMA is a class intended for using the Double Exponential Moving Average technical indicator.

**Description**

CiDEMA class provides the creation, setup, and access to the data of the Double Exponential Moving Average indicator.

**Declaration**

```cpp
class CiDEMA: public CIndicator
```

**Title**

```cpp
#include <Indicators\Trend.mqh>
```

**Inheritance hierarchy**

- CObject
  - CArray
    - CArrayObj
      - CSeries
        - CIndicator
          - CiDEMA

MaPeriod

Returns the averaging period.

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
IndShift

Returns the horizontal shift of the indicator.

```cpp
int IndShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```cpp
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```c
bool Create(
    string symbol,       // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period,       // averaging period
    int ind_shift,       // shift
    int applied          // price type, handle
)
```

**Parameters**

`string` 

`period` 

`int ma_period` 

`int ind_shift` 
[in] Horizontal shift.

`int applied` 
[in] Price type or handle to apply.

**Return Value**

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index   // index
)
```

**Parameters**

`index`

**Return Value**

Buffer element of the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_DEMA for CiDEMA).
CiTEMA

CiTEMA is a class intended for using the Triple Exponential Moving Average technical indicator.

Description

CiTEMA class provides the creation, setup, and access to the data of the Triple Exponential Moving Average indicator.

Declaration

```cpp
class CiTEMA: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

- CObject
- CArray
- CArrayObj
- CSeries
- CIndicator
- CiTEMA

MaPeriod

Returns the averaging period.

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
**IndShift**

Returns the horizontal shift of the indicator.

```c
int IndShift() const
```

**Return Value**

Returns the horizontal shift value, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```c
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```c
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    int ma_shift, // shift
    int applied // price type, handle
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **ma_period**

- **ma_shift**
  - [in] Horizontal shift.

- **applied**
  - [in] Price type or handle to apply.

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```cpp
double Main(
    int index  // index
)
```

Parameters

`index`

Return Value

Buffer element of the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```
virtual int Type() const
```

Return Value

Indicator type (IND_TEMA for CiTEMA).
CiFrAMA

CiFrAMA is a class intended for using the Fractal Adaptive Moving Average technical indicator.

Description

CiFrAMA class provides the creation, setup, and access to the data of the Fractal Adaptive Moving Average indicator.

Declaration

```cpp
class CiFrAMA: public CIndicator
```

Title

```
#include <Indicators\Trend.mqh>
```

**MaPeriod**

Returns the averaging period.

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
IndShift

Returns the horizontal shift of the indicator.

```c
int IndShift() const
```

Return Value

Returns the horizontal shift value, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```c
int Applied() const
```

**Return Value**

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,   // period
    int ma_period,   // averaging period
    int ma_shift,   // shift
    int applied     // price type, handle
)
```

**Parameters**

- `symbol`  

- `period`  

- `ma_period`  

- `ma_shift`  
  [in] Horizontal shift.

- `applied`  
  [in] Price type or handle to apply.

**Return Value**

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index    // index
)
```

Parameters

- **index**
  - [in] Buffer element index.

Return Value

- Buffer element of the specified index if successful, or `EMPTY_VALUE` if there is no correct data.
**Type**

Virtual identification method.

```cpp
virtual int Type() const
```

**Return Value**

Indicator type (`IND_FRAMA` for CiFrAMA).
CiAMA

CiAMA is a class intended for using the Adaptive Moving Average technical indicator.

Description

CiAMA class provides the creation, setup, and access to the data of the Adaptive Moving Average indicator.

Declaration

```cpp
class CiAMA: public CIndicator

MaPeriod

Returns the averaging period.

```cpp
int MaPeriod() const
```

**Return Value**

Returns the averaging period, defined at the indicator creation.
FastEmaPeriod

Returns the averaging period for the fast EMA.

```cpp
int FastEmaPeriod() const
```

**Return Value**

Returns the averaging period for the fast EMA, defined at the indicator creation.
SlowEmaPeriod

Returns the averaging period for the slow EMA.

```cpp
int SlowEmaPeriod() const
```

Return Value

Returns the averaging period for the slow EMA, defined at the indicator creation.
### IndShift

Returns the horizontal shift of the indicator.

```cpp
int IndShift() const
```

**Return Value**

Returns the horizontal shift value, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```c
int Applied() const
```

Return Value

*Price type or handle to apply, defined at the indicator creation.*
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    int fast_ema_period, // fast EMA period
    int slow_ema_period, // slow EMA period
    int ind_shift, // shift
    int applied // price type, handle
)
```

Parameters

- **string**
  - [in] Symbol.

- **period**

- **ma_period**

- **fast_ema_period**

- **slow_ema_period**
  - [in] Slow EMA averaging period.

- **ind_shift**
  - [in] Horizontal shift.

- **applied**
  - [in] Price type or handle to apply.

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

index

Return Value

Buffer element of the specified index, or `EMPTY_VALUE` if there is no correct data.
**Type**

Virtual identification method.

```cpp
virtual int Type() const
```

**Return Value**

Indicator type (`IND_AMA` for CIAMA).
CiVIDyA

CiVIDyA is a class intended for using the Variable Index Dynamic Average technical indicator.

Description

CiVIDyA class provides the creation, setup, and access to the data of the Variable Index Dynamic Average indicator.

Declaration

```cpp
class CiVIDyA: public CIndicator
```

Title

```cpp
#include <Indicators\Trend.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj
      - CSeries
        - CIndicator
          - CiVIDyA

CmoPeriod

Closes the chart bound to the class instance.

```cpp
int CmoPeriod() const
```
**EmaPeriod**

Returns the chart symbol.

```cpp
int EmaPeriod() const
```

**Return Value**

Returns a chart symbol bound to a class instance. "" - no bound chart.
**IndShift**

Returns the horizontal shift of the indicator.

```cpp
int IndShift() const
```

**Return Value**

Returns the horizontal shift value, defined at the indicator creation.
**Applied**

Returns the price type or handle to apply.

```
int Applied() const
```

**Return Value**

- Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int cmo_period, // momentum period
    int ema_period, // averaging period
    int ind_shift, // shift
    int applied // price type, handle
)
```

Parameters

symbol

period

cmo_period

ema_period

ind_shift
  [in] Horizontal shift.

applied
  [in] Price type or handle to apply.

Return Value

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

`index`

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```
virtual int Type() const
```

Return Value

Indicator type (IND_VIDYA for CiVIDya).
Oscillator Classes

This group of chapters contains the technical details of Oscillators classes, as well as descriptions of the appropriate components of the MQL5 Standard Library.

```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **ma_period**

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index    // index
)
```

Parameters

`index`
- [in] Buffer element index.

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_ATR for CiATR).
CiBearsPower

CiBearsPower is a class intended for using the Bears Power technical indicator.

Description

CiBearsPower class provides the creation, setup, and access to the data of the Bears Power indicator.

Declaration

```cpp
class CiBearsPower: public CIndicator
```

Title

```cpp
#include <Indicators/Oscilators.mqh>

```

Parameters

- `symbol`
  - [in] Symbol.

- `period`

- `ma_period`

Return Value

- true - successful, false - cannot create the indicator.
# Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

## Parameters

- `index`
  - [in] Buffer element index.

## Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_BEARS for CiBearsPower).
CiBullsPower

CiBullsPower is a class intended for using the Bulls Power technical indicator.

Description

CiBullsPower class provides the creation, setup, and access to the data of the Bulls Power indicator.

Declaration

**Parameters**

- **symbol**
  - [in] Symbol.

- **period**

- **ma_period**

**Return Value**

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int  index    // index
)
```

Parameters

`index`

- [in] Buffer element index.

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (**IND_BULLS** for CiBullsPower).
CiCCI

CiCCI is a class intended for using the Commodity Channel Index technical indicator.

Description

CiCCI class provides the creation, setup, and access to the data of the Commodity Channel Index indicator.

Declaration

class CiCCI: public CIndicator

**MaPeriod**

Returns the averaging period.

```c
int MaPeriod() const
```

**Return Value**

Returns the averaging period, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

\[
\text{int} \quad \text{Applied}() \quad \text{const}
\]

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period,  // averaging period
    int applied  // price type, handle
)
```

**Parameters**

- `symbol`
  

- `period`
  

- `ma_period`
  

- `applied`
  
  [in] Price type or handle to apply.

**Return Value**

- `true` - successful, `false` - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

- `index`
  

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (\texttt{IND\_CCI} for CiCCI).
CiChai

CiChai is a class intended for using the Chaikin Oscillator technical indicator.

Description

CiChai is a class intended for using the Chaikin Oscillator technical indicator.

Declaration

```cpp
class CiChaikin: public CIndicator
```

Title

```
#include <Indicators\Oscillators.mqh>
```

Inheritance hierarchy

- **CObject**
- **CArray**
- **CArrayObj**
- **CSeries**
- **CIndicator**
- **CiChaikin**

# FastMaPeriod

Returns the averaging period for the fast EMA.

```
int FastMaPeriod() const
```

## Return Value

Returns the averaging period for the fast EMA, defined at the indicator creation.
SlowMaPeriod

Returns the averaging period for the slow EMA.

```
int SlowMaPeriod() const
```

Return Value

Returns the averaging period for the slow EMA, defined at the indicator creation.
### MaMethod

Returns the averaging method.

| ENUM_MA_METHOD | MaMethod() const |

**Return Value**

Returns the averaging method, defined at the indicator creation (`ENUM_MA_METHOD` enumeration value).
Applied

Returns the object (volume type) to apply.

| ENUM_APPLIED_VOLUME | Applied() const |

Return Value

Object (volume type) to apply, defined at the indicator creation (ENUM_APPLIED_VOLUME enumeration value).
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```csharp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int fast_ma_period, // fast EMA period
    int slow_ma_period, // slow EMA period
    ENUM_MA_METHOD ma_method, // averaging method
    ENUM_APPLIED_VOLUME applied // volume type
)
```

Parameters

**symbol**

**period**

**fast_ma_period**

[in] Period for fast EMA.

**slow_ma_period**

[in] Period for slow EMA.

**ma_method**

**applied**

[in] Object (volume type) to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```cpp
double Main(
    int index   // index
)
```

Parameters

index

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_CHAIKIN for CiChaikin).
**CiDeMarker**

CiDeMarker is a class intended for using the DeMarker technical indicator.

**Description**

CiDeMarker class provides the creation, setup, and access to the data of the DeMarker indicator.

**Declaration**

```cpp
class CiDeMarker: public CIndicator
```

**Title**

```cpp
#include <Indicators\Oscilators.mqh>
```

**Inheritance hierarchy**

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period  // averaging period
)
```

**Parameters**

- `symbol`
  

- `period`
  

- `ma_period`
  

**Return Value**

- `true` - successful, `false` - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

- **index**
  - [in] Buffer element index.

Return Value

- Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (`IND_DEMARKER` for CiDeMarker).
CiForce

CiForce is a class intended for using the Force Index technical indicator.

Description

CiForce class provides the creation, setup, and access to the data of the Force Index indicator.

Declaration

class CiForce: public CIndicator

MaPeriod

Returns the averaging period.

```
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
MaMethod

Returns the averaging method.

| ENUM_MA_METHOD | MaMethod() | const |

Return Value

Returns the averaging method, defined at the indicator creation.
Applied

Returns the object (volume type) to apply.

| ENUM_APPLIED_VOLUME | Applied() const |

Return Value

Object (volume type) to apply, defined at the indicator creation (ENUM_APPLIED_VOLUME enumeration value).
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,       // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period,       // averaging period
    ENUM_MA_METHOD ma_method,  // averaging method
    ENUM_APPLIED_VOLUME applied  // volume type
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **ma_period**

- **ma_method**

- **applied**
  - [in] Object (volume type) to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

`index`

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
**Type**

Virtual identification method.

```cpp
virtual int Type() const
```

**Return Value**

Indicator type (`IND_FORCE` for CiForce).
CiMACD

CiMACD is a class intended for using the Moving Averages Convergence-Divergence technical indicator.

Description

CiMACD class provides the creation, setup, and access to the data of the Moving Averages Convergence-Divergence indicator.

Declaration

```cpp
class CiMACD: public CIndicator
```

Title

```cpp
#include <Indicators\Oscilators.mqh>
```

Inheritance hierarchy

FastEmaPeriod

Returns the averaging period for the fast EMA.

```cpp
int FastEmaPeriod() const
```

Return Value

Returns the averaging period for the fast EMA, defined at the indicator creation.
SlowEmaPeriod

Returns the averaging period for the slow EMA.

```cpp
int SlowEmaPeriod() const
```

Return Value

Returns the averaging period for the slow EMA, defined at the indicator creation.
**SignalPeriod**

Returns the averaging period for the signal line.

```cpp
int SignalPeriod() const
```

**Return Value**

Returns the averaging period for the signal line, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```c
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,       // symbol
    ENUM_TIMEFRAMES period, // period
    int fast_ema_period,  // fast EMA period
    int slow_ema_period,  // slow EMA period
    int signal_period,    // signal period
    int applied           // price type, handle
)
```

Parameters

- **symbol**
  - [in] Symbol.
- **period**
- **fast_ema_period**
- **slow_ema_period**
  - [in] Slow EMA averaging period.
- **signal_period**
  - [in] Signal line averaging period.
- **applied**
  - [in] Price type or handle to apply.

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the main line buffer element by the specified index.

```cpp
double Main(
    int index  // index
)
```

Parameters

- `index`
  - [in] Buffer element index.

Return Value

- Main line buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Signal

Returns the buffer element of the signal line by the specified index.

```c
double Signal(
    int index  // index
)
```

**Parameters**

- `index`  
  - [in] Buffer element index.

**Return Value**

The buffer element of the signal line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (INDMACD for CiMACD).
CiMomentum

CiMomentum is a class intended for using the Momentum technical indicator.

Description

CiMomentum class provides the creation, setup, and access to the data of the Momentum indicator.

Declaration

```cpp
class CiMomentum: public CIndicator
```

Title

```cpp
#include <Indicators/Oscilators.mqh>
```

Inheritance hierarchy

MaPeriod

Returns the averaging period.

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```c
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period, // period
    int ma_period,   // averaging period
    int applied      // price type, handle
)
```

Parameters

- `symbol`
  - [in] Symbol.
- `period`
- `ma_period`
- `applied`
  - [in] Price type or handle to apply.

Return Value

- `true` - successful, `false` - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```cpp
double Main(int index) // index
```

Parameters

- **index**
  - [in] Buffer element index.

Return Value

- Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
**Type**

Virtual identification method.

```
virtual int Type() const
```

**Return Value**

Indicator type (`IND_MOMENTUM` for `CiMomentum`).
CiOsMA

CiOsMA is a class intended for using the Moving Average of Oscillator (MACD histogram) technical indicator.

Description

CiOsMA class provides the creation, setup, and access to the data of the Moving Average of Oscillator (MACD histogram) indicator.

Declaration

```cpp
class CiOsMA: public CIndicator
```

Title

```cpp
#include <Indicators\Oscilators.mqh>

FastEmaPeriod

Returns the averaging period for the fast EMA.

```cpp
int FastEmaPeriod() const
```

Return Value

Returns the averaging period for the fast EMA, defined at the indicator creation.
**SlowEmaPeriod**

Returns the averaging period for the slow EMA.

```cpp
int SlowEmaPeriod() const
```

**Return Value**

Returns the averaging period for the slow EMA, defined at the indicator creation.
SignalPeriod

Returns the averaging period for the signal line.

```
int SignalPeriod() const
```

Return Value

Returns the averaging period for the signal line, defined at the indicator creation.
**Applied**

Returns the price type or handle to apply.

```c
int Applied() const
```

**Return Value**

*Price type or handle to apply, defined at the indicator creation.*
Create

Creates the indicator with specified parameters. Use \textit{Refresh()} and \textit{GetData()} to update and get the indicator values.

\begin{verbatim}
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int fast_ema_period, // fast EMA period
    int slow_ema_period, // slow EMA period
    int signal_period, // signal line period
    int applied // price type, handle
)
\end{verbatim}

\textbf{Parameters}

\textit{symbol}  

\textit{period}  
[in] Timeframe (\texttt{ENUM\_TIMEFRAMES} enumeration value).

\textit{fast\_ema\_period}  

\textit{slow\_ema\_period}  
[in] Slow EMA averaging period.

\textit{signal\_period}  
[in] Signal line averaging period.

\textit{applied}  
[in] Price type or handle to apply.

\textbf{Return Value}

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

double Main(
    int index     // index
)

Parameters

index

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_OSMA for CiOsMA).
CiRSI

CiRSI is a class intended for using the Relative Strength Index technical indicator.

Description

CiRSI class provides the creation, setup, and access to the data of the Relative Strength Index indicator.

Declaration

```cpp
class CiRSI: public CIndicator
```

Title

```cpp
#include <Indicators\Oscilators.mqh>
```

Inheritance hierarchy

- **CObject**
- **CArray**
  - **CArrayObj**

MaPeriod

Returns the averaging period.

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
**Applied**

Returns the price type or handle to apply.

```c
int Applied() const
```

**Return Value**

Price type or handle to apply, defined at the indicator creation.
# Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period,  // averaging period
    int applied  // price type, handle
)
```

## Parameters

- **symbol**  

- **period**  
  [in] Timeframe ([ENUM_TIMEFRAMES](#) enumeration value).

- **ma_period**  

- **applied**  
  [in] Price type or handle to apply.

## Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

Return Value

- Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_RSI for CiRSI).
CiRVI

CiRVI is a class intended for using the Relative Vigor Index technical indicator.

Description

CiRVI class provides the creation, setup, and access to the data of the Relative Vigor Index indicator.

Declaration

```
class CiRVI: public CIndicator
```

MaPeriod

Returns the averaging period.

```cpp
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period  // averaging period
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **ma_period**

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the main line buffer element by the specified index.

```cpp
double Main(
    int index  // index
)
```

Parameters

index

Return Value

Main line buffer element by the specified index, or EMPTY_VALUE if there is no correct data.
Signal

Returns the buffer element of the signal line by the specified index.

```c
double Signal(
    int index  // index
)
```

**Parameters**

- `index`  

**Return Value**

The buffer element of the signal line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_RVI for CiRVI).
CiStochastic

CiStochastic is a class intended for using the Stochastic Oscillator technical indicator.

Description

CiStochastic class provides the creation, setup, and access to the data of the Stochastic Oscillator indicator.

Declaration

```cpp
class CiStochastic: public CIndicator
```

Title

```cpp
#include <Indicators\Oscillators.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayObj
    - CSeries
      - CIndicator
      - CiStochastic

Kperiod

Returns the averaging period for the %K line.

```cpp
int Kperiod() const
```

Return Value

Returns the averaging period for the %K line, defined at the indicator creation.
**Dperiod**

Returns the averaging period for the %D line.

```c
int Dperiod() const
```

**Return Value**

Returns the averaging period for the %D line, defined at the indicator creation.
### Slowing

Returns the period of slowing.

```cpp
int Slowing() const
```

**Return Value**

Returns the period of slowing, defined at the indicator creation.
**MaMethod**

Returns the averaging method.

| ENUM_MA_METHOD | MaMethod() const |

**Return Value**

Returns the averaging method, defined at the indicator creation (`ENUM_MA_METHOD` enumeration value).
PriceField

Returns the object (Low/High or Close/Close) to apply.

```cpp
ENUM_STO_PRICE PriceField() const
```

Return Value

The object (Low/High or Close/Close) to apply, defined at the indicator creation (`ENUM_STO_PRICE` enumeration value).
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```c
bool Create(
    string     symbol,     // symbol
    ENUM_TIMEFRAMES period, // period
    int        Kperiod,    // %K period
    int        Dperiod,    // %D period
    int        slowing,    // slowing period
    ENUM_MA_METHOD ma_method, // averaging method
    ENUM_STO_PRICE price_field // application
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **Kperiod**
  - [in] Averaging period of %K indicator.

- **Dperiod**
  - [in] Averaging period of %D indicator.

- **slowing**
  - [in] Slowing period.

- **ma_method**

- **price_field**
  - [in] Object (Low/High or Close/Close) to apply (ENUM_STO_PRICE enumeration value).

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the main line buffer element by the specified index.

```c
double Main(
    int index   // index
)
```

**Parameters**

*index*

**Return Value**

Main line buffer element by the specified index, or **EMPTY_VALUE** if there is no correct data.
Signal

Returns the buffer element of the signal line by the specified index.

```c
double Signal(
    int index    // index
)
```

Parameters

- `index`
  - [in] Buffer element index.

Return Value

The buffer element of the signal line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
class Type {
public:
    virtual int Type() const;
};
```

Return Value

Indicator type (IND_STOCHASTIC for CiStochastic).
CiTriX

CiTriX is a class intended for using the Triple Exponential Moving Averages Oscillator technical indicator.

Description

CiTriX class provides the creation, setup, and access to the data of the Triple Exponential Moving Averages Oscillator indicator.

Declaration

```cpp
class CiTriX: public CIndicator
```

Title

```cpp
#include <Indicators\Oscilators.mqh>
```

Inheritance hierarchy

**MaPeriod**

Returns the averaging period.

```cpp
int MaPeriod() const
```

**Return Value**

Returns the averaging period, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```c
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() andGetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol, // symbol
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    int applied // price type, handle
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**
  - [in] Timeframe (**ENUM_TIMEFRAMES** enumeration value).

- **ma_period**

- **applied**
  - [in] Price type of handle to apply.

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (`IND_TRIX` for CiTriX).
CiWPR

CiWPR is a class intended for using the Williams' Percent Range technical indicator.

Description

CiWPR class provides the creation, setup, and access to the data of the Williams' Percent Range indicator.

Declaration

```cpp
class CiWPR: public CIndicator
```

CalcPeriod

Returns the period for calculation.

```cpp
int CalcPeriod() const
```

Return Value

Returns the period for calculation, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,     // symbol
    ENUM_TIMEFRAMES period,     // period
    int calc_period     // calculation period
)
```

Parameters

symbol

period

calc_period

[in] Period for calculation.

Return Value

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

**index**
- [in] Buffer element index.

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_WPR for CIWPR).
Volume Indicators

**Applied**

Returns the volume type to apply.

| ENUM_APPLIED_VOLUME | Applied() const |

**Return Value**

Volume type to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    ENUM_APPLIED_VOLUME applied  // volume type
)
```

Parameters

symbol

period

applied

[in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

index

Return Value

Buffer element by the specified index, or EMPTY_VALUE if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_AD for CiAD).
CiMFI

CiMFI is a class intended for using the Money Flow Index technical indicator.

Description

CiMFI class provides the creation, setup, and access to the data of the Money Flow Index indicator.

Declaration

```cpp
class CiMFI: public CIndicator
```

Title

```cpp
#include <Indicators\Volumes.mqh>
```

MaPeriod

Returns the averaging period.

```c
int MaPeriod() const
```

Return Value

Returns the averaging period, defined at the indicator creation.
Applied

Returns the volume type to apply.

```
ENUM_APPLIED_VOLUME  Applied() const
```

Return Value

Volume type to apply, defined at the indicator creation (ENUM_APPLIED_VOLUME enumeration value).
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```c
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    int ma_period,  // averaging period
    ENUM_APPLIED_VOLUME applied  // volume type
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **ma_period**

- **applied**
  - [in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```cpp
double Main(
    int index  // index
)
```

Parameters

index

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
**Type**

Virtual identification method.

```cpp
virtual int Type() const
```

**Return Value**

Indicator type (IND_MFI for CiMFI).
CiOBV

CiOBV is a class intended for using the On Balance Volume technical indicator.

Description

CiOBV class provides the creation, setup, and access to the data of the On Balance Volume indicator.

Declaration

```cpp
class CiOBV: public CIndicator
```

**Applied**

Returns the volume type to apply.

| ENUM_APPLIED_VOLUME | Applied() const |

**Return Value**

Volume type to apply, defined at the indicator creation (ENUM_APPLIED_VOLUME enumeration value).
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    ENUM_APPLIED_VOLUME applied  // volume type
)
```

**Parameters**

*symbol*

*period*

*applied*

[in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

**Return Value**

true - successful, false - cannot create the indicator.
# Main

Returns the buffer element by the specified index.

```c
double Main(
    int index      // index
)
```

## Parameters

- `index`
  - [in] Buffer element index.

## Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_OBV for CiOBV).
CiVolumes

CiVolumes is a class intended for using the Volumes technical indicator.

Description

CiVolumes class provides the creation, setup, and access to the data of the Volumes indicator.

Declaration

```cpp
class CiVolumes: public CIndicator
```

Title

```cpp
#include <Indicators\Volumes.mqh>

```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **applied**
  - [in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

index

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_VOLUMES for CiVolumes).
Bill Williams Indicators

- Handle, Status, FullRelease, Redrawer, Create, BufferResize, BarsCalculated, GetData, GetData, GetData, GetData, Minimum, MinValue, Maximum, MaxValue, Refresh, AddToChart, DeleteFromChart, MethodDescription, PriceDescription, VolumeDescription
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```c
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period  // period
)
```

Parameters

- `symbol`  
  

- `period`  
  

Return Value

- true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index  // index
)
```

Parameters

- **index**
  - [in] Buffer element index.

Return Value

- Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (`IND_Ac` for CiAC).
CiAlligator

CiAlligator is a class intended for using the Alligator technical indicator.

Description

CiAlligator class provides the creation, setup, and access to the data of the Alligator indicator.

Declaration

```
class CiAlligator: public CIndicator
```

Title

```
#include <Indicators\BillWilliams.mqh>
```

Inheritance hierarchy

```
CObject
  CArray
    CArrayObj
      CSeries
        CIndicator
          CiAlligator
```

JawPeriod

Returns the averaging period for the Jaw line.

```cpp
int JawPeriod() const
```

Return Value

Returns the averaging period for the Jaw line, defined at the indicator creation.
**JawShift**

Returns the horizontal shift of the Jaws line.

```c
int JawShift() const
```

**Return Value**

Horizontal shift of the Jaws line, defined at the indicator creation.
TeethPeriod

Returns the averaging period for the Teeth line.

```c
int TeethPeriod() const
```

Return Value

Returns the averaging period for the Teeth line, defined at the indicator creation.
TeethShift

Returns the horizontal shift of the Teeth line.

```
int TeethShift() const
```

Return Value

Horizontal shift of the Teeth line, defined at the indicator creation.
LipsPeriod

Returns the averaging period for the Lips line.

```cpp
int LipsPeriod() const
```

Return Value

Returns the averaging period for the Lips line, defined at the indicator creation.
LipsShift

Returns the horizontal shift of the Lips line.

```
int LipsShift() const
```

Return Value

Horizontal shift of the Lips line, defined at the indicator creation.
**MaMethod**

Returns the averaging method.

```cpp
enum MaMethod

R
```

**Return Value**

Returns the averaging method, defined at the indicator creation.
Applied

Returns the price type or handle to apply.

```cpp
int Applied() const
```

Return Value

Price type or handle to apply, defined at the indicator creation.
Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```csharp
bool Create(
    string symbol,       // symbol
    ENUM_TIMEFRAMES period,    // period
    int jaw_period,       // jaws period
    int jaw_shift,        // jaws shift
    int teeth_period,     // teeth period
    int teeth_shift,      // teeth shift
    int lips_period,      // lips period
    int lips_shift,       // lips shift
    ENUM_MA_METHOD ma_method,    // averaging method
    int applied          // price type, handle
)
```

**Parameters**

- **symbol**
  - `[in]` Symbol.

- **period**

- **jaw_period**

- **jaw_shift**

- **teeth_period**

- **teeth_shift**

- **lips_period**
  - `[in]` Lips averaging period.

- **lips_shift**
  - `[in]` Lips horizontal shift.

- **ma_method**

- **applied**
  - `[in]` Price type, handle to apply.

**Return Value**

- `true` - successful, `false` - cannot create the indicator.
Jaw

Returns the buffer element of the Jaws line by the specified index.

```cpp
double Jaw(
    int index // index
)
```

**Parameters**

`index`

[In] Jaws line buffer element index.

**Return Value**

The buffer element of the Jaws line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Teeth

Returns the buffer element of the Teeth line by the specified index.

```c
double Teeth(
    int index  // index
)
```

Parameters

- `index`  

Return Value

The buffer element of the Teeth line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Lips

Returns the buffer element of the Lips line by the specified index.

```c
double Lips(
    int index    // index
)
```

**Parameters**

- `index`  
  [in] Lips line buffer element index.

**Return Value**

The buffer element of the Lips line by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_ALLIGATOR for CiAlligator).
CiAO

CiAO is a class intended for using the Awesome Oscillator technical indicator.

Description

CiAO class provides the creation, setup, and access to the data of the Awesome Oscillator indicator.

Declaration

```
class CiAO: public CIndicator
```

Title

```
#include <Indicators\BillWilliams.mqh>
```

Inheritance hierarchy

```
CObject
  CArray
    CArrayObj
    CSeries
      CIndicator
      CiAO

Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period  // period
)
```

Parameters

- **symbol**
  

- **period**
  

Return Value

- true - successful, false - cannot create the indicator.
Upper

Returns the element of the upper buffer by the specified index.

```cpp
double Upper(
    int index // index
)
```

**Parameters**

*index*

[in] Upper buffer element index.

**Return Value**

The element of the upper buffer by the specified index, or `EMPTY_VALUE` if there is no correct data.
Lower

Returns the element of the lower buffer by the specified index.

```
double Lower(int index) // index
```

**Parameters**

`index`

[in] Lower buffer element index.

**Return Value**

The element of the lower buffer by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_FRACTALS for CiFractals).
CiGator

CiGator is a class intended for using the Gator Oscillator technical indicator.

Description

CiGator class provides the creation, setup, and access to the data of the Gator Oscillator indicator.

Declaration

```cpp
class CiGator: public CIndicator
```

Title

JawPeriod

Returns the averaging period for the Jaws line.

```
int JawPeriod() const
```

**Return Value**

Returns the averaging period for the Jaws line, defined at the indicator creation.
**JawShift**

Returns the horizontal shift of the Jaws line.

```cpp
int JawShift() const
```

**Return Value**

Horizontal shift of the Jaws line, defined at the indicator creation.
**TeethPeriod**

Returns the averaging period for the Teeth line.

```cpp
int TeethPeriod() const
```

**Return Value**

Returns the averaging period for the Teeth line, defined at the indicator creation.
TeethShift

Returns the horizontal shift of the Teeth line.

```
int TeethShift() const
```

Return Value

Horizontal shift of the Teeth line, defined at the indicator creation.
LipsPeriod

Returns the averaging period for the Lips line.

```cpp
int LipsPeriod() const
```

Return Value

Returns the averaging period for the Lips line, defined at the indicator creation.
LipsShift

Returns the horizontal shift of the Lips line.

```cpp
int LipsShift() const
```

Return Value

Horizontal shift of the Lips line, defined at the indicator creation.
**MaMethod**

Returns the averaging method.

| ENUM_MA_METHOD | MaMethod() const |

**Return Value**

Returns the averaging method, defined at the indicator creation.
**Applied**

Returns the price type or handle to apply.

```
int Applied() const
```

**Return Value**

Price type or handle to apply, defined at the indicator creation.
# Create

Creates the indicator with specified parameters. Use `Refresh()` and `GetData()` to update and get the indicator values.

```csharp
bool Create(
    string symbol,       // symbol
    ENUM_TIMEFRAMES period,    // period
    int jaw_period,        // jaws period
    int jaw_shift,         // jaws shift
    int teeth_period,      // teeth period
    int teeth_shift,       // teeth shift
    int lips_period,       // lips period
    int lips_shift,        // lips shift
    ENUM_MA_METHOD ma_method, // averaging method
    int applied            // price type, handle
)
```

## Parameters

- **symbol**: [in] Symbol.
- **period**: [in] Timeframe (ENUM_TIMEFRAMES enumeration value).
- **jaw_period**: [in] Jaws averaging period.
- **teeth_period**: [in] Teeth averaging period.
- **lips_period**: [in] Lips averaging period.
- **lips_shift**: [in] Lips horizontal shift.
- **applied**: [in] Price type or handle to apply.

## Return Value

- `true` - successful, `false` - cannot create the indicator.
Upper

Returns the element of the upper buffer by the specified index.

```c
double Upper(
    int index // index
)
```

**Parameters**

- `index`
  - [in] Upper buffer element index.

**Return Value**

The upper buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Lower

Returns the element of the lower buffer by the specified index.

```c
double Upper(
    int  index  // index
)
```

**Parameters**

- `index`  
  [in] Lower buffer element index.

**Return Value**

The element of the lower buffer by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (IND_GATOR for CiGator).
CiBWMFI

CiBWMFI is a class intended for using the Market Facilitation Index by Bill Williams technical indicator.

Description

CiBWMFI class provides the creation, setup, and access to the data of the Market Facilitation Index by Bill Williams indicator.

Declaration

```cpp
class CiBWMFI: public CIndicator
```

Title

```cpp
#include <Indicators\BillWilliams.mqh>
```

Applied

Returns the volume type to apply.

| ENUM_APPLICATION_VOLUME | Applied() const |

Return Value

Volume type to apply, defined at the indicator creation (ENUM_APPLICATION_VOLUME enumeration value).
Create

Creates the indicator with specified parameters. Use Refresh() and GetData() to update and get the indicator values.

```cpp
bool Create(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // period
    ENUM_APPLIED_VOLUME applied  // volume type
)
```

Parameters

- **symbol**
  - [in] Symbol.

- **period**

- **applied**
  - [in] Volume type to apply (ENUM_APPLIED_VOLUME enumeration value).

Return Value

true - successful, false - cannot create the indicator.
Main

Returns the buffer element by the specified index.

```c
double Main(
    int index // index
)
```

Parameters

`index`

Return Value

Buffer element by the specified index, or `EMPTY_VALUE` if there is no correct data.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (**IND_BWMFI** for CiBWMFI).
**CiCustom**

CiCustom is a class intended for using the custom technical indicators.

**Description**

CiCustom class provides the creation, setup, and access to the data of a custom indicator.

**Declaration**

```cpp
class CiCustom: public CIndicator
```

**Title**

```cpp
#include <Indicators\Custom.mqh>
```

</table>
**NumBuffers**

Sets the number of buffers.

```cpp
bool NumBuffers();
```

**Return Value**

true - successful, false - cannot set the necessary number of buffers.
NumParams

Gets the number of parameters used when creating an indicator.

```cpp
int NumParams() const
```

Return Value

Number of parameters, used in creation of the indicator.
**ParamType**

Gets a type of the parameter.

```cpp
ENUM_DATATYPE ParamType(
    int  index  // index
) const
```

**Parameters**

index

[in] Parameter index.

**Return Value**

Returns the data type of the specified parameter, used in indicator creation.

**Note**

If parameter index is invalid, it returns `WRONG_VALUE`.

ParamLong

Gets the value of specified parameter of long type.

```cpp
long ParamLong(
    int  index  // index
) const
```

**Parameters**

- **index**
  - [in] Parameter index.

**Return Value**

The value of specified parameter of long type, used in creation of the indicator.

**Note**

If the parameter index is invalid or the parameter is not of long type, it returns 0.
ParamDouble

Gets the value of specified parameter of double type.

```c
double ParamDouble(
    int index // index
) const
```

Parameters

`index`

[in] Parameter index.

Return Value

The value of specified parameter of double type, used in creation of the indicator.

Note

If the parameter index is invalid or the parameter type is not of double type, it returns `EMPTY_VALUE`.
ParamString

Gets the value of specified parameter of string type.

```
string ParamString
{
    int index  // index
}
```

Parameters

```
index
    [in] Parameter index.
```

Return Value

The value of specified string parameter, used in creation of the indicator.

Note

If the number is invalid or the parameter is not of string type, it returns an empty string.
Type

Virtual identification method.

```cpp
virtual int Type() const
```

Return Value

Indicator type (`IND_CUSTOM` for CiCustom).
Trade Classes

This section contains technical details of working with trade classes and description of the relevant components of the MQL5 standard library.

Using trade classes will save time when creating custom programs (Expert Advisors).

MQL5 Standard Library (in terms of trade classes) is placed in the terminal working directory, in the Include\Trade folder.

<table>
<thead>
<tr>
<th>Class/Group</th>

<td>Gets the amount of free margin left after execution of trade operation</td>
</tr>
<tr>
<td>MaxLotCheck</td>
<td>Gets the maximal possible volume of trade operation</td>
</tr>
</tbody>
</table>

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare
Login

Gets the account number.

```cpp
long Login() const
```

Return Value

Account number.
TradeMode

Gets the trade mode.

```c
  ENUM_ACCOUNT_TRADE_MODE  TradeMode() const
```

Return Value

Trade mode from the `ENUM_ACCOUNT_TRADE_MODE` enumeration.
TradeModeDescription

Gets the trade mode as a string.

```cpp
string TradeModeDescription() const
```

Return Value

Trade mode as a string.
Leverage

Gets the amount of given leverage.

```cpp
long Leverage() const
```

Return Value

*Amount of given leverage.*
StopoutMode

Gets the mode of the Stop Out level specification.

` ENUM_ACCOUNT_STOPOUT_MODE StopoutMode() const`

**Return Value**

The stop out setting mode from the `ENUM_ACCOUNT_STOPOUT_MODE` enumeration.
**StopoutModeDescription**

Gets the mode of the Stop Out level specification as a string.

```cpp
string StopoutModeDescription() const
```

**Return Value**

The stop out setting mode as a string.
**MarginMode**

Gets the margin calculation mode.

```cpp
const ENUM_ACCOUNT_MARGIN_MODE MarginMode()
```

**Return Value**

The margin calculation mode from the `ENUM_ACCOUNT_MARGIN_MODE` enumeration.
MarginModeDescription

Gets the margin calculation mode as a string.

```cpp
string MarginModeDescription() const
```

Return Value

Margin calculation mode as a string.
TradeAllowed

Gets the flag of trade allowance.

```cpp
bool TradeAllowed() const
```

Return Value

Flag of trade allowance.
TradeExpert

Gets the flag of automated trade allowance.

```
bool TradeExpert() const
```

Return Value

Flag of automated trade allowance.
LimitOrders

Gets the maximal number of allowed pending orders

```c
int LimitOrders() const
```

Return Value

The maximal number of allowed pending orders.

Note

0 - no limits.
Balance

Gets the balance of account.

```c
double Balance() const
```

Return Value

The balance of account (in deposit currency).
Credit

Gets the amount of given credit.

```cpp
double Credit() const
```

Return Value

Amount of given credit (in deposit currency).
Profit

Gets the amount of current profit on account.

```cpp
double Profit() const
```

Return Value

Amount of current profit on account (in deposit currency).
Equity

Gets the amount of current equity on account.

```cpp
double Equity() const
```

**Return Value**

*Amount of current equity on account (in deposit currency).*
**Margin**

Gets the amount of reserved margin.

```cpp
double Margin() const
```

**Return Value**

*Amount of reserved margin (in deposit currency).*
FreeMargin

Gets the amount of free margin.

```cpp
double FreeMargin() const
```

Return Value

Amount of free margin (in deposit currency).
**MarginLevel**

Gets the level of margin.

```cpp
double MarginLevel() const
```

**Return Value**

Level of margin.
MarginCall

Gets the level of margin for a deposit.

double MarginCall() const

Return Value

Level of margin for a deposit.
**MarginStopOut**

Gets the level of margin for Stop Out.

```cpp
double MarginStopOut() const
```

**Return Value**

Level of margin for Stop Out.
Name

Gets the client name.

```cpp
string Name() const
```

Return Value

Client name.
Server

Gets the trade server name.

```
string Server() const
```

Return Value

Trade server name.
Currency

Gets the deposit currency name.

```cpp
string Currency() const
```

Return Value

Deposit currency name.
Company

Gets the company name, that serves an account.

```c++
string Company() const
```

Return Value

Company name that serves an account.
InfoInteger

Gets the value of specified integer type property.

```c
long InfoInteger(
    ENUM_ACCOUNT_INFO_INTEGER prop_id  // property ID
) const
```

Parameters

- `prop_id`  
  [in] Identifier of the property. The value can be one of the values of `ENUM_ACCOUNT_INFO_INTEGER` enumeration.

Return Value

- Value of `long` type.
InfoDouble

Gets the value of specified double type property.

```cpp
double InfoDouble(
    ENUM_ACCOUNT_INFO_DOUBLE prop_id // property ID
) const
```

Parameters

- `prop_id`
  - [in] Identifier of the property. The value can be one of the values of `ENUM_ACCOUNT_INFO_DOUBLE` enumeration.

Return Value

- Value of `double` type.
**InfoString**

Gets the value of specified string type property.

```c
string InfoString(
    ENUM_ACCOUNT_INFO_STRING prop_id  // property ID
) const
```

**Parameters**

- `prop_id`

  [in] Identifier of the property. The value can be one of the values of `ENUM_ACCOUNT_INFO_STRING` enumeration.

**Return Value**

Value of `string` type.
OrderProfitCheck

The function calculates the profit for the current account, based on the parameters passed. The function is used for pre-evaluation of the result of a trade operation. The value is returned in the account currency.

double OrderProfitCheck(
    const string symbol,  // symbol
    ENUM_ORDER_TYPE trade_operation,  // order type (ORDER_TYPE_BUY or ORDER_TYPE_SELL)
    double volume,  // volume
    double price_open,  // position open price
    double price_close   // position close price
) const

Parameters
symbol
    [in] Symbol for trade operation.
trade_operation
    [in] Type of trade operation from ENUM_ORDER_TYPE enumeration.
volume
    [in] Volume of trade operation.
price_open
price_close

Return Value

If successful, it returns amount of profit or EMPTY_VALUE in the case of error.
MarginCheck

Gets the amount of margin, required for trade operation.

```c
double MarginCheck(
    const string symbol,   // symbol
    ENUM_ORDER_TYPE trade_operation, // order type {ORDER_TYPEBUY or ORDER_TYI
    double volume,        // volume
    double price          // price
) const
```

**Parameters**

*symbol*

[in] Symbol for trade operation.

*trade_operation*

[in] Type of trade operation from `ENUM_ORDER_TYPE` enumeration.

*volume*

[in] Volume of trade operation.

*price*

[in] Price of trade operation.

**Return Value**

Amount of margin required for trade operation.
**FreeMarginCheck**

Gets the amount of free margin left after trade operation.

```cpp
double FreeMarginCheck(
    const string symbol,  // symbol
    ENUM_ORDER_TYPE trade_operation, // order type (ORDER_TYPE_BUY or ORDER_TYPE_SELL)
    double volume,        // volume
    double price          // price
) const
```

**Parameters**

- **symbol**
  - [in] Symbol for trade operation.

- **trade_operation**
  - [in] Type of trade operation from `ENUM_ORDER_TYPE` enumeration.

- **volume**
  - [in] Volume of trade operation.

- **price**
  - [in] Price of trade operation.

**Return Value**

Amount of free margin left after trade operation.
MaxLotCheck

Gets the maximum possible volume of trade operation.

```
double MaxLotCheck(
    const string symbol,          // symbol
    ENUM_ORDER_TYPE trade_operation,  // order type (ORDER_TYPE_BUY or ORDER_TYPE_SELL)
    double price,                 // price
    double percent=100           // percent of available margin (default is 100)
) const
```

Parameters

- `symbol`  
  [in] Symbol for trade operation.

- `trade_operation`  
  [in] Type of trade operation from ENUM_ORDER_TYPE enumeration.

- `price`  
  [in] Price of trade operation.

- `percent=100`  
  [in] Percent of available margin (in %) to be used for trade operation.

Return Value

Maximum possible volume of trade operation.
CSymbolInfo

CSymbolInfo is a class for easy access to the symbol properties.

Description

CSymbolInfo class provides access to the symbol properties.

Declaration

```cpp
class CSymbolInfo : public CObject
```

Title

```cpp
#include <Trade\SymbolInfo.mqh>
```

Inheritance hierarchy

- CObject
- CSymbolInfo

Class methods by groups

<td>Gets the rate of margin charging for Limit orders</td>
</tr>
<tr>
<td><code>MarginStop</code></td>
<td>Gets the rate of margin charging for Stop orders</td>
</tr>
<tr>
<td><code>MarginStopLimit</code></td>
<td>Gets the rate of margin charging for StopLimit orders</td>
</tr>
<tr>
<td><code>TradeTimeFlags</code></td>
<td>Gets the flags of allowed expiration modes</td>
</tr>
<tr>
<td><code>TradeFillFlags</code></td>
<td>Gets the flags of allowed filling modes</td>
</tr>
</tbody>
</table>

### Quantization

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Digits</code></td>
<td>Gets the number of digits after period</td>
</tr>
<tr>
<td><code>Point</code></td>
<td>Gets the value of one point</td>
</tr>
<tr>
<td><code>TickValue</code></td>
<td>Gets the tick value (minimal change of price)</td>
</tr>
<tr>
<td><code>TickValueProfit</code></td>
<td>Gets the calculated tick price for a profitable position</td>
</tr>
<tr>
<td><code>TickValueLoss</code></td>
<td>Gets the calculated tick price for a losing position</td>
</tr>
<tr>
<td><code>TickSize</code></td>
<td>Gets the minimal change of price</td>
</tr>
</tbody>
</table>

### Contracts sizes

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ContractSize</code></td>
<td>Gets the amount of trade contract</td>
</tr>
<tr>
<td><code>LotsMin</code></td>
<td>Gets the minimal volume to close a deal</td>
</tr>
<tr>
<td><code>LotsMax</code></td>
<td>Gets the maximal volume to close a deal</td>
</tr>
<tr>
<td><code>LotsStep</code></td>
<td>Gets the minimal step of volume change to close a deal</td>
</tr>
<tr>
<td><code>LotsLimit</code></td>
<td>Gets the maximal allowed volume of opened position and pending orders (direction insensitive) for one symbol</td>
</tr>
</tbody>
</table>

### Swaps sizes

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SwapLong</code></td>
<td>Gets the value of long position swap</td>
</tr>
<tr>
<td><code>SwapShort</code></td>
<td>Gets the value of short position swap</td>
</tr>
</tbody>
</table>
### Controlling

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CurrencyBase</code></td>
<td>Gets the name of symbol base currency</td>
</tr>
<tr>
<td><code>CurrencyProfit</code></td>
<td>Gets the profit currency name</td>
</tr>
<tr>
<td><code>CurrencyMargin</code></td>
<td>Gets the margin currency name</td>
</tr>
<tr>
<td><code>Bank</code></td>
<td>Gets the name of current quote source</td>
</tr>
<tr>
<td><code>Description</code></td>
<td>Gets the string description of symbol</td>
</tr>
<tr>
<td><code>Path</code></td>
<td>Gets the path in symbols tree</td>
</tr>
</tbody>
</table>

### Symbol properties

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>

<tbody>
<tr>
<td><code>SessionDeals</code></td>
<td>Gets the number of deals in the current session</td>
</tr>
<tr>
<td><code>SessionBuyOrders</code></td>
<td>Gets the number of Buy orders at the moment</td>
</tr>
<tr>
<td><code>SessionSellOrders</code></td>
<td>Gets the number of Sell orders at the moment</td>
</tr>
<tr>
<td><code>SessionTurnover</code></td>
<td>Gets the summary of turnover of the current session</td>
</tr>
<tr>
<td><code>SessionInterest</code></td>
<td>Gets the summary of open interest of the current session</td>
</tr>
<tr>
<td><code>SessionBuyOrdersVolume</code></td>
<td>Gets the current volume of Buy orders</td>
</tr>
<tr>
<td><code>SessionSellOrdersVolume</code></td>
<td>Gets the current volume of Sell orders</td>
</tr>
<tr>
<td><code>SessionOpen</code></td>
<td>Gets the open price of the current session</td>
</tr>
<tr>
<td><code>SessionClose</code></td>
<td>Gets the close price of the current session</td>
</tr>
<tr>
<td><code>SessionAW</code></td>
<td>Gets the average weighted price of the current session</td>
</tr>
<tr>
<td><code>SessionPriceSettlement</code></td>
<td>Gets the settlement price of the current session</td>
</tr>
<tr>
<td><code>SessionPriceLimitMin</code></td>
<td>Gets the minimal price of the current session</td>
</tr>
<tr>
<td><code>SessionPriceLimitMax</code></td>
<td>Gets the maximal price of the current session</td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td><code>NormalizePrice</code></td>
<td>Returns the value of price, normalized using the symbol properties</td>
</tr>
</tbody>
</table>

Methods inherited from class CObject
Refresh

Refreshes the symbol data.

```c
void Refresh()
```

Return Value

None.

Note

The symbol should be selected by `Name` method.
RefreshRates

Refreshes the symbol quotes data.

```cpp
bool RefreshRates()
```

Return Value

true - success, false - unable to refresh quotes.

Note

The symbol should be selected by Name method.
Name

Gets symbol name.

```cpp
string Name() const
```

Return Value

Symbol name.

Name

Sets symbol name.

```cpp
bool Name(string name)
```

Return Value

None.
Select

Gets the “Market Watch” symbol flag.

```cpp
bool Select() const
```

Return Value

“Market Watch” symbol flag.

Select

Sets the “Market Watch” symbol flag.

```cpp
bool Select()
```

Return Value

true - success, false - unable to change flag.

Note

The symbol should be selected by Name method.
IsSynchronized

Checks the symbol synchronization with server.

```cpp
bool IsSynchronized() const
```

Return Value

true - if the symbol is synchronized with server, false - if not.

Note

The symbol should be selected by `Name` method.
**Volume**

Gets the volume of last deal.

```c
long Volume() const
```

**Return Value**

Volume of last deal.

**Note**

The symbol should be selected by `Name` method.
**VolumeHigh**

Gets the maximal volume of the day.

```c
long VolumeHigh() const
```

**Return Value**

Maximal volume of the day.

**Note**

The symbol should be selected by `Name` method.
VolumeLow

Gets the minimal volume of the day.

```cpp
long VolumeLow() const
```

**Return Value**

Minimal volume of the day.

**Note**

The symbol should be selected by `Name` method.
Time

Gets the time of last quote.

```cpp
datetime Time() const
```

Return Value

Time of last quote.

Note

The symbol should be selected by `Name` method.
Spread

Gets the amount of spread (in points).

```c
int Spread() const
```

Return Value

Gets the amount of spread (in points).

Note

The symbol should be selected by `Name` method.
**SpreadFloat**

Gets the flag of floating spread.

```c
bool SpreadFloat() const
```

**Return Value**

Flag of floating spread.

**Note**

The symbol should be selected by `Name` method.
TicksBookDepth

Gets the depth of ticks saving.

```cpp
int TicksBookDepth() const
```

Return Value

- Depth of ticks saving.

Note

The symbol should be selected by `Name` method.
**StopsLevel**

Gets the minimal stop level for orders (in points).

```c
int StopsLevel() const
```

**Return Value**

*Minimal stop level for orders (in points).*

**Note**

The symbol should be selected by `Name` method.
FreezeLevel

Gets the freeze level (in points).

```
int FreezeLevel() const
```

**Return Value**

Distance of freeze level (in points).

**Note**

The symbol should be selected by `Name` method.
Bid

Gets the current Bid price.

```cpp
double Bid() const
```

Return Value

- Current Bid price.

Note

The symbol should be selected by `Name` method.
BidHigh

Gets the maximal Bid price of the day.

```plaintext
double BidHigh() const
```

Return Value

Maximal Bid price of the day.

Note

The symbol should be selected by Name method.
**BidLow**

Gets the minimal Bid price of the day.

```c
double BidLow() const
```

**Return Value**

Minimal Bid price of the day.

**Note**

The symbol should be selected by `Name` method.
**Ask**

Gets the current Ask price.

```cpp
double Ask() const
```

**Return Value**

Current Ask price.

**Note**

The symbol should be selected by `Name` method.
AskHigh

Gets the maximal Ask price for a day.

```cpp
double AskHigh() const
```

Return Value

Maximal Ask price of the day.

Note

The symbol should be selected by Name method.
AskLow

Gets the minimal Ask price for a day.

```cpp
double AskLow() const
```

**Return Value**

*Minimal Ask price of the day.*

**Note**

The symbol should be selected by `Name` method.
Last

Gets the current Last price.

```cpp
double Last() const
```

Return Value

Current Last price.
**LastHigh**

Gets the maximal Last price of the day.

```cpp
    double LastHigh() const
```

**Return Value**

Maximal Last price of the day.

**Note**

The symbol should be selected by `Name` method.
LastLow

Gets the minimal Last price of the day.

```
  double LastLow() const
```

**Return Value**

Minimal Last price of the day.

**Note**

The symbol should be selected by `Name` method.
TradeCalcMode

Gets the mode of contract cost calculation.

```
ENUM_SYMBOL_CALC_MODE TradeCalcMode() const
```

Return Value

Mode of contract cost calculation from `ENUM_SYMBOL_CALC_MODE` enumeration.

Note

The symbol should be selected by `Name` method.
**TradeCalcModeDescription**

Gets the mode of contract cost calculation as a string.

```cpp
string TradeCalcModeDescription() const
```

**Return Value**

Mode of contract cost calculation as a string.

**Note**

The symbol should be selected by `Name` method.
TradeMode

Gets the order execution type.

```cpp
const ENUM_SYMBOL_TRADE_MODE TradeMode();
```

Return Value

Order execution type from `ENUM_SYMBOL_TRADE_MODE` enumeration.

Note

The symbol should be selected by `Name` method.
**TradeModeDescription**

Gets the trade mode as a string.

```cpp
string TradeModeDescription() const
```

**Return Value**

Trade mode as a string.

**Note**

The symbol should be selected by `Name` method.
**TradeExecution**

Gets the trade execution mode.

```
ENUM_SYMBOL_TRADE_EXECUTION  TradeExecution() const
```

**Return Value**

Trade execution mode from `ENUM_SYMBOL_TRADE_EXECUTION` enumeration.

**Note**

The symbol should be selected by `Name` method.
TradeExecutionDescription

Gets the description of trade execution mode as a string.

```
string TradeExecutionDescription() const
```

Return Value

Trade execution mode as a string.

Note

The symbol should be selected by Name method.
SwapMode

Gets the swap calculation mode.

```c
const ENUM_SYMBOL_SWAP_MODE SwapMode() const
```

Return Value

Swap calculation mode from `ENUM_SYMBOL_SWAP_MODE` enumeration.

Note

The symbol should be selected by `Name` method.
**SwapModeDescription**

Gets the swap mode description as a string.

```cpp
string SwapModeDescription() const
```

**Return Value**

Swap mode description as a string.

**Note**

The symbol should be selected by Name method.
SwapRollover3days

Gets the swap rollover day.

```
ENUM_DAY_OF_WEEK SwapRollover3days() const
```

Return Value

Swap rollover day from `ENUM_DAY_OF_WEEK` enumeration.

Note

The symbol should be selected by `Name` method.
**SwapRollover3daysDescription**

Gets the swap rollover day as a string.

```cpp
string SwapRollover3daysDescription() const
```

**Return Value**

Swap rollover day as a string.

**Note**

The symbol should be selected by `Name` method.
**MarginInitial**

Gets the value of initial margin.

```cpp
double MarginInitial()
```

**Return Value**

Value of initial margin.

**Note**

It returns the amount of margin (in margin currency of instrument) that is charged from one lot. Used to check client's equity, when they enter the market.

The symbol should be selected by `Name` method.
**MarginMaintenance**

Gets the value of maintenance margin.

```c
double MarginMaintenance()
```

**Return Value**

Value of maintenance margin.

**Note**

It returns the amount of margin (in margin currency of instrument) that is charged from one lot. Used to check client's equity, when the account state is changed. If the maintenance margin is equal to 0, then the initial margin is used.

The symbol should be selected by Name method.
MarginLong

Gets the rate of margin charging on long positions.

```cpp
double MarginLong() const
```

Return Value

Rate of margin charging on long positions.

Note

The symbol should be selected by Name method.
MarginShort

Gets the rate of margin charging on short positions.

```cpp
double MarginShort() const
```

Return Value

Rate of margin charging on short positions.

Note

The symbol should be selected by Name method.
**MarginLimit**

Gets the rate of margin charging on Limit orders.

```cpp
double MarginLimit() const
```

**Return Value**

Rate of margin charging on Limit orders.

**Note**

The symbol should be selected by `Name` method.
**MarginStop**

Gets the rate of margin charging on Stop orders.

```cpp
double MarginStop() const
```

**Return Value**

Rate of margin charging on Stop orders.

**Note**

The symbol should be selected by `Name` method.
MarginStopLimit

Gets the rate of margin charging on Stop Limit orders.

```cpp
double MarginStopLimit() const
```

Return Value

Rate of margin charging on Stop Limit orders.

Note

The symbol should be selected by Name method.
TradeTimeFlags

Gets the flags of allowed expiration modes.

```c
int TradeTimeFlags() const
```

Return Value

Flags of allowed expiration modes.

Note

The symbol should be selected by `Name` method.
TradeFillFlags

Gets the flags of allowed filling modes.

```c
int TradeFillFlags() const
```

Return Value

Flags of allowed filling modes.

Note

The symbol should be selected by Name method.
**Digits**

*Gets the number of digits after period.*

```c
int Digits() const
```

**Return Value**

The number of digits after period.

**Note**

The symbol should be selected by `Name` method.
Point

Gets the value of one point.

```cpp
double Point() const
```

Return Value

Value of one point.

Note

The symbol should be selected by Name method.
TickValue

Gets the tick value (minimal change of price).

```cpp
double TickValue() const
```

Return Value

Tick value (minimal change of price).

Note

The symbol should be selected by Name method.
**TickValueProfit**

Gets the calculated tick price for a profitable position.

```c
double TickValueProfit() const
```

**Return Value**

The calculated tick price for a profitable position.

**Note**

The symbol should be selected by `Name` method.
**TickValueLoss**

Gets the calculated tick price for a losing position.

```cpp
double TickValueLoss() const
```

**Return Value**

The calculated tick price for a losing position.

**Note**

The symbol should be selected by `Name` method.
TickSize

Gets the minimal change of price.

```cpp
double TickSize() const
```

Return Value

Minimal change of price.

Note

The symbol should be selected by `Name` method.
**ContractSize**

Gets the amount of trade contract.

```cpp
    double ContractSize() const
```

**Return Value**

Amount of trade contract.

**Note**

The symbol should be selected by `Name` method.
LotsMin

Gets the minimal volume to close a deal.

```c
double LotsMin() const
```

Return Value

- Minimal volume to close a deal.

Note

The symbol should be selected by `Name` method.
LotsMax

Gets the maximal volume to close a deal.

```c
double LotsMax() const
```

**Return Value**

Maximal volume to close a deal.

**Note**

The symbol should be selected by Name method.
LotsStep

Gets the minimal step of volume change to close a deal.

```cpp
double LotsStep() const
```

Return Value

Minim**al step of volume change to close a deal.

Note

The symbol should be selected by `Name` method.
LotsLimit

Gets the maximal allowed volume of opened position and pending orders (direction insensitive) for one symbol.

```cpp
double LotsLimit() const
```

**Return Value**

The maximal allowed volume of opened position and pending orders (direction insensitive) for one symbol.

**Note**

The symbol should be selected by Name method.
SwapLong

Gets the value of long position swap.

```c
    double SwapLong() const
```

Return Value

Value of long position swap.

Note

The symbol should be selected by Name method.
**SwapShort**

Gets the value of short position swap.

```cpp
double SwapShort() const
```

**Return Value**

Value of short position swap.

**Note**

The symbol should be selected by `Name` method.
CurrencyBase

Gets the name of symbol base currency.

```cpp
string CurrencyBase() const
```

Return Value

Name of symbol base currency.

Note

The symbol should be selected by Name method.
**CurrencyProfit**

Gets the profit currency name.

```cpp
string CurrencyProfit() const
```

Return Value

*Profit currency name.*

**Note**

The symbol should be selected by `Name` method.
CurrencyMargin

Gets the margin currency name.

```cpp
string CurrencyMargin() const
```

Return Value

Margin currency name.

Note

The symbol should be selected by `Name` method.
Bank

Gets the name of current quote source.

```
string Bank() const
```

Return Value

Name of current quote source.

Note

The symbol should be selected by `Name` method.
Description

Gets the string description of symbol.

```c
string Description() const
```

Return Value

String description of symbol.

Note

The symbol should be selected by `Name` method.
Path

Gets the path in symbols tree.

```cpp
string Path() const
```

Return Value

Gets the path in symbols tree.

Note

The symbol should be selected by `Name` method.
**SessionDeals**

Gets the number of deals in the current session.

```cpp
long SessionDeals() const
```

**Return Value**

Number of deals in the current session.

**Note**

The symbol should be selected by `Name` method.
SessionBuyOrders

Gets the number of Buy orders at the moment.

```cpp
long SessionBuyOrders() const
```

Return Value

Number of Buy orders at the moment.

Note

The symbol should be selected by Name method.
SessionSellOrders

Gets the number of Sell orders at the moment.

```cpp
long SessionSellOrders() const
```

Return Value

- Number of Sell orders at the moment.

Note

The symbol should be selected by `Name` method.
SessionTurnover

Gets summary turnover of the current session.

```cpp
double SessionTurnover() const
```

**Return Value**

Summary turnover of the current session.

**Note**

The symbol should be selected by Name method.
SessionInterest

Gets the summary of open interest of the current session.

```cpp
double SessionInterest() const
```

Return Value

Summary open interest of the current session.

Note

The symbol should be selected by Name method.
SessionBuyOrdersVolume

Gets the current volume of Buy orders.

```
  double SessionBuyOrdersVolume() const
```

**Return Value**

Current volume of Buy orders.

**Note**

The symbol should be selected by Name method.
SessionSellOrdersVolume

Gets the current volume of Sell orders.

```c
double SessionSellOrdersVolume() const
```

Return Value

Current volume of Sell orders.

Note

The symbol should be selected by Name method.
SessionOpen

Gets the open price of the current session.

```
  double SessionOpen() const
```

Return Value

Open price of the current session.

Note

The symbol should be selected by `Name` method.
SessionClose

Gets the close price of the current session.

```cpp
    double SessionClose() const
```

Return Value

Close price of the current session.

Note

The symbol should be selected by `Name` method.
SessionAW

Gets the average weighted price of the current session.

```c
double SessionAW() const
```

Return Value

Average weighted price of the current session.

Note

The symbol should be selected by `Name` method.
SessionPriceSettlement

Gets the settlement price of the current session.

```
    double SessionPriceSettlement() const
```

Return Value

Settlement price of the current session.

Note

The symbol should be selected by `Name` method.
SessionPriceLimitMin

Gets the minimal price of the current session.

```c
double SessionPriceLimitMin() const
```

Return Value

Minimal price of the current session.

Note

The symbol should be selected by `Name` method.
**SessionPriceLimitMax**

Gets the maximal price of the current session.

```c
double SessionPriceLimitMax() const
```

**Return Value**

Maximal price of the current session.

**Note**

The symbol should be selected by `Name` method.
InfoInteger

Gets the value of specified integer type property.

```cpp
bool InfoInteger(
    ENUM_SYMBOL_INFO_INTEGER prop_id,  // property ID
    long& var                                // reference to variable
) const
```

**Parameters**

`prop_id`
- [in] ID of integer type property from `ENUM_SYMBOL_INFO_INTEGER` enumeration.

`var`
- [out] Reference to `long` type variable to place result.

**Return Value**

- `true` - success, `false` - unable to get property value.

**Note**

The symbol should be selected by `Name` method.
**InfoDouble**

Gets the value of specified double type property.

```c
bool InfoDouble(
    ENUM_SYMBOL_INFO_DOUBLE prop_id,    // property ID
    double& var                         // reference to variable
) const
```

**Parameters**

- **prop_id**
  - [in] ID of double type property from `ENUM_SYMBOL_INFO_DOUBLE` enumeration.

- **var**
  - [out] Reference to `double` type variable to place result.

**Return Value**

- `true` - success, `false` - unable to get property value.

**Note**

The symbol should be selected by `Name` method.
InfoString

Gets the value of specified string type property.

```cpp
bool InfoString(
    ENUM_SYMBOL_INFO_STRING prop_id, // property ID
    string& var // reference to variable
) const
```

**Parameters**

`prop_id`

[in] ID of text property.

`var`

[out] Reference to `string` type variable to place result.

**Return Value**

true - success, false - unable to get property value.

**Note**

The symbol should be selected by `Name` method.
NormalizePrice

Returns the value of price normalized using the symbol properties.

```c
double NormalizePrice(
   double price   // price
) const
```

**Parameters**

- `price`
  - `[in]` Price.

**Return Value**

- Normalized price.

**Note**

The symbol should be selected by `Name` method.
COrderInfo

COrderInfo is a class for easy access to the pending order properties.

Description

COrderInfo class provides access to the pending order properties.

Declaration

```cpp
class COrderInfo : public CObject
```

Title

```cpp
#include <Trade\OrderInfo.mqh>
```

Inheritance hierarchy

CObject
    COrderInfo

</table>

Methods inherited from class CObject

Prev, Prev, Next, Next, **Save**, Load, Type, Compare
Ticket

Gets the ticket of an order.

```c
ulong Ticket() const
```

Return Value

Order ticket if successful, otherwise - `ULONG_MAX`.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**TimeSetup**

Gets the time of order placement.

```cpp
datetime TimeSetup() const
```

**Return Value**

Time of order placement.

**Note**

The order should be selected using the [Select](https://www.metaquotes.net/mql5/function/Select) (by ticket) or [SelectByIndex](https://www.metaquotes.net/mql5/function/SelectByIndex) (by index) methods.
**TimeSetupMsc**

Receives the time of placing an order for execution in milliseconds since 01.01.1970.

```c
ulong TimeSetupMsc() const
```

**Return Value**

The time of placing an order for execution in milliseconds since 01.01.1970.

**Note**

Order should be preliminarily selected for access using `Select` (by ticket) or `SelectByIndex` (by index) method.
OrderType

Gets the order type.

```c
ENUM_ORDER_TYPE OrderType()
```

**Return Value**

Order type from `ENUM_ORDER_TYPE` enumeration.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
TypeDescription

Gets the order type as a string.

```cpp
string TypeDescription() const
```

**Return Value**

Order type as a string.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
State

Gets the order state.

```cpp
ENUM_ORDER_STATE State() const
```

**Return Value**

Order state from `ENUM_ORDER_STATE` enumeration.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
StateDescription

Gets the order state as a string.

```cpp
string StateDescription() const
```

Return Value

Order state as a string.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
TimeExpiration

Gets the order expiration time.

```cpp
datetime TimeExpiration() const
```

Return Value

Order expiration time, set on its placement.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**TimeDone**

 Gets the time of order execution or cancellation.

```cpp
    datetime TimeDone() const
```

**Return Value**

Time of order execution or cancellation.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**TimeDoneMsc**

Receives order execution or cancellation time in milliseconds since 01.01.1970.

```c
ulong TimeDoneMsc() const
```

**Return Value**

Order execution or cancellation time in milliseconds since 01.01.1970.

**Note**

Order should be preliminarily selected for access using **Select** (by ticket) or **SelectByIndex** (by index) method.
**TypeFilling**

Gets the order filling type.

```
ENUM_ORDER_TYPE_FILLING TypeFilling() const
```

**Return Value**

Order filling type from `ENUM_ORDER_TYPE_FILLING` enumeration.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
TypeFillingDescription

Gets the order filling type as a string.

```cpp
string TypeFillingDescription() const
```

Return Value

Order filling type as a string.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
TypeTime

Gets the type of order at the time of the expiration.

```cpp
ENUM_ORDER_TYPE_TIME TypeTime() const
```

Return Value

Type of order at the time of the expiration from `ENUM_ORDER_TYPE_TIME` enumeration.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**TypeTimeDescription**

Gets the order type by expiration time as a string.

```cpp
string TypeTimeDescription() const
```

**Return Value**

Order type by expiration time as a string.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
Magic

Gets the ID of an Expert Advisor that placed the order.

```c
long Magic() const
```

**Return Value**

ID of an Expert Advisor that placed the order.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
PositionId

Gets the ID of position.

```c
long PositionId() const
```

Return Value

ID of position, in which the order was involved.

Note

The order should be selected using the Select (by ticket) or SelectByIndex (by index) methods.
**VolumeInitial**

Gets the initial volume of order.

```
double VolumeInitial() const
```

**Return Value**

Initial volume of order.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**VolumeCurrent**

Gets the unfilled volume of order.

```cpp
double VolumeCurrent() const
```

**Return Value**

Unfilled volume of order.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**PriceOpen**

Gets the order price.

```cpp
double PriceOpen() const
```

**Return Value**

*Price of order placement.*

**Note**

The order should be selected using the [Select](#) (by ticket) or [SelectByIndex](#) (by index) methods.
StopLoss

Gets the order's Stop Loss.

```cpp
    double StopLoss() const
```

Return Value

Order's Stop Loss.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**TakeProfit**

Gets the order's Take Profit.

```c
double TakeProfit() const
```

Return Value

Order's Take Profit.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**PriceCurrent**

Gets the current price by order symbol.

```cpp
double PriceCurrent() const
```

**Return Value**

Current price by order symbol.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**PriceStopLimit**

Gets the price of a pending order.

```cpp
    double PriceStopLimit() const
```

**Return Value**

Pending order price.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
Symbol

Gets the name of order symbol.

```cpp
string Symbol() const
```

Return Value

Name of order symbol.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
Comment

Gets the order comment.

```cpp
string Comment() const
```

Return Value

Order comment.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
InfoInteger

Gets the value of specified integer type property.

```cpp
bool InfoInteger(  
    ENUM_ORDER_PROPERTY_INTEGER prop_id, // property ID  
    long& var // reference to variable
) const
```

Parameters

- `prop_id`
  - [in] ID of integer type property from `ENUM_ORDER_PROPERTY_INTEGER` enumeration.
- `var`
  - [out] Reference to `long` type variable to place result.

Return Value

- `true` - success, `false` - unable to get property value.

Note

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
InfoDouble

Gets the value of specified double type property.

```cpp
bool InfoDouble(
    ENUM_ORDER_PROPERTY_DOUBLE prop_id,  // property ID
double& var                      // reference to variable
) const
```

**Parameters**

- **prop_id**
  - [in] ID of double type property from `ENUM_ORDER_PROPERTY_DOUBLE` enumeration.

- **var**
  - [out] Reference to double type variable to place result.

**Return Value**

true - success, false - unable to get property value.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
InfoString

Gets the value of specified string type property.

```cpp
bool InfoString(
    ENUM_ORDER_PROPERTY_STRING prop_id, // property ID
    string& var  // reference to variable
) const
```

**Parameters**

*prop_id*

[in] ID of string property from `ENUM_ORDER_PROPERTY_STRING` enumeration.

*var*

[Out] Reference to `string` type variable to place result.

**Return Value**

true - success, false - unable to get property value.

**Note**

The order should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
StoreState

Saves the order parameters.

```cpp
void StoreState()
```

Return Value

None.
CheckState

Checks the current parameters against the saved parameters.

```cpp
bool CheckState()
```

Return Value

- `true` - if the order parameters have changed since the last call of the `StoreState()` method, otherwise

- `false`. 

**Select**

Selects an order by ticket for further access to its properties.

```cpp
bool Select(
    ulong ticket  // order ticket
)
```

**Return Value**

- true - success, false - unable to select order.
**SelectByIndex**

Selects an order by index.

```cpp
bool SelectByIndex(
    int index  // order index
)
```

**Parameters**

- `index`
  - [in] Order index.

**Return Value**

- `true` - success, `false` - unable to select order.
CHistoryOrderInfo

CHistoryOrderInfo is a class for easy access to the history order properties.

Description

CHistoryOrderInfo class provides easy access to the history order properties.

Declaration

```cpp
class CHistoryOrderInfo : public CObject
```

Title

```cpp
#include <Trade\HistoryOrderInfo.mqh>
```

Inheritance hierarchy

- CObject
  - CHistoryOrderInfo

Methods inherited from class CObject

   Prev, Prev, Next, Next, Save, Load, Type, Compare
**TimeSetup**

Gets the time of order placement.

```
    datetime  TimeSetup() const
```

**Return Value**

Time of order placement.

**Note**

The historical order should be selected using the [Ticket](#) (by ticket) or [SelectByIndex](#) (by index) methods.
TimeSetupMsc

Receives the time of placing an order for execution in milliseconds since 01.01.1970.

```
ulong TimeSetupMsc() const
```

Return Value

The time of placing an order for execution in milliseconds since 01.01.1970.

Note

Historical order should be preliminarily selected for access using Ticket (by ticket) or SelectByIndex (by index) method.
**OrderType**

**Gets the order type.**

```cpp
ENUM_ORDER_TYPE OrderType() const
```

**Return Value**

Order type from `ENUM_ORDER_TYPE` enumeration.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**TypeDescription**

Gets the order type as a string.

```cpp
    string TypeDescription() const
```

**Return Value**

Order type as a string.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
State

Gets the order state.

```
ENUM_ORDER_STATE State() const
```

Return Value

Order state from `ENUM_ORDER_STATE` enumeration.

Note

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
StateDescription

Gets the order state as a string.

```cpp
string StateDescription() const
```

Return Value

Order state as a string.

Note

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**TimeExpiration**

Gets the time of order expiration.

```cpp
datetime TimeExpiration() const
```

**Return Value**

Time of order expiration, set on its placement.

**Note**

The historical order should be selected using the [Ticket](#) (by ticket) or [SelectByIndex](#) (by index) methods.
**TimeDone**

Gets the time of order execution or cancellation.

```cpp
datetime TimeDone() const
```

**Return Value**

Time of order execution or cancellation.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**TimeDoneMsc**

Receives order execution or cancellation time in milliseconds since 01.01.1970.

```c
ulong TimeDoneMsc() const
```

**Return Value**

Order execution or cancellation time in milliseconds since 01.01.1970.

**Note**

Historical order should be preliminarily selected for access using `Ticket` (by ticket) or `SelectByIndex` (by index) method.
TypeFilling

Gets the type of order execution by remainder.

```cpp
const ENUM_ORDER_TYPE_FILLING TypeFilling();
```

Return Value

Type of order execution by remainder from `ENUM_ORDER_TYPE_FILLING` enumeration.

Note

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**TypeFillingDescription**

Gets the type of order execution by remainder as a string.

```cpp
string TypeFillingDescription() const
```

**Return Value**

Type order of execution by remainder as a string.

**Note**

The historical order should be selected using the [Ticket](#) (by ticket) or [SelectByIndex](#) (by index) methods.
**TypeTime**

Gets the type of order at the time of the expiration.

```c
ENUM_ORDER_TYPE_TIME TypeTime() const
```

**Return Value**

Type of order at the time of the expiration from `ENUM_ORDER_TYPE_TIME` enumeration.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
TypeTimeDescription

Gets the order type by expiration time as a string.

```cpp
string TypeTimeDescription() const
```

Return Value

Order type by expiration time as a string.

Note

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**Magic**

Gets the ID of the Expert Advisor, that placed the order.

```cpp
long Magic() const
```

**Return Value**

ID of the Expert Advisor, that placed the order.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**PositionId**

Gets the ID of position.

```cpp
long PositionId() const
```

**Return Value**

ID of position, in which the order was involved.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**VolumeInitial**

Gets the initial volume of order.

```cpp
    double VolumeInitial() const
```

**Return Value**

Initial volume of order.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
VolumeCurrent

Gets the unfilled volume of order.

```cpp
double VolumeCurrent() const
```

Return Value

Unfilled volume of order.

Note

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**PriceOpen**

Gets the order price.

```cpp
double PriceOpen() const
```

**Return Value**

*Price of order placement.*

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
StopLoss

Gets the Stop Loss price of the order.

```c
    double StopLoss() const
```

**Return Value**

Stop Loss price of the order.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
TakeProfit

Gets the Take Profit price of the order.

```cpp
double TakeProfit() const
```

**Return Value**

The Take Profit price of the order.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
PriceCurrent

 Gets the current price of the order's symbol.

```
double PriceCurrent() const
```

Return Value

The current price of order's symbol.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.
PriceStopLimit

Gets the pending order price.

```cpp
double PriceStopLimit() const
```

Return Value

Pending orders price.

Note

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.
Symbol

Gets the name of order symbol.

```cpp
string Symbol() const
```

**Return Value**

Name of order symbol.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
Comment

Gets the order comment.

```cpp
string Comment() const
```

Return Value

Order comment.

Note

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
InfoInteger

Gets the value of specified integer type property.

```cpp
bool InfoInteger(
    ENUM_ORDER_PROPERTY_INTEGER prop_id, // property ID
    long& var // reference to variable
) const
```

Parameters

- `prop_id`
  - [in] ID of integer type property from `ENUM_ORDER_PROPERTY_INTEGER` enumeration.

- `var`
  - [out] Reference to `long` type variable to place result.

Return Value

- `true` - success, `false` - unable to get property value.

Note

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
InfoDouble

Gets the value of specified double type property.

```cpp
bool InfoDouble(
    ENUM_ORDER_PROPERTY_DOUBLE prop_id, // property ID
    double& var // reference to variable
) const
```

**Parameters**

`prop_id`
- [in] ID of double type property from ENUM_ORDER_PROPERTY_DOUBLE enumeration.

`var`
- [out] Reference to double type variable to place result.

**Return Value**

true - success, false - unable to get property value.

**Note**

The historical order should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.
# InfoString

Gets the value of specified string type property.

```c
bool InfoString(
    ENUM_ORDER_PROPERTY_STRING prop_id, // property ID
    string& var // reference to variable
) const
```

**Parameters**

- **prop_id**
  - [in] ID of text property from `ENUM_ORDER_PROPERTY_STRING` enumeration.
  
- **var**
  - [out] Reference to `string` type variable to place result.

**Return Value**

- `true` - success, `false` - unable to get property value.

**Note**

The historical order should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
### Ticket (Get method)

Gets the order ticket.

```cpp
ulong Ticket() const
```

**Return Value**

Order ticket.

### Ticket (Set method)

Select the order for further work.

```cpp
void Ticket(
    ulong ticket // ticket
)
```

**Parameters**

- `ticket`

SelectByIndex

Selects a historical order by index.

```cpp
bool SelectByIndex(
    int index // order index
)
```

**Parameters**

`index`

[in] Historical order index.

**Return Value**

`true` - success, `false` - unable to select order.
CPositionInfo

CPositionInfo is a class for easy access to the open position properties.

Description

CPositionInfo class provides easy access to the open position properties.

Declaration

```cpp
class CPositionInfo : public CObject
```

Title

```cpp
#include <Trade\PositionInfo.mqh>
```

Inheritance hierarchy

CObject
  CPositionInfo

### Methods inherited from class CObject

*Prev, Prev, Next, Next, Save, Load, Type, Compare*
Time

Gets the time of position opening.

```c
datetime Time() const
```

**Return Value**

Time of position opening.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**TimeMsc**

Receives position opening time in milliseconds since 01.01.1970.

```c
ulong TimeMsc() const
```

**Return Value**

Position opening time in milliseconds since 01.01.1970.

**Note**

Position should be preliminarily selected for access using Select (by symbol) or SelectByIndex (by index) method.
**TimeUpdate**

Receives the time of position changing in seconds since 01.01.1970.

```cpp
datetime TimeUpdate() const
```

**Return Value**

Time of position changing in seconds since 01.01.1970.

**Note**

Position should be preliminarily selected for access using `Select` (by symbol) or `SelectByIndex` (by index) method.
TimeUpdateMsc

Receives the time of position changing in milliseconds since 01.01.1970.

```
ulong TimeUpdateMsc() const
```

Return Value

The time of position changing in milliseconds since 01.01.1970.

Note

Position should be preliminarily selected for access using Select (by symbol) or SelectByIndex (by index) method.
**PositionType**

Gets the position type.

```c
ENUM_POSITION_TYPE PositionType() const
```

**Return Value**

Position type from `ENUM_POSITION_TYPE` enumeration.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
TypeDescription

Gets the position type as a string.

```cpp
string TypeDescription() const
```

**Return Value**

Position type as a string.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
Magic

Gets the ID of Expert Advisor that opened the position.

```c
long Magic() const
```

Return Value

ID of the Expert Advisor that opened the position.

Note

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**Identifier**

Gets the ID of position.

```cpp
long Identifier() const
```

**Return Value**

ID of position.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**Volume**

Gets the volume of position.

```cpp
double Volume() const
```

**Return Value**

Volume of position.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
PriceOpen

Gets the price of position opening.

```plaintext
double PriceOpen() const
```

Return Value

Position open price.

Note

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
StopLoss

Gets the Stop Loss price of the position.

```
double StopLoss() const
```

Return Value

The Stop Loss price of the position.

Note

The position should be selected using the Select (by ticket) or SelectByIndex (by index) methods.
TakeProfit

Gets the Take Profit price of the position.

```c++
   double TakeProfit() const
```

Return Value

The Take Profit price of the position.

Note

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**PriceCurrent**

Gets the current price by position symbol.

```cpp
double PriceCurrent() const
```

**Return Value**

Current price by position symbol.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**Commission**

Gets the amount of commission of the position.

```cpp
double Commission() const
```

**Return Value**

Amount of commission of the position (in deposit currency).

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
Swap

Gets the amount of swap of the position.

```cpp
double Swap() const
```

Return Value

Amount of swap of the position (in deposit currency).

Note

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**Profit**

Gets the amount of current profit of the position.

```c
double Profit() const
```

**Return Value**

Amount of current profit of the position (in deposit currency).

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
Symbol

Gets the name of position symbol.

```cpp
string Symbol() const
```

Return Value

Name of position symbol.

Note

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
Comment

Gets the comment of the position.

```cpp
string Comment() const
```

Return Value

Comment of the position.

Note

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**InfoInteger**

Gets the value of specified integer type property.

```cpp
bool InfoInteger(
    ENUM_POSITION_PROPERTY_INTEGER prop_id,  // property ID
    long& var // reference to variable
) const
```

**Parameters**

- `prop_id`  
  [in] ID of integer type property from `ENUM_POSITION_PROPERTY_INTEGER` enumeration.

- `var`  
  [out] Reference to `long` type variable to place result.

**Return Value**

- true - success, false - unable to get property value.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
**InfoDouble**

Gets the value of specified double type property.

```c
bool InfoDouble(
    ENUMPOSITIONPROPERTYDOUBLE prop_id, // property ID
    double& var // reference to variable
) const
```

**Parameters**

*prop_id*

[in] ID of double type property from `ENUM_POSITION_PROPERTY_DOUBLE` enumeration.

*var*

[in] Reference to `double` type variable to place result.

**Return Value**

true - success, false - unable to get property value.

**Note**

The position should be selected using the `Select` (by ticket) or `SelectByIndex` (by index) methods.
InfoString

Gets the value of specified string type property.

```c
bool InfoString(  
    ENUM_POSITIONPROPERTY_STRING prop_id,  // property ID  
    string& var  // reference to variable
) const
```

Parameters

- **prop_id**
  - [in] ID of text property from **ENUM_POSITIONPROPERTY_STRING** enumeration.

- **var**
  - [out] Reference to **string** type variable to place result.

Return Value

- true - success, false - unable to get property value.

Note

The position should be selected using the **Select** (by ticket) or **SelectByIndex** (by index) methods.
Select

Select the position for further work.

```cpp
bool Select(
    const string symbol // symbol
)
```

Parameters

symbol

SelectByIndex

Selects the position by index for further access to its properties.

```cpp
bool SelectByIndex(
    int index  // position index
);
```

Return Value

ture - success, false - unable to select position.
SelectByMagic

Select a position based on the name of a financial instrument and magic number to further work with.

```c++
bool SelectByMagic(
    const string symbol, // symbol name
    const ulong magic   // magic number
);
```

Parameters

symbol
  [in] Symbol name.

magic
  [in] Magic number of the position.

Return Value

true - successful, false - unable to select position.
SelectByTicket

Selects position by ticket for further operation.

```cpp
bool SelectByTicket(
    ulong ticket  // position ticket
);
```

Parameters

ticket

[in] Position ticket.

Return value

true - success, false - no position selected.
StoreState

Saves the position parameters.

```c
void StoreState()
```

Return Value

None.
CheckState

Checks the current parameters against the saved parameters.

```cpp
bool CheckState()
```

Return Value

true - the position parameters have changed since the last call of the `StoreState()` method, otherwise - false.
CDealInfo

CDealInfo is a class for easy access to the deal properties.

Description

CDealInfo class provides access to the deal properties.

Declaration

```cpp
class CDealInfo : public CObject
```

Title

```cpp
#include <Trade\DealInfo.mqh>
```

Inheritance hierarchy

- CObject
  - CDealInfo

### Methods inherited from class CObject

- Prev, Prev, Next, Next, Save, Load, Type, Compare
**Order**

Gets the order by which the deal is executed.

```cpp
long Order() const
```

**Return Value**

Order by which the deal is executed.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
Time

Gets the time of deal execution.

```cpp
datetime Time() const
```

Return Value

Time of deal execution.

Note

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**TimeMsc**

Receives the time of a deal execution in milliseconds since 01.01.1970.

```c
ulong TimeMsc() const
```

**Return Value**

The time of a deal execution in milliseconds since 01.01.1970.

**Note**

Deal should be preliminarily selected for access using `Ticket` (by ticket) or `SelectByIndex` (by index) method.
**DealType**

Gets the deal type.

```
ENUM_DEAL_TYPE DealType() const
```

**Return Value**

Deal type from `ENUM_DEAL_TYPE` enumeration.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**TypeDescription**

Gets the deal type as a string.

```
string TypeDescription() const
```

Return Value

Deal type as a string.

Note

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**Entry**

Compares the deal direction.

| ENUM_DEAL_ENTRY | Entry() const |

**Return Value**

Deal direction (value of `ENUM_DEAL_ENTRY` enumeration).

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**EntryDescription**

Gets the deal direction as a string.

```cpp
string EntryDescription() const
```

**Return Value**

Deal direction as a string.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**Magic**

Gets the ID of the Expert Advisor, that executed the deal.

```cpp
long Magic() const
```

**Return Value**

ID of the Expert Advisor, that executed the deal.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**PositionId**

Gets the ID of position, in which the deal was involved.

```c
long PositionId() const
```

**Return Value**

ID of position, in which the deal was involved.

**Note**

The deal should be selected using the *Ticket* (by ticket) or *SelectByIndex* (by index) methods.
Volume

Gets the volume of deal.

```cpp
double Volume() const
```

**Return Value**

Volume of deal.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
Price

Gets the deal price.

```cpp
double Price() const
```

Return Value

Deal price.

Note

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
Commission

Gets the amount of commission of the deal.

```cpp
double Commission() const
```

Return Value

Amount of commission of the deal.

Note

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**Swap**

Gets the amount of swap when position is closed.

```cpp
double Swap() const
```

**Return Value**

Amount of swap when position is closed.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**Profit**

Gets the financial result of the deal.

```cpp
double Profit() const
```

**Return Value**

Financial result of the deal (in deposit currency).

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
Symbol

Gets the name of the deal symbol.

string Symbol() const

Return Value

Name of the deal symbol.

Note

The deal should be selected using the Ticket (by ticket) or SelectByIndex (by index) methods.
Comment

Gets the deal comment.

```
string Comment() const
```

Return Value

Deal comment.

Note

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
InfoInteger

Gets the value of specified integer type property.

```cpp
bool InfoInteger( 
    ENUM DEAL PROPERTY INTEGER prop_id, // property ID
    long& var // reference to variable
) const
```

Parameters

- **prop_id**
  - [in] ID of integer type property from `ENUM DEAL PROPERTY INTEGER` enumeration.

- **var**
  - [out] Reference to `long` type variable to place result.

Return Value

- `true` - success, `false` - unable to get property value.

Note

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**InfoDouble**

Gets the value of specified double type property.

```cpp
bool InfoDouble{
    ENUMDealPropertyDouble prop_id, // property ID
    double& var // reference to variable
} const
```

**Parameters**

- `prop_id`
  - [in] ID of double type property from `ENUMDealPropertyDouble` enumeration.

- `var`
  - [out] Reference to `double` type variable to place result.

**Return Value**

- `true` - success, `false` - unable to get property value.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
**InfoString**

Gets the value of specified string type property.

```cpp
bool InfoString(
    ENUM DEAL PROPERTY STRING prop_id, // property ID
    string& var // reference to variable
) const
```

**Parameters**

- **prop_id**
  - [in] ID of text property from `ENUM DEAL PROPERTY STRING` enumeration.

- **var**
  - [out] Reference to `string` type variable to place result.

**Return Value**

- `true` - success, `false` - unable to get property value.

**Note**

The deal should be selected using the `Ticket` (by ticket) or `SelectByIndex` (by index) methods.
Ticket (Get method)

Gets the deal ticket.

```c
ulong Ticket() const
```

Return Value

Deal ticket.

Ticket (Set method)

Select the position for further work.

```c
void Ticket(
    ulong ticket // ticket
)
```

Parameters

ticket

[in] Deal ticket.
SelectByIndex

Selects the deal by index for further access to its properties.

```cpp
bool SelectByIndex(int index) // order index
```

Return Value

true - success, false - unable to select the deal.
**CTrade**

CTrade is a class for easy access to the trade functions.

**Description**

CTrade class provides easy access to the trade functions.

**Declaration**

```
class CTrade : public CObject
```

**Title**

```
#include <Trade\Trade.mqh>
```

**Inheritance hierarchy**

**CObject**

CTrade

**Direct descendants**

CExpertTrade

**Class methods by groups**

<tr>
<td><code>PrintRequest</code></td>
<td>Prints the last request parameters into journal</td>
</tr>
<tr>
<td><code>PrintResult</code></td>
<td>Prints the results of the last request into journal</td>
</tr>
<tr>
<td><code>FormatRequest</code></td>
<td>Prepares the formatted string with last request parameters</td>
</tr>
<tr>
<td><code>FormatRequestResult</code></td>
<td>Prepares the formatted string with results of the last request execution</td>
</tr>
</tbody>
</table>

Methods inherited from class `CObject`
 LogLevel

Sets logging level for messages.

```c
void LogLevel(
    ENUM_LOG_LEVELS  log_level  // level
)
```

**Parameters**

`log_level`

[in] New logging level.

**Return Value**

None.

**Note**

LOG_LEVEL_NO and less disables displaying any messages (set up automatically in the optimization mode). LOG_LEVEL_ERRORS enables displaying only error messages (value by default). LOG_LEVEL_ALL and greater enables displaying any messages (set up automatically in the test mode).

**ENUM_LOG_LEVELS**

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOG_LEVEL_NO</td>
<td>Displaying messages disabled</td>
<td>0</td>
</tr>
<tr>
<td>LOG_LEVEL_ERRORS</td>
<td>Only error messages are displayed</td>
<td>1</td>
</tr>
<tr>
<td>LOG_LEVEL_ALL</td>
<td>All messages are displayed</td>
<td>2</td>
</tr>
</tbody>
</table>
SetExpertMagicNumber

Sets the expert ID.

```c
void SetExpertMagicNumber(
    ulong magic  // ID
);
```

Parameters

`magic`

Return Value

None.
SetDeviationInPoints

Sets the allowed deviation.

```cpp
void SetDeviationInPoints(
    ulong deviation  // deviation
)
```

Parameters

- `deviation`
  - `[in]` Allowed deviation in points.

Return Value

None.
**SetTypeFilling**

Sets filling type of the order.

```c
void SetTypeFilling(
    ENUM_ORDER_TYPE_FILLING filling     // order filling type
)
```

**Parameters**

`filling`  
[in] Order filling type from `ENUM_ORDER_TYPE_FILLING` enumeration.

**Return Value**

None.
**SetTypeFillingBySymbol**

Sets filling type of the order according to the specified symbol settings.

```cpp
bool SetTypeFillingBySymbol(
    const string symbol // symbol name
)
```

**Parameters**

*symbol*

[in] Name of the symbol, in which `SYMBOL_FILLING_MODE` contains allowed order filling policies.

**Return Value**

- true - successful execution, false - failed to define the filling policy.

**Note**

If `SYMBOL_FILLING_FOK` and `SYMBOL_FILLING_IOC` filling policies are allowed for a symbol simultaneously, the `ORDER_FILLING_FOK` value is set for the order.
SetAsyncMode

Sets asynchronous mode for trade operations.

```c
void SetAsyncMode(
    bool mode  // asynchronous mode flag
)
```

Parameters

- `mode`:

Return Value

- None.

Note

- This mode is used for asynchronous (without waiting for the trade server's response to a sent request) trade operations (see `OrderSendAsync`).
SetMarginMode

Sets margin calculation mode in accordance with the current account settings.

```cpp
void SetMarginMode()
```

Return Value

- No.

Note

The margin calculation mode is specified in `ENUM_ACCOUNT_MARGIN_MODE`.
OrderOpen

Places the pending order with set parameters.

```cpp
bool OrderOpen(
    const string symbol,  // symbol
    ENUM_ORDER_TYPE order_type,  // order type
    double volume,  // order volume
    double limit_price,  // StopLimit price
    double price,  // execution price
    double sl,  // Stop Loss price
    double tp,  // Take Profit price
    ENUM_ORDER_TYPE_TIME type_time,  // type by expiration
    datetime expiration,  // expiration
    const string comment="")  // comment
```

Parameters

- **symbol**
  - [in] Name of trade instrument.

- **order_type**
  - [in] Type of order trade operation from **ENUM_ORDER_TYPE** enumeration.

- **volume**
  - [in] Requested order volume.

- **limit_price**
  - [in] Price at which the StopLimit order will be placed.

- **price**
  - [in] Price at which the order must be executed.

- **sl**
  - [in] Price at which the Stop Loss will trigger.

- **tp**
  - [in] Price at which the Take Profit will trigger.

- **type_time**
  - [in] Order type by execution from **ENUM_ORDER_TYPE_TIME** enumeration.

- **expiration**
  - [in] Expiration date of pending order.

- **comment=\"\"**
  - [in] Order comment.

Return Value

true - successful check of the basic structures, otherwise - false.
Note

Successful completion of the OrderSend(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of a trade request (trade server return code) using `ResultRetcode()` and value returned by `ResultOrder()`.
OrderModify

Modifies the pending order parameters.

```csharp
bool OrderModify(
  ulong ticket, // order ticket
  double price, // execution price
  double sl, // Stop Loss price
  double tp, // Take Profit price
  ENUM_ORDER_TYPE_TIME type_time, // type by expiration
  datetime expiration, // expiration
  double stoplimit // Limit order price
)
```

Parameters

ticket

price
  [in] The new price by which the order must be executed (or the previous value, if the change is not necessary).

sl
  [in] The new price by which the Stop Loss will trigger (or the previous value, if the change is not necessary).

tp
  [in] The new price by which the Take Profit will trigger (or the previous value, if the change is not necessary).

type_time
  [in] The new type of order by expiration from ENUM_ORDER_TYPE_TIME enumeration (or the previous value, if the change is not necessary).

expiration
  [in] The new expiration date of pending order (or the previous value, if the change is not necessary).

stoplimit
  [in] New price used for setting a Limit order when the price reaches price value. It is specified only for StopLimit orders.

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the OrderModify(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode().
**OrderDelete**

Deletes the pending order.

```cpp
bool OrderDelete(ulong ticket)  // order ticket
```

**Parameters**

- **ticket**
  - [in] Order ticket.

**Return Value**

- true - successful check of the basic structures, otherwise - false.

**Note**

Successful completion of the OrderDelete(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using `ResultRetcode()`.
**PositionOpen**

Opens a position with the specified parameters.

```cpp
bool PositionOpen(
    const string symbol,       // symbol
    ENUM_ORDER_TYPE order_type, // order type to open position
    double volume,             // position volume
    double price,              // execution price
    double sl,                 // Stop Loss price
    double tp,                 // Take Profit price
    const string comment=""    // comment
)
```

**Parameters**

- `symbol`
  - [in] Name of trade instrument, by which it is intended to open position.

- `order_type`
  - [in] Order type (trade operation) to open position from `ENUM_ORDER_TYPE` enumeration.

- `volume`
  - [in] Requested position volume.

- `price`
  - [in] Price at which the position must be opened.

- `sl`
  - [in] Price at which the Stop Loss will trigger.

- `tp`
  - [in] Price at which the Take Profit will trigger.

- `comment=""`
  - [in] Position comment.

**Return Value**

- `true` - successful check of the basic structures, otherwise - `false`.

**Note**

Successful completion of the `PositionOpen(...)` method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using `ResultRetcode()` and value returned by `ResultDeal()`.
PositionModify

Modifies the position parameters by specified symbol.

```cpp
bool PositionModify(
    const string symbol,  // symbol
    double sl,            // Stop Loss price
    double tp             // Take Profit price
)
```

Modifies position parameters by the specified ticket.

```cpp
bool PositionModify(
    const ulong ticket,  // position ticket
    double sl,          // Stop Loss price
    double tp            // Take Profit price
)
```

Parameters

symbol
[in] Name of trade instrument, by which it is intended to modify position.

ticket
[in] Ticket of the position to be modified.

sl
[in] The new price by which the Stop Loss will trigger (or the previous value, if the change is not necessary).

tp
[in] The new price by which the Take Profit will trigger (or the previous value, if the change is not necessary).

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the PositionModify(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode().

For the "netting" interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol. In this case, PositionModify will modify the position with the lowest ticket.
PositionClose

Closes a position by the specified symbol.

```cpp
bool PositionClose(
    const string symbol, // symbol
    ulong deviation=ULONG_MAX // deviation
)
```

Closes a position with the specified ticket.

```cpp
bool PositionClose(
    const ulong ticket, // position ticket
    ulong deviation=ULONG_MAX // deviation
)
```

Parameters

- **symbol**
  - [in] Name of trade instrument, by which it is intended to close position.

- **ticket**

- **deviation=ULONG_MAX**
  - [in] Maximal deviation from the current price (in points).

Return Value

true - successful check of the basic structures, otherwise - false.

Note

Successful completion of the PositionClose(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode().

For the “netting” interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol. In this case, PositionClose will close a position with the lowest ticket.
PositionClosePartial

Partially closes a position on a specified symbol in case of a “hedging” accounting.

```cpp
bool PositionClosePartial(
    const string symbol,  // symbol
    const double volume,   // volume
    ulong deviation=ULONG_MAX // deviation
)
```

Partially closes a position having a specified ticket in case of a “hedging” accounting.

```cpp
bool PositionClosePartial(
    const ulong ticket,    // position ticket
    const double volume,   // volume
    ulong deviation=ULONG_MAX // deviation
)
```

**Parameters**

*symbol*

[in] Name of a trading instrument, on which a position is closed partially. If a symbol (not a ticket) is specified for a position partial closing, the first detected position having a specified MagicNumber (Expert Advisor ID) on the symbol is selected. Therefore, it is sometimes better to use PositionClosePartial() with a specified position ticket.

*volume*

[in] Volume, by which a position should be decreased. If the value exceeds the volume of a partially closed position, it is closed in full. No position in the opposite direction is opened.

*ticket*

[in] Closed position ticket.

*deviation=ULONG_MAX*

[in] The maximum deviation from the current price (in points).

**Return Value**

true if the basic check of structures is successful, otherwise false.

**Note**

A successful completion of the PositionClosePartial(...) method does not always mean a successful execution of a trading operation. You should call the `ResultRetcode()` method to check the result of a trade request (trade server return code).

In the “netting” system (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), for each symbol, at any given moment of time, only one position can be open, which is the result of one or more deals. Do not confuse the current pending orders with positions that are also displayed on the “Trade” tab of the client terminal’s “Toolbox” panel.
In case of the position representation (ACCOUNT_MARGIN_MODE RETAIL HEDGING), multiple positions can be opened on each symbol simultaneously. In this case, PositionClose closes a position having a least ticket.
PositionCloseBy

Closes a position with the specified ticket by an opposite position.

```csharp
bool PositionCloseBy{
    const ulong ticket,  // position ticket
    const ulong ticket_by // opposite position ticket
}
```

Parameters

ticket

ticket_by
    [in] Ticket of the opposite position used for closing.

Returned value

true - the basic check of structures is successful, otherwise - false.

Note

A successful completion of the PositionCloseBy(...) method does not always mean a successful execution of a trading operation. You should call the `ResultRetcode()` method to check the result of a trade request (trade server return code).
Buy

Opens a long position with specified parameters.

```cpp
bool Buy(
    double volume,  // position volume
    const string symbol=NULL,  // symbol
    double price=0.0,  // execution price
    double sl=0.0,     // stop loss price
    double tp=0.0,     // take profit price
    const string comment=""  // comment
)
```

Parameters

- **volume**
  - [in] Requested position volume.

- **symbol=NULL**
  - [in] Position symbol. If it is not specified, the current symbol will be used.

- **price=0.0**
  - [in] Price. If the price is not specified, the current market Ask price will be used.

- **sl=0.0**
  - [in] Stop Loss price.

- **tp=0.0**
  - [in] Take Profit price.

- **comment=""**
  - [in] Comment.

Return Value

- true - successful check of the structures, otherwise - false.

Note

Successful completion of the `Buy(...)` method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using `ResultRetcode()` and value returned by `ResultDeal()`.
Sell

Opens a short position with specified parameters.

```cpp
bool Sell(
    double volume,  // position volume
    const string symbol=NULL,  // symbol
    double price=0.0,  // execution price
    double sl=0.0,  // stop loss price
    double tp=0.0,  // take profit price
    const string comment=""  // comment
)
```

Parameters

- `volume`  
  - [in] Requested position volume.

- `symbol=NULL`  
  - [in] Position symbol. If the symbol is not specified, the current symbol will be used.

- `price=0.0`  
  - [in] Price. If the price is not specified, the current market Bid price will be used.

- `sl=0.0`  
  - [in] Stop Loss price.

- `tp=0.0`  
  - [in] Take Profit price.

- `comment=""`  
  - [in] Comment.

Return Value

- True - successful check of the structures, otherwise - false.

Note

Successful completion of the Sell(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using ResultRetcode() and value returned by ResultDeal().
BuyLimit

Places the pending order of Buy Limit type (buy at the price lower than current market price) with specified parameters.

```cpp
bool BuyLimit(
    double volume, // order volume
    double price,  // order price
    const string symbol=NULL, // symbol
    double sl=0.0,  // stop loss price
    double tp=0.0,  // take profit price
    ENUM_ORDER_TYPE_TIME type_time=ORDER_TIME_GTC, // order lifetime
    datetime expiration=0, // order expiration time
    const string comment="" // comment
)
```

Parameters

- `symbol=NULL` [in] Order symbol. If the symbol is not specified, the current symbol will be used.
- `sl=0.0` [in] Stop Loss price.
- `tp=0.0` [in] Take Profit price.
- `type time=ORDER_TIME_GTC` [in] Order lifetime from `ENUM_ORDER_TYPE_TIME` enumeration.
- `expiration=0` [in] Order expiration time (used only if `type_time=ORDER_TIME_SPECIFIED`).
- `comment=""` [in] Order comment.

Return Value

- `true` - successful check of the structures, otherwise - `false`.

Note

Successful completion of the `BuyLimit()` method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server `return code`) using `ResultRetcode()` and value returned by `ResultOrder()`. 
BuyStop

Places the pending order of Buy Stop type (buy at the price higher than current market price) with specified parameters.

```c
bool BuyStop(
    double volume, // order volume
    double price, // order price
    const string symbol=NULL, // symbol
    double sl=0.0, // stop loss price
    double tp=0.0, // take profit price
    ENUM_ORDER_TYPE_TIME type_time=ORDER_TIME_GTC, // order lifetime
    datetime expiration=0, // order expiration time
    const string comment="" // comment
)
```

### Parameters

- `symbol=NULL` [in] Order symbol. If the symbol isn't specified, the current symbol will be used.
- `sl=0.0` [in] Stop Loss price.
- `tp=0.0` [in] Take Profit price.
- `type_time=ORDER_TIME_GTC` [in] Order lifetime from `ENUM_ORDER_TYPE_TIME` enumeration.
- `expiration=0` [in] Order expiration time (used only if type_time=ORDER_TIME_SPECIFIED).
- `comment=""` [in] Order comment.

### Return Value

- `true` - successful check of the structures, otherwise - false.

### Note

Successful completion of the BuyStop(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server return code) using `ResultRetcode()` and value returned by `ResultOrder()`.
SellLimit

Places the pending order of Sell Limit type (sell at the price higher than current market price) with specified parameters.

```c
bool SellLimit(
    double volume,         // order volume
    double price,          // order price
    const string symbol=NULL,    // symbol
    double sl=0.0,         // stop loss price
    double tp=0.0,         // take profit price
    ENUM_ORDER_TYPE_TIME type_time=ORDER_TIME_GTC, // order lifetime
    datetime expiration=0,  // order expiration time
    const string comment="" // comment
)
```

Parameters

- `symbol=NULL` [in] Order symbol. If the symbol is not specified, the current symbol will be used.
- `sl=0.0` [in] Stop Loss price.
- `tp=0.0` [in] Take Profit price.
- `type_time=ORDER_TIME_GTC` [in] Order lifetime from `ENUM_ORDER_TYPE_TIME` enumeration.
- `expiration=0` [in] Order expiration time (used only if `type_time=ORDER_TIME_SPECIFIED`).
- `comment=""` [in] Order comment.

Return Value

- true - successful check of the structures, otherwise - false.

Note

Successful completion of the `SellLimit(...)` method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server `return code`) using `ResultRetcode()` and value returned by `ResultOrder()`.
SellStop

Places the pending order of Sell Stop type (sell at the price lower than current market price) with specified parameters.

```c
bool SellStop(  
    double volume,       // order volume  
    double price,        // order price  
    const string symbol=NULL, // symbol  
    double sl=0.0,        // stop loss price  
    double tp=0.0,        // take profit price  
    ENUM_ORDER_TYPE_TIME type_time=ORDER_TIME_GTC, // order lifetime  
    datetime expiration=0, // order expiration time  
    const string comment="" // comment  
)
```

**Parameters**

- `volume`  

- `price`  

- `symbol=NULL`  
  [in] Order symbol. If the symbol is not specified, the current symbol will be used.

- `sl=0.0`  
  [in] Stop Loss price.

- `tp=0.0`  
  [in] Take Profit price.

- `type_time=ORDER_TIME_GTC`  
  [in] Order lifetime from `ENUM_ORDER_TYPE_TIME` enumeration.

- `expiration=0`  
  [in] Order expiration time (used only if `type_time=ORDER_TIME_SPECIFIED`).

- `comment=""`  
  [in] Order comment.

**Return Value**

- `true` - successful check of the structures, otherwise - `false`.

**Note**

Successful completion of the SellStop(...) method does not always mean successful execution of the trade operation. It is necessary to check the result of trade request (trade server `return code`) using `ResultRetcode()`, and value returned by `ResultOrder()`. 
Request

Gets the copy of the last request structure.

```cpp
void Request(
    MqlTradeRequest& request // reference
) const
```

Parameters

- `request`
  - `[out]` Reference to the copied structure.

Return Value

None.
RequestAction

Gets the trade operation type.

```
ENUM_TRADE_REQUEST_ACTIONS RequestAction() const
```

Return Value

Trade operation type used in the last request from `ENUM_TRADE_REQUEST_ACTIONS` enumeration.
**RequestActionDescription**

Gets the trade operation type as string.

```cpp
string RequestActionDescription() const
```

**Return Value**

Trade operation type (as string) used in the last request.
RequestMagic

Gets the magic number of the Expert Advisor.

```
ulong RequestMagic() const
```

Return Value

The magic number (ID) of the Expert Advisor, used in the last request.
RequestOrder

Gets the order ticket.

    ulong RequestOrder() const

Return Value

Order ticket of the last request.
RequestSymbol

Gets the name of the symbol.

```cpp
string RequestSymbol() const
```

Return Value

The name of the symbol used in the last request.
**RequestVolume**

Gets the trade volume (in lots).

```cpp
double RequestVolume() const
```

**Return Value**

The requested trade volume (in lots) used in the last request.
RequestPrice

Gets the order execution price.

```c
double RequestPrice() const
```

Return Value

Order execution price used in the last request.
RequestStopLimit

Gets the price of pending order of Stop Limit type.

```cpp
double RequestStopLimit() const
```

Return Value

The price of pending order of Stop Limit type used in the last request.
**RequestSL**

Gets the Stop Loss price of an order.

```cpp
double RequestSL() const
```

**Return Value**

The Stop Loss price used in the last request.
RequestTP

Gets the Take Profit price of the order.

```cpp
double RequestTP() const
```

Return Value

The Take Profit price used in the last request.
RequestDeviation

Gets the maximum price deviation from a requested price.

```c
ulong RequestDeviation() const
```

Return Value

The maximum allowable price deviation from a requested price used in the last request.
**RequestType**

Gets the type of the order.

```cpp
enum RequestType
```

**Return Value**

Order type used in the last request from `ENUM_ORDER_TYPE` enumeration.
**RequestTypeDescription**

Gets the type of the order (as string).

```cpp
string RequestTypeDescription() const
```

**Return Value**

The order type (as string) used in the last request.
**RequestTypeFilling**

Gets the filling type of the order.

```cpp
ENUM_ORDER_TYPE_FILLING RequestTypeFilling() const
```

**Return Value**

The filling type of the order from `ENUM_ORDER_TYPE_FILLING` used in the last request.

**RequestTypeFillingDescription**

Gets the filling type of the order (as string).

```cpp
string RequestTypeFillingDescription() const
```

**Return Value**

The filling type (as string) of the order used in the last request.
**RequestTypeTime**

Gets the validity period of the order.

```
ENUM_ORDER_TYPE_TIME RequestTypeTime() const
```

**Return Value**

The validity period of the order from `ENUM_ORDER_TYPE_TIME` enumeration used in the last request.
**RequestTypeTimeDescription**

Gets the validity period of the order (as string).

```cpp
string RequestTypeTimeDescription() const
```

**Return Value**

The validity period of the order (as string) used in the last request.
RequestExpiration

Gets the expiration time of a pending order.

```
datetime RequestExpiration() const
```

Return Value

The expiration time of a pending order used in the last request.
RequestComment

Gets the comment of the order.

```cpp
string RequestComment() const
```

Return Value

The comment of the order used in the last request.
**RequestPosition**

Gets position ticket.

```c
ulong RequestPosition() const
```

**Return value**

Position ticket used in the last request.
RequestPositionBy

Gets opposite position ticket.

```
ulong RequestPositionBy() const
```

Return value

Opposite position ticket used in the last request.
Result

Gets the copy of the structure of the last request result.

```c
void Result(
    MqlTradeResult& result // reference
) const
```

Parameters

`result`

[out] Reference to the structure of `MqlTradeResult` type for copying.

Return Value

None.
ResultRetcode

Gets the code of request execution result.

```cpp
uint ResultRetcode() const
```

Return Value

The **code** of request result.
ResultRetcodeDescription

Gets the code of request execution result as a string.

```cpp
string ResultRetcodeDescription() const
```

**Return Value**

- Code of the last request result as a string.
**ResultDeal**

Gets the deal ticket.

```c
ulong ResultDeal() const
```

**Return Value**

Deal ticket if the deal is executed.
ResultOrder

Gets the order ticket.

```c
ulong ResultOrder() const
```

Return Value

Order ticket if the order is placed.
ResultVolume

Gets the volume of deal or order.

```c
double ResultVolume() const
```

**Return Value**

Volume of deal or order confirmed by a broker.
ResultPrice

Gets the price confirmed by a broker.

```cpp
double ResultPrice() const
```

Return Value

Price confirmed by a broker.
**ResultBid**

Gets the current bid price (the requote).

```cpp
double ResultBid() const
```

**Return Value**

Current bid price (the requote).
ResultAsk

Gets the current ask price (the requote).

```cpp
double ResultAsk() const
```

Return Value

Current ask price (the requote).
**ResultComment**

Gets the broker comment.

```cpp
string ResultComment() const
```

**Return Value**

Broker comment to the operation.
CheckResult

Gets the copy of the structure of the last request check result.

```cpp
void CheckResult(
    MqlTradeCheckResult& check_result  // reference
) const
```

**Parameters**

- **check_result**
  
  [out] Reference to the target structure of the `MqlTradeCheckResult` type for copying.

**Return Value**

None.
CheckResultRetcode

Gets the value of the retcode field of `MqlTradeCheckResult` type, filled while checking the request correctness.

```c
uint CheckResultRetcode() const
```

**Return Value**

The value of the retcode field (error code) of `MqlTradeCheckResult` type filled while checking the request correctness.
**CheckResultRetcodeDescription**

Gets the string description of the retcode field of `MqlTradeCheckResult` type filled while checking the request correctness.

```cpp
string ResultRetcodeDescription() const
```

**Return Value**

The string description of the retcode field (Error code) of `MqlTradeCheckResult` type filled while checking the request correctness.
CheckResultBalance

Gets the value of the balance field of `MqlTradeCheckResult` type filled while checking the request correctness.

```cpp
double CheckResultBalance() const
```

Return Value

The value of the balance field (balance value that will be after the execution of the trade operation) of `MqlTradeCheckResult` type filled while checking the request correctness.
CheckResultEquity

Gets the value of the equity field of `MqlTradeCheckResult` type filled while checking the request correctness.

```cpp
double CheckResultEquity() const
```

**Return Value**

The value of the equity field (equity value that will be after the execution of the trade operation) of `MqlTradeCheckResult` type filled while checking the request correctness.
CheckResultProfit

Gets the value of a floating profit.

```cpp
    double CheckResultProfit() const
```

Return Value

The value of a floating profit after executing a trading operation.
CheckResultMargin

Gets the value of the margin field of `MqITradeCheckResult` type filled while checking the request correctness.

```cpp
double CheckResultMargin() const
```

Return Value

The value of the margin field (margin required for the trade operation) of `MqITradeCheckResult` type filled while checking the request correctness.
**CheckResultMarginFree**

Gets the value of the margin_free field of *MqlTradeCheckResult* type filled while checking the request correctness.

```cpp
double CheckResultMarginFree() const
```

**Return Value**

The value of the margin_free field (free margin that will be left after the execution of the trade operation) of *MqlTradeCheckResult* type filled while checking the request correctness.
CheckResultMarginLevel

Gets the value of the margin_level field of `MqlTradeCheckResult` type filled while checking the request correctness.

```cpp
double CheckResultMarginLevel() const
```

**Return Value**

The value of the margin_level field (margin level that will be set after the execution of the trade operation) of `MqlTradeCheckResult` type filled while checking the request correctness.
CheckResultComment

The value of the comment field of `MqlTradeCheckResult` type filled while checking the request correctness.

```
string CheckResultComment() const
```

**Return Value**

The value of the comment field (comment to the reply code, error description) of `MqlTradeCheckResult` type filled while checking the request correctness.
PrintRequest

Prints the last request parameters into journal.

```cpp
void PrintRequest() const
```

Return Value

None.
PrintResult

Prints the results of the last request into journal.

void PrintResult() const

Return Value

None.
FormatRequest

Prepares the formatted string with last request parameters.

```c
string FormatRequest(
    string& str,       // string
    const MqlTradeRequest& request  // request
} const
```

**Parameters**

*str*  

*request*  
[in] A structure of `MqlTradeRequest` type with parameters of the last request.

**Return Value**

None.
FormatRequestResult

Prepares the formatted string with results of the last request execution.

```cpp
string FormatRequestResult(
    string& str,   // string
    const MqlTradeRequest& request, // request
    const MqlTradeResult& result     // result
) const
```

Parameters

str

request

[in] A structure of MqlTradeRequest type with parameters of the last request.

result

[in] A structure of MqlTradeResult type with results of the last request.

Return Value

None.
CTerminallInfo

CTerminallInfo is a class for simplified access to the properties of mql5 program environment.

Description

CTerminallInfo class provides access to the properties of mql5 program environment.

Declaration

```cpp
class CTerminalInfo : public CObject
```

Title

```cpp
#include <Trade\TerminalInfo.mqh>
```

Inheritance hierarchy

- CObject
- CTerminalInfo

Class methods by groups

### Methods inherited from class CObject

- Prev, Prev, Next, Next, Save, Load, Type, Compare
Build

Gets the build number of the client terminal.

```c
int CBuild() const
```

Return Value

Build number of the client terminal.

Note

The terminal build number is defined by `TerminalInfInteger()` function (`TERMINAL_BUILD` property).
IsConnected

Gets the information about connection to trade server.

```cpp
bool IsConnected() const
```

Return Value

true - the terminal is connected to a trade server, otherwise - false.

Note

Connection status is defined by `TerminalInfoInteger()` function (`TERMINAL_CONNECTED` property).
IsDLLsAllowed

Gets the information about permission of DLL usage.

```cpp
bool IsDLLsAllowed() const
```

**Return Value**

- **true** - DLL usage is allowed, otherwise - **false**.

**Note**

Permission of DLL usage is defined by `TerminalInfoInteger()` function (`TERMINAL_DLLS_ALLOWED` property).
IsTradeAllowed

Gets the information about permission to trade.

```cpp
bool IsTradeAllowed() const
```

Return Value

- true - trade allowed, otherwise - false.

Note

Permission to trade is defined by `TerminalInfoInteger()` function (`TERMINAL_TRADE_ALLOWED` property).
IsEmailEnabled

Gets the information about permission to send e-mails to SMTP server and login specified in the terminal settings.

```cpp
bool IsEmailEnabled() const
```

Return Value

true - sending e-mails is allowed, otherwise - false.

Note

Permission to send e-mails is defined by `TerminalInfoInteger()` function (`TERMINAL_EMAIL_ENABLED` property).
IsFtpEnabled

Gets the information about permission to send trade reports to FTP server and login specified in the terminal settings.

```cpp
bool IsFtpEnabled() const
```

**Return Value**

true - sending trade reports to FTP server is allowed, otherwise - false.

**Note**

Permission to send trade reports is defined `TerminalInfoInteger()` function (TERMINAL_FTP_ENABLED property).
MaxBars

Gets the maximum number of bars on chart specified in the terminal settings.

```cpp
int MaxBars() const
```

Return Value

- Maximum number of bars on the chart.

Note

The maximum number of bars on chart is defined by `TerminalInfoInteger()` function (`TERMINAL_MAXBARS` property).
CodePage

Gets the information about code page of the language in the terminal.

```cpp
int CodePage() const
```

Return Value

Code page of the language in the client terminal.

Note

Code page of the language is defined by `TerminalInfoInteger()` function (`TERMINAL_CODEPAGE` property).
CPUCores

Gets the information about the number of CPU cores in the system.

```cpp
int CPUCores() const
```

Return Value

Number of CPU cores in the system.

Note

The number of CPU cores is defined by `TerminalInfoInteger()` function (`TERMINAL_CPU_CORES` property).
MemoryPhysical

Gets the information about the physical memory (in Mb).

```c
int MemoryPhysical() const
```

**Return Value**

Physical memory (in Mb).

**Note**

The physical memory is defined by `TerminalInfoInteger()` function (`TERMINAL_MEMORY_PHYSICAL` property).
MemoryTotal

Gets the information about the total memory available to the terminal/agent (in Mb).

```c
int MemoryTotal() const
```

Return Value

Total memory (in Mb) available to the terminal/agent.

Note

The total memory available to the terminal/agent is defined by `TerminalInfoInteger()` function (`TERMINAL_MEMORY_TOTAL` property).
MemoryAvailable

Gets the information about the free memory available to the client terminal/agent (in Mb).

```cpp
int MemoryTotal() const
```

Return Value

Free memory (in Mb) available to the terminal/agent.

Note

The free memory available to the client terminal/agent is defined by `TerminalInfoInteger()` function (`TERMINAL_MEMORY_TOTAL` property).
**MemoryUsed**

Gets the information about the memory used by the client terminal/agent (in Mb).

```cpp
int MemoryUsed() const
```

**Return Value**

The memory used by the client terminal/agent (in Mb).

**Note**

The memory used by the client terminal/agent is defined by `TerminalInfoInteger()` function (`TERMINAL_MEMORY_USED` property).
IsX64

Gets the information about the type of the client terminal.

```cpp
bool IsX64() const
```

Return Value

true - 64-bit version is used, otherwise - false.

Note

The type of the terminal is defined by `TerminalInfoInteger()` function (`TERMINAL_X64` property).
OpenCLSupport

Gets the information about the version of OpenCL supported by video card.

```c
int OpenCLSupport() const
```

Return Value

OpenCL version having the following form: $0x00010002 = \text{"1.2"}$. 0 means that OpenCL is not supported.

Note

OpenCL version is defined by `TerminalInfoInteger()` function (`TERMINAL_OPENCL_SUPPORT` property).
DiskSpace

Gets the information about free disk space available for MQL5\Files folder of the terminal/agent (in Mb).

```cpp
int MDiskSpace() const
```

Return Value

Free disk space.

Note

Free disk space is defined by `TerminalInfInteger()` function (`TERMINAL_DISK_SPACE` property).
**Language**

Gets the information about the language of the client terminal.

```cpp
string Language() const
```

**Return Value**

Language used in the client terminal.

**Note**

The terminal language is defined by `TerminalInfoString()` function (`TERMINAL_LANGUAGE` property).
Name

Gets the information on the name of the client terminal.

```cpp
string Name() const
```

**Return Value**

Name of the client terminal.

**Note**

The name of the terminal is defined by `TerminalInfoString()` function (TERMINAL_NAME property).
Company

Gets the information about the name of the company.

```cpp
string Company() const
```

Return Value

The name of the company.

Note

The company name is defined by `TerminalInfoString()` function (`TERMINAL_COMPANY` property).
Path

Gets the client terminal folder.

```cpp
string Path() const
```

Return Value

The client terminal folder.

Note

The client terminal folder is used by `TerminalInfo::String()` function (TERMINAL_PATH property).
**DataPath**

Gets the information about the terminal data folder.

```
string DataPath() const
```

**Return Value**

Data folder of the client terminal.

**Note**

Client terminal data folder is defined by `TerminalInfoString()` function (TERMINAL_DATA_PATH property).
CommonDataPath

Gets the common data folder of all client terminals installed on the computer.

```cpp
string CommonDataPath() const
```

**Return Value**

Common data folder of all installed terminals.

**Note**

The common data folder of all installed terminals is defined by `TerminalInfoString()` function (`COMMON_DATA_PATH` property).
### InfoInteger

Returns the value of a corresponding integer property of the mql5 program environment.

```c
int TerminalInfoInteger(
    int property_id  // identifier of a property
);
```

**Parameters**

- `property_id`  
  [in] Identifier of a property. It can be one of the values of the enumeration `ENUM_TERMINAL_INFO_INTEGER`.

**Return Value**

Value of int type.

**Note**

The property value is defined by `TerminalInfoInteger()` function.
InfoString

The function returns the value of a corresponding property of the mql5 program environment. The property must be of string type.

```
string TerminalInfoString(
    int property_id // property ID
);
```

Parameters

`property_id`

[in] Identifier of a property. It can be one the values of the enumeration `ENUM_TERMINAL_INFO_STRING`.

Return Value

Value of string type.

Note

The property value is defined by `TerminalInfoString()` function.
Classes for Creating and Testing Trading Strategies

This section contains technical details of working with classes for creation and testing of trading strategies and description of the relevant components of the MQL5 standard library.

The use of these classes will save time when creating (and especially testing) trading strategies.

MQL5 Standard Library (in terms of trading strategies) is placed in the terminal directory, in the `Include\Expert` folder.

CExpertBase

CExpertBase is a base class for the CExpert class and all auxiliary trading strategy classes.

Description

CExpertBase provides the data and methods, which are common to all objects of the Expert Advisor.

Declaration

```cpp
#include <Expert\ExpertBase.mqh>
```

Inheritance hierarchy

CObject
- CExpertBase

Direct descendants
- CExpert, CExpertMoney, CExpertSignal, CExpertTrailing

Class Methods by Groups

Public Methods:

<table>
<thead>
<tr>
<th>Initialization</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual Init</td>
<td>Initializes the object</td>

<tr>
<td>virtual ValidationSettings</td>
<td>Checks the settings</td>
</tr>
</tbody>
</table>

Parameters

| Symbol    | Sets the symbol                                  |
| Period    | Sets the timeframe                               |
| Magic     | Sets the Expert Advisor ID                       |

Indicators and Timeseries

| virtual SetPriceSeries | Sets pointers to external timeseries (price series) |
| virtual SetOtherSeries | Sets pointers to external timeseries (non-price series) |
| virtual InitIndicators | Initializes the indicators and timeseries        |

Access to Protected Data

| InitPhase | Gets the current phase of object initialization |

</tbody>
</table>

**Methods inherited from class CObject**

Prev, Prev, Next, Next, Save, Load, Type, Compare
InitPhase

Gets the current phase of the object initialization.

`ENUM_INIT_PHASE InitPhase()`

**Return Value**

Current phase of the object initialization.

**Note**

The object initialization consist of several phases:

1. Start initialization.
   - start - after finish of the constructor
   - finish - after successful completion of the `Init(...)` method.
   - allowed - call of the `Init(...)` method
   - not allowed - call of the `ValidationSettings()` method and other initialization methods

2. Parameters setting phase. In this phase you need to set all the object parameters, used for creation of indicators.
   - start - after successful completion of the `Init(...)` method
   - finish - after successful completion of the `ValidationSettings()` method
   - allowed - call of `Symbol(...)`, `Period(...)` and `InitIndicators(...)`, `SetPriceSeries(...)`, `SetOtherSeries(...)` methods
   - not allowed - call of `Symbol(...)`, `Period(...)`, `InitIndicators(...)`, `SetPriceSeries(...)`, `SetOtherSeries(...)` and `InitIndicators(...)` methods

3. Checking of parameters.
   - start - after successful completion of the `ValidationSettings()` method
   - finish - after successful completion of the `InitIndicators(...)` method
   - allowed - call of the `Symbol(...)`, `Period(...)` and `InitIndicators(...)` methods
   - not allowed - call of any other initialization methods

4. Finish of initialization.
   - start - after successful completion of the `InitIndicators(...)` method
   - not allowed - call of initialization methods
TrendType

Sets trend type.

```c
void TrendType(
    M_TYPE_TRENDS value      // value
)
```

Parameters

- `value` [in] New value of trend type.

Return Value

None.
**UsedSeries**

Gets the bitmask of timeseries used.

```c
int UsedSeries()
```

**Return Value**

The list of used timeseries as bitmask.

**Note**

If the bit is set, the corresponding timeseries is used, if it is not set, the timeseries is not used.

The bit-timeseries correspondence:

- bit 0 - Open timeseries,
- bit 1 - High timeseries,
- bit 2 - Low timeseries,
- bit 3 - Close timeseries,
- bit 4 - Spread timeseries,
- bit 5 - Time timeseries,
- bit 6 - TickVolume timeseries,
- bit 7 - RealVolume timeseries.
**EveryTick**

Sets the “Every tick” flag.

```c
void EveryTick(
    bool value // flag
)
```

**Parameters**

- `value`
  

**Return Value**

- None.

**Note**

If the flag is set, each price (tick) change at a working symbol is processed.

If the flag is not set, the processing method is called only at a new bar on the working timeframe and symbol.
Open

Gets the element of the Open timeseries by index.

```c
double Open(
    int ind // index
)
```

**Parameters**

*ind*

[in] Element index.

**Return Value**

If successful, it returns the numerical value of the Open timeseries element with specified index, otherwise it returns EMPTY_VALUE.

**Note**

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
High

Gets the element of the High timeseries by index.

```cpp
double High(
    int ind // index
)
```

Parameters

- `ind`
  - [in] Element index.

Return Value

If successful, it returns the numerical value of the High timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
Low

Gets the element of the Low timeseries by index.

```cpp
double Low(
    int ind  // index
)
```

**Parameters**

- `ind`  
  [in] Element index.

**Return Value**

If successful, it returns the numerical value of the Low timeseries element with specified index, otherwise it returns `EMPTY_VALUE`.

**Note**

The `EMPTY_VALUE` is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
Close

Gets the element of the Close timeseries by index.

```c
double Close ( int ind ) // index
```

**Parameters**

`ind`

[in] Element index.

**Return Value**

If successful, it returns the numerical value of the Close timeseries element with specified index, otherwise it returns EMPTY_VALUE.

**Note**

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
**Spread**

Gets the element of the Spread timeseries by index.

```c
double Spread(
    int ind // index
)
```

**Parameters**

`ind`

[in] Element index.

**Return Value**

If successful, it returns the numerical value of the Spread timeseries element with specified index, otherwise it returns EMPTY_VALUE.

**Note**

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
Time

Gets the element of the Time timeseries by index.

```cpp
datetime Time(
    int ind // index
)
```

**Parameters**

`ind`

> [in] Element index.

**Return Value**

If successful, it returns the numerical value of the Time timeseries element with specified index, otherwise it returns EMPTY_VALUE.

**Note**

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
TickVolume

Gets the element of the TickVolume timeseries by index.

```c
long TickVolume(
    int ind // index
)
```

Parameters

`ind`

[in] Element index.

Return Value

If successful, it returns the numerical value of the TickVolume timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
RealVolume

Gets the element of the RealVolume timeseries by index.

```c
long RealVolume(
    int    ind       // index
)
```

Parameters

`ind`

[in] Element index.

Return Value

If successful, it returns the numerical value of the RealVolume timeseries element with specified index, otherwise it returns EMPTY_VALUE.

Note

The EMPTY_VALUE is returned in two cases:

1. Timeseries is not used (the corresponding bit is not set).
2. Element index is out of range.
**Init**

Initializes the object.

```cpp
bool Init(
    CSymbolInfo symbol, // symbol
    ENUM_TIMEFRAMES period, // timeframe
    double point // point
)
```

**Parameters**

- **symbol**
  - [in] Pointer to the object of `CSymbolInfo` type for access to symbol information.

- **period**

- **point**
  - [in] The "weight" of 2/4-digit point.

**Return Value**

true - successful completion, otherwise - false.
Symbol

Sets the object symbol.

```cpp
bool Symbol(
    string name // symbol
)
```

**Parameters**

- `name`
  

**Return Value**

true - successful, otherwise - false.

**Note**

The setting of working symbol is necessary if the object uses the symbol different from symbol defined at the first initialization.
Period

Sets the object timeframe.

```cpp
bool Period(
    ENUM_TIMEFRAMES value  // timeframe
);
```

Parameters

value

Return Value

true - successful, otherwise - false.

Note

The setting of working timeframe is necessary if the object uses the timeframe different from timeframe defined at the initialization.
Magic

Sets the Expert Advisor ID.

```cpp
void Magic(
    ulong value  // magic
}
```

**Parameters**

- `value`
  - `[in]` Expert Advisor ID.

**Return Value**

None.
ValidationSettings

Checks the settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

true - successful, otherwise - false.
SetPriceSeries

Sets pointers to external price series.

```cpp
elemental bool SetPriceSeries(
    CiOpen* open,       // pointer
    CiHigh* high,       // pointer
    CiLow* low,         // pointer
    CiClose* close      // pointer
)
```

Parameters

- `open` [in] Pointer to Open timeseries.
- `high` [in] Pointer to High timeseries.
- `low` [in] Pointer to Low timeseries.
- `close` [in] Pointer to Close timeseries.

Return Value

- true - successful, otherwise - false.

Note

The setting of pointers to external timeseries (price series) is necessary if the object uses the symbol and timeframe (set during the first initialization) and price timeseries necessary for further work.
SetOtherSeries

Sets pointers to external non-price series.

```cpp
virtual bool SetOtherSeries(
    CiSpread* spread, // pointer
    CiTime* time, // pointer
    CiTickVolume* tick_volume, // pointer
    CiRealVolume* real_volume // pointer
)
```

Parameters

spread

[in] Pointer to Spread timeseries.

time

[in] Pointer to Time timeseries.

tick_volume

[in] Pointer to TickVolume timeseries.

real_volume

[in] Pointer to RealVolume timeseries.

Return Value

true - successful, otherwise - false.

Note

The setting of pointers to external timeseries (price series) is necessary if the object uses the symbol and timeframe (set during the first initialization) and price timeseries necessary for further work.
**InitIndicators**

Initializes all indicators and time series.

```cpp
virtual bool InitIndicators(
    CIndicators* indicators=NULL // pointer
)
```

**Parameters**

`indicators`

[in] Pointer to collection of indicators and timeseries.

**Return Value**

true - successful, otherwise - false.

**Note**

The timeseries are initialized only if the object uses the symbol or timeframe different from the symbol or timeframe defined at initialization.
InitOpen

Initializes the Open timeseries.

bool InitOpen(
    CIndicators* indicators  // pointer
)

Parameters

indicators
    [in] Pointer to collection of indicators and timeseries.

Return Value

true - successful, otherwise - false.

Note

The Open timeseries is initialized only if the object uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
### InitHigh

Initializes the High timeseries.

```cpp
bool InitHigh(
    CIndicators* indicators  // pointer
)
```

**Parameters**

- `indicators`
  - [in] Pointer to collection of indicators and timeseries.

**Return Value**

- `true` - successful, otherwise - `false`.

**Note**

The High timeseries is initialized only if the object uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
**InitLow**

Initializes the Low timeseries.

```cpp
bool InitLow(
    CIndicators* indicators // pointer
)
```

**Parameters**

*indicators*

    [in] Pointer to collection of indicators and timeseries.

**Return Value**

  true - successful, otherwise - false.

**Note**

The Low timeseries is initialized only if the object uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
InitClose

Initializes the Close timeseries.

```cpp
bool InitClose(
    CIndicators* indicators  // pointer
)
```

**Parameters**

`indicators`

[in] Pointer to collection of indicators and timeseries.

**Return Value**

true - successful, otherwise - false.

**Note**

The Close timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
### InitSpread

Initializes the Spread timeseries.

```cpp
bool InitSpread(
    CIndicators* indicators // pointer
)
```

**Parameters**

- `indicators`
  - `[in]` Pointer to collection of indicators and timeseries.

**Return Value**

- `true` - successful, otherwise - `false`.

**Note**

The Spread timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
**InitTime**

Initializes the Time timeseries.

```cpp
bool InitTime(
    CIndicators* indicators  // pointer
)
```

**Parameters**

`indicators`

[in] Pointer to collection of indicators and timeseries.

**Return Value**

true - successful, otherwise - false.

**Note**

The Time timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
InitTickVolume

Initializes the TickVolume timeseries.

```c
bool InitTickVolume(
    CIndicators* indicators  // pointer
)
```

**Parameters**

- `indicators`
  
  [in] Pointer to collection of indicators and timeseries.

**Return Value**

- true - successful, otherwise - false.

**Note**

The TickVolume timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
**InitRealVolume**

Initializes the RealVolume timeseries.

```cpp
bool InitRealVolume(
    CIndicators* indicators  // pointer
)
```

**Parameters**

`indicators`

[in] Pointer to collection of indicators and timeseries.

**Return Value**

true - successful, otherwise - false.

**Note**

The RealVolume timeseries is initialized only if Expert Advisor uses the symbol/timeframe different from the symbol/timeframe defined at the first initialization (and timeseries is used further).
PriceLevelUnit

Gets the price level unit.

```c
virtual double PriceLevelUnit()
```

Return Value

The value of price level unit.

Note

The method of a base class returns the "weight" of the 2/4 digits point.
**StartIndex**

Gets the index of starting bar to analyze.

```
virtual int StartIndex()
```

**Return Value**

The index of starting bar to analyze.

**Note**

The method returns 0 if the flag to analyze current bar is set to true (analysis from the current bar). If the flag is not set, it returns 1 (analysis from the last completed bar).
**CompareMagic**

Compares the Expert Advisor ID (magic) with the specified value.

```cpp
virtual bool CompareMagic(
    ulong magic   // identifier
)
```

**Parameters**

- `magic`
  - [in] Identifier value to compare.

**Return Value**

- `true` - identifier matches the specified one, otherwise - `false`.
CExpert

CExpert is a base class for trading strategies.

It already has some elementary trading “skills”. It has built-in algorithms for working with time series and indicators and a set of virtual methods for trading strategy.

How to use it:

1. Prepare an algorithm of the strategy;
2. Create your own class, inherited from CExpert class;
3. Override the virtual methods in your class with your own algorithms.

Description

The CExpert class is a set of virtual methods for implementation of trading strategies.

Note

A position is recognized as belonging to an Expert Advisor and managed by it based on the pair of properties m_symbol and m_magic. In the “hedging” mode, multiple positions can be opened for the same symbol, therefore the m_magic value is important.

Declaration

```cpp
class CExpert : public CExpertBase
```

Title

```cpp
#include <Expert\Expert.mqh>
```

Inheritance hierarchy

CObject
   CExpertBase
      CExpert

| Processing | Main processing algorithm |

**Market Entry Methods**

| CheckOpen | Checks position opening conditions |
| CheckOpenLong | Checks conditions to open long position |
| CheckOpenShort | Checks conditions to open short position |
| OpenLong | Opens a long position |
### Initialization
- **OpenShort**
  - Opens a short position

### Market Exit Methods
- **CheckClose**
  - Checks conditions to close current position
- **CheckCloseLong**
  - Checks conditions to close long position
- **CheckCloseShort**
  - Checks conditions to close short position
- **CloseAll**
  - Closes the opened position and deletes all orders
- **Close**
  - Closes the opened position
- **CloseLong**
  - Closes the long position
- **CloseShort**
  - Closes the short position

### Position Reverse Methods
- **CheckReverse**
  - Checks conditions to reverse opened position
- **CheckReverseLong**
  - Checks conditions to reverse long position
- **CheckReverseShort**
  - Checks conditions to reverse short position
- **ReverseLong**
  - Performs reverse operation of long position
- **ReverseShort**
  - Performs reverse operation of short position

### Position/Order Trailing Methods
- **CheckTrailingStop**
  - Checks conditions to modify position parameters
- **CheckTrailingStopLong**
  - Checks Trailing Stop conditions of long position
- **CheckTrailingStopShort**
  - Checks Trailing Stop conditions of short position
- **TrailingStopLong**
  - Performs Trailing Stop for long position
- **TrailingStopShort**
  - Performs Trailing Stop for short position
- **CheckTrailingOrderLong**
  - Checks Trailing Stop conditions of Buy Limit/Stop order
- **CheckTrailingOrderShort**
  - Checks Trailing Stop conditions of Sell Limit/Stop order
- **TrailingOrderLong**
  - Performs Trailing Stop for Buy Limit/Stop order
- **TrailingOrderShort**
  - Performs Trailing Stop for Sell Limit/Stop order

### Order Delete Methods
- **CheckDeleteOrderLong**
  - Checks conditions to delete Buy order

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries
Init

Class instance initialization method.

```cpp
bool Init(
    string symbol,  // symbol
    ENUM_TIMEFRAMES period,  // timeframe
    bool every_tick,  // flag
    ulong magic       // Expert Advisor identifier
)
```

**Parameters**

- `symbol`  

- `period`  
  [in] Timeframe from `ENUM_TIMEFRAMES` enumeration.

- `every_tick`  

- `magic`  

**Return Value**

None.

**Note**

If `every_tick` is set to true, the `Processing()` method is called at each tick of the working symbol. Otherwise, the `Processing()` is called only when a new bar is formed on the working timeframe of the EA's working symbol.
**Magic**

Sets the Expert Advisor ID (magic).

```cpp
void Magic(
    ulong value    // new value
)
```

**Parameters**

value

[in] New value of Expert Advisor ID.

**Return Value**

None.

**Note**

If EA’s identifier is changed, the same identifier is assigned to all auxiliary objects.

**Implementation**

```cpp
//+------------------------------------------------------------------+
//| Sets magic number for object and its dependent objects            |
//| INPUT:  value - new value of magic number.                        |
//| OUTPUT: no.                                                      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
void CExpert::Magic(ulong value)
{
    if(m_trade!=NULL) m_trade.SetExpertMagicNumber(value);
    if(m_signal!=NULL) m_signal.Magic(value);
    if(m_money!=NULL) m_money.Magic(value);
    if(m_trailing!=NULL) m_trailing.Magic(value);
    //---
    CExpertBase::Magic(value);
}
```
**InitSignal**

Initializes trading signal object.

```cpp
virtual bool InitSignal(
    CExpertSignal* signal=NULL, // pointer
)
```

**Parameters**

*signal*

[in] Pointer to `CExpertSignal` class object (or its descendant).

**Return Value**

true - successful, otherwise - false.

**Note**

If signal is NULL, the `CExpertSignal` class will be used for initialization (it does nothing).
InitTrailing

Initializes trailing stop object.

```
virtual bool InitTrailing(CExpertTrailing* trailing=NULL, // pointer
)
```

**Parameters**

*trailing*

[in] Pointer to `CExpertTrailing` class object (or its descendant).

**Return Value**

true - successful, otherwise - false.

**Note**

If trailing is NULL, the `ExpertTrailing` class will be used for initialization (it does nothing).
**InitMoney**

Initializes the money management object.

```cpp
virtual bool InitMoney(
    CExpertMoney* money=NULL,    // pointer
)
```

**Parameters**

`money`

[in] Pointer to `CExpertMoney` class object (or its descendant).

**Return Value**

true - successful, otherwise - false.

**Note**

If `money` is NULL, the `CExpertMoney` class will be used for initialization (it uses the minimum lot).
InitTrade

Initializes the trade object.

```cpp
virtual bool InitTrade(
    ulong magic, // identifier
    CExpertTrade* trade=NULL // pointer
)
```

Parameters

- `magic` 
  
  `[in]` Expert Advisor ID (will be used in trade requests).

- `trade` 
  
  `[in]` Pointer to trade object.

Return Value

- `true` - successful, otherwise `false`.
Deinit

Class instance deinitialization method.

```cpp
virtual void Deinit()
```

Return Value

None.
OnTickProcess

Sets the OnTick event handling flag.

```cpp
void OnTickProcess(
    bool value  // flag
)
```

Parameters

value

[in] OnTick event handling flag.

Return Value

None.

Note

If the flag is true, the OnTick event is handled. By default, the flag is set to true.
OnTradeProcess

Sets the OnTrade event handling flag.

```c
void OnTradeProcess(
    bool value  // flag
)
```

Parameters

- `value`  
  [in] OnTrade event handling flag.

Return Value

None.

Note

If the flag is true, the OnTrade event is handled. By default, the flag is set to false.
OnTimerProcess

Sets the OnTimer event handling flag.

```c
void OnTimerProcess(
    bool value    // flag
)
```

Parameters

value

[in] OnTimer event handling flag.

Return Value

None.

Note

If the flag is true, the OnTimer event is handled. By default, the flag is set to false.
OnChartEventProcess

Sets a flag to handle the OnChartEvent event.

```cpp
void OnChartEventProcess(
    bool value  // flag
)
```

Parameters

value

[in] Flag to handle the OnChartEvent event.

Return Value

None.

Note

If the flag is true, the OnChartEvent event is handled. By default, the flag is set to false.
OnBookEventProcess

Sets a flag to handle the OnBookEvent event.

```c
void OnChartEventProcess(
    bool value       // flag
)
```

**Parameters**

`value`

[in] Flag to handle the OnBookEvent event.

**Return Value**

None.

**Note**

If the flag is true, the OnBookEvent event is handled. By default, the flag is set to false.
MaxOrders (Get Method)

Gets the maximum amount of allowed orders.

```cpp
int MaxOrders()
```

Return Value

Maximum amount of allowed orders.

MaxOrders (Set Method)

Sets the maximum amount of allowed orders.

```cpp
void MaxOrders(
    int max_orders // amount of orders
)
```

Parameters

- `max_orders`

  `[in]` New value of maximum amount of allowed orders.

Return Value

None.

Note

By default, the maximum amount of allowed orders is equal to 1.
Signal

Gets the pointer to the trade signal object.

CExpertSignal* Signal() const

Return Value

Pointer to the trade signal object.
ValidationSettings

Checks the settings.

```
virtual bool ValidationSettings()
```

**Return Value**

- true - successful, otherwise - false.

**Note**

It also checks the settings of all the Expert Advisor objects.
**InitIndicators**

Initializes necessary indicators and timeseries.

```cpp
virtual bool InitIndicators(
    CIndicators* indicators=NULL // pointer
)
```

**Parameters**

`indicators`

- `[in]` Pointer to collection of indicators and timeseries.

**Return Value**

- `true` - successful completion, otherwise - `false`.

**Note**

The timeseries are initialized if the object uses a symbol or timeframe other than the one defined in the initialization.

Indicators and timeseries of all auxiliary EA objects are initialized.
OnTick

OnTick event handler.

```c
virtual void OnTick()
```

Return Value

None.
OnTrade

OnTrade event handler.

virtual void OnTrade()

Return Value

None.
OnTimer

OnTimer event handler.

```
virtual void OnTimer()
```

Return Value

None.
OnChartEvent

OnChartEvent event handler.

```cpp
virtual void OnChartEvent(
    const int id, // event id
    const long lparam, // long type event parameter
    const double dparam, // double type event parameter
    const string sparam // string type event parameter
)
```

Parameters

- **id**
  - [in] Event ID.

- **lparam**
  - [in] Event parameter of long type.

- **dparam**
  - [in] Event parameter of double type.

- **sparam**
  - [in] Event parameter of string type.

Return Value

- None.
OnBookEvent

OnBookEvent event handler.

```cpp
virtual void OnBookEvent(
    const string& symbol // symbol
)
```

Parameters
symbol

Return Value
None.
InitParameters

Initializes parameters of Expert Advisor.

```
virtual bool InitParameters()
```

**Return Value**

true - successful, otherwise - false.

**Note**

The InitParameters() function of `CExpert` base class does nothing and always returns true.
DeinitTrade

Deinitializes trade object.

```cpp
virtual void DeinitTrade()
```

Return Value

None.
DeinitSignal

Deinitializes trade signal object.

```cpp
virtual void DeinitSignal()
```

Return Value

None.
DeinitTrailing

Deinitializes trailing object.

```cpp
virtual void DeinitTrailing()
```

Return Value

None.
DeinitMoney

Deinitializes money management object.

```cpp
virtual void DeinitMoney()
```

Return Value

None.
DeinitIndicators

Deinitializes indicators and timeseries.

virtual void DeinitIndicators()

Return Value

None.

Note

Indicators and timeseries of all auxiliary EA objects are deinitialized.
Refresh

Updates all necessary data.

```cpp
virtual bool Refresh()
```

Return Value

true - further tick processing is needed, otherwise - false.

Note

It allows to determine the need of tick processing. If it is needed, it updates all quotes and timeseries and indicators data and returns true.

Implementation

```cpp
//+------------------------------------------------------------------+
//| Refreshing data for processing                                    |
//| INPUT: no.                                                      |
//| OUTPUT: true-if successful, false otherwise.                     |
//| REMARK: no.                                                     |
//+------------------------------------------------------------------+
bool CExpert::Refresh()
{
    MqlDateTime time;
    //--- refresh rates
    if(!m_symbol.RefreshRates()) return(false);
    //--- check need processing
    TimeToStruct(m_symbol.Time(),time);
    if(m_period_flags!=WRONG_VALUE && m_period_flags!=0)
        if((m_period_flags & TimeframesFlags(time))==0) return(false);
    m_last_tick_time=time;
    //--- refresh indicators
    m_indicators.Refresh();
    //--- ok
    return(true);
}
```
Processing

Main processing algorithm.

```cpp
virtual bool Processing()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It does the following steps:

1. Checks the presence of the opened position on the symbol. If there is no opened position, skip steps 2, 3, and 4.
2. Checks conditions to reverse opened position (`CheckReverse()` method). If position has been "reversed", exit.
3. Checks conditions to close position (`CheckClose()` method). If position has been closed, skip step 4.
4. Checks conditions to modify position parameters (`CheckTrailingStop()` method). If position parameters have been modified, exit.
5. Check the presence of pending orders on the symbol. If there is no any pending order, go to step 9.
6. Checks condition to delete order (`CheckDeleteOrderLong()` for buy pending orders or `CheckDeleteOrderShort()` for sell pending orders). If the order has been deleted, go to step 9.
7. Check conditions to modify pending order parameters (`CheckTrailingOrderLong()` for buy orders or `CheckTrailingOrderShort()` for sell orders). If the order parameters have been modified, exit.
8. Exit.
9. Checks conditions to open position (`CheckOpen()` method).

If you want to implement your own algorithm, you need to override the `Processing()` method of the descendant class.

Implementation
bool CExpert::Processing()
{
    //--- check if open positions
    if(m_position.Select(m_symbol.Name()))
    {
        //--- open position is available
        //--- check the possibility of reverse the position
        if(CheckReverse()) return(true);
        //--- check the possibility of closing the position/delete pending orders
        if(!CheckClose())
        {
            //--- check the possibility of modifying the position
            if(CheckTrailingStop()) return(true);
            //--- return without operations
            return(false);
        }
    }

    //--- check if placed pending orders
    int total=OrdersTotal();
    if(total!=0)
    {
        for(int i=total-1;i>=0;i--)
        {
            m_order.SelectByIndex(i);
            if(m_order.Symbol()!-m_symbol.Name()) continue;
            if(m_order.OrderType()==ORDER_TYPE_BUY_LIMIT || m_order.OrderType()==ORDER_TYPE_BUY_STOP)
            {
                //--- check the ability to delete a pending order to buy
                if(CheckDeleteOrderLong()) return(true);
                //--- check the possibility of modifying a pending order to buy
                if(CheckTrailingOrderLong()) return(true);
            }
            else
            {
                //--- check the ability to delete a pending order to sell
                if(CheckDeleteOrderShort()) return(true);
                //--- check the possibility of modifying a pending order to sell
                if(CheckTrailingOrderShort()) return(true);
            }
            //--- return without operations
            return(false);
        }
    }

    //--- check the possibility of opening a position/setting pending order
    if(CheckOpen()) return(true);
    //--- return without operations
    return(false);
}
**SelectPosition**

Selects a position to work with.

```cpp
void SelectPosition()
```

**Return Value**

No.

**Implementation**

```cpp
#include <iostream>

bool CExpert::SelectPosition(void)
{
    bool res=false;
    //---
    if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
        res=m_position.SelectByMagic(m_symbol.Name(),m_magic);
    else
        res=m_position.Select(m_symbol.Name());
    //---
    return(res);
}
```
CheckOpen

Checks conditions to open a position.

```cpp
virtual bool CheckOpen()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to open long (CheckOpenLong()) and short (CheckOpenShort()) positions.

Implementation

```cpp
bool CExpert::CheckOpen()
{
    if (CheckOpenLong()) return(true);
    if (CheckOpenShort()) return(true);
    //--- return without operations
    return(false);
}
```
# CheckOpenLong

Checks necessity and conditions to open long position.

```cpp
virtual bool CheckOpenLong()
```

## Return Value

- **true** - a trade operation has been executed, otherwise - **false**.

## Note

It checks the necessity to open a long position (CheckOpenLong() method of Signal object) and does that with the parameters set by Signal object (OpenLong() method) if the conditions are met.

## Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for long position open or limit/stop order set             |
//| INP                                                                  |
//| O                                                                  |
//| REMARK: no.                                                        |
//+------------------------------------------------------------------+
bool CExpert::CheckOpenLong()
{
    double price=EMPTY_VALUE;
    double sl=0.0;
    double tp=0.0;
    datetime expiration=TimeCurrent();
    //--- check signal for long enter operations
    if (m_signal.CheckOpenLong(price,sl,tp,expiration))
    {
        if (!m_trade.SetOrderExpiration(expiration))
        {
            m_expiration=expiration;
        }
        return (OpenLong(price,sl,tp));
    }
    //--- return without operations
    return (false);
}
```
CheckOpenShort

Checks necessity and conditions to open a short position.

virtual bool CheckOpenShort()

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to open a short position (CheckOpenShort() method of Signal object) and does that with the parameters set by Signal object (OpenShort() method) if the conditions are met.

Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for short position open or limit/stop order set            |
//| INPUT: no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                     |
//+------------------------------------------------------------------+

bool CExpert::CheckOpenShort()
{
    double price=EMPTY_VALUE;
    double sl=0.0;
    double tp=0.0;
    datetime expiration=TimeCurrent();
    //--- check signal for short enter operations
    if(m_signal.CheckOpenShort(price,sl,tp,expiration))
    {
        if(!m_trade.SetOrderExpiration(expiration))
        {
            m_expiration=expiration;
        }
        return(OpenShort(price,sl,tp));
    }
    //--- return without operations
    return(false);
}
```
OpenLong

Opens a long position.

```cpp
virtual bool OpenLong(
    double price,  // price
    double sl,     // Stop Loss
    double tp      // Take Profit
)
```

Parameters

- **price**

- **sl**
  - [in] Stop Loss price.

- **tp**
  - [in] Take Profit price.

Return Value

- true - trade operation has been executed, otherwise - false.

Note

It gets trading volume (LotOpenLong(...) method) and opens a long position (Buy() method of Trade object) if trading volume is not equal to 0.

Implementation

```cpp
//+------------------------------------------------------------------+
//| Long position open or limit/stop order set                       |
//| INPU                    |     | OUTPUT: true-if trade operation processed, false otherwise. |
//| T:  price - price,                                           |
//|         sl    - stop loss,                                       |
//|         tp    - take profit.                                     |
//| O        - true-if trade operation processed, false otherwise. |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::OpenLong(double price, double sl, double tp)
{
    if (price==EMPTY_VALUE) return(false);
    //--- get lot for open
    double lot=LotOpenLong(price,sl);
    //--- check lot for open
    if (lot==0.0) return(false);
    //---
    return (m_trade.Buy(lot,price,sl,tp));
}
```
OpenShort

Opens a short position.

```cpp
virtual bool OpenShort(
    double price, // price
    double sl,    // Stop Loss
    double tp     // Take Profit
)
```

**Parameters**

- `price`  

- `sl`  
  [in] Stop Loss price.

- `tp`  
  [in] Take Profit price.

**Return Value**

- `true` - trade operation has been executed, otherwise - `false`.

**Note**

It gets trading volume ([LotOpenShort()](#) method) and opens a short position (by calling Sell method of Trade object) if trading volume is not equal to 0.

**Implementation**

```cpp
//+------------------------------------------------------------------+
//| Short position open or limit/stop order set                      |
//| INPU  T:  price - price,                                           |
//|         sl    - stop loss,                                       |
//|         tp    - take profit.                                     |
//| OUTP UT: true-if trade operation successful, false otherwise.     |
//|   REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::OpenShort(double price, double sl, double tp)
{
    if(price==EMPTY_VALUE) return(false);
    //--- get lot for open
    double lot=LotOpenShort(price,sl);
    //--- check lot for open
    if(lot==0.0) return(false);
    //---
    return(m_trade.Sell(lot,price,sl,tp));
}
```
CheckReverse

Checks necessity and conditions to reverse an open position.

```cpp
virtual bool CheckReverse()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks the necessity to reverse long (CheckReverseLong()) and short (CheckReverseShort()) positions.

Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for position reverse                                       |
//| INPU:  no.                                                      |
//| OUPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckReverse()
{
    if(m_position.PositionType()==POSITION_TYPE_BUY)
    {
        //--- check the possibility of reverse the long position
        if(CheckReverseLong()) return(true);
    }
    else
    //--- check the possibility of reverse the short position
    if(CheckReverseShort()) return(true);
    //--- return without operations
    return(false);
}
```
CheckReverseLong

Checks necessity and conditions to reverse a long position.

```
virtual bool CheckReverseLong()
```

**Return Value**

true - a trade operation has been executed, otherwise - false.

**Note**

It checks the necessity to reverse a long position (CheckReverseLong() method of Signal object) and perform reverse operation of the current long position with the parameters set by Signal object (ReverseLong(...) method) if the conditions are met.

**Implementation**

```
//+------------------------------------------------------------------+
//| Check for long position reverse                                  |
//| INPUT:  no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckReverseLong()
{
    double price=EMPTY_VALUE;
    double sl=0.0;
    double tp=0.0;
    datetime expiration=TimeCurrent();
    //--- check signal for long reverse operations
    if(m_signal.CheckReverseLong(price,sl,tp,expiration)) return (ReverseLong(price,sl,tp));
    //--- return without operations
    return(false);
}
```
**CheckReverseShort**

Checks necessity and conditions to reverse a short position.

```cpp
virtual bool CheckReverseLong()
```

**Return Value**

true - a trade operation has been executed, otherwise - false.

**Note**

It checks the necessity to reverse a short position (CheckReverseShort() method of Signal object) and perform reverse operation of the current short position with the parameters set by Signal object (ReverseShort() method) if the conditions are met.

**Implementation**

```cpp
// Check for short position reverse
// INPUT: no.
// OUTPUT: true-if trade operation processed, false otherwise.
// REMARK: no.

bool CExpert::CheckReverseShort()
{
    double price=EMPTY_VALUE;
    double sl=0.0;
    double tp=0.0;
    datetime expiration=TimeCurrent();
    // check signal for short reverse operations
    if(m_signal.CheckReverseShort(price,sl,tp,expiration)) return ReverseShort(price,s.
    // return without operations
    return(false);
}
```
ReverseLong

Performs reverse operation of a long position.

```cpp
virtual bool ReverseLong(
    double price,  // price
    double sl,     // Stop Loss
    double tp      // Take Profit
)
```

Parameters

- `price`  

- `sl`  
  [in] Stop Loss price.

- `tp`  
  [in] Take Profit price.

Return Value

- `true` - trade operation has been executed, otherwise - `false`.

Note

- It gets the position reverse volume (`LotReverse()` method) and reverses a long position (`Sell()` method of Trade object) if trading volume is not equal to 0.

- In the "hedging" mode of position accounting, position reversal is performed as the closure of the existing position and opening of a new opposite one with the remaining volume.

Implementation
```cpp
bool CExpert::ReverseLong(double price, double sl, double tp)
{
    if (price == EMPTYVALUE)
        return false;
    //--- get lot for reverse
    double lot = LotReverse(sl);
    //--- check lot
    if (lot == 0.0)
        return false;
    //---
    bool result = true;
    if (m_margin_mode == ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
    {
        //--- first close existing position
        lot -= m_position.Volume();
        result = m_trade.PositionCloseByTicket(m_position.Identifier());
    }
    if (result)
        result = m_trade.Sell(lot, price, sl, tp);
    //---
    return result;
}
```
ReverseShort

Performs reverse operation of a short position.

```cpp
virtual bool ReverseShort(
    double price,  // price
    double sl,     // Stop Loss
    double tp      // Take Profit
)
```

Parameters

- **price**
  

- **sl**
  
  [in] Stop Loss price.

- **tp**
  
  [in] Take Profit price.

Return Value

- true - trade operation has been executed, otherwise - false.

Note

It gets position reverse volume (`LotReverse(...)` method) and perform trade operation of the short position reverse (Buy() method of Trade object) if trading volume is not equal to 0.

In the "hedging" mode of position accounting, position reversal is performed as the closure of the existing position and opening of a new opposite one with the remaining volume.

Implementation
bool CExpert::ReverseLong(double price, double sl, double tp)
{
    if (price==EMPTY_VALUE)
        return(false);
    double lot=LotReverse(sl);
    if (lot==0.0)
        return(false);
    bool result=true;
    if (m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
    {
        //--- first close existing position
        lot=m_position.Volume();
        result=m_trade.PositionCloseByTicket(m_position.Identifier());
    }
    if(result)
    {
        result=m_trade.Sell(lot,price,sl,tp);
    }
    return(result);
}
CheckClose

Checks conditions to close position.

```cpp
virtual bool CheckClose()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

1. It checks Expert Advisor Stop Out conditions (CheckClose() method of money management object). If condition is satisfied, it closes the position, deletes all orders (CloseAll()), and exits.

2. It checks conditions to close long or short position (CheckCloseLong() or CheckCloseShort() methods) and if position is closed, it deletes all orders (DeleteOrders() method).

Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for position close or limit/stop order delete             |
//| INPUT:  no.                                                     |
//| OUTPUT: true-if trade operation processed, false otherwise.    |
//| REMARK: no.                                                    |
//+------------------------------------------------------------------+
bool CExpert::CheckClose()
{
  double lot;
  //--- position must be selected before call
  if((lot=m_money.CheckClose(GetPointer(m_position)))!=0.0)
    return(CloseAll(lot));
  //--- check for position type
  if(m_position.PositionType()==POSITION_TYPE_BUY)
  {
    //--- check the possibility of closing the long position / delete pending orders
    if(CheckCloseLong())
      {
      DeleteOrders();
      return(true);
      }
  }
  else
  {
    //--- check the possibility of closing the short position / delete pending orders
    if(CheckCloseShort())
      {
      DeleteOrders();
      return(true);
      }
  }
  //--- return without operations
  return(false);
}
```
**CheckCloseLong**

Checks conditions to close a long position.

```cpp
virtual bool CheckCloseLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks conditions to close a long position (CheckCloseLong() method of Signal object) and if they are satisfied, it closes the open position (CloseLong(...) method).

Implementation

```cpp
bool CExpert::CheckCloseLong()
{
    double price=EMPTY_VALUE;
    //--- check for long close operations
    if(m_signal.CheckCloseLong(price))
        return CloseLong(price);
    //--- return without operations
    return (false);
}
```
CheckCloseShort

Checks conditions to close a short position.

```
virtual bool CheckCloseShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks conditions to close a short position (CheckCloseShort() method of Signal object) and if they are satisfied, it closes the position (CloseShort() method).

Implementation

```
//+------------------------------------------------------------------+
//| Check for short position close or limit/stop order delete        |
//| INPU|: no.                                                      |
//| O|UT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckCloseShort()
{
    double price=EMPTY_VALUE;
    //--- check for short close operations
    if(m_signal.CheckCloseShort(price))
        return(CloseShort(price));
    //--- return without operations
    return(false);
}
```
CloseAll

It performs partial or full position closing.

```
virtual bool CloseAll(
    double lot    // lot
)
```

Parameters

lot

[in] Number of lots to reduce the position.

Return Value

true - trade operation has been executed, otherwise - false.

Note

In the "netting" mode, a position is closed using the CExpertTrade::Buy or CExpertTrade::Sell methods. In the "hedging" mode, the CTrade::PositionClose method is used, which can also be used on accounts with the netting mode. The DeleteOrders() method is used to delete orders.

Implementation

```cpp
//+------------------------------------------------------------------+
//| Position close and orders delete                                |
//| INPU|UT:  lot - volume for close.                                  |
//| OU|TPUT: true-if trade operation processed, false otherwise.      |
//| R|EMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CloseAll(double lot)
{
    bool result=false;
    //--- check for close operations
    if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL,HEDGING)
        result=m_trade.PositionCloseByTicket(m_position.Identifier());
    else
    {
        if(m_position.PositionType()==POSITION_TYPE_BUY)
            result=m_trade.Sell(lot,0,0,0);
        else
            result=m_trade.Buy(lot,0,0,0);
    }
    result|=DeleteOrders();
    //---
    return(result);
} 
```
**Close**

Closes the opened position.

```cpp
virtual bool Close()
```

**Return Value**

true - trade operation has been executed, otherwise - false.

**Note**

Closes the position (PositionClose() method of CTrade class object).

**Implementation**

```cpp
//+------------------------------------------------------------------+
//| Position close                                                   |
//| INPUT: no.                                                      |
//| OUTPUT: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+

bool CExpert::Close()
{
    return m_trade.PositionClose(m_symbol.Name());
}
```
CloseLong

Closes the long position.

```cpp
virtual bool CloseLong(
    double price  // price
)
```

Parameters

`price`

Return Value

true - trade operation has been executed, otherwise - false.

Note

In the "netting" mode, a position is closed using the CExpertTrade::Buy or CExpertTrade::Sell methods. In the "hedging" mode, the CTrade::PositionCloseByTicket method is used.

Implementation

```cpp
//+------------------------------------------------------------------+
//| Long position close                                              |
//| INPU   :  price - price for close.                              |
//| OUTPUT:  true-if trade operation processed, false otherwise.    |
//| REMARK:  no.                                                     |
//+------------------------------------------------------------------+
bool CExpert::CloseLong(double price)
{
    bool result=false;
    //---
    if(price==EMPTY_VALUE)
        return(false);
    if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
        result=m_trade.PositionCloseByTicket(m_position.Identifier());
    else
        result=m_trade.Sell(m_position.Volume(),price,0,0);
    //---
    return(result);
}
```
CloseShort

Closes the short position.

```cpp
virtual bool CloseShort(
    double price  // price
)
```

Parameters

price

Return Value

true - trade operation has been executed, otherwise - false.

Note

In the "netting" mode, a position is closed using the CExpertTrade::Buy or CExpertTrade::Sell methods. In the "hedging" mode, the CTrade::PositionCloseByTicket method is used.

Implementation

```cpp
bool CExpert::CloseShort(double price)
{
    bool result=false;
    //---
    if(price==EMPTY_VALUE)
        return(false);
    if(m_margin_mode==ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)
        result=m_trade.PositionCloseByTicket(m_position.Identifier());
    else
        result=m_trade.Buy(m_position.Volume(),price,0,0);
    //---
    return(result);
}
```
CheckTrailingStop

It checks Trailing Stop conditions of the opened position.

```cpp
virtual bool CheckTrailingStop()
```

Return Value

true - a trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions of the opened position (CheckTrailingStopLong() or CheckTrailingStopShort() for long and short positions).

Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for trailing stop/profit position                          |
//| INPU| no.                                                      |
//| OUTU| true-if trade operation processed, false otherwise.      |
//| TAM| no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckTrailingStop()
{
    //--- position must be selected before call
    if(m_position.PositionType()==POSITION_TYPE_BUY)
    {
        //--- check the possibility of modifying the long position
        if(CheckTrailingStopLong()) return(true);
    }
    else
    {
        //--- check the possibility of modifying the short position
        if(CheckTrailingStopShort()) return(true);
    }
    //--- return without operations
    return(false);
}
```
CheckTrailingStopLong

It checks Trailing Stop conditions of the opened long position.

```cpp
virtual bool CheckTrailingStopLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions of the opened long position (CheckTrailingStopLong(...) method of Expert Trailing object). If conditions are satisfied, it modifies the position parameters (TrailingStopLong(...) method).

Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for trailing stop/profit long position                     |
//| INPU:  no.                                                      |
//| OUTPU: true-if trade operation processed, false otherwise.  |
//| REMARK: no.                                                    |
//+------------------------------------------------------------------+

bool CExpert::CheckTrailingStopLong()
{
    double sl=EMPTY_VALUE;
    double tp=EMPTY_VALUE;
    //--- check for long trailing stop operations
    if(m_trailing.CheckTrailingStopLong(GetPointer(m_position),sl,tp))
    {
        if(sl==EMPTY_VALUE) sl=m_position.StopLoss();
        if(tp==EMPTY_VALUE) tp=m_position.TakeProfit();
        //--- long trailing stop operations
        return(TrailingStopLong(sl,tp));
    }
    //--- return without operations
    return(false);
}
```
CheckTrailingStopShort

It checks Trailing Stop conditions of the opened short position.

```cpp
virtual bool CheckTrailingStopShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions of the opened short position (CheckTrailingStopShort(...) method of Expert Trailing object). If conditions are satisfied, it modifies the position parameters (TrailingStopShort(...) method).

Implementation

```cpp
bool CExpert::CheckTrailingStopShort()
{
    double sl=EMPTY_VALUE;
    double tp=EMPTY_VALUE;
    //--- check for short trailing stop operations
    if(m_trailing.CheckTrailingStopShort(GetPointer(m_position),sl,tp))
    {
        if(sl==EMPTY_VALUE) sl=m_position.StopLoss();
        if(tp==EMPTY_VALUE) tp=m_position.TakeProfit();
        //--- short trailing stop operations
        return(TrailingStopShort(sl,tp));
    }
    //--- return without operations
    return(false);
}
```
TrailingStopLong

It modifies parameters of the opened long position.

```cpp
virtual bool TrailingStopLong(
    double sl,    // Stop Loss
    double tp,    // Take Profit
)
```

Parameters

- **sl**
  
  [in] Stop Loss price.

- **tp**
  
  [in] Take Profit price.

Return Value

true - trade operation has been executed, otherwise - false.

Note

The function modifies parameters of the opened long position (PositionModify(...) method of CTrade class object).

Implementation

```cpp
//+------------------------------------------------------------------+
//| Trailing stop/profit long position                               |
//| INP
//|    U:  sl - new stop loss,                                      |
//|         tp - new take profit.                                    |
//| O       T: true-if trade operation successful, false otherwise. |
//| R       EM A R K: no.                                           |
//+------------------------------------------------------------------+
bool CExpert::TrailingStopLong(double sl, double tp)
{
    return (m_trade.PositionModify(m_symbol.Name(),sl,tp));
}
```
TrailingStopShort

It modifies parameters of the opened short position.

```cpp
virtual bool TrailingStopLong(
    double sl,  // Stop Loss
    double tp,  // Take Profit
)
```

Parameters

- `sl`  
  [in] Stop Loss price.

- `tp`  
  [in] Take Profit price.

Return Value

- `true` - trade operation has been executed, otherwise - `false`.

Note

The function modifies parameters of the opened short position (PositionModify(...) method of CTrade class object).

Implementation

```cpp
//+------------------------------------------------------------------+
//| Trailing stop/profit short position                              |
//| INPU[_UT:  sl - new stop loss,                                      |
//|         tp - new take profit.                                    |
//| OUTPU[PT: true-if trade operation successful, false otherwise.     |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::TrailingStopShort(double sl,double tp)
{
    return (m_trade.PositionModify(m_symbol.Name(),sl,tp));
}
```
CheckTrailingOrderLong

Checks Trailing Stop conditions of Buy Limit/Stop trailing order.

virtual bool CheckTrailingOrderLong()

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions for buy limit/stop trailing order (CheckTrailingOrderLong() method of Trade Signals object) and modifies the order parameters if necessary (TrailingOrderLong(...)) method.

Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for trailing long limit/stop order                         |
//| INPU:  no.                                                      |
//| OUTPU: true-if trade operation processed, false otherwise.      |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
bool CExpert::CheckTrailingOrderLong()
{
    double price;
    //--- check the possibility of modifying the long order
    if(m_signal.CheckTrailingOrderLong(GetPointer(m_order), price))
        return (TrailingOrderLong(m_order.PriceOpen() - price));
    //--- return without operations
    return (false);
}
```
CheckTrailingOrderShort

It checks Trailing Stop conditions of Sell Limit/Stop trailing order.

```cpp
virtual bool CheckTrailingOrderShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It checks Trailing Stop conditions for sell limit/stop trailing order (CheckTrailingOrderShort() method of Trade Signals object) and modifies the order parameters if necessary (TrailingOrderShort() method).

Implementation

```cpp
bool CExpert::CheckTrailingOrderShort()
{
    double price;
    //--- check the possibility of modifying the short order
    if(m_signal.CheckTrailingOrderShort(GetPointer(m_order),price))
        return(TrailingOrderShort(m_order.PriceOpen()-price));
    //--- return without operations
    return(false);
}
```
### TrailingOrderLong

It modifies parameters of *Buy Limit/Stop trailing order*.

**virtual bool TrailingOrderLong(
    double delta  // delta
)\n**

**Parameters**

delta  

[in] Price delta.

**Return Value**

true - trade operation has been executed, otherwise - false.

**Note**

It modifies parameters of *Buy Limit/Stop trailing order* (*OrderModify(...)* method of *CTrade class object*).

**Implementation**

```cpp
//+------------------------------------------------------------------+
//| Trailing long limit/stop order                                   |
//| INPU:  delta - price change.                                     |
//| OUTPU: true-if trade operation successful, false otherwise.      |
//| REMAK: no.                                                       |
//+------------------------------------------------------------------+
bool CExpert::TrailingOrderLong(double delta)
{
    ulong ticket=m_order.Ticket();
    double price =m_order.PriceOpen()-delta;
    double sl    =m_order.StopLoss()-delta;
    double tp    =m_order.TakeProfit()-delta;
    //--- modifying the long order
    return (m_trade.OrderModify(ticket,price,sl,tp,m_order.TypeTime(),m_order.TimeExpiration()));
}
```
TrailingOrderShort

It modifies parameters of Sell Limit/Stop trailing order.

```cpp
virtual bool TrailingOrderShort(
    double delta  // delta
)
```

**Parameters**

`delta`

[in] Price delta.

**Return Value**

true - trade operation has been executed, otherwise - false.

**Note**

It modifies parameters of Sell Limit/Stop trailing order (OrderModify(...) method of CTrade class object).

**Implementation**

```cpp
//+------------------------------------------------------------------+
//| Trailing short limit/stop order                                 |
//| INPU T:  delta - price change.                                  |
//| OUTPUT: true-if trade operation successful, false otherwise.    |
//| REMARK: no.                                                    |
//+------------------------------------------------------------------+
bool CExpert::TrailingOrderShort(double delta)
{
    ulong ticket=m_order.Ticket();
    double price =m_order.PriceOpen()-delta;
    double sl    =m_order.StopLoss()-delta;
    double tp    =m_order.TakeProfit()-delta;
    //--- modifying the short order
    return (m_trade.OrderModify(ticket,price,sl,tp,m_order.TypeTime(),m_order.TimeExpiration()));
}
```
CheckDeleteOrderLong

It checks conditions to delete Buy Limit/Stop order.

```cpp
virtual bool CheckDeleteOrderLong()
```

**Return Value**

true - trade operation has been executed, otherwise - false.

**Note**

It checks the order expiration time. It checks conditions to delete the Buy Limit/Stop order (CheckCloseLong(...) method of Signal class object) and deletes the order if condition is satisfied (DeleteOrderLong() method).

**Implementation**

```cpp
//+------------------------------------------------------------------+
//| Check for delete long limit/stop order                           |
//| INP:   no.                                                        |
//| OUPUT: true-if trade operation processed, false otherwise.       |
//| REMARK: no.                                                       |
//+------------------------------------------------------------------+
bool CExpert::CheckDeleteOrderLong()
{
    double price;
    //--- check the possibility of deleting the long order
    if(m_expiration!=0 && TimeCurrent()>m_expiration)
    {
        m_expiration=0;
        return(DeleteOrderLong());
    }
    if(m_signal.CheckCloseLong(price))
        return(DeleteOrderLong());
    //--- return without operations
    return(false);
}
```
CheckDeleteOrderShort

It checks conditions to delete Sell Limit/Stop order.

```cpp
virtual bool CheckDeleteOrderShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

1. It checks the order expiration time.
2. It checks conditions to delete the Sell Limit/Stop order (CheckCloseShort(...) method of Signal class object) and deletes the order if one of the conditions is satisfied (DeleteOrderShort() method).

Implementation

```cpp
//+------------------------------------------------------------------+
//| Check for delete short limit/stop order                          |
//| INPU                                                                |
//| OUTPU: true-if trade operation processed, false otherwise.        |
//| REMARK: no.                                                        |
//+------------------------------------------------------------------+

bool CExpert::CheckDeleteOrderShort()
{
    double price;
    //--- check the possibility of deleting the short order
    if(m_expiration!=0 && TimeCurrent()>m_expiration)
    {
        m_expiration=0;
        return(DeleteOrderShort());
    }
    if(m_signal.CheckCloseShort(price))
    return(DeleteOrderShort());
    //--- return without operations
    return(false);
}
```
DeleteOrders

Deletes all orders.

```cpp
virtual bool DeleteOrders()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It deletes all orders (DeleteOrder() for all orders).

Implementation

```cpp
bool CExpert::DeleteOrders()
{
    bool result=false;
    int total=OrdersTotal();
    //---
    for(int i=total-1;i>=0;i--)
    {
        if(m_order.Select(OrderGetTicket(i))
        {
            if(m_order.Symbol()! =m_symbol.Name()) continue;
            result|=DeleteOrder();
        }
    }
    //---
    return(result);
}
```
**DeleteOrder**

Deletes the Limit/Stop order.

```cpp
virtual bool DeleteOrder()
```

**Return Value**

true - trade operation has been executed, otherwise - false.

**Note**

It deletes the Limit/Stop order (OrderDelete(...) method of CTrade class object).

**Implementation**

```cpp
bool CExpert::DeleteOrder()
{
    return (m_trade.OrderDelete(m_order.Ticket()));
}
```
DeleteOrderLong

Deletes the Buy Limit/Stop order.

```cpp
virtual bool DeleteOrderLong()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It deletes Buy Limit/Stop order (OrderDelete(...) method of CTrade class object).

Implementation

```cpp
bool CExpert::DeleteOrderLong()
{
    return m_trade.OrderDelete(m_order.Ticket());
}
```
DeleteOrderShort

Deletes the Sell Limit/Stop order.

```cpp
virtual bool DeleteOrderShort()
```

Return Value

true - trade operation has been executed, otherwise - false.

Note

It deletes the Sell Limit/Stop order (OrderDelete(...) method of CTrade class object).

Implementation

```cpp
bool CExpert::DeleteOrderShort()
{
    return m_trade.OrderDelete(m_order.Ticket());
}
```
LotOpenLong

Gets trade volume for buy operation.

```cpp
double LotOpenLong(
    double price,   // price
    double sl       // Stop Loss
)
```

Parameters

*price*

*sl*

[in] Stop Loss price.

Return Value

Trade volume (in lots) for buy operation.

Note

It gets trade volume for buy operation (CheckOpenLong(...) method of money management object).

Implementation

```cpp
//+------------------------------------------------------------------+
//| Method of getting the lot for open long position.                |
//| INPUT:  price - price,                                         |
//|         sl    - stop loss.                                       |
//| OUTPUT: lot for open.                                           |
//| REMARK: no.                                                     |
//+------------------------------------------------------------------+
double CExpert::LotOpenLong(double price, double sl)
{
    return m_money.CheckOpenLong(price, sl);
}
```
LotOpenShort

Gets trade volume for sell operation.

```c
double LotOpenShort(
    double price,  // price
    double sl       // Stop Loss
)
```

Parameters

- `sl` [in] Stop Loss price.

Return Value

Trade volume (in lots) for sell operation.

Note

It gets trade volume for sell operation (CheckOpenShort(...) method of money management object).

Implementation

```c
//+------------------------------------------------------------------+
//| Method of getting the lot for open short position.                |
//| INPUT:  price - price,                                         |
//|         sl    - stop loss.                                       |
//| OUTPUT: lot for open.                                           |
//| REMARK: no.                                                    |
//+------------------------------------------------------------------+

double CExpert::LotOpenShort(double price, double sl)
{
    return (m_money.CheckOpenShort(price,sl));
}
```
LotReverse

Gets trade volume for position reverse.

```
double LotReverse(
    double sl         // Stop Loss
)
```

Parameters

- `sl`
  - [in] Stop Loss price.

Return Value

Trade volume (in lots) for position reverse operation.

Note

It gets trade volume for position reverse operation (CheckReverse(...) method of money management object).

Implementation

```
//+------------------------------------------------------------------+
//| Method of getting the lot for reverse position.                   |
//| INPUT:     sl - stop loss.                                        |
//| OUTPUT:    lot for open.                                          |
//| REMARK: no.                                                      |
//+------------------------------------------------------------------+
double CExpert::LotReverse(double sl)
{
    return (m_money.CheckReverse(GetPointer(m_position),sl));
}
```
PrepareHistoryDate

Sets starting date for tracking of trade history.

```cpp
void PrepareHistoryDate()
```

Note

The trade history tracking period is set from the beginning of the month (but not less than one day).
**HistoryPoint**

Creates a checkpoint of trade history.

```cpp
void HistoryPoint(
    bool from_check_trade=false  // flag
)
```

**Parameters**

- `from_check_trade=false`  
  
  [in] Flag to avoid recursion.

**Note**

It saves the amount of positions, orders, deals, and historical orders.
CheckTradeState

Compares the current state with the saved one and calls the corresponding event handler.

```cpp
bool CheckTradeState()
```

**Return Value**

true - event has been handled, otherwise - false.

**Note**

It checks the number of positions, orders, deals, and historical orders by comparing with the values saved by `HistoryPoint()` method. If trade history has changed, it calls the corresponding virtual event handler.
**WaitEvent**

Sets the event waiting flag.

```c
void WaitEvent(
    ENUM_TRADE_EVENTS event  // flag
)
```

**Parameters**

`event`

[in] Flag of waiting for an event (from ENUM_TRADE_EVENTS enumeration) to set.

**Return Value**

None.

**Event flags**

```c
//--- flags of expected events
enum ENUM_TRADE_EVENTS
{
    TRADE_EVENT_NO_EVENT      =0,       // no expected events
    TRADE_EVENT_POSITION_OPEN =0x1,     // flag of expecting the "opening of
    TRADE_EVENT_POSITION_VOLUME_CHANGE=0x2,  // flag of expecting of the "modification
    TRADE_EVENT_POSITION_MODIFY =0x4,    // flag of expecting of the "modification
    TRADE_EVENT_POSITION_CLOSE =0x8,     // flag of expecting of the "closing
    TRADE_EVENT_POSITION_STOP_TAKE =0x10, // flag of expecting of the "trigger:
    TRADE_EVENT_ORDER_PLACE    =0x20,    // flag of expecting of the "placing
    TRADE_EVENT_ORDER_MODIFY   =0x40,    // flag of expecting of the "modification
    TRADE_EVENT_ORDER_DELETE   =0x80,    // flag of expecting of the "deletion
    TRADE_EVENT_ORDER_TRIGGER  =0x100    // flag of expecting of the "trigger:
};
```
**NoWaitEvent**

Resets the event waiting flag.

```c
void NoWaitEvent(
    ENUM_TRADE_EVENTS event  // flag
);
```

**Parameters**

- `event`  
  [in] Flag with events (from ENUM_TRADE_EVENTS enumeration) to reset.

**Return Value**

None.

**Event flags**

```c
//--- flags of expected events
enum ENUM_TRADE_EVENTS
{
    TRADE_EVENT_NO_EVENT =0,       // no expected events
    TRADE_EVENT_POSITION_OPEN=0x1, // flag of expecting the "opening of
    TRADE_EVENT_POSITION_VOLUME_CHANGE=0x2, // flag of expecting the "modific:
    TRADE_EVENT_POSITION_MODIFY =0x4, // flag of expecting of the "modific:
    TRADE_EVENT_POSITION_CLOSE =0x8,  // flag of expecting of the "closing
    TRADE_EVENT_POSITION_STOP_TAKE =0x10, // flag of expecting of the "trigger:
    TRADE_EVENT_ORDER_PLACE =0x20,    // flag of expecting of the "placing
    TRADE_EVENT_ORDER_MODIFY =0x40,   // flag of expecting of the "modific:
    TRADE_EVENT_ORDER_DELETE =0x80,   // flag of expecting of the "deletio
    TRADE_EVENT_ORDER_TRIGGER =0x100  // flag of expecting of the "trigger.
};
```
TradeEventPositionStopTake

Event handler of the "Position Stop Loss/Take Profit triggered" event.

\[
\text{virtual bool TradeEventPositionStopTake}()\n\]

Return Value

The \text{CExpert} class method does nothing and always returns true.
TradeEventOrderTriggered

Event handler of the “Pending Order triggered” event.

```
virtual bool TradeEventOrderTriggered()
```

Return Value

The `CExpert` class method does nothing and always returns true.
TradeEventPositionOpened

Event handler of the "Position opened" event.

```cpp
virtual bool TradeEventPositionOpened()
```

**Return Value**

The `CExpert` class method does nothing and always returns true.
TradeEventPositionVolumeChanged

Event handler of the "Position volume changed" event.

```cpp
virtual bool TradeEventPositionVolumeChanged()
```

Return Value

The **CExpert** class method does nothing and always returns true.
TradeEventPositionModified

Event handler of the "Position modified" event.

```cpp
virtual bool TradeEventPositionModified()
```

Return Value

The CExpert class method does nothing and always returns true.
TradeEventPositionClosed

Event handler of the "Position closed" event.

```cpp
virtual bool TradeEventPositionClosed()
```

Return Value

The `CExpert` class method does nothing and always returns true.
TradeEventOrderPlaced

Event handler of the "Pending order placed" event.

```cpp
virtual bool TradeEventOrderPlaced()
```

Return Value

The `CExpert` class method does nothing and always returns true.
TradeEventOrderModified

Event handler of the "Pending order modified" event.

```cpp
virtual bool TradeEventOrderModified()
```

**Return Value**

The [CExpert](#) class method does nothing and always returns true.
**TradeEventOrderDeleted**

Event handler of the "Pending order deleted" event.

```cpp
class CE: public CObject
{
public:
    virtual bool TradeEventOrderDeleted();
};
```

**Return Value**

The `CE: : TradeEventOrderDeleted` class method does nothing and always returns true.
**TradeEventNotIdentified**

Event handler of the non-identified event.

```cpp
virtual bool TradeEventNotIdentified()
```

**Return Value**

The **CExpert** class method does nothing and always returns true.

**Note**

Note that several trade events can arrive, in such cases it is difficult to identify them.
TimeframeAdd

Add a timeframe for tracking.

```c
void TimeframeAdd(
    ENUM_TIMEFRAMES period  // timeframe
)
```

Parameters

`period`

[in] Timeframe (from `ENUM_TIMEFRAMES` enumeration) to be tracked.

Return Value

None.
TimeframesFlags

Forms the timeframe flags.

```c
int TimeframesFlags(
    MqlDateTime& time       // reference
)
```

Parameters

time

[in] Reference to `MqlDateTime` type structure containing a new time.

Return Value

It returns the flag that indicates timeframes with a new bar.
CExpertSignal

CExpertSignal is a base class for trading signals, it does nothing (except CheckReverseLong() and CheckReverseShort() methods) but provides the interfaces.

How to use it:

1. Prepare an algorithm for trading signals;
2. Create your own trading signal class, inherited from CExpertSignal class;
3. Override the virtual methods in your class with your own algorithms.

You can find an examples of trading signal classes in the Expert\Signal\ folder.

Description

CExpertSignal is a base class for implementation of trading signal algorithms.

Declaration

```cpp
class CExpertSignal : public CExpertBase

#include <Expert\ExpertSignal.mqh>
```

Inheritance hierarchy

```
CObject
  CExpertBase
    CExpertSignal
```

Direct descendants

CSignalAC, CSignalAMA, CSignalAO, CSignalBearsPower, CSignalBullsPower, CSignalCCI, CSignalDeM, CSignalDEMA, CSignalEnvelopes, CSignalFrAMA, CSignalRSI, CSignalRV, CSignalSAR, CSignalStoch, CSignalTEMA, CSignalTriX, CSignalWPR

#### Methods inherited from class `CObject`

- Prev, Prev, Next, Next, `Save`, `Load`, `Type`, `Compare`

#### Methods inherited from class `CExpertBase`

- `InitPhase`, `TrendType`, `UsedSeries`, `EveryTick`, `Open`, `High`, `Low`, `Close`, `Spread`, `Time`, `TickVolume`, `RealVolume`, `Init`, `Symbol`, `Period`, `Magic`, `SetMarginMode`, `SetPriceSeries`, `SetOtherSeries`
BasePrice

Sets base price level.

```cpp
void BasePrice(
    double value  // value
)
```

Parameters

value

Return Value

None.
UsedSeries

Gets the flags of the timeseries used.

```c
int UsedSeries()
```

Return Value

Flags of the used timeseries (if the symbol/timeframe corresponds to the working symbol/timeframe), otherwise 0.
Weight

Sets new value of "Weight" parameter.

```c
void Weight(
    double value       // value
)
```

Parameters

value

[in] "Weight" parameter.

Return Value

None.
PatternUsage

Sets new value of "PatternsUsage" parameter.

```c
void PatternUsage(
    double value // value
)
```

Parameters

value

[in] New value of "PatternsUsage".

Return Value

None.
General

Sets new value of “General” parameter.

```c
void General(
    int value    // value
)
```

Parameters

value

[in] New value of “General”.

Return Value

None.
Ignore

Sets new value of "Ignore" parameter.

```c
void Ignore(
    long value      // value
)
```

Parameters

- `value`
  - [in] New value of "Ignore".

Return Value

None.
Invert

Sets new value of "Invert" parameter.

```cpp
void Invert(
    long value // value
)
```

Parameters

- `value` 
  - [in] New value of "Invert".

Return Value

None.
ThresholdOpen

Sets new value of "ThresholdOpen" parameter.

```c
void ThresholdOpen(
    long value    // value
)
```

Parameters

value

[in] New value of "ThresholdOpen".

Return Value

None.

Note

The range of "ThresholdOpen" parameter is from 0 to 100. Used when "voting" to open position.
ThresholdClose

Sets new value of “ThresholdClose” parameter.

```c
void ThresholdOpen(
    long value       // value
)
```

**Parameters**

- `value`
  - `[in]` New value of “ThresholdClose”.

**Return Value**

None.

**Note**

The range of “ThresholdClose” parameter is from 0 to 100. Used when “voting” to close position.
PriceLevel

Sets new value of "PriceLevel" parameter.

```c
void PriceLevel(
    double value // value
)
```

Parameters

value

[in] New value of "PriceLevel".

Return Value

None.

Note

The value of "PriceLevel" is defined in price level units. The numerical values of price level unit is returned by PriceLevelUnit() method. The "PriceLevel" is used to define the open price relative to the base price.
StopLevel

Sets new value of “StopLevel” parameter.

```cpp
void StopLevel(
    double value  // value
)
```

Parameters

value

[in] New value of “StopLevel”.

Return Value

None.

Note

The value of “StopLevel” is defined in price level units. The numerical values of price level unit is returned by PriceLevelUnit() method. The “StopLevel” is used to define the Stop Loss price relative to the open price.
TakeLevel

Sets new value of "TakeLevel" parameter.

```c
void TakeLevel(
    double value // value
)
```

Parameters

value

[in] New value of "TakeLevel".

Return Value

None.

Note

The value of "TakeLevel" is defined in price level units. The numerical values of price level unit is returned by PriceLevelUnit() method. The "TakeLevel" is used to define the Take Profit price relative to the open price.
Expiration

Sets the value of “Expiration” parameter.

```c
void Expiration(
    int value  // value
)
```

Parameters

`value`

[in] New value of “Expiration”.

Return Value

None.

Note

The value of “Expiration” parameter is defined in bars. It is used as Expiration time for Pending Orders (when trading using pending orders).
Magic

Sets the value of "Magic" parameter.

```c
void Magic(
    int value    // value
)
```

Parameters

value

Return Value

None.
ValidationSettings

Checks the object settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

- true - object settings are correct, otherwise - false.
InitIndicators

Initializes all necessary indicators and timeseries.

```cpp
virtual bool InitIndicators(
    CIndicators* indicators  // pointer
)
```

**Parameters**

*indicators*

[in] Pointer to collection of indicators and timeseries.

**Return Value**

true - successful completion, otherwise - false.

**Note**

The necessary timeseries are initialized only if the object uses the symbol or timeframe different from the one defined at initialization.
AddFilter

Add a filter to the composite signal.

```cpp
virtual bool AddFilter(
    CExpertSignal* filter  // pointer
)
```

**Parameters**

*indicators*

[in] Pointer to filter object.

**Return Value**

true - successful, otherwise - false.
CheckOpenLong

Checks conditions to open a long position.

```c
virtual bool CheckOpenLong(
    double& price,       // price
    double& sl,          // Stop Loss
    double& tp,          // Take Profit
    datetime& expiration // expiration
)
```

**Parameters**

- **price**
  - [in][out] Variable for open price, passed by reference.

- **sl**
  - [in][out] Variable for Stop Loss price, passed by reference.

- **tp**
  - [in][out] Variable for Take Profit price, passed by reference.

- **expiration**
  - [in][out] Variable for expiration time, passed by reference (if necessary).

**Return Value**

- true - condition is satisfied, otherwise - false.
CheckOpenShort

Checks conditions to open a short position.

```cpp
virtual bool CheckOpenShort(
    double& price, // price
    double& sl,    // Stop Loss
    double& tp,    // Take Profit
    datetime& expiration // expiration
)
```

**Parameters**

- **price**
  - [in][out] Variable for open price, passed by reference.

- **sl**
  - [in][out] Variable for Stop Loss price, passed by reference.

- **tp**
  - [in][out] Variable for Take Profit price, passed by reference.

- **expiration**
  - [in][out] Variable for expiration time, passed by reference (if necessary).

**Return Value**

- true - condition is satisfied, otherwise - false.
OpenLongParams

Sets parameters to open a long position.

```cpp
virtual bool OpenLongParams(
    double& price, // price
    double& sl,    // Stop Loss
    double& tp,    // Take Profit
    datetime& expiration // expiration
)
```

**Parameters**

- `price`: [in][out] Variable for open price, passed by reference.
- `tp`: [in][out] Variable for Take Profit price, passed by reference.
- `expiration`: [in][out] Variable for expiration time, passed by reference (if necessary).

**Return Value**

- `true` - successful, otherwise - `false`.
OpenShortParams

Sets parameters to open a short position.

```c++
virtual bool OpenShortParams(
    double& price,       // price
    double& sl,          // Stop Loss
    double& tp,          // Take Profit
    datetime& expiration // expiration
)
```

**Parameters**

- **price**
  - [in][out] Variable for price, passed by reference.

- **sl**
  - [in][out] Variable for Stop Loss price, passed by reference.

- **tp**
  - [in][out] Variable for Take Profit price, passed by reference.

- **expiration**
  - [in][out] Variable for expiration time, passed by reference (if necessary).

**Return Value**

- true - successful, otherwise - false.
CheckCloseLong

Checks conditions to close a long position.

```c
virtual bool CheckCloseLong(
    double& price  // price
)
```

Parameters

- `price`  
  [in][out] Variable for close price, passed by reference.

Return Value

- `true` - condition is satisfied, otherwise - `false`. 
CheckCloseShort

Checks conditions to close a short position.

```cpp
virtual bool CheckCloseShort(
    double& price  // price
)
```

Parameters

- **price**
  
  [in][out] Variable for close price, passed by reference.

Return Value

- true - condition is satisfied, otherwise - false.
CloseLongParams

Sets parameters to close a long position.

```cpp
virtual bool CloseLongParams(
    double& price  // price
)
```

Parameters

- `price` - [in][out] Variable for close price, passed by reference.

Return Value

- `true` - successful, otherwise - `false`.
**CloseShortParams**

Sets parameters to close a short position.

```cpp
virtual bool CloseShortParams(
    double& price  // price
)
```

**Parameters**

`price`

`[in][out]` Variable for close price, passed by reference.

**Return Value**

true - successful, otherwise - false.
CheckReverseLong

Checks conditions of a long position reversal

```cpp
virtual bool CheckReverseLong(
    double& price,    // price
    double& sl,       // Stop Loss
    double& tp,       // Take Profit
    datetime& expiration // expiration
)
```

**Parameters**

*price*
  

*sl*
  
  [in][out] Variable for Stop Loss price, passed by reference.

*tp*
  
  [in][out] Variable for Take Profit price, passed by reference.

*expiration*
  
  [in][out] Variable for expiration time, passed by reference (if necessary).

**Return Value**

*true* - condition is satisfied, otherwise - *false*. 

© 2000-2021, MetaQuotes Ltd
**CheckReverseShort**

Checks conditions of a short position reversal.

```cpp
virtual bool CheckReverseShort(
    double& price,  // price
    double& sl,     // Stop Loss
    double& tp,     // Take Profit
    datetime& expiration // expiration
)
```

**Parameters**

- **price**
  - [in][out] Variable for reversal price, passed by reference.

- **sl**
  - [in][out] Variable for Stop Loss price, passed by reference.

- **tp**
  - [in][out] Variable for Take Profit price, passed by reference.

- **expiration**
  - [in][out] Variable for expiration time, passed by reference (if necessary).

**Return Value**

- true - condition is satisfied, otherwise - false.
CheckTrailingOrderLong

Checks conditions to modify parameters of Buy Pending order.

```cpp
virtual bool CheckTrailingOrderLong(
    COrderInfo* order, // order
double& price // price
)
```

Parameters

order

[in] Pointer to COrderInfo class object.

price

[in][out] Variable for Stop Loss price.

Return Value

true - condition is satisfied, otherwise - false.
CheckTrailingOrderShort

Checks conditions to modify parameters of Sell Pending order.

```cpp
virtual bool CheckTrailingOrderShort(
    COrderInfo* order,       // order
    double& price            // price
)
```

Parameters

- **order**
  - [in] Pointer to `COrderInfo` class object.

- **price**
  - [in][out] Variable for Stop Loss price.

Return Value

- true - condition is satisfied, otherwise - false.
LongCondition

Checks conditions to open a long position.

```cpp
virtual int LongCondition()
```

Return Value

If the conditions are satisfied, it returns the value from 1 to 100 (depending on “strength” of a signal). If there is no signal to open a long position, it returns 0.

Note

The base class has no implementation of checking conditions to open a long position and always returns 0.
ShortCondition

Checks conditions to open a short position.

virtual int ShortCondition()

Return Value

If the conditions are satisfied, it returns the value from 1 to 100 (depending on "strength" of a signal). If there isn't a signal to open short position, it returns 0.

Note

The base class has no implementation of checking conditions to open a short position and always returns 0.
Direction

Returns the value of "weighted" price direction.

```cpp
virtual double Direction()
```

Return Value

It returns the value $>0$ when upward direction is most probable and $<0$ in case of a downward direction. The absolute value depends on the "strength" of a signal.

Note

If the built-in filters are used, their results are considered when defining the general direction.
**CExpertTrailing**

CExpertTrailing is a base class for trailing algorithms, it does nothing but provides the interfaces.

How to use it:

1. Prepare an algorithm for trailing;
2. Create your own trailing class inherited from CExpertTrailing class;
3. Override the virtual methods in your class with your own algorithms.

You can find an examples of trailing classes in the Expert\Trailing\ folder.

**Description**

CExpertTrailing is a base class for implementation of trailing stop algorithms.

**Declaration**

```cpp
class CExpertTrailing : public CExpertBase
```

**Title**

```cpp
#include <Expert\ExpertTrailing.mqh>
```

**Inheritance hierarchy**

- CObject
  - CExpertBase
    - CExpertTrailing

**Direct descendants**

- CTrailingFixedPips, CTrailingMA, CTrailingNone, CTrailingPSAR

**Class Methods by Groups**

CheckTrailingStopLong

Checks conditions to modify parameters of a long position.

```cpp
virtual bool CheckTrailingStopLong(
    CPositionInfo* position, // pointer
    double& sl, // Stop Loss
    double& tp // Take Profit
)
```

Parameters

- `position`  
  [in] Pointer to `CPositionInfo` class object.

- `sl`  
  [in][out] Variable for Stop Loss price, passed by reference.

- `tp`  
  [in][out] Variable for Take Profit price, passed by reference.

Return Value

- true - condition is satisfied, otherwise - false.

Note

- Base class method always returns false.
CheckTrailingStopShort

Checks conditions to modify parameters of a short position.

```cpp
virtual bool CheckTrailingStopShort(
    CPositionInfo* position, // pointer
    double& sl,             // Stop Loss
    double& tp               // Take Profit
)
```

**Parameters**

*position*  
[in] Pointer to CPositionInfo class object.

*sl*  
[in][out] Variable for Stop Loss price, passed by reference.

*tp*  
[in][out] Variable for Take Profit price, passed by reference.

**Return Value**

true - condition is satisfied, otherwise - false.

**Note**

Base class method always returns false.
CExpertMoney

CExpertMoney is a base class for money and risk management algorithms.

Description

CExpertMoney is a base class for implementation of money and risk management classes.

Declaration

```cpp
class CExpertMoney : public CObject
```

Title

```cpp
#include <Expert\ExpertMoney.mqh>
```

Inheritance hierarchy

- CObject
  - CExpertBase
    - CExpertMoney

© 2000-2021, MetaQuotes Ltd
Percent

Sets the value of “Risk percent” parameter.

```cpp
void Percent(
    double percent  // risk percent
)
```

Parameters

percent

   [in] Risk percent.

Return Value

None.
ValidationSettings

Checks the settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

- true - successful, otherwise - false.

Note

Base class method always returns true.
CheckOpenLong

Gets the volume for a long position.

```cpp
virtual double CheckOpenLong(
    double price,  // price
    double sl      // Stop Loss
)
```

Parameters

- **price**
  - [in] Opening price of a long position.

- **sl**
  - [in] Stop Loss price of a long position.

Return Value

- Trade volume for a long position.
CheckOpenShort

Gets the volume for a short position.

```c++
virtual double CheckOpenShort(
    double price,    // price
    double sl        // Stop Loss
)
```

**Parameters**

- `price`  

- `sl`  

**Return Value**

Trade volume for a short position.
CheckReverse

Gets the volume for reverse of the position.

**virtual double CheckReverse**

- **CPositionInfo* position**, // pointer
- **double sl**, // Stop Loss

**Parameters**

- **position**
  - [in] Pointer to **CPositionInfo** class object.
- **sl**
  - [in] Stop Loss price.

**Return Value**

Volume for reverse of the position.
CheckClose

Checks conditions to close the opened position.

virtual double CheckClose()

Return Value

true - condition is satisfied, otherwise - false.
Modules of Trade Signals

The standard delivery of the client terminal includes a set of ready-made modules of trade signals for “MQL5 Wizard”. When creating an Expert Advisor in MQL5 Wizard, you can use any combination of the modules of trade signals (up to 64). The final decision on a trade operation is made on the basis of complex analysis of signals obtained from all included modules. The detailed description of the mechanism of making trade decisions is given below.

The standard delivery includes the following modules of signals:

- Signals of the Indicator Accelerator Oscillator
- Signals of the Indicator Adaptive Moving Average
- Signals of the Indicator Awesome Oscillator
- Signals of the Oscillator Bears Power
- Signals of the Oscillator Bulls Power
- Signals of the Oscillator Commodity Channel Index
- Signals of the Oscillator DeMarker
- Signals of the Indicator Double Exponential Moving Average
- Signals of the Indicator Envelopes
- Signals of the Indicator Fractal Adaptive Moving Average
- Signals of the Intraday Time Filter
- Signals of the Oscillator MACD
- Signals of the Indicator Moving Average
- Signals of the Indicator Parabolic SAR
- Signals of the Oscillator Relative Strength Index
- Signals of the Oscillator Relative Vigor Index
- Signals of the Oscillator Stochastic
- Signals of the Oscillator Triple Exponential Average
- Signals of the Indicator Triple Exponential Moving Average
- Signals of the Oscillator Williams Percent Range

The Mechanism of Making Trade Decisions on the Basis of Signal Modules

The mechanism of making trade decisions can be represented as the following list of basic principles:

- Each of the modules of signals has its set of market modules (certain combination of prices and values of an indicator).
- Each market model has a significance that may vary with the range of 1 to 100. The higher is the significance, the stronger the model is.
- Each of the models generates a forecast of direction of the price movement.
- A forecast of a module is the result of search for embedded models, and it is outputted as a number within the range of -100 to 100. The sign determines the direction of forecast movement (negative
sign means the price will fall, positive sign means the price will rise). The absolute value corresponds to the strength of the best found model.

- The forecast of each module is sent to the final "voting" with a weight coefficient of 0 to 1 specified in its settings ("Weight").
- The result of voting is a number within the range of -100 to 100, where the sign determines direction of the forecast movement, and the absolute value characterizes the strength of the signal. It is calculated as the Arithmetic mean of weighted forecasts of all the modules of signals. The absolute value is used by an Expert Advisor to make trade decisions.

Each generated Expert Advisor has two adjustable settings — threshold levels of opening and closing a position (ThresholdOpen and ThresholdClose) that can be equal to a value in the range of 0 to 100. If the strength of final signal exceeds a threshold level, a trade operation that corresponds to the sign of the signal is performed.

**Examples**

Consider an Expert Advisor with the following threshold levels: ThresholdOpen=20 and ThresholdClose=90. Two modules of signals participate in making decisions on trade operations: the MA module with weight 0.4 and the Stochastic module with weight 0.8. Let's analyze two variants of obtained trade signals:

**Variant 1**

The price crossed the rising MA upwards. This case corresponds to one of the market models implemented in the MA module. This model implies a rise of price. Its significance is equal to 100. At the same time, the Stochastic oscillator turned down and formed a divergence with price. This case corresponds to one of the models implemented in the Stochastic module. This model implies a fall of price. The weight of this model is 80.

Let's calculate the result of final "voting". The rate obtained from the MA module is calculated as $0.4 \times 100 = 40$. The value from the Stochastic module is calculated as $0.8 \times (-80) = -64$. The final value is calculated as the Arithmetic mean of these two rates: $(40 + (-64))/2 = -12$. The result of voting is the signal for selling with relative strength equal to 12. The threshold level that is equal to 20 is not reached. Thus a trade operation is not performed.

**Variant 2**

The price crossed the rising MA downwards. This case corresponds to one of the models implemented in the MA module. This model implies a rise of price. Its significance is equal to 10. At the same time, the Stochastic oscillator turned down and formed a divergence with price. This case corresponds to one of the models implemented in the Stochastic module. This model implies a fall of price. The weight of this model is 80.

Let's calculate the result of final "voting". The rate obtained from the MA module is calculated as $0.4 \times 10 = 4$. The value from the Stochastic module is calculated as $0.8 \times (-80) = -64$. The final value is calculated as the Arithmetic mean of these two rates: $(4 + (-64))/2 = -30$. The result of voting is the signal for selling with relative strength equal to 30. The threshold level that is equal to 20 is reached. Thus the result is the signal for opening a short position.
a) Divergence of the price and the Stochastic oscillator (variants 1 and 2).

b) The price crossed the MA indicator upwards (variant 1).

c) The price crossed the MA indicator downwards (variant 2).
Signals of the Indicator Accelerator Oscillator

This module is based on the market models of the indicator Accelerator Oscillator. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

Signals of the Intraday Time Filter

This module is based on the assumption that the efficiency of market models changes in time. Using this module, you can filter signals received from the other modules by hour and days of week. It allows increasing the quality of generated signals due to cutting off the unfavorable time periods. The mechanism of making trade decisions on the basis of signals of the modules is described in a separate section.

Conditions of Generation of Signals

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

</tr>
</tbody>
</table>

- **No objections to buying**
  The price is above the indicator.

- **No objections to selling**
  The price is below the indicator.

**Note**

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).
### Adjustable Parameters

This module has the following adjustable parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Weight</strong></td>
<td>Weight of signal of the module in the interval 0 to 1.</td>
</tr>
<tr>
<td><strong>PeriodMA</strong></td>
<td>Period of averaging of the indicator.</td>
</tr>
<tr>
<td><strong>Shift</strong></td>
<td>Shift of the indicator along the time axis (in bars).</td>
</tr>
<tr>
<td><strong>Method</strong></td>
<td>Method of averaging.</td>
</tr>
<tr>
<td><strong>Applied</strong></td>
<td>A <strong>price series</strong> used for calculation of the indicator.</td>
</tr>
</tbody>
</table>
**Signals of the Oscillator Williams Percent Range**

This module of signals is based on the market models of the oscillator Williams Percent Range. The mechanism of making trade decisions based on signals obtained from the modules is described in a separate section.

**Conditions of Generation of Signals**

Below you can find the description of conditions when the module passes a signal to an Expert Advisor.

<table>
<thead>
<tr>
<th>Signal Type</th>
<th>Description of Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>For buying</td>
<td>• Reverse behind the oversold level — the oscillator turned upwards and its value at the analyzed bar is behind the oversold level (default value is -80).</td>
</tr>
<tr>
<td></td>
<td>• Divergence — the first analyzed bottom of the oscillator is higher than the previous one, and the corresponding price bottom is lower than the previous one.</td>
</tr>
<tr>
<td>Signal Type</td>
<td>Description of Conditions</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>For selling</strong></td>
<td>• <strong>Reverse behind the overbought level</strong> — the oscillator turned downwards and its value at the analyzed bar is behind the overbought level (default value is -20).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Divergence</strong> — the first analyzed peak of the oscillator is lower than the previous one, and the corresponding price peak is higher than the previous peak.</td>
</tr>
</tbody>
</table>

| No objections to buying | Value of the oscillator grows at the analyzed bar. |
| No objections to selling | Value of the oscillator falls at the analyzed bar. |

**Note**

Depending on the mode of operation of an Expert Advisor ("Every tick" or "Open prices only") an analyzed bar is either the current bar (with index 0), or the last formed bar (with index 1).
Remember that the oscillator Williams Percent Range has a reversed scale. Its maximum value is -100, and minimum is 0.

**Adjustable Parameters**

This module has the following adjustable parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>Weight of signal of the module in the interval 0 to 1.</td>
</tr>
<tr>
<td>PeriodWPR</td>
<td>Period of calculation of the oscillator.</td>
</tr>
</tbody>
</table>
Trailing Stop classes

This section contains technical details of working with trailing stop classes and description of the relevant components of the MQL5 standard library.

The use of these classes will save time when creating (and testing) trading strategies.

MQL5 Standard Library (in terms of trading strategies) is placed in the terminal directory, in the Include\Expert\Trailing folder.

<table>
<thead>
<tr>

</tbody>
</table>
CTrailingFixedPips

CTrailingFixedPips is a class with implementation of Trailing Stop algorithm based on fixed points trailing.

CTrailingFixedPips class implements the following algorithm of trailing open positions: If Stop Loss level is equal to zero, Stop Loss order modification condition is considered unfulfilled, therefore there is no suggestion to change a position's Stop Loss. Otherwise, the check of whether the price has moved in favorable direction is performed.

If a position has a Stop Loss order, it checks the minimal allowed Stop Loss distance to the current price. If the position has no Stop Loss level, the distance between the current and open prices is checked. If the distance exceeds Stop Loss level, the system suggests to set a new Stop Loss price.

If Stop Loss modification condition is fulfilled and Take Profit is not equal to zero, the system suggests setting a new Take Profit price.

If Expert Advisor class has been initialized with the flag every_tick=false, it will perform all operations (trading, trailing, etc) only at the new bar on a working symbol and timeframe. In this case, setting Take Profit order allows you to close position when the price moves in the position direction before a new bar appears.

Description

CTrailingFixedPips implements the Trailing Stop algorithm at a specified "distance" from the current price (in points).

Declaration

```cpp
class CTrailingFixedPips: public CExpertTrailing
```

Title

```
#include <Expert\Trailing\CTrailingFixedPips.mqh>
```

Inheritance hierarchy

```
CObject
    CExpertBase
        CExpertTrailing
            CTrailingFixedPips
```

Check Trailing Methods
Initialization

| virtual CheckTrailingStopLong | Check Trailing Stop conditions of a long position |
| virtual CheckTrailingStopShort | Check Trailing Stop conditions of a short position |

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries, InitIndicators
StopLevel

Sets the value of Stop Loss level.

```c
void StopLevel(
    int stop_level // level
)
```

**Parameters**

*stop_loss*

[in] The value of Stop Loss level (in conventional 2/4-digit points).

**Note**

If Stop Loss level is equal to 0, the Trailing Stop is not used.
**ProfitLevel**

Sets the value of Take Profit level.

```cpp
void ProfitLevel(
    int profit_level  // level
)
```

**Parameters**

- `profit_level`  
  - [in] The value of Take Profit level (in conventional 2/4-digit points).

**Note**

If profit level is equal to 0, the Trailing Stop is not used.
ValidationSettings

Checks the settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

The function checks Take Profit and Stop Loss levels. The correct values are 0 and values greater than the minimal indentation in points from the current close price to place Stop orders.
CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```cpp
virtual bool CheckTrailingStopLong(
    CPositionInfo* position, // pointer
    double& sl,              // reference to Stop Loss
    double& tp               // reference to Take Profit
)
```

**Parameters**

- `position`
  - [in] Pointer to `CPositionInfo` object.

- `sl`
  - [in][out] Reference to variable for Stop Loss price.

- `tp`
  - [in][out] Reference to variable for Take Profit price.

**Return Value**

true - conditions are satisfied, otherwise - false.

**Note**

If Stop Loss level is equal to 0, the condition is not fulfilled (exit). If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the current Bid price is higher than base price+stop loss level, it suggests to set new Stop Loss price. In this case, if position already has Take Profit price, it suggests to set new Take Profit price equal to Bid price+take profit level.
CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```cpp
virtual bool CheckTrailingStopShort(
    CPositionInfo* position,       // pointer
    double&   sl,                  // reference to Stop Loss
    double&   tp                    // reference to Take Profit
)
```

**Parameters**

- `position`  
  [in] Pointer to `CPositionInfo` object.

- `sl`  
  [in][out] Reference to variable for Stop Loss price.

- `tp`  
  [in][out] Reference to variable for Take Profit price.

**Return Value**

true - conditions are satisfied, otherwise - false.

**Note**

If Stop Loss level is equal to 0, the condition is not fulfilled (exit). If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the current Ask price is lower than base price - stop loss level, it suggests to set new Stop Loss price. In this case, if position already has Take Profit price, it suggests to set new Take Profit price equal to Ask price - take profit level.
CTrailingMA

CTrailingMA is a class with implementation of Trailing Stop algorithm based on the values of moving average indicator.

Description

CTrailingMA class implements Trailing Stop algorithm based on the values of moving average indicator of the previous (completed) bar.

Declaration

```c
class CTrailingMA: public CExpertTrailing
```

Title

```c
#include <Expert\Trailing\TrailingMA.mqh>
```

Inheritance hierarchy

- CObject
  - CExpertBase
    - CExpertTrailing
      - CTrailingMA

Check Trailing Methods

| virtual **CheckTrailingStopLong** | Check Trailing Stop conditions of a long position |
| virtual **CheckTrailingStopShort** | Check Trailing Stop conditions of a short position |

Methods inherited from class CObject

- Prev, Prev, Next, Next, Save, Load, Type, Compare

Methods inherited from class CExpertBase
Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume,
RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries
Period

Sets period of a moving average.

```c
void Period(
    int period    // period
)
```

Parameters

- `period`
  - [in] Period of a moving average.
**Shift**

Sets shift of a moving average.

```c
void Shift(
    int shift  // parameter
)
```

**Parameters**

- `shift`
  - `[in]` Shift of a moving average.
**Method**

Sets smoothing method of a moving average.

```c
void Method(
    ENUM_MA_METHOD method  // parameter
)
```

**Parameters**

*method*

[in] Smoothing method (from `ENUM_MA_METHOD` enumeration) of a moving average.
Applied

Sets applied price of a moving average.

```c
void Applied(
    ENUM_APPLIED_PRICE applied // parameter
)
```

Parameters

- **applied**
  
InitIndicators

Initializes indicators and timeseries.

```cpp
virtual bool InitIndicators(
    CIndicators* indicators  // pointer
)
```

**Parameters**

*indicators*

[in] Pointer to indicators and timeseries collection (CExpert class member).

**Return Value**

true - successful, otherwise - false.
ValidationSettings

Checks the settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

The function checks the period of moving average, the correct values are positive.
CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```cpp
virtual bool CheckTrailingStopLong(
    CPositionInfo* position,  // pointer
    double& sl,              // reference
    double& tp                // reference
)
```

**Parameters**

- `position`  
  [in] Pointer to `CPositionInfo` object.

- `sl`  
  [in][out] Reference to variable for Stop Loss price.

- `tp`  
  [in][out] Reference to variable for Take Profit price.

**Return Value**

- `true` - conditions are satisfied, otherwise - `false`.

**Note**

First it calculates the maximal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of moving average indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the base price is the open price of the position. If the calculated Stop Loss price is higher than base price and lower than maximal allowed Stop Loss price, it suggests to set new Stop Loss price.
CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```cpp
virtual bool CheckTrailingStopShort(
    CPositionInfo* position,  // pointer
    double& sl,               // reference
    double& tp                 // reference
)
```

Parameters

- **position**
  - [in] Pointer to `CPositionInfo` object.
- **sl**
  - [in][out] Reference to variable for Stop Loss price.
- **tp**
  - [in][out] Reference to variable for Take Profit price.

Return Value

- `true` - conditions are satisfied, otherwise - `false`.

Note

First it calculates the minimal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of moving average indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the base price is the open price of the position. If the calculated Stop Loss price is lower than base price and higher than minimal allowed Stop Loss price, it suggests to set new Stop Loss price.
CTrailingNone

CTrailingNone is a stub class. This class should be used at initialization of trailing object in CExpert class if your strategy does not use Trailing Stop.

Description

CTrailingNone class does not implement any Trailing Stop algorithm. The methods of checking Trailing Stop conditions always return false.

Declaration

```cpp
class CTrailingNone: public CExpertTrailing
```

Title

```cpp
#include <Expert\Trailing\TrailingNone.mqh>
```

Inheritance hierarchy

- CObject
- CExpertBase
  - CExpertTrailing
    - CTrailingNone

Class Methods by Groups

Methods inherited from class CExpertTrailing

- `CheckTrailingStopLong`, `CheckTrailingStopShort`
CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```cpp
virtual bool CheckTrailingStopLong(
    CPositionInfo* position,  // pointer
    double&       sl,        // reference
    double&       tp          // reference
)
```

**Parameters**

- `position`  
  [in] Pointer to `CPositionInfo` object.

- `sl`  
  [in][out] Reference to variable for Stop Loss price.

- `tp`  
  [in][out] Reference to variable for Take Profit price.

**Return Value**

- true - conditions are satisfied, otherwise - false.

**Note**

The function always returns false.
CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```cpp
virtual bool CheckTrailingStopShort(
    CPositionInfo* position,  // pointer
    double& sl,               // reference
    double& tp                 // reference
)
```

**Parameters**

- `position` 
  
    [in] Pointer to `CPositionInfo` object.

- `sl` 
  
    [in][out] Reference to variable for Stop Loss price.

- `tp` 
  
    [in][out] Reference to variable for Take Profit price.

**Return Value**

  true - conditions are satisfied, otherwise - false.

**Note**

  The function always returns false.
CTrailingPSAR

CTrailingPSAR is a class with implementation of Trailing Stop algorithm based on the values of Parabolic SAR indicator.

Description

CTrailingPSAR class implements the Trailing Stop algorithm based on the values of Parabolic SAR indicator of the previous (completed) bar.

Declaration

```cpp
class CTrailingPSAR: public CExpertTrailing
```

Include

```cpp
#include <Expert\Trailing\TrailingParabolicSAR.mqh>
```

Inheritance hierarchy

- CObject
  - CExpertBase
    - CExpertTrailing
      - CTrailingPSAR

Methods inherited from class CExpertBase

- InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, ValidationSettings, SetPriceSeries, SetOtherSeries
Step

Sets the value of step of Parabolic SAR indicator.

```cpp
void Step(
    double step               // parameter
)
```

Parameters

step

Maximum

Sets the value of maximum of Parabolic SAR indicator.

```cpp
void Maximum{
    double maximum  // parameter
}
```

Parameters

maximum

**InitIndicators**

Initializes indicators and timeseries.

```cpp
virtual bool InitIndicators(
    CIndicators* indicators  // pointer
)
```

**Parameters**

- `indicators`  
  `[in]` Pointer to indicators and timeseries collection (**Expert** class member).

**Return Value**

- `true` - successful, otherwise - `false`. 
CheckTrailingStopLong

Checks Trailing Stop conditions of a long position.

```cpp
virtual bool CheckTrailingStopLong(
    CPositionInfo* position,       // pointer
    double& sl,                    // reference
    double& tp)                    // reference
```

**Parameters**

- `position`  
  [in] Pointer to `CPositionInfo` object.

- `sl`  
  [in][out] Reference to variable for Stop Loss price.

- `tp`  
  [in][out] Reference to variable for Take Profit price.

**Return Value**

- `true` - conditions are satisfied, otherwise - `false`.

**Note**

First it calculates the maximal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of Parabolic SAR indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the calculated Stop Loss price is higher than base price and lower than maximal allowed Stop Loss price, it suggests to set new Stop Loss price.
CheckTrailingStopShort

Checks Trailing Stop conditions of a short position.

```cpp
virtual bool CheckTrailingStopShort(
    CPositionInfo* position,  // pointer
    double& sl,              // reference
    double& tp                // reference
);
```

**Parameters**

- `position`
  - [in] Pointer to `CPositionInfo` object.
- `sl`
  - [in][out] Reference to variable for Stop Loss price.
- `tp`
  - [in][out] Reference to variable for Take Profit price.

**Return Value**

- `true` - conditions are satisfied, otherwise - `false`.

**Note**

First it calculates the minimal allowed Stop Loss price closest to the current price and calculates Stop Loss price using the values of Parabolic SAR indicator of the previous (completed) bar. If position already has Stop Loss price, its value is assumed as a base price, otherwise the position open price is assumed as a base price. If the calculated Stop Loss price is lower than base price and higher than minimal allowed Stop Loss price, it suggests to set new Stop Loss price.
Money Management classes

This section contains technical details of working with money and risk management classes and description of the relevant components of the MQL5 standard library.

The use of these classes will save time when creating (and testing) trading strategies.

MQL5 Standard Library (in terms of money and risk management classes) is placed in the terminal directory, in the Include\Expert\Money\ folder.

- InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries, InitIndicators

Methods inherited from class CExpertMoney

- Percent, CheckReverse, CheckClose
Lots

Sets trading volume (in lots).

```c
void Lots(
    double lots  // number of lots
)
```

Parameters

- `lots`
  
ValidationSettings

Checks the settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

Checks if the predefined fixed lot falls within the range of allowed values and is multiple of change step.
CheckOpenLong

Gets trade volume for a long position.

```cpp
virtual double CheckOpenLong(
    double price,   // price
    double sl       // Stop Loss price
)
```

**Parameters**

*price*

*sl*

**Return Value**

Trade volume for a long position.

**Note**

The function always returns the predefined fixed trade volume.
CheckOpenShort

Gets trade volume for a short position.

```cpp
virtual double CheckOpenShort(
    double price,      // price
    double sl          // Stop Loss price
)
```

**Parameters**

*price*

*sl*

**Return Value**

Trade volume for a short position.

**Note**

The function always returns the predefined fixed trade volume.
CMoneyFixedMargin

CMoneyFixedMargin is the class designed to implement money management algorithm based on trading with predefined fixed margin.

Description

CMoneyFixedMargin implements money management algorithm based on trading with predefined fixed margin.

Declaration

```cpp
class CMoneyFixedMargin: public CExpertMoney
```

Title

```cpp
#include <Expert\Money\MoneyFixedMargin.mqh>
```

Inheritance hierarchy

- CObject
- CExpertBase
  - CExpertMoney

Methods inherited from class CExpertMoney

- Percent, ValidationSettings, CheckReverse, CheckClose
CheckOpenLong

Gets trade volume for a long position.

```cpp
virtual double CheckOpenLong(
    double price,     // price
    double sl         // Stop Loss price
)
```

**Parameters**

- **price**
  - [in] Estimated open price.
- **sl**
  - [in] Estimated Stop Loss price.

**Return Value**

Trade volume for a long position.

**Note**

The function returns trade volume for a long position with a fixed predefined margin. The margin is defined by Percent parameter of `CExpertMoney` base class.
CheckOpenShort

Gets trade volume for a short position.

```cpp
virtual double CheckOpenShort(
    double price,     // price
    double sl         // Stop Loss price
)
```

**Parameters**

- `price`  

- `sl`  
  [in] Estimated Stop Loss price.

**Return Value**

- Trade volume for a short position.

**Note**

The function returns trade volume for a short position with a predefined fixed margin. The margin is defined by Percent parameter of `CExpertMoney` base class.
CMoneyFixedRisk

CMoneyFixedRisk is a class with implementation of money management algorithm with fixed predefined risk.

Description

CMoneyFixedRisk class implements the money management algorithm with fixed predefined risk.

Declaration

```cpp
class CMoneyFixedRisk : public CExpertMoney
```

Title

```cpp
#include <Expert\Money\MoneyFixedRisk.mqh>
```

- InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries, InitIndicators

Methods inherited from class CExpertMoney

- Percent, ValidationSettings, CheckReverse
CheckOpenLong

Gets trade volume for a long position.

```cpp
virtual double CheckOpenLong(
    double price, // price
    double sl     // Stop Loss price
)
```

**Parameters**

- `price`  
  - `[in]` Estimated open price.

- `sl`  
  - `[in]` Estimated Stop Loss price.

**Return Value**

Trade volume for a long position.

**Note**

The function returns trade volume for a long position with a fixed predefined risk level. The risk is defined by Percent parameter of `CExpertMoney` base class.
CheckOpenShort

Gets trade volume for a short position.

```cpp
virtual double CheckOpenShort(
    double price, // price
    double sl     // Stop Loss price
)
```

Parameters

- `price`
  - [in] Estimated open price.

- `sl`
  - [in] Estimated Stop Loss price.

Return Value

Trade volume for a short position.

Note

The function returns trade volume for a short position with a fixed predefined risk level. The risk is defined by Percent parameter of `CExpertMoney` base class.
CMoneyNone

CMoneyNone is a class with implementation of the "absence" of money and risk management.

Description

CMoneyNone class implements trading with minimal allowed lot.

Declaration

```cpp
class CMoneyNone: public CExpertMoney
```

Title

```cpp
#include <Expert\Money\MoneyNone.mqh>
```

Inheritance hierarchy

- CObject
  - CExpertBase
    - CExpertMoney
      - CMoneyNone

- InitIndicators

Methods inherited from class CExpertMoney

- Percent, CheckReverse, CheckClose
ValidationSettings

Checks the settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

The function always returns true.
CheckOpenLong

Gets trade volume for a long position.

```cpp
virtual double CheckOpenLong(
    double price,  // price
    double sl      // Stop Loss price
)
```

Parameters
- `price`  
  - [in] Estimated open price.
- `sl`  
  - [in] Estimated Stop Loss price.

Return Value
- Trade volume for a long position.

Note
- The function always returns the minimal lot size.
CheckOpenShort

Gets trade volume for a short position.

```cpp
virtual double CheckOpenShort(
    double price,  // price
    double sl      // Stop Loss price
)
```

**Parameters**

*price*

*sl*

[in] Estimated Stop Loss price.

**Return Value**

Trade volume for a short position.

**Note**

The function always returns the minimal lot size.
CMoneySizeOptimized

CMoneySizeOptimized is a class with implementation of money and risk management algorithm depending on results of the previous deals.

Description

CMoneySizeOptimized implements the market entry algorithm with the lot size depending on results of the previous deals.

Declaration

```cpp
class CMoneySizeOptimized: public CExpertMoney
```

Title

```cpp
#include <Expert\Money\MoneySizeOptimized.mqh>
```

Inheritance hierarchy

- CObject
  - CExpertBase
    - CExpertMoney
      - CMoneySizeOptimized

Methods inherited from class CExpertBase

- InitPhase, TrendType, UsedSeries, EveryTick, Open, High, Low, Close, Spread, Time, TickVolume, RealVolume, Init, Symbol, Period, Magic, SetMarginMode, SetPriceSeries, SetOtherSeries, InitIndicators

Methods inherited from class CExpertMoney

- Percent, CheckReverse, CheckClose
**DecreaseFactor**

Sets the value of decrease factor.

```cpp
void DecreaseFactor(
    double decrease_factor  // decrease factor
)
```

**Parameters**

- `decrease_factor`
  - [in] Decrease factor.

**Note**

The `DecreaseFactor` defines the open position volume decreasing coefficient (compared with the volume of a previous position) for the case of consecutive loss trades.
ValidationSettings

Checks the settings.

```cpp
virtual bool ValidationSettings()
```

Return Value

true - successful, otherwise - false.

Note

If the value of decrease factor is negative, it returns false, otherwise it returns true.
CheckOpenLong

Gets trade volume for a long position.

```cpp
virtual double CheckOpenLong(
    double price,     // price
    double sl         // Stop Loss price
)
```

**Parameters**

- **price**
  - [in] Estimated open price.

- **sl**
  - [in] Estimated Stop Loss price.

**Return Value**

Trade volume for long position.

**Note**

The function returns trade volume for a long position considering results of previous deals.
CheckOpenShort

Gets trade volume for a short position.

```cpp
virtual double CheckOpenShort(
    double price,   // price
    double sl       // Stop Loss price
)
```

Parameters

- **price**
  - [in] Estimated open price.

- **sl**
  - [in] Estimated Stop Loss price.

Return Value

- Trade volume for a long position.

Note

- The function returns trade volume for a short position considering results of previous deals.
Classes for Creating Control Panels and Dialogs

This section contains technical details of working with classes for creation of control panels and dialogs, as well as description of the relevant components of the MQL5 standard library.

The use of these classes will save time when developing custom interactive MQL5 applications, including Expert Advisors and indicators.

MQL5 Standard Library (in terms of classes for creation of control panels and dialogs) is placed in the terminal data folder, in the MQL5\Include\Controls.

Find the examples of working with classes in the following articles:

- How to create a graphical panel of any complexity level
- Improving Panels: Adding transparency, changing background color and inheriting from CAppDialog/CWndClient
- Adding a control panel to an indicator or an Expert Advisor in no time
- Create your own graphical panels in MQL5
- Creating active control panels in MQL5 for trading

The sample Expert Advisor, which illustrates the operation of these classes, can be found in MQL5\Expert\Examples\Controls.

## CRect

CRect is a class of the rectangular area of the chart.

### Description

CRect is a class of the area, it is defined by both coordinates of the upper-left and lower-right corners of a rectangle in Cartesian coordinates.

### Declaration

```cpp
class CRect
```

### Title

```cpp
#include <Controls\Rect.mqh>
```

</tbody>
</table>
**Left (Get Method)**

Gets the X coordinate of the upper-left corner.

```cpp
int Left()
```

**Return Value**

X coordinate of the upper-left corner.

**Left (Set Method)**

Sets the X coordinate of the upper-left corner.

```cpp
void Left(
    const int x  // x coordinate
)
```

**Parameters**

x  

[in] New X coordinate of the upper-left corner.

**Return Value**

None.
Top (Get Method)

Gets the Y coordinate of the upper-left corner.

```cpp
int Top()
```

Return Value

Y coordinate of the upper-left corner.

Top (Set Method)

Sets the Y coordinate of the upper-left corner.

```cpp
void Top(const int y // y coordinate)
```

Parameters

- **y**
  - [in] New Y coordinate of the upper-left corner.

Return Value

None.
Right (Get Method)

Gets the X coordinate of the lower-right corner.

```cpp
int Right()
```

Return Value

X coordinate of the lower-right corner.

Right (Set Method)

Sets the X coordinate of the lower-right corner.

```cpp
void Right(
    const int x // x coordinate
)
```

Parameters

- `x` [in] New X coordinate of the lower-right corner.

Return Value

None.
Bottom (Get Method)

Gets the Y coordinate of the lower-right corner.

```c
int Bottom()
```

Return Value

Y coordinate of the lower-right corner.

Bottom (Set Method)

Sets the Y coordinate of the lower-right corner.

```c
void Bottom(
    const int y  // y coordinate
)
```

Parameters

- `y`
  
  [in] New Y coordinate of the lower-right corner.

Return Value

None.
Width (Get Method)

Gets the width of the area.

```
int Width()
```

Return Value

Width of the area.

Width (Set Method)

Sets new width of the area.

```
virtual bool Width(
    const int w  // width
)
```

Parameters

`w`

Return Value

true - successful, otherwise - false.
**Height (Get Method)**

Gets the height of the area.

```cpp
int Height()
```

**Return Value**

Height of the area.

**Height (Set Method)**

Sets new height of the area.

```cpp
virtual bool Height(
    const int h // height
)
```

**Parameters**

- `h`
  

**Return Value**

- `true` - successful, otherwise - `false`. 
**SetBound**

Sets new coordinates of the area using CRect class coordinates.

```cpp
void SetBound(
    const &CRect rect // CRect class
)
```

**Parameters**

- `l`  
  [in] X coordinate of the upper-left corner.

- `t`  
  [in] Y coordinate of the upper-left corner.

- `r`  
  [in] X coordinate of the lower-right corner.

- `b`  
  [in] Y coordinate of the lower-right corner.

**Return Value**

None.
Move

Performs the absolute displacement of the area coordinates.

```c
void Move(...)
{
    const int x, // X coordinate
    const int y  // Y coordinate
}
```

Parameters

- `x`
  - [in] New X coordinate.

- `y`
  - [in] New Y coordinate.

Return Value

None.
Shift

Performs the relative displacement (shift) of the area coordinates.

```cpp
void Shift(
    const int dx,  // delta X
    const int dy   // delta Y
)
```

Parameters

- `dx`  
  [in] Delta X.

- `dy`  
  [in] Delta Y.

Return Value

None.
Contains

Checks if the point is inside the CRect class area.

```cpp
bool Contains(
    const int x,  // X coordinate
    const int y   // Y coordinate
)
```

Parameters

- \(x\)  
  [in] X coordinate.

- \(y\)  
  [in] Y coordinate.

Return Value

true - the point is inside the area (including borders), otherwise - false.
Format

Gets the area coordinates as a string.

```c
string Format(
    string & fmt,  // format
) const
```

Parameters

- `fmt`
  - [in] String with format.

Return Value

String with the area coordinates.
CDateTime

CDateTime is a structure for working with date and time.

Description

CDateTime is a structure derived from MqlDateTime, it is used for operation with date and time in controls.

Declaration

```cpp
struct CDateTime
```

Title

```cpp
#include <Tools\DateTime.mqh>
```

Methods

**Properties**

- `MonthName` Gets month name
- `ShortMonthName` Gets short name of the month
- `DayName` Gets full name of the day in a week
- `ShortDayName` Gets short name of the day in a week
- `DaysInMonth` Gets number of days in month

Get/Set methods

- `DateTime` Gets/sets date and time
- `Date` Sets date
- `Time` Sets time
- `Sec` Sets seconds
- `Min` Sets minutes
- `Hour` Sets hour
- `Day` Sets day of the month
- `Mon` Sets month
- `Year` Sets year

Additional methods

- `SecDec` Subtracts specified number of seconds
- `SecInc` Adds specified number of seconds
- `MinDec` Subtracts specified number of minutes
<table>
<thead>
<tr>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MinInc</strong></td>
<td>Adds specified number of minutes</td>
</tr>
<tr>
<td><strong>HourDec</strong></td>
<td>Subtracts specified number of hours</td>
</tr>
<tr>
<td><strong>HourInc</strong></td>
<td>Adds specified number of hours</td>
</tr>
<tr>
<td><strong>DayDec</strong></td>
<td>Subtracts specified number of days</td>
</tr>
<tr>
<td><strong>DayInc</strong></td>
<td>Adds specified number of days</td>
</tr>
<tr>
<td><strong>MonDec</strong></td>
<td>Subtracts specified number of months</td>
</tr>
<tr>
<td><strong>MonInc</strong></td>
<td>Adds specified number of months</td>
</tr>
<tr>
<td><strong>YearDec</strong></td>
<td>Subtracts specified number of years</td>
</tr>
<tr>
<td><strong>YearInc</strong></td>
<td>Adds specified number of years</td>
</tr>
</tbody>
</table>
MonthName

Gets month name.

```cpp
string MonthName() const
```

Gets month name by index.

```cpp
string MonthName(
    const int num // month index
) const
```

**Parameters**

- `num`
  - [in] Month index (1-12).

**Return Value**

- Full month name.
**ShortMonthName**

Gets short month name.

```cpp
string ShortMonthName() const
```

Gets short month name by index.

```cpp
string ShortMonthName(const int num // month index)
```

**Parameters**

- `num`
  
  [in] Month index (1-12).

**Return Value**

Short month name.
DayName

Gets full name of the day in a week.

```cpp
string DayName() const
```

Gets full name of the day in a week by index.

```cpp
string DayName(
    const int num // day index
) const
```

**Parameters**

`num`

[in] Day index (0-6).

**Return Value**

Full name of the day.
ShortDayName

Gets short name of the day in a week.

```cpp
string ShortDayName() const
```

Gets short name of the day in a week by index.

```cpp
string ShortDayName(
    const int num // day index
) const
```

Parameters

`num`

[in] Day index (0-6).

Return Value

Short name of the day.
DaysInMonth

Gets number of days in month.

```cpp
int DaysInMonth() const
```

Return Value

Number of days in month.
DateTime (Get Method)

Gets date and time.

```cpp
dateTime DateTime()
```

Return Value

Value of `dateTime` type.

DateTime (Set Method dateTime)

Sets date and time with `dateTime` type.

```cpp
void DateTime(
    const dateTime value // date and time
)
```

Parameters

- `value`
  
  [in] Value of `dateTime` type.

Return Value

None.

DateTime (Set Method MqlDateTime)

Sets date and time with `MqlDateTime` type.

```cpp
void DateTime(
    const MqlDateTime &value // date and time
)
```

Parameters

- `value`
  
  [in] Value of `MqlDateTime` type.

Return Value

None.
Date (Set Method datetime)

Sets date with `datetime` type.

```c
void Date(const datetime value); // date
```

**Parameters**

- `value`
  - [in] Value of `datetime` type.

**Return Value**

None.

Date (Set Method MqlDateTime)

Sets date with `MqlDateTime` type.

```c
void Date(const MqlDateTime &value); // date
```

**Parameters**

- `value`
  - [in] Value of `MqlDateTime` type.

**Return Value**

None.
Time (Set Method datetime)

Sets time with `datetime` type.

```cpp
void Time(
    const datetime value  // time
)
```

Parameters

- `value` 
  - [in] Value of `datetime` type.

Return Value

None.

Time (Set Method MqlDateTime)

Sets time with `MqlDateTime` type.

```cpp
void Time(
    const MqlDateTime &value  // time
)
```

Parameters

- `value` 
  - [in] Value of `MqlDateTime` type.

Return Value

None.
Sec

Sets seconds.

```cpp
void Sec(
    const int value  // seconds
)
```

Parameters

value

[in] Seconds.

Return Value

None.
Min

Sets minutes.

```cpp
void Min(
    const int value  // minutes
)
```

Parameters

value

Return Value

None.
Hour

Sets hour.

```c
void Hour(
    const int value    // hour
)
```

Parameters

value

[in] Hour.

Return Value

None.
Day

Sets day of the month.

```cpp
void Day(
    const int value  // day of month
)
```

Parameters

- `value`
  - `[in]` Day of month.

Return Value

None.
Mon

Sets month.

```c
void Mon(
    const int value  // month
)
```

Parameters

- `value`
  - `[in]` Month.

Return Value

None.
Year

Sets year.

```cpp
void Year(
    const int value   // year
)
```

Parameters

- `value` [in] Year.

Return Value

None.
SecDec

Subtracts specified number of seconds.

```c
void SecDec(
    int delta=1 // seconds
);
```

**Parameters**

`delta`

[in] Seconds to subtract.

**Return Value**

None.
SecInc

Adds specified number of seconds.

```c
void SecInc(
    int delta=1  // seconds
)
```

**Parameters**

delta

[in] Seconds to add.

**Return Value**

None.
**MinDec**

Subtracts specified number of minutes.

```c
void MinDec(
    int delta=1 // minutes
)
```

**Parameters**

- `delta`
  
  [in] Minutes to subtract.

**Return Value**

None.
MinInc

Adds specified number of minutes.

```c
void MinInc(
    int delta=1  // minutes
)
```

**Parameters**

delta

[in] Minutes to add.

**Return Value**

None.
HourDec

Subtracts specified number of hours.

```cpp
void HourDec(
    int delta=1  // hours
)
```

Parameters

delta

[in] Hours to subtract.

Return Value

None.
HourInc

Adds specified number of hours.

```c
void HourInc(
    int delta=1 // hours
)
```

**Parameters**

*delta*

[in] Hours to add.

**Return Value**

None.
**DayDec**

Subtracts specified number of days.

```c
void DayDec(
    int delta=1       // days
)
```

**Parameters**

- `delta`

  [in] Days to subtract.

**Return Value**

None.
DayInc

Adds specified number of days.

```cpp
void DayInc(
    int delta=1  // days
)
```

Parameters

delta
  [in] Days to add.

Return Value

None.
**MonDec**

Subtracts specified number of months.

```c
void MonDec(
    int delta=1    // months
)
```

**Parameters**

`delta`

[in] Months to subtract.

**Return Value**

None.
MonInc

Adds specified number of months.

```c
void MonInc(
    int delta=1  // months
)
```

**Parameters**

- `delta`
  - [in] Months to add.

**Return Value**

None.
YearDec

Subtracts specified number of years.

```c
void YearDec(
    int delta=1 // years
)
```

Parameters

delta

[in] Years to subtract.

Return Value

None.
YearInc

Adds specified number of years.

```cpp
void YearInc(
    int delta=1 // years
)
```

Parameters

delta

[in] Years to add.

Return Value

None.
**CWnd**

CWnd is a base class for all Standard Library controls.

**Description**

CWnd class is the implementation of the base control class.

**Declaration**

```cpp
#include <Controls/Wnd.mqh>
```

**Inheritance hierarchy**

- CObject
  - CWnd

**Direct descendants**

- CDragWnd, CWndContainer, CWndObj

### Create and destroy

- **Deactivate**  
  Deactivates the control

### State flags

- **StateFlags**  
  Gets/sets the control state flags
- **StateFlagsSet**  
  Sets the control state flags  
- **StateFlagsReset**  
  Resets the control state flags

### Properties flags

- **PropFlags**  
  Gets/sets the control properties flags
- **PropFlagsSet**  
  Sets the control properties flags
- **PropFlagsReset**  
  Resets the control properties flags

### Mouse operations

- **MouseX**  
  Gets/saves the mouse X coordinate
- **MouseY**  
  Gets/saves the mouse Y coordinate
- **MouseFlags**  
  Gets/saves the mouse buttons state
- **MouseFocusKill**  
  Kills mouse focus

### Internal event handlers

- **OnCreate**  
  "Create" event handler
- **OnDestroy**  
  "Destroy" event handler
- **OnMove**  
  "Move" event handler
- **OnResize**  
  "Resize" event handler
- **OnEnable**  
  "Enable" event handler
- **OnDisable**  
  "Disable" event handler
- **OnShow**  
  "Show" event handler
- **OnHide**  
  "Hide" event handler
- **OnActivate**  
  "Activate" event handler
- **OnDeactivate**  
  "Deactivate" event handler
- **OnClick**  
  "Click" event handler
- **OnChange**  
  "Change" event handler

### Mouse event handlers

- **OnMouseDown**  
  "MouseDown" event handler
- **OnMouseUp**  
  "MouseUp" event handler
## Create and destroy

**Methods inherited from class CObject**

- Prev, Prev, Next, Next, Save, Load, Type, Compare
Create

Creates a control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,    // x1 coordinate
    const int y1,    // y1 coordinate
    const int x2,    // x2 coordinate
    const int y2    // y2 coordinate
);
```

**Parameters**

- `chart`
  - [in] ID of the chart, at which the control is created.

- `name`
  - [in] Unique name of the control.

- `subwin`
  - [in] Chart subwindow, at which the control is created.

- `x1`
  - [in] X coordinate of the upper-left corner.

- `y1`
  - [in] Y coordinate of the upper-left corner.

- `x2`
  - [in] X coordinate of the lower-right corner.

- `y2`
  - [in] Y coordinate of the lower-right corner.

**Return Value**

- `true` - successful, otherwise - `false`.

**Note**

Base class method only saves the creation parameters and always returns `true`. 
Destroy

Destroys a control.

```cpp
virtual bool Destroy()
```

Return Value

true - successful, otherwise - false.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,       // ID
    const long& lparam, // event parameter
    const double& dparam, // event parameter
    const string& sparam // event parameter
)
```

**Parameters**

*id*

[in] Event ID.

*lparam*

*dparam*

[in] Event parameter of `double` type, passed by reference.

*sparam*

[in] Event parameter of `string` type, passed by reference.

**Return Value**

true - event has been processed, otherwise - false.
OnMouseEvent

Mouse event handler (the CHARTEVENT_MOUSE_MOVE chart event).

```cpp
virtual bool OnMouseEvent(
    const int x,  // x coordinate
    const int y,  // y coordinate
    const int flags // flags
)
```

**Parameters**

- `x`  
  [in] X coordinate of the mouse cursor relative to the upper-left corner of the chart.

- `y`  
  [in] Y coordinate of the mouse cursor relative to the upper-left corner of the chart.

- `flags`  

**Return Value**

- `true` - event has been processed, otherwise - `false`.

© 2000-2021, MetaQuotes Ltd
Name

Gets control name.

```
string Name() const
```

Return Value

Control name.
ControlsTotal

Gets the number of controls in the container.

```cpp
int ControlsTotal() const
```

Return Value

Number of controls in container.

Note

The base class method does not have the container, it provides the access to container for its heirs and always returns 0.
Control

Gets the control from the container by index.

```cpp
CWnd* Control(
    const int ind // index
) const
```

### Parameters

- `ind`
  - [in] Control index.

### Return Value

A pointer to the control.

### Note

The base class method does not have the container, it provides the access to container for its heirs and always returns NULL.
ControlFind

Gets the control from container by specified ID.

```cpp
virtual CWnd* ControlFind(
    const long id   // ID
)
```

**Parameters**

- `id`  
  - [in] Identifier of the control to find.

**Return Value**

- Pointer to the control from the container.

**Note**

The base class method does not have the container, it provides the access to container for its heirs. If the specified ID matches the container's one, it returns a pointer to itself (this).
Rect

Gets the pointer to the CRect class object.

```cpp
const CRect* Rect() const
```

Return Value

Pointer to the CRect class object.
Left (Get Method)

Gets the X coordinate of the upper-left corner of the control.

```cpp
int Left()
```

Return Value

X coordinate of the upper-left corner of the control.

Left (Set Method)

Sets the X coordinate of the upper-left corner of the control.

```cpp
void Left(
    const int x  // coordinate
)
```

Parameters

x

[in] New X coordinate of the upper-left corner.

Return Value

None.
Top (Get Method)

Gets the Y coordinate of the upper-left corner of the control.

```cpp
int Top()
```

Return Value

Y coordinate of the upper-left corner of the control.

Top (Set Method)

Sets the Y coordinate of the upper-left corner of the control.

```cpp
void Top(
    const int y // y coordinate
)
```

Parameters

y

[in] New Y coordinate of the upper-left corner.

Return Value

None.
Right (Get Method)

Gets the X coordinate of the lower-right corner of the control.

```cpp
int Right()
```

Return Value

X coordinate of the lower-right corner.

Right (Set Method)

Sets the X coordinate of the lower-right corner of the control.

```cpp
void Right(
    const int x  // x coordinate
)
```

Parameters

x

[in] New X coordinate of the lower-right corner.

Return Value

None.
**Bottom (Get Method)**

Gets the Y coordinate of the lower-right corner of the control.

```c
int Bottom()
```

**Return Value**

Y coordinate of the lower-right corner of the control.

**Bottom (Set Method)**

Sets the Y coordinate of the lower-right corner of the control.

```c
void Bottom(
    const int y  // y coordinate
)
```

**Parameters**

- `y`
  - `[in]` New Y coordinate of the lower-right corner.

**Return Value**

None.
**Width (Get Method)**

Gets the control width.

```cpp
int Width()
```

**Return Value**

Width of the control.

**Width (Set Method)**

Sets the width of the control.

```cpp
virtual bool Width(
    const int w  // width
)
```

**Parameters**

- `w`
  

**Return Value**

- `true` - successful, otherwise - `false`. 
**Height (Get Method)**

Gets the control height.

```
int Height()
```

**Return Value**

Height of the control.

---

**Height (Set Method)**

Sets new height of the control.

```
virtual bool Height(
    const int h // height
)
```

**Parameters**

- `h`
  

**Return Value**

- `true` - successful, otherwise - `false`. 
**Move**

Performs absolute displacement of a control.

```cpp
void Move(
    const int x,  // x coordinate
    const int y   // y coordinate
)
```

**Parameters**

- **x**
  - `[in]` New X coordinate of the upper-left point.

- **y**
  - `[in]` New Y coordinate of the upper-left point.

**Return Value**

- `true` - successful, otherwise - `false`. 
Shift

Performs the relative shift of a control.

```c
void Shift(
    const int dx,  // delta X
    const int dy   // delta Y
)
```

Parameters

dx
[in] Delta X.
dy
[in] Delta Y.

Return Value

ture - successful, otherwise - false.
Resize

Sets a size of the control.

```c
virtual bool Resize(
    const int w,
    const int h
)
```

Parameters

Return Value

- `true` - successful, otherwise - `false`.
Contains

Checks if the point is inside the control area of the chart.

```cpp
bool Contains(
    const int x,  // X coordinate
    const int y   // Y coordinate
)
```

Parameters

- x
  - [in] X coordinate.

- y
  - [in] Y coordinate.

Return Value

- true - the point is inside the area (including borders), otherwise - false.

Contains

Checks if the specified control is inside the control area of the chart.

```cpp
bool Contains(
    const CWnd* control  // pointer
)
```

Parameters

- control
  - [in] Object pointer.

Return Value

- true - the specified control is inside the area (including borders), otherwise - false.
Alignment

Sets alignment parameters of the control.

```c
void Alignment(
    const int flags, // flags
    const int left,  // offset
    const int top,   // offset
    const int right, // offset
    const int bottom // offset
)
```

Parameters

- **flags**

- **left**
  - [in] Fixed offset from the left border.

- **top**
  - [in] Fixed offset from the top border.

- **right**
  - [in] Fixed offset from the right border.

- **bottom**
  - [in] Fixed offset from the bottom border.

Return Value

None.

Note

Alignment flags:

```c
enum WND_ALIGN_FLAGS
{
    WND_ALIGN_NONE=0,          // no align
    WND_ALIGN_LEFT=1,          // align left
    WND_ALIGN_TOP=2,           // align top
    WND_ALIGN_RIGHT=4,         // align right
    WND_ALIGN_BOTTOM=8,        // align bottom
    WND_ALIGN_WIDTH = WND_ALIGN_LEFT|WND_ALIGN_RIGHT,  // align width
    WND_ALIGN_HEIGHT=WND_ALIGN_TOP|WND_ALIGN_BOTTOM,  // align height
    WND_ALIGN_CLIENT=WND_ALIGN_WIDTH|WND_ALIGN_HEIGHT, // align height and width
}
```
Align

Performs control alignment in the specified chart area.

```cpp
virtual bool Align(
    const CRect* rect // pointer
)
```

Parameters

- `rect`
  - [in] Pointer to the object with chart area coordinates.

Return Value

- true - successful, otherwise - false.

Note

- The alignment parameters must be specified (no alignment by default).
**Id (Get Method)**

Gets the control ID.

```cpp
long Id() const
```

**Return Value**

The control identifier.

**Id (Set Method)**

Sets the value of the control ID.

```cpp
virtual long Id(
    const long id // identifier
)
```

**Parameters**

- `id`

**Return Value**

None.
isEnabled

Checks the control ability to respond to user's actions.

```cpp
bool isEnabled() const
```

Return Value

- true - control is enabled, otherwise - false.
Enable

Enables the control ability to respond to user's actions.

```cpp
virtual bool Enable()
```

Return Value

true - successful, otherwise - false.

Note

If the control is enabled, it is able to process the external events.
Disable

Disables the control ability to respond to user's actions.

```cpp
virtual bool Disable()
```

Return Value

- true - successful, otherwise - false.

Note

The disabled control is not able to process the external events.
isVisible

Checks whether the control is visible.

```cpp
bool isVisible() const
```

Return Value

- true - control is shown on the chart, otherwise - false.
Visible

Sets the visibility flag.

```cpp
virtual bool Visible(
    const bool flag  // flag
)
```

**Parameters**

*flag*

**Return Value**

true - successful, otherwise - false.
Show

Shows the control.

```cpp
virtual bool Show()
```

Return Value

- `true` - successful, otherwise - `false`. 
Hide

Hides the control.

virtual bool Hide()

Return Value

ture - successful, otherwise - false.
IsActive

Gets a value indicating whether the control is active.

```cpp
bool IsActive() const
```

Return Value

- true - control is active, otherwise - false.
Activate

Activates the control.

```cpp
virtual bool Activate();
```

Return Value

true - successful, otherwise - false.

Note

The control becomes active when the mouse cursor is hovering over it.
Deactivate

Deactivates the control.

```cpp
virtual bool Deactivate()
```

Return Value

true - successful, otherwise - false.

Note

The control becomes inactive when the mouse cursor is out off the control.
StateFlags (Get Method)

Gets the control state flags.

```cpp
int StateFlags()
```

Return Value

The control state flags.

StateFlags (Set Method)

Sets the control state flags.

```cpp
virtual void StateFlags(
    const int flags  // flags
)
```

Parameters

`flags`

Return Value

None.
StateFlagsSet

Sets the control state flags.

```
virtual void StateFlagsSet(
    const int flags // flags
);
```

Parameters

- **flags**
  - [in] Flags to set.

Return Value

None.
StateFlagsReset

Resets the control state flags.

virtual void StateFlagsReset(
    const int flags // flags
)

Parameters

flags
   [in] Flags to reset.

Return Value

None.
PropFlags (Get Method)

Gets the control properties flags.

```cpp
void PropFlags(
    const int flags // flags
)
```

Return Value

The control properties flags.

PropFlags (Set Method)

Sets the control properties flags.

```cpp
virtual void PropFlags(
    const int flags // flags
)
```

Parameters

flags

Return Value

None.
PropFlagsSet

Sets the control properties flags.

```cpp
virtual void PropFlagsSet(
    const int flags    // flags
)
```

Parameters

`flags`

[in] Flags to set.

Return Value

None.
**PropFlagsReset**

Resets the control properties flags.

```cpp
virtual void PropFlagsReset(
    const int flags // flags
)
```

**Parameters**

- `flags`
  - [in] Flags to reset.

**Return Value**

None.
MouseX (Set Method)

Saves the mouse X coordinate.

```c
void MouseX(
    const int value  // coordinate
)
```

Parameters

- `value`
  - [in] The X coordinate of the mouse.

Return Value

None.

MouseX (Get Method)

Gets the saved X coordinate of the mouse.

```c
int MouseX()
```

Return Value

The X coordinate of the mouse.
**MouseY (Set Method)**

Saves the mouse Y coordinate.

```cpp
void MouseY(
    const int value  // coordinate
)
```

**Parameters**

`value`

**Return Value**

None.

---

**MouseY (Get Method)**

Gets the saved Y coordinate of the mouse.

```cpp
int MouseY()
```

**Return Value**

The Y coordinate of the mouse.
MouseFlags (Set Method)

Saves the state of mouse buttons.

```cpp
virtual void MouseFlags(
    const int value  // state
)
```

**Parameters**

`value`

**Return Value**

None.

MouseFlags (Get Method)

Gets the saved state of mouse buttons.

```cpp
int MouseFlags()
```

**Return Value**

State of mouse buttons.
MouseFocusKill

Clears the saved state of mouse buttons and deactivates the control.

```cpp
bool MouseFocusKill(
    const long id=CONTROLS_INVALID_ID  // id
)
```

**Parameters**

- `id=CONTROLS_INVALID_ID`
  
  [in] Identifier of the control, that received mouse focus.

**Return Value**

The control deactivation result.
OnCreate

The virtual handler of the internal "Create" event.

```cpp
virtual bool OnCreate()
```

Return Value

- true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
**OnDestroy**

The virtual handler of the internal “Destroy” event.

```
virtual bool OnDestroy()
```

**Return Value**

true - event processed, otherwise - false.

**Note**

The base class method does nothing and always returns true.
OnMove

The virtual handler of the internal "Move" event.

```cpp
virtual bool OnMove()
```

Return Value

- true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
**OnResize**

The virtual handler of the internal "Resize" event.

```cpp
virtual bool OnResize()
```

**Return Value**

- true - event processed, otherwise - false.

**Note**

The base class method does nothing and always returns true.
OnEnable

The virtual handler of the internal "Enable" event (if enabled, it can respond to user interaction).

```cpp
virtual bool OnEnable()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnDisable

The virtual handler of the internal “Disable” event (if disabled, it cannot respond to user interaction).

    virtual bool OnDisable()

Return Value

    true - event processed, otherwise - false.

Note

    The base class method does nothing and always returns true.
OnShow

The virtual handler of the internal "Show" event.

```cpp
virtual bool OnShow()
```

**Return Value**

- true - event processed, otherwise - false.

**Note**

The base class method does nothing and always returns true.
OnHide

The virtual handler of the internal "Hide" event.

```cpp
virtual bool OnHide()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnActivate

The virtual handler of the internal "Activate" event.

```cpp
virtual bool OnActivate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnDeactivate

The virtual handler of the internal "Deactivate" event.

```cpp
virtual bool OnDeactivate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnClick

The virtual handler of the internal "Click" event (mouse click).

```cpp
virtual bool OnClick()
```

Return Value

true - event processed, otherwise - false.
OnChange

The virtual handler of the internal "Change" event.

```cpp
virtual bool OnChange()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnMouseDown

The virtual handler of the "MouseDown" (mouse click) event.

```cpp
virtual bool OnMouseDown()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseDown" event occurs when left mouse button is pressed on the control.
OnMouseUp

The virtual handler of the "MouseUp" (mouse button release) event.

```cpp
virtual bool OnMouseUp()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseUp" event occurs when left mouse button is released on the control.
OnDragStart

The virtual handler of the "DragStart" (start dragging) event.

```cpp
virtual bool OnDragStart()
```

Return Value

- true - event processed, otherwise - false.

Note

The "DragStart" event occurs at the start of control dragging operation.
OnDragProcess

The virtual handler of the "DragProcess" (dragging) event.

```cpp
virtual bool OnDragProcess(
    const int x,  // x coordinate
    const int y   // y coordinate
)
```

Parameters

- `x`
  - [in] Current X coordinate of mouse cursor.

- `y`

Return Value

- true - event processed, otherwise - false.

Note

- The "DragProcess" event occurs when the control is dragged.
OnDragEnd

The virtual handler of the "DragEnd" event.

```cpp
virtual bool OnDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "DragEnd" event occurs when control drag process is finished.
DragObjectCreate

Creates drag object.

```cpp
virtual bool DragObjectCreate()
```

**Return Value**

true - successful, otherwise - false.

**Note**

true - event processed, otherwise - false.
DragObjectDestroy

Destroys drag object.

```cpp
virtual bool DragObjectDestroy()
```

Return Value

true - successful, otherwise - false.
**CWндObj**

**CWндObj** is a base class for simple controls (based on chart objects) of the Standard Library.

**Description**

**CWндObj** class implements base methods of the simple control.

**Declaration**

```cpp
class CWндObj : public CWnd
```

**Title**

```cpp
#include <ControlsWndObj.mqh>
```

**Inheritance hierarchy**

```
CObject
 CWnd
     CWндObj
```

**Direct descendants**

```
CBmpButton, CButton, CEdit, CLabel, CPanel, CPicture
```

### Methods inherited from class CWnd

Create, Destroy, OnMouseEvent, Name, ControlsTotal, Control, ControlFind, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Move, Move, Shift, Contains, Contains, Alignment, Align, Id, Id, IsEnabled, Enable, Disable, IsVisible, Visible, Show, Hide, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id, // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

**Parameters**

*id*

[in] Event ID.

*lparam*

*dparam*

[in] Event parameter of `double` type, passed by reference.

*sparam*

[in] Event parameter of `string` type, passed by reference.

**Return Value**

true - event processed, otherwise - false.
Text (Get method)

Gets the `OBJPROP_TEXT` (text) property of the chart object.

```csharp
string Text();
```

Return Value

The value of the `OBJPROP_TEXT` property.

Text (Set method)

Sets the `OBJPROP_TEXT` (text) property of the chart object.

```csharp
bool Text(
    const string value // value
);
```

Parameters

- `value`
  - `[in]` New value of the `OBJPROP_TEXT` property.

Return Value

- `true` - successful, otherwise - `false`. 
Color (Get method)

Gets the OBJPROP_COLOR (color) property of the chart object.

```cpp
  color  Color();
```

Return Value

The value of the OBJPROP_COLOR property.

Color (Set method)

Sets the OBJPROP_COLOR (color) property of the chart object.

```cpp
  bool  Color(
      const color  value  // value
  );
```

Parameters

- `value`
  
  [in] New value of the OBJPROP_COLOR property.

Return Value

true - successful, otherwise - false.
ColorBackground (Get method)

Gets the OBJPROP_BGCOLOR (background color) of the chart object.

```cpp
color ColorBackground()
```

Return Value

The value of the OBJPROP_BGCOLOR property.

ColorBackground (Set method)

Sets the OBJPROP_BGCOLOR (background color) property of the chart object.

```cpp
bool ColorBackground{
    const color value      // value
}
```

Parameters

value

Return Value

true - successful, otherwise - false.
ColorBorder (Get method)

Gets the OBJPROP_BORDER_COLOR (border color) property of the chart object.

```cpp
color ColorBorder()
```

**Return Value**

The value of the OBJPROP_BORDER_COLOR property.

---

ColorBorder (Set method)

Sets the OBJPROP_BORDER_COLOR (border color) property of the chart object.

```cpp
bool ColorBorder(
    const color value  // value
)
```

**Parameters**

`value`

**Return Value**

true - successful, otherwise - false.
Font (Get method)

Gets the OBJPROP_FONT (font) property of the chart object.

```cpp
string Font();
```

**Return Value**

The value of the OBJPROP_FONT property.

Font (Set method)

Sets the OBJPROP_FONT (font) property of the chart object.

```cpp
bool Font(const string value); // value
```

**Parameters**

- `value`  

**Return Value**

true - successful, otherwise - false.
FontSize (Get method)

Gets the OBJPROP_FONTIZE (font size) property of the chart object.

```csharp
int FontSize()
```

Return Value

The value of the OBJPROP_FONTIZE property.

FontSize (Set method)

Sets the OBJPROP_FONTIZE (font size) property of the chart object.

```csharp
bool FontSize(
    const int value    // value
)
```

Parameters

value

[in] New value of the OBJPROP_FONTIZE property.

Return Value

true - successful, otherwise - false.
ZOrder (Get method)

Gets the OBJPROP_ZORDER property of the chart object.

```cpp
long ZOrder()
```

Return Value

The value of the OBJPROP_ZORDER property.

ZOrder (Set method)

Sets the OBJPROP_ZORDER property of the chart object.

```cpp
bool ZOrder(
            const long value // value
)
```

Parameters

value

Return Value

true - successful, otherwise - false.
OnObjectCreate

The virtual handler of chart object `CHARTEVENT_OBJECT_CREATE` event.

```cpp
virtual bool OnObjectCreate()
```

Return Value

- true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnObjectChange

The virtual handler of chart object `CHART_EVENT_OBJECT_CHANGE` event.

```cpp
virtual bool OnObjectChange()
```

Return Value

- true - event processed, otherwise - false.
OnObjectDelete

The virtual handler of chart object CHARTEVENT_OBJECT_DELETE event.

virtual bool OnObjectDelete()

Return Value

true - event processed, otherwise - false.
OnObjectDrag

The virtual handler of chart object `CHART_EVENT_OBJECT_DRAG` event.

```cpp
virtual bool OnObjectDrag()
```

Return Value

- true - event processed, otherwise - false.
OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```c++
virtual bool OnSetText()
```

Return Value

- true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```cpp
virtual bool OnSetColor()
```

Return Value

- true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnSetColorBackground

The virtual handler of control "SetColorBackground" (change of the OBJPROP_BGCOLOR property) event.

```cpp
virtual bool OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnSetFont

The virtual handler of “SetFont” (change of the OBJPROP.FONT property) event.

```cpp
virtual bool OnSetFont()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnSetFontSize

The virtual handler of "SetFontSize" (change of the OBJPROP_FONTSIZE property) event.

```cpp
virtual bool OnSetFontSize()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnSetZOrder

The virtual handler of “SetZOrder” (change of the OBJPROP_ZORDER property) event.

```cpp
virtual bool OnSetZOrder()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnDestroy

The virtual handler of control "Destroy" internal event.

```cpp
virtual bool OnDestroy()
```

Return Value

- true - event processed, otherwise - false.
**OnChange**

The virtual handler of control "Change" internal event.

```c
virtual bool OnChange()
```

**Return Value**

true - event processed, otherwise - false.
CWndContainer

CWndContainer is a base class for a complex control (containing dependent controls) of the Standard library.

Description

CWndContainer class implements base methods of the complex control.

Declaration

```cpp
class CWndContainer : public CWnd
```

Title

```cpp
#include <Controls\WndContainer.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndContainer

Direct descendants

- CCheckBox, CComboBox, CDateDropList, CDatePicker, CDialog, CRadioButton, CScroll, CSpinEdit, CWndClient

</tbody>
</table>
**Destroy**

Destroys all the container controls.

```cpp
virtual bool Destroy()
```

**Return Value**

- `true` - successful, otherwise - `false`. 
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,  // ID
    const long& lparam,  // parameter
    const double& dparam,  // parameter
    const string& sparam  // parameter
) {
}
```

**Parameters**

- `id`[
  - [in] Event ID.

- `lparam`[
  - [in] Event parameter of `long` type, passed by reference.

- `dparam`[
  - [in] Event parameter of `double` type, passed by reference.

- `sparam`[
  - [in] Event parameter of `string` type, passed by reference.

**Return Value**

- true - event processed, otherwise - false.
OnMouseEvent

Mouse event handler.

```cpp
class OnMouseEvent {
  virtual bool OnMouseEvent(
    const int x,    // x coordinate
    const int y,    // y coordinate
    const int flags // flags
  )
}
```

Parameters

- **x**
  - [in] X coordinate of the mouse cursor relative to the upper-left corner of the chart.

- **y**
  - [in] Y coordinate of the mouse cursor relative to the upper-left corner of the chart.

- **flags**
  - [in] Flag of mouse buttons states.

Return Value

- true - event processed, otherwise - false.
ControlsTotal

Gets the number of controls in the container.

```
int ControlsTotal(const)  // const
```

Return Value

Number of controls in the container.
Control

Gets control from the container by index.

```cpp
HWND* Control(
    const int ind  // index
) const
```

Parameters

- `ind`
  - [in] Index of the control needed.

Return Value

- Pointer to the control, otherwise NULL if the control is not found.
ControlFind

Gets control from the container by identifier.

```cpp
virtual CWnd* ControlFind(
    const long id // id
)
```

**Parameters**

`id`

[in] Control ID.

**Return Value**

Pointer to the control, otherwise NULL if the control is not found.
Add

Adds a control to a group (container).

```cpp
bool Add(
    CWnd& control // reference
)
```

Parameters

control

[in] Control to add, passed by reference.

Return Value

true - successful, otherwise - false.
Delete

Deletes control from a group (container).

```cpp
bool Delete(
    CWnd& control  // reference
)
```

Parameters

control

[in] Control to delete, passed by reference.

Return Value

true - successful, otherwise - false.
**Move**

Performs an absolute displacement of all controls of the container.

```cpp
virtual bool Move(
    const int x,  // X coordinate
    const int y  // Y coordinate
)
```

**Parameters**

- `x`
  - [in] New X coordinate of the upper-left corner.

- `y`
  - [in] New Y coordinate of the upper-left corner.

**Return Value**

true - successful, otherwise - false.
Shift
Performs the relative shift of the coordinates for all controls of the container.

```cpp
virtual bool Shift(
    const int dx,  // delta X
    const int dy   // delta Y
);
```

**Parameters**

- `dx`  
  `[in]` Delta X.

- `dy`  
  `[in]` Delta Y.

**Return Value**

true · successful, otherwise · false.
**Id**

Sets the ID for all controls of the container.

```cpp
virtual long Id(const long id) // identifier
```

**Parameters**

`id`

[in] Base group identifier.

**Return Value**

Number of identifiers used by container controls.
Enable

Enables all the controls of the container.

```
virtual bool Enable()
```

Return Value

true - successful, otherwise - false.
Disable

Disables all controls of the container.

```cpp
virtual bool Disable()
```

Return Value

true - successful, otherwise - false.
Show

Shows all controls of the container.

```cpp
virtual bool Show()
```

Return Value

- true - successful, otherwise - false.
Hide

Hides all controls of the container.

```cpp
virtual bool Hide()
```

Return Value

- `true` - successful, otherwise - `false`. 
MouseFocusKill

Clears the saved state of mouse buttons and deactivates all controls in the container.

```cpp
bool MouseFocusKill(
    const long id=CONTROLS_INVALID_ID // id
);
```

Parameters

- `id=CONTROLS_INVALID_ID`
  - [in] Identifier of the control, that received mouse focus.

Return Value

The controls deactivation result.
Save

Saves container information to file.

```cpp
virtual bool Save(
    const int file_handle  // handle
)
```

**Parameters**

- `file_handle`
  
  [in] Handle of the binary file previously opened for writing.

**Return Value**

- `true` - successful, otherwise - `false`. 
Load

Loads container information from file

```cpp
virtual bool Load(
    const int file_handle // handle
)
```

**Parameters**

- `file_handle`
  
  [in] Handle of the binary file previously opened for reading.

**Return Value**

- `true` - successful, otherwise - `false`. 
OnResize

The virtual handler of control “Resize” internal event.

```cpp
virtual bool OnResize()
```

**Return Value**

true - event processed, otherwise - false.

**Note**

The base class method does nothing and always returns true.
OnActivate

The virtual handler of control "Activate" internal event.

```cpp
virtual bool OnActivate()
```

Return Value

- true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnDeactivate

The virtual handler of control "Deactivate" internal event.

```
virtual bool OnDeactivate()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
CLabel

CLabel is class of the simple control based on "Text label" chart object.

Description

CLabel is intended for creation of simple non-editable text labels.

Declaration

```cpp
class CLabel : public CWndObj
```

Title

```cpp
#include <Controls\Label.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndObj
      - CLabel

}
```
Create

Creates new CLabel control.

```cpp
virtual bool Create(
    const long chart,       // chart ID
    const string name,      // name
    const int subwin,       // chart subwindow
    const int x1,           // x1 coordinate
    const int y1,           // y1 coordinate
    const int x2,           // x2 coordinate
    const int y2            // y2 coordinate
)
```

**Parameters**

- `chart` [in] ID of the chart, at which the control is created.
- `name` [in] Unique name of the control.
- `subwin` [in] Subwindow of the chart, at which the control is created.
- `x1` [in] X coordinate of the upper left corner.
- `y1` [in] Y coordinate of the upper left corner.
- `x2` [in] X coordinate of the lower right corner.
- `y2` [in] Y coordinate of the lower right corner.

**Return Value**

- `true` - successful, otherwise - `false`.
OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```
virtual bool OnSetText()
```

Return Value

true - event processed, otherwise - false.
OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```cpp
virtual bool OnSetColor()
```

Return Value

- true - event processed, otherwise - false.
OnSetFont

The virtual handler of control “SetFont” (change of the OBJPROP_FONT property) event.

virtual bool OnSetFont()

Return Value

true - event processed, otherwise - false.
### OnSetFontSize

The virtual handler of control "SetFontSize" (change of the OBJPROP_FONTSIZE property) event.

```cpp
virtual bool OnSetFontSize()
```

**Return Value**

true - event processed, otherwise - false.
**OnCreate**

The virtual handler of control "Create" internal event.

```c
virtual bool OnCreate()
```

**Return Value**

- true - event processed, otherwise - false.
OnShow

The virtual handler of control "Show" internal event.

```cpp
virtual bool OnShow()
```

Return Value

- true - event processed, otherwise - false.
OnHide

The virtual handler of control "Hide" internal event.

```cpp
virtual bool OnHide()
```

Return Value

true - event processed, otherwise - false.
OnMove

The virtual handler of control "Move" internal event.

```cpp
virtual bool OnMove()
```

Return Value

- true - event processed, otherwise - false.
CBmpButton

CBmpButton is class of the simple control based on “Bitmap label” chart object.

Description

CBmpButton is intended for creation of buttons with graphic image.

Declaration

```cpp
class CBmpButton : public CWndObj
```

Title

```cpp
#include <Controls\BmpButton.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndObj
    - CBmpButton

### Create

#### Properties

- **Border**
  - Gets/sets the “Border” property of the control

- **BmpNames**
  - Sets the name of bmp files of the control

- **BmpOffName**
  - Gets/sets the name of bmp file for the OFF state

- **BmpOnName**
  - Gets/sets the name of bmp file for the ON state

- **BmpPassiveName**
  - Gets/sets the name of bmp file for the passive state

- **BmpActiveName**
  - Gets/sets the name of bmp file for the active state

- **State**
  - **Pressed**
    - Gets/sets the state of the control
  - **Locking**
    - Gets/sets the “Locking” property of the control

#### Internal event handlers

- **OnSetZOrder**
  - “SetZOrder” internal event handler

- **OnCreate**
  - “Create” internal event handler

- **OnShow**
  - “Show” internal event handler

- **OnHide**
  - “Hide” internal event handler

- **OnMove**
  - “Move” internal event handler

- **OnChange**

    ExtDialog.ChartEvent(id,lparam,dparam,sparam);
}
Create

Creates new CBmpButton control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,     // x1 coordinate
    const int y1,     // y1 coordinate
    const int x2,     // x2 coordinate
    const int y2      // y2 coordinate
) {
}
```

Parameters

- **chart**
  - [in] ID of the chart, at which the control is created.

- **name**
  - [in] Unique name of the control.

- **subwin**
  - [in] Subwindow of the chart, at which the control is created.

- **x1**
  - [in] X coordinate of the upper left corner.

- **y1**
  - [in] Y coordinate of the upper left corner.

- **x2**
  - [in] X coordinate of the lower right corner.

- **y2**
  - [in] Y coordinate of the lower right corner.

Return Value

- true - successful, otherwise - false.
**Border (Get method)**

Gets the “Border” (border width) property of the control.

```cpp
int Border() const
```

**Return Value**

The “Border” property.

**Border (Set method)**

Sets the “Border” (border width) property of the control.

```cpp
bool Border(
    const int value // value
)
```

**Parameters**

- `value`
  

**Return Value**

- true - successful, otherwise - false.
BmpNames

Sets the name of bmp files of the control

```cpp
bool BmpNames(
    const string off="", // file name
    const string on=""    // file name
)
```

**Parameters**

- `off=""`  
  [in] Name of bmp file for OFF state.

- `on=""`  
  [in] Name of bmp file for ON state.

**Return Value**

- true · successful, otherwise · false.
BmpOffName (Get method)

Gets the name of bmp file for OFF state.

```cpp
string BmpOffName() const
```

Return Value

Name of bmp file for OFF state.

BmpOffName (Set method)

Sets the name of bmp file for OFF state.

```cpp
bool BmpOffName(
    const string& name  // file name
)
```

Parameters

name

[in] Name of bmp file for OFF state.

Return Value

true - successful, otherwise - false.
BmpOnName (Get method)

Gets the name of bmp file for ON state.

```cpp
string BmpOnName() const
```

Return Value

Name of bmp file for ON state.

BmpOnName (Set method)

Sets the name of bmp file for ON state.

```cpp
bool BmpOnName(
    const string name  // file name
)
```

Parameters

- **name**
  
  [in] Name of bmp file for ON state.

Return Value

- true - successful, otherwise - false.
BmpPassiveName (Get method)

Gets the name of bmp file for the control passive state.

```cpp
string BmpPassiveName() const
```

Return Value

Name of bmp file for the control passive state.

BmpPassiveName (Set method)

Sets the name of bmp file for the passive state.

```cpp
bool BmpPassiveName(
    const string name  // file name
)
```

Parameters

- `name`
  
  [in] Name of bmp file for the control passive state.

Return Value

- `true` - successful, otherwise - `false`.
BmpActiveName (Get method)

Gets the name of bmp file for the active state.

```
string BmpActiveName() const
```

Return Value

Name of bmp file for the active state.

Note

The control becomes active when the mouse cursor is hovering over it.

BmpActiveName (Set method)

Sets the name of bmp file for the active state.

```
bool BmpActiveName(
    const string name // file name
)
```

Parameters

name

[in] Name of bmp file for the active state.

Return Value

true - successful, otherwise - false.
**Pressed (Get method)**

Gets the state ("Pressed" property) of the control.

```cpp
bool Pressed() const
```

**Return Value**

Control state.

**Pressed (Set method)**

Sets the state ("Pressed" property) of the control.

```cpp
bool Pressed(
    const bool pressed // state
)
```

**Parameters**

`pressed`

[in] New control state.

**Return Value**

true - successful, otherwise - false.
Locking (Get method)

Gets the “Locking” property of the control.

```cpp
bool Locking() const
```

Return Value

The value of “Locking” property.

Locking (Set method)

Sets new value of the “Locking” property of the control.

```cpp
void Locking(
    const bool locking // value
)
```

Parameters

`locking`

Return Value

None.
OnSetZOrder

The virtual handler of control "SetZOrder" (change of the OBJPROP_ZORDER property) event.

```cpp
virtual bool OnSetZOrder()
```

Return Value

- true - event processed, otherwise - false.
OnCreate

The virtual handler of control “Create” internal event.

```cpp
virtual bool OnCreate()
```

**Return Value**

`true` - event processed, otherwise - `false`. 
OnShow

The virtual handler of control “Show” internal event.

```cpp
virtual bool OnShow()
```

Return Value

- true - event processed, otherwise - false.
OnHide

The virtual handler of control "Hide" internal event.

```cpp
virtual bool onHide()
```

Return Value

true - event processed, otherwise - false.
OnMove

The virtual handler of control "Move" internal event.

```cpp
virtual bool OnMove()
```

Return Value

true - event processed, otherwise - false.
OnChange

The virtual handler of control “Change” internal event.

```cpp
virtual bool OnChange()
```

Return Value

true - event processed, otherwise - false.
OnActivate

The virtual handler of control “Activate” internal event.

```cpp
virtual bool OnActivate()
```

Return Value

- true - event processed, otherwise - false.
OnDeactivate

The virtual handler of control "Deactivate" internal event.

```cpp
virtual bool OnDeactivate()
```

Return Value

- true - event processed, otherwise - false.
OnMouseDown

The virtual handler of control "MouseDown" event.

```cpp
virtual bool OnMouseDown()
```

Return Value

- true - event processed, otherwise - false.
OnMouseUp

The virtual handler of control "MouseUp" (mouse button release) event.

```cpp
virtual bool OnMouseUp()
```

**Return Value**

true - event processed, otherwise - false.
CButton

CButton is a class of a simple control based on "Button" chart object.

Description

CButton class is intended for creation of simple buttons.

Declaration

```cpp
class CButton : public CWndObj
```

Title

```
#include <Controls\Button.mqh>
```

Inheritance hierarchy

```
CObject
   CWnd
      CWndObj
         CButton
```

Result of the code provided below:

![Chart with buttons](chart.png)

    if (!ExtDialog.Create (0,"Controls",0,40,40,380,344))
        return (INIT_FAILED);
    //--- run application
    ExtDialog.Run();
    //--- succeed
    return (INIT_SUCCEEDED);
void OnDeinit(const int reason)
{
    //--- clear comments
    Comment(""');
    //--- destroy dialog
    ExtDialog.Destroy(reason);}

void OnChartEvent(const int id,       // event ID
    const long& lparam, // event parameter of the long type
    const double& dparam, // event parameter of the double type
    const string& sparam) // event parameter of the string type
{
    ExtDialog.ChartEvent(id, lparam, dparam, sparam);
}
Create

Creates new CButton control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,    // coordinate
    const int y1,    // coordinate
    const int x2,    // coordinate
    const int y2    // coordinate
)
```

Parameters
chart
  [in] ID of the chart, at which the control is created.

name
  [in] Unique name of the control.

subwin
  [in] Subwindow of the chart, at which the control is created.
x1
  [in] X coordinate of the upper left corner.
y1
  [in] Y coordinate of the upper left corner.
x2
  [in] X coordinate of the lower right corner.
y2
  [in] Y coordinate of the lower right corner.

Return Value
true - successful, otherwise - false.
Pressed (Get method)

Gets the state ("Pressed" property) of the control.

```cpp
bool Pressed() const
```

Return Value

"Pressed" property of the control.

Pressed (Set method)

Sets the state ("Pressed" property) of the control.

```cpp
bool Pressed(const bool pressed // state
}
```

Parameters

`pressed`

[in] New control state.

Return Value

true - successful, otherwise - false.
Locking (Get method)

Gets the “Locking” property of the control.

```cpp
bool Locking() const
```

Return Value

The value of “Locking” property.

Locking (Set method)

Sets the value of “Locking” property of the control.

```cpp
void Locking(
    const bool locking  // value
)
```

Parameters

`locking`

Return Value

None.
OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```cpp
virtual bool OnSetText()
```

Return Value

- true - event processed, otherwise - false.
OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```cpp
virtual bool OnSetColor()
```

Return Value

true - event processed, otherwise - false.
OnSetColorBackground

The virtual handler of control “SetColorBackground” (change of the OBJPROP_BGCOLOR property) event.

```cpp
virtual bool OnSetColorBackground()
```

Return Value

- true - event processed, otherwise - false.
OnSetColorBorder

The virtual handler of control “SetColorBorder” (change of the OBJPROP_BORDER_COLOR property) event.

```cpp
virtual bool OnSetColorBackground()
```

**Return Value**

true - event processed, otherwise - false.
**OnSetFont**

The virtual handler of control "SetFont" (change of the `OBJPROP_FONT` property) event.

```cpp
virtual bool OnSetFont()
```

**Return Value**

- true - event processed, otherwise - false.
OnSetFontSize

The virtual handler of control "SetFontSize" (change of the OBJPROP_FONT_SIZE property) event.

```cpp
virtual bool OnSetFontSize()
```

Return Value

true - event processed, otherwise - false.
OnCreate

The virtual handler of control "Create" internal event.

```cpp
virtual bool OnCreate()
```

Return Value

- true - event processed, otherwise - false.
OnShow

The virtual handler of control "Show" internal event.

virtual bool OnShow()

Return Value

true - event processed, otherwise - false.
OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool onHide()
```

Return Value

- true - event processed, otherwise - false.
OnMove

The virtual handler of control "Move" internal event.

```cpp
virtual bool OnMove()
```

Return Value

- true - event processed, otherwise - false.
OnResize

The virtual handler of control "Resize" internal event.

```cpp
virtual bool OnResize()
```

Return Value

- true - event processed, otherwise - false.
OnMouseDown

The virtual handler of control "MouseDown" event handler.

```cpp
virtual bool OnMouseDown()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseDown" event occurs when left mouse button is pressed on the control.
OnMouseUp

The virtual handler of control "MouseUp" (left mouse button release) event.

```cpp
virtual bool OnMouseUp()
```

Return Value

true - event processed, otherwise - false.

Note

The "MouseUp" event occurs when left mouse button is released on the control.
CEdit

CEdit is class of the simple control based on “Edit” chart object.

Description

CEdit class is intended for creation of controls, in which the user can enter text.

Declaration

```cpp
class CEdit : public CWndObj
```

Title

```cpp
#include <Controls\Edit.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndObj
      - CEdit

//+------------------------------------------------------------------+
void OnChartEvent(const int id,   // event ID
    const long& lparam,   // event parameter of the long type
    const double& dparam, // event parameter of the double type
    const string& sparam) // event parameter of the string type
{
    ExtDialog.ChartEvent(id,lparam,dparam,sparam);
}
Create

Creates CEdit control

```cpp
virtual bool Create(
    const long chart,  // chart ID
    const string name, // name
    const int subwin,  // chart subwindow
    const int x1,      // coordinate
    const int y1,      // coordinate
    const int x2,      // coordinate
    const int y2       // coordinate
)
```

Parameters

- `chart` [in] ID of the chart, at which the control is created.
- `name` [in] Unique name of the control.
- `subwin` [in] Subwindow of the chart, at which the control is created.
- `x1` [in] X coordinate of the upper left corner.
- `y1` [in] Y coordinate of the upper left corner.
- `x2` [in] X coordinate of the lower right corner.
- `y2` [in] Y coordinate of the lower right corner.

Return Value

- true - successful, otherwise - false.
**ReadOnly (Get Method)**

Gets the “ReadOnly” property of the control.

```cpp
bool ReadOnly()
```

**Return Value**

The value of “ReadOnly” property.

**ReadOnly (Set Method)**

Sets the value of “ReadOnly” property of the control.

```cpp
bool ReadOnly(
    const bool flag // value
)
```

**Parameters**

*flag*

[in] New value of “ReadOnly” property.

**Return Value**

true - successful, otherwise - false.
**TextAlign (Get method)**

Gets the value of “TextAlign” property (text alignment mode) of the control.

```cpp
ENUM_ALIGN_MODE TextAlign() const
```

**Return Value**

Value of “TextAlign” property of the control.

**TextAlign (Set method)**

Sets new value of “TextAlign” property (text alignment mode) of the control.

```cpp
bool TextAlign(
    ENUM_ALIGN_MODE align  // property value
)
```

**Parameters**

`align`

[IN] New value of “TextAlign” property.

**Return Value**

true - successful, false - cannot change the property.
OnObjectEndEdit

The virtual handler of \texttt{CHARTEVENT\_OBJECT\_ENDED} chart object event.

\begin{verbatim}
virtual bool OnObjectEndEdit()
\end{verbatim}

Return Value

true - event processed, otherwise - false.
OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

virtual bool OnSetText()  

Return Value

true - event processed, otherwise - false.
OnSetColor

The virtual handler of control "SetColor" (change of the OBJPROP_COLOR property) event.

```cpp
virtual bool OnSetColor()
```

Return Value

true - event processed, otherwise - false.
**OnSetColorBackground**

The virtual handler of control “SetColorBackground” (change of the `OBJPROP_BGCOLOR` property) event.

```cpp
virtual bool OnSetColorBackground()
```

**Return Value**

true - event processed, otherwise - false.
OnSetColorBorder

The virtual handler of control "SetColorBorder" (change of the \texttt{OBJPROP\_BORDER\_COLOR} property) event.

\begin{verbatim}
    virtual bool OnSetColorBackground()
\end{verbatim}

\textbf{Return Value}

true - event processed, otherwise - false.
OnSetFont

The virtual handler of control "SetFont" (change of the OBJPROP_FONT property) event.

```cpp
virtual bool OnSetFont()
```

Return Value

true - event processed, otherwise - false.
OnSetFontSize

The virtual handler of control "SetFontSize" (change of the OBJPROP_FONT_SIZE property) event.

```cpp
virtual bool OnSetFontSize()
```

Return Value

true - event processed, otherwise - false.
OnSetZOrder

The virtual handler of control "SetOrder" (change of the OBJPROP_ZORDER property) event.

    virtual bool OnSetZOrder()  

Return Value

    true - event processed, otherwise - false.
OnCreate

The virtual handler of control "Create" internal event.

```cpp
virtual bool OnCreate()
```

Return Value

- true - event processed, otherwise - false.
**OnShow**

The virtual handler of control "Show" internal event.

```cpp
virtual bool OnShow()
```

**Return Value**

- `true` - event processed, otherwise - `false`. 
OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool OnHide()
```

Return Value

- true - event processed, otherwise - false.
OnMove

The virtual handler of control "Move" internal event.

```cpp
virtual bool OnMove()
```

Return Value

true - event processed, otherwise - false.
## OnResize

The virtual handler of control "Resize" internal event.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>virtual bool OnResize()</code></td>
<td></td>
</tr>
</tbody>
</table>

**Return Value**

- true - event processed, otherwise - false.
OnChange

The virtual handler of control "Change" internal event.

```cpp
virtual bool OnChange()
```

Return Value

true - event processed, otherwise - false.
**OnClick**

The virtual handler of control "Click" (mouse button click) internal event.

```cpp
virtual bool OnClick()
```

**Return Value**

- true - event processed, otherwise - false.
**CPanel**

CPanel is a class of the simple control based on "Rectangle label" chart object.

**Description**

CPanel class is intended to combine the controls with similar functions in the group.

**Declaration**

```cpp
class CPanel : public CWndObj
```

**Title**

```cpp
#include <Controls\Panel.mqh>
```

**Inheritance hierarchy**

- CObject
- CWnd
- CWndObj
- CPanel

//--+------------------------------------------------------------------+-
void OnTimer()
{
    pause=!pause;
}
Create

Creates new CPanel control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,     // coordinate
    const int y1,     // coordinate
    const int x2,     // coordinate
    const int y2      // coordinate
)
```

Parameters

- `chart`
  - [in] ID of the chart, at which the control is created.

- `name`
  - [in] Unique name of the control.

- `subwin`
  - [in] Subwindow of the chart, at which the control is created.

- `x1`
  - [in] X coordinate of the upper left corner.

- `y1`
  - [in] Y coordinate of the upper left corner.

- `x2`
  - [in] X coordinate of the lower right corner.

- `y2`
  - [in] Y coordinate of the lower right corner.

Return Value

- `true` - successful, otherwise - `false`.
**BorderType (Get method)**

Gets the “BorderType” property of the chart object.

```cpp
ENUM_BORDER_TYPE BorderType()
```

**Return Value**

The value of “BorderType” property.

**BorderType (Set method)**

Sets new value of “BorderType” property of the chart object.

```cpp
bool BorderType(const ENUM_BORDER_TYPE type) // value
```

**Parameters**

*type*

[in] New value of “BorderType” property.

**Return Value**

true - successful, otherwise - false.
OnSetText

The virtual handler of control "SetText" (change of the OBJPROP_TEXT property) event.

```cpp
virtual bool OnSetText()
```

Return Value

- true - event processed, otherwise - false.
OnSetColorBackground

The virtual handler of control "SetColorBackground" (change of the OBJPROP_BGCOLOR property) event.

```cpp
virtual bool OnSetColorBackground()
```

Return Value

true - event processed, otherwise - false.
OnSetColorBorder

The virtual handler of control "SetColorBorder" (change of the OBJPROP_BORDER_COLOR property) event.

```cpp
virtual bool OnSetColorBackground()
```

Return Value

- true - event processed, otherwise - false.
OnCreate

The virtual handler of control "Create" internal event.

```
virtual bool OnCreate()
```

Return Value

true - event processed, otherwise - false.
OnShow

The virtual handler of control "Show" internal event.

```cpp
virtual bool OnShow()
```

**Return Value**

- true - event processed, otherwise - false.
OnHide

The virtual handler of control "Hide" internal event.

```cpp
virtual bool OnHide()
```

Return Value

true - event processed, otherwise - false.
OnMove

The virtual handler of control "Move" internal event.

```c
virtual bool OnMove()
```

Return Value

- true - event processed, otherwise - false.
OnResize

The virtual handler of control "Resize" internal event.

```cpp
virtual bool OnResize() {
    // Implementation goes here
}
```

**Return Value**

- true - event processed, otherwise - false.
OnChange

The virtual handler of control "Change" internal event.

```cpp
virtual bool OnChange()
```

Return Value

true - event processed, otherwise - false.
**CPicture**

CPicture is a class of the simple control based on “Bitmap Label” object.

**Description**

CPicture class is intended for creation of simple graphic images.

**Declaration**

```cpp
class CPicture : public CWndObj
```

**Title**

```cpp
#include <Controls\Picture.mqh>
```

**Inheritance hierarchy**

- `CObject`
  - `CWnd`
    - `CWndObj`
      - `CPicture`

}
Create

Creates new CPicture control.

```cpp
virtual bool Create(
    const long chart,         // chart ID
    const string name,        // name
    const int subwin,         // chart subwindow
    const int x1,             // coordinate
    const int y1,             // coordinate
    const int x2,             // coordinate
    const int y2              // coordinate
  )
```

**Parameters**

- `chart`  
  [in] ID of the chart, at which the control is created.

- `name`  
  [in] Unique name of the control.

- `subwin`  
  [in] Subwindow of the chart, at which the control is created.

- `x1`  
  [in] X coordinate of the upper left corner.

- `y1`  
  [in] Y coordinate of the upper left corner.

- `x2`  
  [in] X coordinate of the lower right corner.

- `y2`  
  [in] Y coordinate of the lower right corner.

**Return Value**

- `true` - successful, otherwise - `false`. 
**Border (Get method)**

Gets the “Border” (border width) property of the control.

```cpp
int Border() const
```

**Return Value**

The “Border” property.

**Border (Set method)**

Sets the “Border” (border width) property of the control.

```cpp
bool Border(
    const int value // value
)
```

**Parameters**

- `value`
  

**Return Value**

- `true` - successful, otherwise - `false`.
**BmpName (Get method)**

Gets the name of bmp file of the control.

```cpp
string BmpName() const
```

**Return Value**

Name of bmp file of the control.

**BmpName (Set method)**

Sets the name of bmp file of the control.

```cpp
bool BmpName(
    const string name  // file name
)
```

**Parameters**

`name`

[in] Name of bmp file of the control.

**Return Value**

true - successful, otherwise - false.
OnCreate

The virtual handler of control “Create” internal event.

```c
virtual bool OnCreate()
```

Return Value

- true - event processed, otherwise - false.
OnShow

The virtual handler of control "Show" internal event.

```cpp
virtual bool OnShow()
```

Return Value

true - event processed, otherwise - false.
OnHide

The virtual handler of control "Hide" internal event.

```
virtual bool OnHide()
```

**Return Value**

true - event processed, otherwise - false.
**OnMove**

The virtual handler of control "Move" internal event.

```cpp
virtual bool OnMove()
```

**Return Value**

- `true` - event processed, otherwise - `false`. 
OnChange

The virtual handler of control "Change" internal event.

```cpp
virtual bool OnChange()
```

Return Value

- true - event processed, otherwise - false.
CScroll

CScroll is a base class for creation of scroll bars.

Description

CScroll is a complex control (with dependent controls), it contains the base functionality for creation of scroll bars. The base class itself is not used as a separate control, two of its heirs (CScrollV and CScrollH classes) are used as controls.

Declaration

```cpp
class CScroll : public CWndContainer
```

Title

```cpp
#include <Controls\Scrolls.mqh>
```

Inheritance hierarchy

- CObject
- CWnd
  - CWndContainer
  - CScroll

Direct descendants

- CScrollH, CScrollV

Create

CreateThumb
Creates thumb button (can be dragged) of the scroll bar

Dependent controls event handlers

OnClickInc
Event handler used for handling increment button events

OnClickDec
Event handler used for handling decrement button events

Internal event handlers

OnShow
“Create” internal event handler

OnHide
“Hide” internal event handler

OnChangePos
“ChangePosition” internal event handler

Object drag handlers

OnThumbDragStart
“ThumbDragStart” event handler

OnThumbDragProcess
“ThumbDragProcess” event handler

OnThumbDragEnd
“ThumbDragEnd” event handler

Position
CalcPos
Gets scroll bar position by coordinate

Methods inherited from class CObject
Prev, Prev, Next, Next, Type, Compare

Methods inherited from class CWnd
Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndContainer
Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide, Save, Load
Create

Creates new CScroll control.

```cpp
virtual bool Create(
    const long chart,    // chart ID
    const string name,   // name
    const int subwin,    // chart subwindow
    const int x1,        // coordinate
    const int y1,        // coordinate
    const int x2,        // coordinate
    const int y2)        // coordinate
)
```

**Parameters**

- `chart`  
  [in] ID of the chart, at which the control is created.

- `name`  
  [in] Unique name of the control.

- `subwin`  
  [in] Subwindow of the chart, at which the control is created.

- `x1`  
  [in] X coordinate of the upper left corner.

- `y1`  
  [in] Y coordinate of the upper left corner.

- `x2`  
  [in] X coordinate of the lower right corner.

- `y2`  
  [in] Y coordinate of the lower right corner.

**Return Value**

- `true` - successful, otherwise `false`. 
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,       // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

Parameters

- `id`  
  [in] Event ID.

- `lparam`  

- `dparam`  

- `sparam`  

Return Value

- `true` - event processed, otherwise - `false`.
MinPos (Get method)

Gets the value of "MinPos" (minimal position) of the CScroll control.

```cpp
int MinPos() const
```

Return Value

New value of "MinPos" property.

MinPos (Set method)

Sets the value of "MinPos" (minimal position) of the CScroll control.

```cpp
void MinPos(
    const int value // value
)
```

Parameters

value

Return Value

None.
**MaxPos (Get method)**

Gets the value of “MaxPos” (maximal position) of the CScroll control.

```csharp
int MaxPos() const
```

**Return Value**

New value of “MaxPos” property.

**MaxPos (Set method)**

Sets the value of “MaxPos” (maximal position) of the CScroll control.

```csharp
void MaxPos(  
const int value // value  
)
```

**Parameters**

`value`

**Return Value**

None.
**CurrPos (Get method)**

Gets the value of “CurrPos” (current position) of the CScroll control.

```cpp
int CurrPos() const
```

**Return Value**

New value of “CurrPos” property.

**CurrPos (Set method)**

Sets the value of “CurrPos” (current position) of the CScroll control.

```cpp
void CurrPos(
    const int value  // value
)
```

**Parameters**

- `value`
  

**Return Value**

None.
CreateBack

Creates background button of the CScroll control.

virtual bool CreateBack()

Return Value

true - successful, otherwise - false.
**CreateInc**

Creates increment button of CScroll control.

```c
virtual bool CreateInc()
```

**Return Value**

- `true` - successful, otherwise - `false`. 
CreateDec

Creates decrement button of CScroll control.

```cpp
virtual bool CreateDec()
```

Return Value

- `true` - successful, otherwise - `false`. 
CreateThumb

Creates thumb button (can be dragged) of CScroll control.

```
virtual bool CreateThumb()
```

Return Value

true - successful, otherwise - false.
OnClickInc

The virtual handler of the control "ClickInc" (left mouse button click on the increment button) internal event.

```cpp
virtual bool OnClickInc()
```

Return Value

true - event processed, otherwise - false.
**OnClickDec**

The virtual handler of the control "ClickDec" (left mouse button click on the decrement button) internal event.

```cpp
virtual bool OnClickDec()
```

**Return Value**

true - event processed, otherwise - false.
**OnShow**

The virtual handler of the control “Show” event.

```cpp
virtual bool OnShow()
```

**Return Value**

- true - event processed, otherwise - false.
OnHide

The virtual handler of the control "Hide" internal event.

```cpp
virtual bool OnHide()
```

Return Value

True - event processed, otherwise - false.
OnChangePos

The virtual handler of the control "ChangePos" (position change) internal event.

```cpp
virtual bool OnChangePos()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnThumbDragStart

The virtual handler of the control “ThumbDragStart” (drag start) event.

```cpp
virtual bool OnThumbDragStart()
```

Return Value

true - event processed, otherwise - false.

Note

The “ThumbDragStart” event occurs at start of the drag operation.
OnThumbDragProcess

The virtual handler of the control "ThumbDragProcess" event.

```cpp
virtual bool OnThumbDragProcess(
    const int x,  // x coordinate
    const int y   // y coordinate
)
```

Parameters

- `x`  

- `y`  

Return Value

- true - event processed, otherwise - false.

Note

The "ThumbDragProcess" occurs when the scroll bar control (thumb button) is moved.
OnThumbDragEnd

The virtual handler of the control "ThumbDragEnd" (drag process finished) event.

```cpp
virtual bool OnThumbDragEnd()
```

Return Value

- true - event processed, otherwise - false.

Note

The "ThumbDragEnd" occurs when the drag operation of the scroll bar control (thumb button) is finished.
CalcPos

Gets the control scroll bar position by coordinate.

```cpp
virtual int CalcPos(
    const int coord  // coordinate
)
```

**Parameters**

`coord`

[in] Scroll bar coordinate.

**Return Value**

Scroll bar position.
CScrollIV

CScrollIV is a class of the "Vertical scroll bar" complex control.

Description

CScrollIV class is intended for creation of vertical scroll bars.

Declaration

```cpp
class CScrollIV : public CScroll
```

Title

```cpp
#include <Controls\Scrolls.mqh>
```

Inheritance hierarchy

CObject
  CWnd
    CWndContainer
      CScroll
        CScrollIV
```

    ExtDialog.ChartEvent(id, lparam, dparam, sparam);
}
**CreateInc**

Creates increment button of the control.

```cpp
virtual bool CreateInc()
```

**Return Value**

- true - successful, otherwise - false.
CreateDec

Creates decrement button of the control.

```
virtual bool CreateDec()
```

Return Value

true - successful, otherwise - false.
CreateThumb

Creates thumb button (can be dragged) of the control.

\[
\text{virtual bool CreateThumb()}
\]

Return Value

true - successful, otherwise - false.
OnResize

The virtual handler of the control "Resize" internal event.

```cpp
virtual bool OnResize()
```

**Return Value**

- true - event processed, otherwise - false.
**OnChangePos**

The virtual handler of the control "ChangePos" (position change) internal event.

```cpp
virtual bool OnChangePos()
```

Return Value

- true - event processed, otherwise - false.
OnThumbDragStart

The virtual handler of the control "ThumbDragStart" (drag start) event.

```cpp
virtual bool OnThumbDragStart()
```

Return Value

- `true` - event processed, otherwise - `false`.

Note

The "ThumbDragStart" event occurs at start of the drag operation.
OnThumbDragProcess

The virtual handler of the control “ThumbDragProcess” event.

```cpp
virtual bool OnThumbDragProcess(
    const int x,  // x coordinate
    const int y   // y coordinate
)
```

Parameters

- `x`  

- `y`  

Return Value

- `true` - event processed, otherwise - `false`.

Note

- The “ThumbDragProcess” occurs when the scroll bar control (thumb button) is moved.
OnThumbDragEnd

The virtual handler of the control "ThumbDragEnd" (drag process finished) event.

```
virtual bool OnThumbDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragEnd" occurs when the drag operation of the scroll bar control (thumb button) is finished.
CalcPos

Gets the control scroll bar position by coordinate.

```cpp
virtual int CalcPos(
    const int coord // coordinate
)
```

**Parameters**

`coord`

[in] Scroll bar coordinate.

**Return Value**

Scroll bar position.
CScrollH

CScrollH is a class of the "Horizontal scroll bar" complex control.

Description

CScrollH is intended for creation of horizontal scroll bars.

Declaration

```
class CScrollH : public CScroll
```

Title

```
#include <Controls\Scrolls.mqh>
```

Inheritance hierarchy

```
CObject
  CWnd
    CWndContainer
      CScroll
        CScrollH
```

Result of the code provided below:

### Position

The `CalcPos` method gets scroll bar position by coordinate.

### Methods inherited from class `CObject`

- Prev, Prev, Next, Next, `Type`, `Compare`

### Methods inherited from class `CWnd`

- `Name`, `ControlsTotal`, `Control`, `Rect`, `Left`, `Left`, `Top`, `Top`, `Right`, `Right`, `Bottom`, `Bottom`, `Width`, `Width`, `Height`, `Height`, `Size`, `Size`, `Size`, `Contains`, `Contains`, `Alignment`, `Align`, `Id`, `IsEnabled`, `IsVisible`, `Visible`, `IsActive`, `Activate`, `Deactivate`, `StateFlags`, `StateFlags`, `StateFlagsSet`, `StateFlagsReset`, `PropFlags`, `PropFlags`, `PropFlagsSet`, `PropFlagsReset`, `MouseX`, `MouseX`, `MouseY`, `MouseY`, `MouseFlags`, `MouseFlags`, `MouseFocusKill`, `BringToTop`

### Methods inherited from class `CWndContainer`

- `Destroy`, `OnMouseEvent`, `ControlsTotal`, `Control`, `ControlFind`, `MouseFocusKill`, `Add`, `Add`, `Delete`, `Delete`, `Move`, `Move`, `Shift`, `Id`, `Enable`, `Disable`, `Show`, `Hide`, `Save`, `Load`

### Methods inherited from class `CScroll`

- `Create`, `OnEvent`, `MinPos`, `MinPos`, `MaxPos`, `MaxPos`, `CurrPos`, `CurrPos`

### Example of creating a panel with horizontal scrollbar:

}
```
CreateInc

Creates increment button of the control.

```cpp
virtual bool CreateInc()
```

Return Value

true - successful, otherwise - false.
CreateDec

Creates decrement button of the control.

```
virtual bool CreateDec()
```

Return Value

true - successful, otherwise - false.
CreateThumb

Creates thumb button (can be dragged) of the control.

```cpp
virtual bool CreateThumb()
```

Return Value

- `true` - successful, otherwise - `false`. 
OnResize

The virtual handler of the control "Resize" internal event.

```cpp
virtual bool OnResize()
```

Return Value

- true - event processed, otherwise - false.
**OnChangePos**

The virtual handler of the control "ChangePos" (position change) internal event.

```cpp
virtual bool OnChangePos()
```

**Return Value**

true - event processed, otherwise - false.
**OnThumbDragStart**

The virtual handler of the control "ThumbDragStart" (drag start) event.

```cpp
virtual bool OnThumbDragStart()
```

**Return Value**

true - event processed, otherwise - false.

**Note**

The "ThumbDragStart" event occurs at start of the drag operation.
OnThumbDragProcess

The virtual handler of the control “ThumbDragProcess” event.

```cpp
virtual bool OnThumbDragProcess(
    const int x,       // x coordinate
    const int y        // y coordinate
);
```

**Parameters**

- **x**
  

- **y**
  

**Return Value**

true - event processed, otherwise - false.

**Note**

The “ThumbDragProcess” occurs when the scroll bar control (thumb button) is moved.
OnThumbDragEnd

The virtual handler of the control "ThumbDragEnd" (drag process finished) event.

```cpp
virtual bool OnThumbDragEnd()
```

Return Value

true - event processed, otherwise - false.

Note

The "ThumbDragEnd" occurs when the drag operation of the scroll bar control (thumb button) is finished.
CalcPos

Gets the control scroll bar position by coordinate.

```cpp
virtual int CalcPos(
    const int coord      // coordinate
)
```

**Parameters**

- `coord`
  - `[in]` Scroll bar coordinate.

**Return Value**

Scroll bar position.
**CWndClient**

CWndClient is a class of the “Client area” complex control (with dependent controls). It is a base class for creation of scroll bars area.

**Description**

CWndClient implements the functionality for creation of client area with scroll bars.

**Declaration**

```cpp
class CWndClient : public CWndContainer
```

**Title**

```
#include <Controls\WndClient.mqh>
```

**Inheritance hierarchy**

- CObject
  - CWnd
    - CWndContainer
      - CWndClient

**Direct descendants**

- CCheckGroup, CListView, CRadioGroup

**Methods inherited from class CWndContainer**

© 2000-2021, MetaQuotes Ltd
Methods inherited from class CObject
Prev, Prev, Next, Next, Type, Compare
Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete,
Delete, Move, Move, Shift, Enable, Disable, Hide, Save, Load
Create

Creates new CWndClient control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1, // coordinate
    const int y1, // coordinate
    const int x2, // coordinate
    const int y2 // coordinate
)
```

**Parameters**

- **chart**
  
  [in] ID of the chart, at which the control is created.

- **name**
  
  [in] Unique name of the control.

- **subwin**
  
  [in] Subwindow of the chart, at which the control is created.

- **x1**
  
  [in] X coordinate of the upper left corner.

- **y1**
  
  [in] Y coordinate of the upper left corner.

- **x2**
  
  [in] X coordinate of the lower right corner.

- **y2**
  
  [in] Y coordinate of the lower right corner.

**Return Value**

- true - successful, otherwise - false.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,       // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

**Parameters**

- **id**
  - [in] Event ID.

- **lparam**

- **dparam**
  - [in] Event parameter of `double` type passed by reference.

- **sparam**
  - [in] Event parameter of `string` type passed by reference.

**Return Value**

- `true` - event processed, otherwise - `false`.
ColorBackground

Sets background color of the control.

```cpp
bool ColorBackground(
    const color value // background color
);
```

Parameters

value

[in] Background color of the control.

Return Value

true - successful, otherwise - false.
ColorBorder

Set border color of the control.

```cpp
bool ColorBorder(
    const color value  // color
)
```

**Parameters**

- **value**
  - `[in]` Border color of the control

**Return Value**

- true - successful, otherwise - false.
**BorderType**

Sets border type of the control.

```cpp
bool BorderType(
    const ENUM_BORDER_TYPE type  // value
)
```

**Parameters**

- `type`
  - [in] Border type of the control.

**Return Value**

- `true` - successful, otherwise - `false`. 

VScrolled (Get method)

Gets the flag indicating that vertical scroll bar is used.

```
bool VScrolled()
```

Return Value

true - vertical scroll bar is used, otherwise - false.

VScrolled (Set method)

Sets the flag indicating that vertical scroll bar is used.

```
bool VScrolled(
    const bool flag  // flag
)
```

Parameters

flag

Return Value

true - successful, otherwise - false.
HScrolled (Get method)

Gets the flag indicating that horizontal scroll bar is used.

```cpp
bool HScrolled()
```

Return Value

true - horizontal scroll bar is used, otherwise - false.

HScrolled (Set method)

Sets the flag indicating that horizontal scroll bar is used.

```cpp
bool HScrolled(
    const bool flag  // flag
)
```

Parameters

flag

Return Value

true - successful, otherwise - false.
CreateBack

Creates background button of the control.

```cpp
virtual bool CreateBack()
```

Return Value

true - successful, otherwise - false.
CreateScrollV

Creates vertical scroll bar.

```
virtual bool CreateScrollV()
```

Return Value

- **true** - successful, otherwise - **false**.
CreateScrollH

Creates horizontal scroll bar.

virtual bool CreateScrollH()

Return Value

ture - successful, otherwise - false.
OnResize

The virtual handler of the control "Resize" internal event.

```cpp
virtual bool OnResize()
```

Return Value

- true - event processed, otherwise - false.
OnVScrollShow

The virtual handler of the VScroll (vertical scroll) dependent control “Show” (vertical scroll bar show) internal event.

```cpp
virtual bool OnVScrollShow()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnVScrollHide

The virtual handler of the VScroll (vertical scroll) dependent control “Hide” (vertical scroll bar hide) internal event.

```cpp
virtual bool OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnHScrollShow

The virtual handler of the HScroll (horizontal scroll) dependent control “Show” (horizontal scroll bar show) internal event.

```cpp
virtual bool OnHScrollShow()
```

**Return Value**

true - event processed, otherwise - false.

**Note**

The base class method does nothing and always returns true.
OnHScrollHide

The virtual handler of the HScroll (horizontal scroll) dependent control “Hide” (horizontal scroll bar hide) internal event.

```cpp
virtual bool OnHScrollHide()
```

**Return Value**

true - event processed, otherwise - false.

**Note**

The base class method does nothing and always returns true.
OnScrollLineDown

The virtual handler of the VScroll (vertical scroll) dependent control “ScrollLineDown” (vertical scroll line down) internal event.

```cpp
virtual bool OnScrollLineDown()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnScrollLineUp

The virtual handler of the VScroll (vertical scroll) dependent control “ScrollLineUp” (vertical scroll line up) internal event.

```cpp
virtual bool OnScrollLineUp()
```

**Return Value**

true - event processed, otherwise - false.

**Note**

The base class method does nothing and always returns true.
OnScrollLineLeft

The virtual handler of the HScroll (horizontal scroll) dependent control “ScrollLineLeft” (horizontal scroll line left) internal event.

```cpp
virtual bool OnScrollLineLeft()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
OnScrollLineRight

The virtual handler of the HScroll (horizontal scroll) dependent control “ScrollLineRight” (horizontal scroll line right) internal event.

```cpp
virtual bool OnScrollLineRight()
```

Return Value

true - event processed, otherwise - false.

Note

The base class method does nothing and always returns true.
ReBound

Sets new parameters of the control using CRect class coordinates.

```cpp
void ReBound(
    const &CRect rect   // CRect class
)
```

Return Value

None.
**CLListView**

CLListView is a class of the ListView complex control (with dependent controls).

**Description**

CLListView class encapsulates list-control functionality.

**Declaration**

```cpp
class CLListView : public CWndClient
```

**Title**

```
#include <Controls\ListView.mqh>
```

**Inheritance hierarchy**

```
CObject
    CWnd
        CWndContainer
            CWndClient
                CLListView
```

{
    ExtDialog.ChartEvent(id, lparam, dparam, sparam);
}
Create

Creates CListView control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1, // coordinate
    const int y1, // coordinate
    const int x2, // coordinate
    const int y2 // coordinate
)
```

Parameters

- `chart`
  - [in] ID of the chart, at which the control is created.

- `name`
  - [in] Unique name of the control.

- `subwin`
  - [in] Subwindow, at which the control is created.

- `x1`
  - [in] X coordinate of the upper left corner.

- `y1`
  - [in] Y coordinate of the upper left corner.

- `x2`
  - [in] X coordinate of the lower right corner.

- `y2`
  - [in] Y coordinate of the lower right corner.

Return Value

- true - successful, otherwise - false.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,  // ID
    const long& lparam,  // parameter
    const double& dparam,  // parameter
    const string& sparam  // parameter
)
```

Parameters

- `id`  
  [in] Event ID.

- `lparam`  

- `dparam`  

- `sparam`  

Return Value

- `true` - event processed, otherwise - false.
TotalView

Sets the number of items shown on the control.

```cpp
bool TotalView(const int value) // number of items shown
```

Parameters

value

[in] The number of items shown on the control.

Return Value

true - successful, otherwise - false.

Note

The number of shown items can be specified only at once.
AddItem

Adds an item to the control list.

```cpp
bool AddItem(
    const string item,  // text
    const long value    // value
)
```

Parameters

item

value
  [in] Value.

Return Value

true - successful, otherwise - false.
Select

Selects current list element by index.

```cpp
bool Select(
    const int index  // index
)
```

Parameters

- `index`
  - [in] Item index.

Return Value

- `true` - successful, otherwise - `false`. 
SelectByText

Selects the current list element by text.

```cpp
bool SelectByText(
    const string text  // text
)
```

**Parameters**

text

  [in] Element text.

**Return Value**

true - successful, otherwise - false.
**SelectByValue**

Selects the current list element by value.

```c
bool SelectByValue(
    const long value      // value
)
```

**Parameters**

value

[in] Value.

**Return Value**

true - successful, otherwise - false.
**Value**

Gets the value of the current list element.

```c
long Value()
```

**Return Value**

The value of the current list element.
CreateRow

Creates a row of the CListView control.

```cpp
bool CreateRow(
    const int index // index
)
```

**Parameters**

- `index`
  - [in] Item index.

**Return Value**

- true - successful, otherwise - false.
OnResize

The virtual handler of the control "Resize" internal event.

```cpp
virtual bool OnResize()
```

Return Value

true - event processed, otherwise - false.
OnVScrollShow

The virtual handler of the VScroll (vertical scroll) dependent control "VScrollShow" (vertical scroll bar show) internal event.

```cpp
virtual bool OnVScrollShow()
```

Return Value

true - event processed, otherwise - false.
OnVScrollHide

The virtual handler of the VScroll (vertical scroll) dependent control “VScrollHide” (vertical scroll bar hide) internal event.

```cpp
virtual bool OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.
OnScrollLineDown

The virtual handler of the VScroll (vertical scroll) dependent control "ScrollLineDown" (vertical scroll line down) internal event.

```cpp
virtual bool OnScrollLineDown()
```

Return Value

- true - event processed, otherwise - false.
OnScrollLineUp

The virtual handler of the VScroll (vertical scroll) dependent control "ScrollLineUp" (vertical scroll line up) internal event.

```cpp
definition of OnScrollLineUp()
```

**Return Value**

true - event processed, otherwise - false.
OnItemClick

The virtual handler of “ItemClick” (mouse button click) internal event on a specified row of CListView control.

```cpp
virtual bool OnItemClick()
    const int index // index
```

Return Value

true - event processed, otherwise - false.
Redraw

Redraws the control.

```cpp
bool Redraw()
```

Return Value

- true - successful, otherwise - false.
RowState

Changes the state of the specified row of the CListView control.

```cpp
bool RowState(
    const int index // index
    const bool select // state
)
```

**Parameters**

- **index**
  - [in] Row index.

- **select**
  - [in] Row state.

**Return Value**

- `true` - successful, otherwise - `false`. 
CheckView

Checks the “visibility” of the specified row of the CListView control.

```cpp
bool CheckView()
```

Return Value

true - selected row is visible, otherwise - false.
CComboBox

CComboBox is a class of the ComboBox complex control (with dependent controls).

Description

ComboBox consists of a list box, combined with a static control, intended for selection. The list-box portion of the control may be dropped down when a user selects the drop-down arrow next to the control.

Declaration

```cpp
class CComboBox : public CWndContainer
```

Title

```cpp
#include <Controls\ComboBox.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndContainer
      - CComboBox

    return(INIT_SUCCEEDED);
}
//+------------------------------------------------------------------+
//| Expert deinitialization function                                 |
//+------------------------------------------------------------------+
void OnDeinit(const int reason)
{
//---
    Comment("");
//--- destroy dialog
    ExtDialog.Destroy(reason);

void OnChartEvent(const int id,       // event ID
    const long& lparam,     // event parameter of the long type
    const double& dparam,   // event parameter of the double type
    const string& sparam)   // event parameter of the string type
{
    ExtDialog.ChartEvent(id,lparam,dparam,sparam);
}
Create

Creates CComboBox control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,    // coordinate
    const int y1,    // coordinate
    const int x2,    // coordinate
    const int y2    // coordinate
)
```

Parameters

**chart**

[in] ID of the chat, at which the control is created.

**name**

[in] Unique name of the control.

**subwin**

[in] Subwindow of the chart, at which the control is created.

**x1**

[in] X coordinate of the upper left corner.

**y1**

[in] Y coordinate of the upper left corner.

**x2**

[in] X coordinate of the lower right corner.

**y2**

[in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.
OnEvent

Chart event handler.

```
virtual bool OnEvent(
    const int id,       // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

**Parameters**

- **id**
  - [in] Event ID.

- **lparam**

- **dparam**
  - [in] Event parameter of `double` type passed by reference.

- **sparam**
  - [in] Event parameter of `string` type passed by reference.

**Return Value**

- `true` - event processed, otherwise - `false`.  

© 2000-2021, MetaQuotes Ltd
AddItem

Adds an item to the control.

```cpp
bool AddItem(
    const string item,  // text
    const long value    // value
)
```

Parameters

- **item**
  - [in] Text.
  - [in] Value.

Return Value

- true - successful, otherwise - false.
ListViewItems

Sets the number of list elements of the CComboBox control.

```cpp
void ListViewItems(
    const int value  // number of elements
);
```

**Parameters**

- `value`  
  
  [in] Number of the drop-down list elements.

**Return Value**

- true - successful, otherwise - false.
Select

Selects the current list element by index.

```cpp
bool Select(
    const int index  // index
)
```

Parameters

`index`

[in] Item index.

Return Value

true - successful, otherwise - false.
SelectByText

Selects the current list element by a specified text.

```cpp
bool SelectByText(
    const string text // text
)
```

Parameters

text
   [in] Text of the item.

Return Value

true - successful, otherwise - false.
**SelectByValue**

Selects the current list element by a specified value.

```cpp
bool SelectByValue(
    const long value  // value
)
```

**Parameters**

*value*

[in] Value.

**Return Value**

true - successful, otherwise - false.
Value

Gets the value of the current list element.

```c
long Value()
```

Return Value

The value of the current list element.
CreateEdit

Creates dependent control (edit) of the control.

```cpp
virtual bool CreateEdit()
```

Return Value

- true - successful, otherwise - false.
CreateButton

Creates dependent control (button).

```cpp
virtual bool CreateButton()
```

Return Value

true - successful, otherwise - false.
CreateList

Creates dependent control (list view).

virtual bool CreateList()  

Return Value

true - successful, otherwise - false.
**OnClickEdit**

The virtual handler of the control "ClickEdit" (mouse click on the edit) internal event.

```cpp
virtual bool OnClickEdit()
```

**Return Value**

- true - event processed, otherwise - false.
**OnClickButton**

The virtual handler of the "ButtonClick" (mouse click on the button) internal event.

```cpp
virtual bool OnClickButton()
```

**Return Value**

- true - event processed, otherwise - false.
**OnChangeList**

The virtual handler of the "ChangeList" (change of the list) internal event.

```cpp
virtual bool OnChangeList()
```

**Return Value**

true - event processed, otherwise - false.
ListShow

Shows the drop-down list of the control.

```cpp
virtual bool ListShow()
```

Return Value

- true - successful, otherwise - false.
ListHide

Hides the drop-down list of the control.

```cpp
virtual bool ListHide()
```

Return Value

true - successful, otherwise - false.
CCheckBox

CCheckBox is the class of the CheckBox complex control.

Description

CCheckBox control displays a check box that allows a user to select a true or false condition at a mouse click.

Declaration

```cpp
class CCheckBox : public CWndContainer
```

Title

```cpp
#include <Controls\CheckBox.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndContainer
      - CCheckBox

    const double &dparam, // event parameter of the double type
    const string &sparam) // event parameter of the string type
{
    ExtDialog.ChartEvent(id,lparam,dparam,sparam);
}
Create

Creates CCheckBox control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,     // coordinate
    const int y1,     // coordinate
    const int x2,     // coordinate
    const int y2      // coordinate
)
```

**Parameters**

- **chart**
  - [in] ID of the chart, at which the control is created.

- **name**
  - [in] Unique name of the control.

- **subwin**
  - [in] Subwindow of the chart, at which the control is created.

- **x1**
  - [in] X coordinate of the upper left corner.

- **y1**
  - [in] Y coordinate of the upper left corner.

- **x2**
  - [in] X coordinate of the lower right corner.

- **y2**
  - [in] Y coordinate of the lower right corner.

**Return Value**

- true - successful, otherwise - false.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int   id,    // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam  // parameter
)
```

Parameters

* `id`  
  [in] Event ID.

* `lparam`  

* `dparam`  

* `sparam`  

Return Value

true - event processed, otherwise - false.
Text (Get method)

Gets text of the label associated with the control.

```cpp
string Text()
```

Return Value

Text of the label.

Text (Set method)

Sets text of the label associated with the control.

```cpp
bool Text(
    const string value  // text
)
```

Parameters

value

[in] New text of the label.

Return Value

true - successful, otherwise - false.

Note

Label text is specified by setting `OBJPROP_TEXT` (text) of a chart object.
Color (Get method)

Gets color of the label associated with the control.

```cpp
color Color() const
```

Return Value

Label color.

Color (Set method)

Sets color of the label associated with the control.

```cpp
bool Color(
    const color value  // color
)
```

Parameters

- `value`
  

Return Value

- `true` - successful, otherwise - `false`.

Note

Label color is specified by setting `OBJPROP_COLOR` (color) of a chart object.
**Checked (Get method)**

Gets state of the control.

```cpp
bool Checked() const
```

**Return Value**

State of the control.

**Checked (Set method)**

Sets state of the control.

```cpp
bool Checked(
    const bool flag  // state
)
```

**Parameters**

- `flag`
  - [in] New state.

**Return Value**

true - successful, otherwise - false.
Value (Get method)

Gets the value associated with the control.

```cpp
int Value() const
```

Return Value

The value associated with the control.

Value (Set method)

Sets the value associated with the control.

```cpp
void Value(
    const int value  // value
)
```

Parameters

- **value**
  - [in] New value.

Return Value

None.
CreateButton

Creates dependent control (button).

```cpp
virtual bool CreateButton()
```

Return Value

- `true` - successful, otherwise - `false`. 
CreateLabel

Creates dependent control (label).

```
virtual bool CreateLabel()
```

Return Value

true - successful, otherwise - false.
**OnClickButton**

The virtual handler of the control "ClickButton" (mouse click on the button) internal event.

```cpp
virtual bool OnClickButton()
```

Return Value

- true - event processed, otherwise - false.
**OnClickLabel**

The virtual handler of the control "ClickLabel" (mouse click on the label) internal event.

```cpp
virtual bool OnClickLabel()
```

**Return Value**

- true - event processed, otherwise - false.
**CCheckGroup**

CCheckGroup is a class of the CheckGroup complex control (with dependent controls).

**Description**

CCheckGroup provides the possibility for creation of controls, which allow to display and edit flags.

**Declaration**

```cpp
class CCheckGroup : public CWndClient
```

**Title**

```cpp
#include <Controls\CheckGroup.mqh>
```

**Inheritance hierarchy**

- **CObject**
- **CWnd**
  - **CWndContainer**
    - **CWndClient**
      - **CCheckGroup**

                  const string& sparam)  // event parameter of the string type
{
    ExtDialog.ChartEvent(id,lparam,dparam,sparam);
}
Create

Creates new CCheckGroup control.

```cpp
virtual bool Create(
    const long chart,       // chart ID
    const string name,      // name
    const int subwin,       // chart subwindow
    const int x1,           // coordinate
    const int y1,           // coordinate
    const int x2,           // coordinate
    const int y2            // coordinate
);
```

Parameters

**chart**
- [in] ID of the chart, at which the control is created.

**name**
- [in] Unique name of the control.

**subwin**
- [in] Subwindow of the chart, at which the control is created.

**x1**
- [in] X coordinate of the upper left corner.

**y1**
- [in] Y coordinate of the upper left corner.

**x2**
- [in] X coordinate of the lower right corner.

**y2**
- [in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.
OnEvent

Chart event handler.

```csharp
virtual bool OnEvent(
    const int id,    // ID
    const long& lparam,  // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

**Parameters**

- **id**
  - [in] Event ID.

- **lparam**

- **dparam**
  - [in] Event parameter of `double` type passed by reference.

- **sparam**
  - [in] Event parameter of `string` type passed by reference.

**Return Value**

- `true` - event processed, otherwise - `false`.
AddItem

Adds an item (row) to the control.

```csharp
bool AddItem(
    const string item,   // text
    const long value     // value
)
```

Parameters

- **item**
  - `[in]` Added control label text.

- **value=0**
  - `[in]` Value associated with the added control.

Return Value

- true - successful, otherwise - false.
Value

Gets the value associated with the control.

```cpp
long Value()
```

Return Value

The value associated with the control.

Note

The value depends on state of all items of the CCheckGroup.
**CreateButton**

Creates new CCheckBox class instance at a specified index.

```cpp
bool CreateButton(
    int index  // index
)
```

**Parameters**

`index`

[in] Index of the new item in the CCheckGroup.

**Return Value**

true - successful, otherwise - false.
OnVScrollShow

The virtual handler of the dependent VS (vertical scroll) control “Show” internal event.

```cpp
virtual bool OnVScrollShow()
```

Return Value

- true - event processed, otherwise - false.
OnVScrollHide

The virtual handler of the dependent VScroll (vertical scroll) control “Hide” internal event.

```cpp
virtual bool OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.
OnScrollLineDown

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineDown" internal event.

```cpp
virtual bool OnScrollLineDown()
```

Return Value

true - event processed, otherwise - false.
OnScrollLineUp

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineUp" internal event.

```cpp
virtual bool OnScrollLineUp()
```

Return Value

true - event processed, otherwise - false.
OnChangeltem

The virtual handler of the control "Changeltem" (item change) internal event.

```cpp
virtual bool OnChangeltem(
    const int index  // index
)
```

**Parameters**

index

[in] Index of the changed item.

**Return Value**

true - event processed, otherwise - false.
Redraw

Redraws the control.

```c
bool Redraw()
```

Return Value

- true - successful, otherwise - false.
RowState

Sets the state of the specified item.

```cpp
bool RowState(
    const int index,  // item index
    const bool select  // state
)
```

Parameters

- `index`
  - [in] Item index to change.

- `select`
  - [in] New state.

Return Value

- true - successful, otherwise - false.
CRadioButton

CRadioButton is a class of RadioButton complex control.

Description

CRadioButton itself is not used, it used for creation of CRadioGroup items.

Declaration

```
class CRadioButton : public CWndContainer
```

Title

```
#include <Controls\RadioButton.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndContainer
      - CRadioButton

Methods inherited from class CWndContainer
Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide, Save, Load
Create

Creates new CRadioButton control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,    // coordinate
    const int y1,    // coordinate
    const int x2,    // coordinate
    const int y2     // coordinate
)
```

Parameters

`chart`
- [in] ID of the chart, at which the control is created.

`name`
- [in] Unique name of the control.

`subwin`
- [in] Subwindow of the chart, at which the control is created.

`x1`
- [in] X coordinate of the upper left corner.

`y1`
- [in] Y coordinate of the upper left corner.

`x2`
- [in] X coordinate of the lower right corner.

`y2`
- [in] Y coordinate of the lower right corner.

Return Value

true - successful, otherwise - false.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int  id,       // ID
    const long& lparam,  // parameter
    const double& dparam, // parameter
    const string& sparam  // parameter
)
```

**Parameters**

- **id**
  - [in] Event ID.

- **lparam**
  - [in] Event parameter of **long** type passed by reference.

- **dparam**
  - [in] Event parameter of **double** type passed by reference.

- **sparam**
  - [in] Event parameter of **string** type passed by reference.

**Return Value**

true - event processed, otherwise - false.
**Text (Get method)**

Gets text of the label associated with the control.

```cpp
string Text();
```

**Return Value**

Text of the label.

---

**Text (Set method)**

Sets text of the label.

```cpp
bool Text(
    const string value  // text
);
```

**Parameters**

- `value`
  - [in] New text of the label.

**Return Value**

- `true` - successful, otherwise - `false`. 
Color (Get method)

Gets color of the label associated with the control.

```cpp
    color Color() const
```

Return Value

Label color.

Color (Set method)

Sets color of the label associated with the control.

```cpp
    bool Color(
        const color value // color
    )
```

Parameters

value

Return Value

true - successful, otherwise - false.
State (Get method)

Gets the button state.

```c
bool State() const
```

Return Value

Button state.

State (Set method)

Sets the button state.

```c
bool State(
    const bool flag  // flag
)
```

Parameters

flag

[in] New button state.

Return Value

true - successful, otherwise - false.
CreateButton

Creates button.

```cpp
virtual bool CreateButton()
```

**Return Value**

true - successful, otherwise - false.
**CreateLabel**

Creates label.

```cpp
virtual bool CreateLabel()
```

**Return Value**

- `true` - successful, otherwise - `false`. 
OnClickButton

The virtual handler of the control "ButtonClick" (button click) internal event.

```cpp
virtual bool OnClickButton()
```

Return Value

true - event processed, otherwise - false.
**OnClickLabel**

The virtual handler of the control “ClickLabel” (click on the label) internal event.

```cpp
virtual bool OnClickLabel()
```

**Return Value**

- true - event processed, otherwise - false.
CRadioGroup

CRadioGroup is a class of RadioGroup complex control (with dependent controls).

Description

CRadioGroup enables creation of a control allowing the display and editing the enumerable type field.

Declaration

```cpp
class CRadioGroup : public CWndClient
```

Title

```cpp
#include <Controls\RadioGroup.mqh>
```

Inheritance hierarchy

```
CObject
   CWnd
      CWndContainer
         CWndClient
             CRadioGroup
```

                  const string & sparam) // event parameter of the string type
{
    ExtDialog.ChartEvent(id,lparam,dparam,sparam);
}
Create

Creates new CRadioGroup control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,     // coordinate
    const int y1,     // coordinate
    const int x2,     // coordinate
    const int y2      // coordinate
)
```

Parameters

- `chart` [in] ID of the chart, at which the control is created.
- `name` [in] Unique name of the control.
- `subwin` [in] Subwindow of the chart, at which the control is created.
- `x1` [in] X coordinate of the upper left corner.
- `y1` [in] Y coordinate of the upper left corner.
- `x2` [in] X coordinate of the lower right corner.
- `y2` [in] Y coordinate of the lower right corner.

Return Value

- `true` - successful, otherwise - `false`. 
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,       // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

Parameters

- `id`
  - [in] Event ID.

- `lparam`

- `dparam`
  - [in] Event parameter of `double` type passed by reference.

- `sparam`
  - [in] Event parameter of `string` type passed by reference.

Return Value

- true - event processed, otherwise - false.
AddItem

Adds an item to the control.

```cpp
bool AddItem(
    const string item, // text
    const long value=0 // value
)
```

Parameters

- **item**
  
  [in] Added control label text.

- **value=0**
  
  [in] Value associated with the added control.

Return Value

- true - successful, otherwise - false.
Value

Gets the value associated with the control.

```c
long Value()
```

Return Value

The value associated with the control.

Note

The value depends on state of all CRadioButton items of the CRadioGroup control.
CreateButton

Creates new CRadioButton class instance at a specified index.

```cpp
bool CreateButton(const int index) // index
```

**Parameters**

`index`  
[in] Index of the new item in the CRadioGroup.

**Return Value**

true - successful, otherwise - false.
OnVScrollShow

The virtual handler of the dependent VScroll (vertical scroll) control "Show" internal event.

```cpp
virtual bool OnVScrollShow()
```

Return Value

true - event processed, otherwise - false.
OnVScrollHide

The virtual handler of the dependent VScroll (vertical scroll) control “Hide” internal event.

```cpp
virtual bool OnVScrollHide()
```

Return Value

true - event processed, otherwise - false.
OnScrollLineDown

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineDown" internal event.

```cpp
virtual bool OnScrollLineDown()
```

Return Value

true - event processed, otherwise - false.
OnScrollLineUp

The virtual handler of the dependent VScroll (vertical scroll) control "ScrollLineUp" internal event.

```cpp
virtual bool OnScrollLineUp()
```

Return Value

- true - event processed, otherwise - false.
OnChangeltem

The virtual handler of the control "Changeltem" (item change) event.

```cpp
virtual bool OnChangeltem(const int index) // index
```

Parameters

index

[in] Index of the changed item.

Return Value

true - event processed, otherwise - false.
Redraw

Redraws the control.

```cpp
bool Redraw()
```

Return Value

true - successful, otherwise - false.
RowState

Changes the state of an item.

```cpp
bool RowState(
    const int index,    // index
    const bool select   // state
)
```

Parameters

- **index**
  - [in] Item index to change.

- **select**
  - [in] New state.

Return Value

- true - successful, otherwise - false.
Select

Selects the current item.

```
void Select(
    const int index // index
)
```

Parameters

- `index`  
  [in] Item index to select.

Return Value

- None.
**CSpinEdit**

CSpinEdit is a class of SpinEdit complex control (with dependent controls).

**Description**

CSpinEdit class is intended for creation of a control, which allows editing a value of integer type with a specified step and within specified limitations.

**Declaration**

```cpp
class CSpinEdit : public CWndContainer
```

**Title**

```cpp
#include <Controls\SpinEdit.mqh>
```

**Inheritance hierarchy**

- CObject
  - CWnd
    - CWndContainer
      - CSpinEdit

Result of the code provided below:

![Graph showing CSpinEdit usage](image)

**Class Methods by Groups**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create</td>
<td>Creates control</td>
</tr>
</tbody>
</table>
Create Chart event handlers

**OnEvent**
Event handler of all chart events

Properties

**MinValue**
Gets/sets the minimal allowed value

**MaxValue**
Gets/sets the maximal allowed value

State

**Value**
Gets/sets the current value

Dependent controls

**CreateEdit**
Creates dependent control (edit)

**CreateInc**
Creates dependent control (increment button)

**CreateDec**
Creates dependent control (decrement button)

Dependent controls event handlers

**OnClickInc**
"ClickInc" internal event handler (virtual)

**OnClickDec**
"ClickDec" internal event handler (virtual)

Internal event handlers

**OnChangeValue**
"ChangeValue" internal event handler (virtual)

Methods inherited from class CObject

Prev, Prev, Next, Next, Type, Compare

Methods inherited from class CWnd

Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

Methods inherited from class CWndContainer

Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide

Example of creating a panel with spin edit control:

```cpp
//+------------------------------------------------------------------+
//|                                             ControlsSpinEdit.m

    const string& sparam) // event parameter of the string type
{
    ExtDialog.ChartEvent(id,lparam,dparam,sparam);
}
Create

Creates new CSpinEdit control.

```cpp
virtual bool Create(
    const long chart,  // chart ID
    const string name,  // name
    const int subwin,  // chart subwindow
    const int x1,      // coordinate
    const int y1,      // coordinate
    const int x2,      // coordinate
    const int y2       // coordinate
)
```

Parameters

- **chart**
  - [in] ID of the chart, at which the control is created.

- **name**
  - [in] Unique name of the control.

- **subwin**
  - [in] Subwindow of the chart, at which the control is created.

- **x1**
  - [in] X coordinate of the upper left corner.

- **y1**
  - [in] Y coordinate of the upper left corner.

- **x2**
  - [in] X coordinate of the lower right corner.

- **y2**
  - [in] Y coordinate of the lower right corner.

Return Value

- true - successful, otherwise - false.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
  const int  id,     // ID
  const long& lparam, // parameter
  const double& dparam, // parameter
  const string& sparam  // parameter
)
```

**Parameters**

- **id**
  
  [in] Event ID.

- **lparam**
  

- **dparam**
  

- **sparam**
  

**Return Value**

- true - event processed, otherwise - false.
**MinValue (Get method)**

Gets the value of "MinValue" property (minimal value) of the control.

```c
int MinValue() const
```

**Return Value**

The value of "MinValue" property.

**MinValue (Set method)**

Sets the value of "MinValue" property (minimal value) of the control.

```c
void MinValue(
    const int value  // value
)
```

**Parameters**

`value`

**Return Value**

None.
MaxValue (Get method)

Gets the value of "MaxValue" property (maximal value) of the control.

```cpp
int MaxValue() const
```

Return Value

The value of "MaxValue" property.

MaxValue (Set method)

Sets the value of "MaxValue" property (maximal value) of the control.

```cpp
void MaxValue(
    const int value // value
)
```

Parameters

value

[in] New value of "MaxValue" property.

Return Value

None.
Value (Get method)

Gets the “Value” property (current value) of the control.

```cpp
int Value() const
```

Return Value

The “Value” property.

Value (Set method)

Sets the “Value” property (current value) of the control.

```cpp
void Value(
    const int value   // value
)
```

Parameters

`value`

Return Value

None.
CreateEdit

Creates dependent control (CEdit).

```
virtual bool CreateEdit()
```

Return Value

true - successful, otherwise - false.
CreateInc

Creates dependent control (increment button).

```
virtual bool CreateInc()
```

Return Value

ture - successful, otherwise - false.
CreateDec

Creates dependent control (decrement button).

```cpp
virtual bool CreateDec()
```

Return Value

true - successful, otherwise - false.
OnClickInc

The virtual handler of the control "ClickInc" (mouse click on the increment button) internal event.

```cpp
virtual bool OnClickInc()
```

Return Value

- true - event processed, otherwise - false.
**OnClickDec**

The virtual handler of the control "ClickDec" (mouse click on the decrement button) internal event.

```cpp
virtual bool OnClickDec()
```

**Return Value**

- true - event processed, otherwise - false.
OnChangeValue

The virtual handler of the control "ChangeValue" (changing the current value) internal event.

```cpp
virtual bool OnChangeValue() {
    // Return value
    return true; // event processed, otherwise - false.
}
```
# CDialog

**CDialog**

CDialog is class of the Dialog complex control.

## Description

CDialog class is intended to combine the controls with different functions in the group.

## Declaration

```cpp
class CDialog : public CWndContainer
```

## Title

```cpp
#include <Controls\Dialog.mqh>
```

## Inheritance hierarchy

- **CObject**
  - **CWnd**
    - **CWndContainer**
      - **CDialog**

## Direct descendants

- **CAppDialog**

### Methods inherited from class CObject

- Prev, Prev, Next, Next, **Type**, Compare

### Methods inherited from class CWnd

- Name, ControlsTotal, Control, Rect, Left, Left, Top, Top, Right, Right, Bottom, Bottom, Width, Width, Height, Height, Size, Size, Size, Contains, Contains, Alignment, Align, Id, IsEnabled, IsVisible, Visible, IsActive, Activate, Deactivate, StateFlags, StateFlags, StateFlagsSet, StateFlagsReset, PropFlags, PropFlags, PropFlagsSet, PropFlagsReset, MouseX, MouseX, MouseY, MouseY, MouseFlags, MouseFlags, MouseFlags, MouseFocusKill, BringToTop

### Methods inherited from class CWndContainer

- Destroy, OnMouseEvent, ControlsTotal, Control, ControlFind, MouseFocusKill, Add, Add, Delete, Delete, Move, Move, Shift, Id, Enable, Disable, Show, Hide
Create

Creates new CDialog control.

```cpp
virtual bool Create(
    const long chart, // chart ID
    const string name, // name
    const int subwin, // chart subwindow
    const int x1,     // coordinate
    const int y1,     // coordinate
    const int x2,     // coordinate
    const int y2      // coordinate
)
```

Parameters

- `chart`: [in] ID of the chart, at which the control is created.
- `name`: [in] Unique name of the control.
- `subwin`: [in] Subwindow of the chart, at which the control is created.
- `x1`: [in] X coordinate of the upper left corner.
- `y1`: [in] Y coordinate of the upper left corner.
- `x2`: [in] X coordinate of the lower right corner.
- `y2`: [in] Y coordinate of the lower right corner.

Return Value

- `true` - successful, otherwise - `false`.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,       // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

**Parameters**

- **id**
  - [in] Event ID.
- **lparam**
- **dparam**
  - [in] Event parameter of `double` type passed by reference.
- **sparam**
  - [in] Event parameter of `string` type passed by reference.

**Return Value**

- `true` - event processed, otherwise - `false`. 
**Caption (Get method)**

Gets the "Caption" property of the CDialog control.

```cpp
string MinValue() const
```

**Return Value**

The "Caption" property.

**Caption (Set method)**

Sets the "Caption" property of the CDialog control.

```cpp
bool Caption(
    const string text  // text
)
```

**Parameters**

*text*

[In] New value of "Caption" property.

**Return Value**

true - successful, otherwise - false.
Add

Adds control to the client area by pointer.

```cpp
bool Add(
    CWnd *control,    // pointer
)
```

Parameters

control

[in] Pointer to control.

Return Value

true - successful, otherwise - false.

Add

Adds control to the client area by reference.

```cpp
bool Add(
    CWnd &control,    // reference
)
```

Parameters

control

[in] Reference to control

Return Value

true - successful, otherwise - false.
**CreateWhiteBorder**

Creates dependent control (white border).

```cpp
virtual bool CreateWhiteBorder()
```

**Return Value**

- true - successful, otherwise - false.
CreateBackground

Creates dependent control (background).

```
virtual bool CreateBackground()
```

Return Value

- true - successful, otherwise - false.
CreateCaption

Creates dependent control (caption).

\[
\text{virtual bool CreateCaption()}
\]

Return Value

- true - successful, otherwise - false.
CreateButtonClose

Creates dependent control (close button)

```cpp
virtual bool CreateButtonClose()
```

Return Value

- `true` - successful, otherwise - `false`. 
CreateClientArea

Creates dependent control (client area).

```
virtual bool CreateClientArea()
```

Return Value

- true - successful, otherwise - false.
OnClickCaption

The virtual handler of the control "ClickCaption" internal event.

```cpp
virtual bool OnClickCaption()
```

Return Value

true - successful, otherwise - false.
**OnClickButtonClose**

The virtual handler of the control "ClickButtonClose" internal event.

```cpp
virtual bool OnClickButtonClose()
```

**Return Value**

- true - successful, otherwise - false.
**ClientAreaVisible**

Sets a flag indicating whether the client area is visible.

```cpp
bool ClientAreaVisible(
    const bool visible // visibility flag
);
```

**Parameters**

`visible`

**Return Value**

true - successful, otherwise - false.
ClientAreaLeft

Gets X coordinate of the upper-left corner of the control client area.

```cpp
int ClientAreaLeft()
```

Return Value

The X coordinate of the upper-left corner of the control client area.
**ClientAreaTop**

Gets Y coordinate of the upper-left corner of the control client area.

```cpp
int ClientAreaTop()
```

**Return Value**

The Y coordinate of the upper-left corner of the control client area.
**ClientAreaRight**

Gets X coordinate of the lower-right corner of the control client area.

```cpp
int ClientAreaRight()
```

**Return Value**

The X coordinate of the lower-right corner of the control client area.
**ClientAreaBottom**

Gets Y coordinate of the lower-right corner of the control client area.

```cpp
int ClientAreaBottom()
```

**Return Value**

The Y coordinate of the lower-right corner of the control client area.
ClientAreaWidth

Gets the width of the control client area.

```cpp
int ClientAreaWidth()
```

Return Value

The width of the client area.
ClientAreaHeight

Gets the height of the control client area.

```c
int ClientAreaHeight()
```

Return Value

The height of the control client area.
OnDialogDragStart

The virtual handler of the control "DialogDragStart" event.

```
virtual bool OnDialogDragStart()
```

Return Value

true - event processed, otherwise - false.

Note

The "DialogDragStart" event occurs at start of the drag of the control.
OnDialogDragProcess

The virtual handler of the control “DialogDragProcess” event.

```cpp
virtual bool OnDialogDragProcess()
```

Return Value

true - event processed, otherwise - false.

Note

The “DialogDragProcess” event occurs when the control is dragged.
OnDialogDragEnd

The virtual handler of the control "DialogDragEnd" event.

```cpp
virtual bool OnDialogDragEnd()
```

Return Value

- true - event processed, otherwise - false.

Note

The "DialogDragEnd" event occurs at the end of the drag of the control.
CAppDialog

CAppDialog is a class of Application Dialog complex control (with dependent controls).

Description

CAppDialog class is intended to combine the controls with different functions in the group inside the MQL5 program.

Declaration

```cpp
class CAppDialog : public CDialog
```

Title

```cpp
#include <Controls\Dialog.mqh>
```

Inheritance hierarchy

- CObject
  - CWnd
    - CWndContainer
      - CDialog
        - CAppDialog

Methods inherited from class CDialog

Caption, Caption, Add, Add
Create

Creates new CAppDialog control.

```cpp
virtual bool Create(
    const long chart,    // chart ID
    const string name,   // name
    const int subwin,    // chart subwindow
    const int x1,        // coordinate
    const int y1,        // coordinate
    const int x2,        // coordinate
    const int y2         // coordinate
)
```

Parameters

- **chart**
  - [in] ID of the chart, at which the control is created.

- **name**
  - [in] Unique name of the control.

- **subwin**
  - [in] Subwindow of the chart, at which the control is created.

- **x1**
  - [in] X coordinate of the upper left corner.

- **y1**
  - [in] Y coordinate of the upper left corner.

- **x2**
  - [in] X coordinate of the lower right corner.

- **y2**
  - [in] Y coordinate of the lower right corner.

Return Value

- true - successful, otherwise - false.
Destroy

CAppDialog control deinitialization method.

```cpp
virtual void Destroy(
    const int reason=REASON_PROGRAM  // reason code
)
```

**Parameters**

`reason`

[in] Deinitialization reason code. `REASON_PROGRAM` is set by default.

**Return Value**

None.
OnEvent

Chart event handler.

```cpp
virtual bool OnEvent(
    const int id,          // ID
    const long& lparam,    // parameter
    const double& dparam,  // parameter
    const string& sparam   // parameter
)
```

Parameters

- **id**
  
  [in] Event ID.

- **lparam**
  

- **dparam**
  

- **sparam**
  

Return Value

- `true` - event processed, otherwise - `false`.
Run

Runs control.

```cpp
bool Run()
```

Return Value

- true - successful, otherwise - false.
ChartEvent

Virtual handler of the control events.

```cpp
virtual bool ChartEvent(
    const int id,       // ID
    const long& lparam, // parameter
    const double& dparam, // parameter
    const string& sparam // parameter
)
```

Parameters

- **id**
  - [in] Event ID.

- **lparam**

- **dparam**
  - [in] Event parameter of `double` type passed by reference.

- **sparam**
  - [in] Event parameter of `string` type passed by reference.

Return Value

true - event processed, otherwise - false.
Minimized

Sets the value of “Minimized” (window state) property of the control.

```cpp
bool Minimized(
    const bool flag  // state
)
```

Parameters

`flag`

[in] New state.

Return Value

true - successful, otherwise - false.
IniFileSave

Saves the control state to file.

```cpp
void IniFileSave()
```

Return Value

true - successful, otherwise - false.
## IniFileLoad

Loads the control state from file.

| void IniFileLoad() |

**Return Value**

- true - successful, otherwise - false.
**IniFileName**

Sets the file name for loading/saving the control state.

```cpp
virtual string IniFileName() const
```

**Return Value**

File name for loading/saving of the control state.

**Note**

The file name includes the name of the Expert Advisor/indicator and working symbol, on which MQL5 program is launched.
IniFileExt

Sets the file extension for loading/saving the control state.

```cpp
virtual string IniFileExt() const
```

Return Value

File extension used for loading/saving of the control state.
CreateCommon

Common initialization method.

```cpp
bool CreateCommon(
    const long chart,       // chart ID
    const string name,     // name
    const int subwin,      // chart subwindow
)
```

Parameters

* `chart`
  
  [in] ID of the chart, at which the control is created.

* `name`
  
  [in] Unique name of the control.

* `subwin`
  
  [in] Subwindow of the chart, at which the control is created.

Return Value

true - successful, otherwise - false.
CreateExpert

Initialization method for working in Expert Advisors.

```cpp
bool CreateExpert(
    const int x1, // coordinate
    const int y1, // coordinate
    const int x2, // coordinate
    const int y2 // coordinate
)
```

**Parameters**

- **x1**
  - [in] X coordinate of the upper left corner.
- **y1**
  - [in] Y coordinate of the upper left corner.
- **x2**
  - [in] X coordinate of the lower right corner.
- **y2**
  - [in] Y coordinate of the lower right corner.

**Return Value**

- true - successful, otherwise - false.
CreateIndicator

Initialization method for working in indicators.

```cpp
bool CreateIndicator(
    const int x1,       // coordinate
    const int y1,       // coordinate
    const int x2,       // coordinate
    const int y2        // coordinate
)
```

Parameters

- **x1**
  - [in] X coordinate of the upper left corner.

- **y1**
  - [in] Y coordinate of the upper left corner.

- **x2**
  - [in] X coordinate of the lower right corner.

- **y2**
  - [in] Y coordinate of the lower right corner.

Return Value

- true - successful, otherwise - false.
CreateButtonMinMax

Creates dependent controls (minimize/maximize buttons).

```cpp
virtual void CreateButtonMinMax()
```

Return Value

None.
**OnClickButtonClose**

The virtual handler of the control "ClickButtonClose" (mouse click on close button) internal event.

```cpp
virtual void OnClickButtonClose()
```

**Return Value**

None.
OnClickButtonMinMax

The virtual handler of the control "ClickListenerMinMax" (mouse click on minimize/maximize button) internal event.

```cpp
virtual void OnClickButtonClose()
```

Return Value

None.
OnAnotherApplicationClose

The virtual handler of the control external events.

```
virtual void OnAnotherApplicationClose()
```

Return Value

None.
Rebound

Sets new coordinates of the control using CRect class coordinates.

```cpp
bool Rebound(const &CRect rect // CRect class )
```

Return Value

true - successful, otherwise - false.
**Minimize**

Shows the control window in the minimized state.

```cpp
virtual void Minimize()
```

**Return Value**

- true - successful, otherwise - false.
Maximize

Shows the control window in the maximized (restored) state.

```
virtual void Maximize()
```

**Return Value**

true - successful, otherwise - false.
CreateInstanceId

Creates a unique prefix for the names of the control objects.

```
string CreateInstanceId()
```

**Return Value**

*Prefix for the object names.*
**ProgramName**

Gets the name of the MQL5 program, at which the control is used.

```c
string ProgramName()
```

**Return Value**

Name of the MQL5 program.
SubwinOff

Gets the Y offset of the control subwindow.

```c
void SubwinOff()
```

Return Value

None.
Moving from MQL4 to MQL5

MQL5 is the evolution of its predecessor - the MQL4 programming language, in which numerous indicators, scripts, and Expert Advisors were written. Despite the fact that the new programming language is maximally compatible with the previous-generation language, there are still some differences between these languages. And when transferring programs these differences should be noted.

This section contains information intended to facilitate the adaptation of codes to the new MQL5 language for programmers who know MQL4.

First it should be noted:

- The new language does not contain functions `start()`, `init()` and `deinit()`.
- No limit for the number of indicator buffers.
- DLLs are loaded immediately after loading an Expert Advisor (or any other mql5 program).
- Check of logical conditions is shortened.
- When limits of an array are exceeded, the current performance is terminated (critically - with the output of an errors).
- Precedence of operators like in C++.
- The language offers the implicit type cast (even from string to a number).
- Local variables are not initialized automatically (except for strings).
- Common local arrays are automatically deleted.

**Special Functions init, start and deinit**

The MQL4 language contained only three predefined functions that could be used in the indicator, script or Expert Advisor (not taking into account the include files *.mqh and library files). In MQL5 there are no such functions, but there are their analogues. The table shows the approximate correspondence of functions.

<table>
<thead>
<tr>
<th>MQL4</th>
<th>MQL5</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>OnInit</td>
</tr>
<tr>
<td>start</td>
<td>OnStart</td>
</tr>
<tr>
<td>deinit</td>
<td>OnDeinit</td>
</tr>
</tbody>
</table>

Functions `OnInit` and `OnDeinit` perform the same role as `init` and `deinit` in MQL4 - they are designed to locate the code, which must be performed during initialization and deinitialization of mql5 programs. You can either just rename these functions accordingly, or leave them as they are, but add calls of these functions in corresponding places.

**Example:**

```c
void OnInit()
{
    //--- Call function upon initialization
    init();
}
```
{  
    void OnDeinit(const int reason)  
    {  
      //--- Call function upon deinitialization  
      deinit();  
      //---  
    }  
  }

The start function is replaced by `OnStart` only in scripts. In Expert Advisors and indicators it should be renamed to `OnTick` and `OnCalculate`, respectively. The code that is to be executed during a mql5 program operation should be located in these three functions:

<table>
<thead>
<tr>
<th>mql5-program</th>
<th>main function</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>OnStart</td>
</tr>
<tr>
<td>indicator</td>
<td>OnCalculate</td>
</tr>
<tr>
<td>Expert Advisor</td>
<td>OnTick</td>
</tr>
</tbody>
</table>

If the indicator or script code does not contain the main function, or the function name differs from the required one, the call of this function is not performed. It means, if the source code of a script doesn’t contain OnStart, such a code will be compiled as an Expert Advisor.

If an indicator code doesn’t contain the OnCalculate function, the compilation of such an indicator is impossible.

**Predefined Variables**

In MQL5 there are no such predefined variables as Ask, Bid, Bars. Variables Point and Digits have a slightly different spelling:

<table>
<thead>
<tr>
<th>MQL4</th>
<th>MQL5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digits</td>
<td>_Digits</td>
</tr>
<tr>
<td>Point</td>
<td>_Point</td>
</tr>
<tr>
<td></td>
<td>_LastError</td>
</tr>
<tr>
<td></td>
<td>_Period</td>
</tr>
<tr>
<td></td>
<td>_Symbol</td>
</tr>
<tr>
<td></td>
<td>_StopFlag</td>
</tr>
<tr>
<td></td>
<td>_UninitReason</td>
</tr>
</tbody>
</table>

**Access to Timeseries**

In MQL5 there are no such predefined timeseries as Open[], High[], Low[], Close[], Volume[] and Time[]. The necessary depth of a timeseries can now be set using corresponding functions to access timeseries.
Expert Advisors

Expert Advisors in MQL5 do not require the obligatory presence of functions that handle the *events* of a new tick receipt - OnTick, as it was in MQL4 (the start function in MQL4 is executed when a new tick is received). In MQL5 Expert Advisors can contain pre-defined handler functions of several types of events:

- **OnTick** - receipt of a new tick;
- **OnTimer** - timer event;
- **OnTrade** - trade event;
- **OnChartEvent** - events of input from the keyboard and mouse, events of a graphic object moving, event of a text editing completion in the entry field of the LabelEdit object;
- **OnBookEvent** - event of Depth of Market status change.

Custom Indicators

In MQL4, the number of indicator buffers is limited and can’t exceed 8. In MQL5 there are no such limitations, but it should be remembered that each indicator buffer requires allocation of a certain part of memory for its location in the terminal, so the new possibility should not be abused.

MQL4 offered only 6 types of custom indicator plotting; while MQL5 now offers 18 *drawing styles*. The names of drawing types haven’t changed, but the ideology of the graphical representation of indicators has changed significantly.

The direction of indexing in indicator buffers also differs. By default, in MQL5 all the indicator buffers have the behavior of common arrays, i.e. 0 indexed element is the oldest one in the history, and as the index increases, we move from the oldest data to the most recent ones.

The only function for working with *custom indicators* that was preserved from MQL4 is *SetIndexBuffer*. But its call has changed; now you should specify *type of data to be stored in an array*, linked to the indicator buffer.

Properties of custom indicators also have changed and expanded. New functions for *accessing timeseries* have been added, so the total calculation algorithm must be reconsidered.

Graphical Objects

The number of graphical objects in MQL5 has been significantly increased. Besides, graphical objects can now be positioned in time with the accuracy of a second in a chart of any timeframe - now object anchor points are not rounded off to the bar opening time in the current price chart.

For the Arrow, Text and Label objects now you can specify *binding methods*, and for the Label, Button, Chart, Bitmap Label and Edit objects you can set *chart corner to which an object is attached*. 
## List of MQL5 Functions

All MQL5 functions in alphabetical order.

<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountInfoDouble</td>
<td>Returns a value of double type of the corresponding account property</td>
<td>Account Information</td>
</tr>
<tr>
<td>AccountInfoInteger</td>
<td>Returns a value of integer type (bool, int or long) of the corresponding account property</td>
<td>Account Information</td>
</tr>
<tr>
<td>AccountInfoString</td>
<td>Returns a value string type corresponding account property</td>
<td>Account Information</td>
</tr>
<tr>
<td>acos</td>
<td>Returns the arc cosine of ( x ) in radians</td>
<td>Math Functions</td>
</tr>
<tr>
<td>Alert</td>
<td>Displays a message in a separate window</td>
<td>Common Functions</td>
</tr>
<tr>
<td>ArraySearch</td>
<td>Searches for a specified value in a multidimensional numeric array sorted ascending</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayCompare</td>
<td>Returns the result of comparing two arrays of simple types or custom structures without complex objects</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayCopy</td>
<td>Copies one array into another</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayFill</td>
<td>Fills an array with the specified value</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayFree</td>
<td>Frees up buffer of any dynamic array and sets the size of the zero dimension in 0.</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayGetAsSeries</td>
<td>Checks direction of array indexing</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayInitialize</td>
<td>Sets all elements of a numeric array into a single value</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayIsDynamic</td>
<td>Checks whether an array is dynamic</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayIsSeries</td>
<td>Checks whether an array is a timeseries</td>
<td>Array Functions</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>ArrayMaximum</td>
<td>Searches for the largest element in the first dimension of a multidimensional numeric array</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayMinimum</td>
<td>Searches for the lowest element in the first dimension of a multidimensional numeric array</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayRange</td>
<td>Returns the number of elements in the specified dimension of the array</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayResize</td>
<td>Sets the new size in the first dimension of the array</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArraySetAsSeries</td>
<td>Sets the direction of array indexing</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArraySize</td>
<td>Returns the number of elements in the array</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArraySort</td>
<td>Sorting of numeric arrays by the first dimension</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayPrint</td>
<td>Prints an array of a simple type or a simple structure into journal</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayInsert</td>
<td>Inserts the specified number of elements from a source array to a receiving one starting from a specified index</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayRemove</td>
<td>Removes the specified number of elements from the array starting with a specified index</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArrayReverse</td>
<td>Reverses the specified number of elements in the array starting with a specified index</td>
<td>Array Functions</td>
</tr>
<tr>
<td>ArraySwap</td>
<td>Swaps the contents of two dynamic arrays of the same type</td>
<td>Array Functions</td>
</tr>
<tr>
<td>asin</td>
<td>Returns the arc sine of x in radians</td>
<td>Math Functions</td>
</tr>
<tr>
<td>atan</td>
<td>Returns the arc tangent of x in radians</td>
<td>Math Functions</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>Bars</td>
<td>Returns the number of bars the history for a specified symbol and period</td>
<td>Timeseries and Indicators</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Access</td>
</tr>
<tr>
<td>BarsCalculated</td>
<td>Returns the number of calculated data in an indicator buffer or -1 in the case of error (data hasn’t been calculated yet)</td>
<td>Timeseries and Indicators</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Access</td>
</tr>
<tr>
<td>CalendarCountryById</td>
<td>Get a country description by its ID</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarEventById</td>
<td>Get an event description by its ID</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarValueById</td>
<td>Get an event value description by its ID</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarCountries</td>
<td>Get the array of country names available in the calendar</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarEventByCountry</td>
<td>Get the array of descriptions of all events available in the calendar by a specified country code</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarEventByCurrency</td>
<td>Get the array of descriptions of all events available in the calendar by a specified currency</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarValueHistoryById</td>
<td>Get the array of values for all events in a specified time range by an event ID</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarValueHistory</td>
<td>Get the array of values for all events in a specified time range with the ability to sort by country and/or currency</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarValueLastById</td>
<td>Get the array of event values by its ID since the calendar database status with a specified change_id</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>CalendarValueLast</td>
<td>Get the array of values for all events with the ability to sort by country and/or currency since the calendar database status with a specified change_id</td>
<td>Economic Calendar</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td><strong>ceil</strong></td>
<td>Returns integer numeric value closest from above</td>
<td><strong>Math Functions</strong></td>
</tr>
<tr>
<td><strong>CharArrayToString</strong></td>
<td>Converting symbol code (ansi) into one-symbol array</td>
<td><strong>Conversion Functions</strong></td>
</tr>
<tr>
<td><strong>ChartApplyTemplate</strong></td>
<td>Applies a specific template from a specified file to the chart</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartClose</strong></td>
<td>Closes the specified chart</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartFirst</strong></td>
<td>Returns the ID of the first chart of the client terminal</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartGetDouble</strong></td>
<td>Returns the double value property of the specified chart</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartGetInteger</strong></td>
<td>Returns the integer value property of the specified chart</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartGetString</strong></td>
<td>Returns the string value property of the specified chart</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartID</strong></td>
<td>Returns the ID of the current chart</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartIndicatorAdd</strong></td>
<td>Adds an indicator with the specified handle into a specified chart window</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartIndicatorDelete</strong></td>
<td>Removes an indicator with a specified name from the specified chart window</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartIndicatorGet</strong></td>
<td>Returns the handle of the indicator with the specified short name in the specified chart window</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartIndicatorName</strong></td>
<td>Returns the short name of the indicator by the number in the indicators list on the specified chart window</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartIndicatorsTotal</strong></td>
<td>Returns the number of all indicators applied to the specified chart window.</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td><strong>ChartNavigate</strong></td>
<td>Performs shift of the specified chart by the specified number of bars relative to the specified position in the chart</td>
<td><strong>Chart Operations</strong></td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>ChartNext</td>
<td>Returns the chart ID of the chart next to the specified one</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartOpen</td>
<td>Opens a new chart with the specified symbol and period</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>CharToString</td>
<td>Converting a symbol code into a one-character string</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>ChartPeriod</td>
<td>Returns the period value of the specified chart</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartPriceOnDropped</td>
<td>Returns the price coordinate of the chart point, the Expert Advisor or script has been dropped to</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartRedraw</td>
<td>Calls a forced redrawing of a specified chart</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartSaveTemplate</td>
<td>Saves current chart settings in a template with a specified name</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartScreenShot</td>
<td>Provides a screenshot of the chart of its current state in a GIF, PNG or BMP format depending on specified extension</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartSetDouble</td>
<td>Sets the double value for a corresponding property of the specified chart</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartSetInteger</td>
<td>Sets the integer value (datetime, int, color, bool or char) for a corresponding property of the specified chart</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartSetString</td>
<td>Sets the string value for a corresponding property of the specified chart</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartSetSymbolPeriod</td>
<td>Changes the symbol value and a period of the specified chart</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartSymbol</td>
<td>Returns the symbol name of the specified chart</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartTimeOnDropped</td>
<td>Returns the time coordinate of the chart point, the Expert Advisor or script has been dropped to</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>ChartTimePriceToXY</td>
<td>Converts the coordinates of a chart from the time/price representation to the X and Y coordinates</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartWindowFind</td>
<td>Returns the number of a subwindow where an indicator is drawn</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartWindowOnDropped</td>
<td>Returns the number (index) of the chart subwindow, the Expert Advisor or script has been dropped to</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartXOnDropped</td>
<td>Returns the X coordinate of the chart point, the Expert Advisor or script has been dropped to</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartXYToTimePrice</td>
<td>Converts the X and Y coordinates on a chart to the time and price values</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>ChartYOnDropped</td>
<td>Returns the Y coordinate of the chart point, the Expert Advisor or script has been dropped to</td>
<td>Chart Operations</td>
</tr>
<tr>
<td>CheckPointer</td>
<td>Returns the type of the object pointer</td>
<td>Common Functions</td>
</tr>
<tr>
<td>CLBufferCreate</td>
<td>Creates an OpenCL buffer</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLBufferFree</td>
<td>Deletes an OpenCL buffer</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLBufferRead</td>
<td>Reads an OpenCL buffer into an array</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLBufferWrite</td>
<td>Writes an array into an OpenCL buffer</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLContextCreate</td>
<td>Creates an OpenCL context</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLContextFree</td>
<td>Removes an OpenCL context</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLEexecute</td>
<td>Runs an OpenCL program</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLGetDeviceInfo</td>
<td>Receives device property from OpenCL driver</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLGetInfoInteger</td>
<td>Returns the value of an integer property for an OpenCL object or device</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td>CLHandleType</td>
<td>Returns the type of an OpenCL handle as a value of the ENUM_OPENCL_HANDLE_TYPE enumeration</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLKernelCreate</td>
<td>Creates an OpenCL start function</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLKernelFree</td>
<td>Removes an OpenCL start function</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLProgramCreate</td>
<td>Creates an OpenCL program from a source code</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLProgramFree</td>
<td>Removes an OpenCL program</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLSetKernelArg</td>
<td>Sets a parameter for the OpenCL function</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>CLSetKernelArgMem</td>
<td>Sets an OpenCL buffer as a parameter of the OpenCL function</td>
<td>Working with OpenCL</td>
</tr>
<tr>
<td>ColorToARGB</td>
<td>Converting color type to uint type to receive ARGB representation of the color.</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>ColorToString</td>
<td>Converting color value into string as “R,G,B”</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>Comment</td>
<td>Outputs a comment in the left top corner of the chart</td>
<td>Common Functions</td>
</tr>
<tr>
<td>CopyBuffer</td>
<td>Gets data of a specified buffer from a specified indicator into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyClose</td>
<td>Gets history data on bar closing price for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyHigh</td>
<td>Gets history data on maximal bar price for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyLow</td>
<td>Gets history data on minimal bar price for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyOpen</td>
<td>Gets history data on bar opening price for a specified</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>--------------------------------------</td>
</tr>
<tr>
<td>CopyRates</td>
<td>Gets history data of the Rates structure for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyRealVolume</td>
<td>Gets history data on trade volumes for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopySpread</td>
<td>Gets history data on spreads for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyTicks</td>
<td>Gets ticks accumulated by the terminal for the current working session into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyTickVolume</td>
<td>Gets history data on tick volumes for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>CopyTime</td>
<td>Gets history data on bar opening time for a specified symbol and period into an array</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>cos</td>
<td>Returns the cosine of a number</td>
<td>Math Functions</td>
</tr>
<tr>
<td>CryptDecode</td>
<td>Performs the inverse transformation of the data from array</td>
<td>Common Functions</td>
</tr>
<tr>
<td>CryptEncode</td>
<td>Transforms the data from array with the specified method</td>
<td>Common Functions</td>
</tr>
<tr>
<td>CustomSymbolCreate</td>
<td>Create a custom symbol with the specified name in the specified group</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomSymbolDelete</td>
<td>Delete a custom symbol with the specified name</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomSymbolSetInteger</td>
<td>Set the integer type property value for a custom symbol</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomSymbolSetDouble</td>
<td>Set the real type property value for a custom symbol</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>CustomSymbolSetString</td>
<td>Set the string type property value for a custom symbol</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomSymbolSetMarginRate</td>
<td>Set the margin rates depending on the order type and direction for a custom symbol</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomSymbolSetSessionQuote</td>
<td>Set the start and end time of the specified quotation session for the specified symbol and week day</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomSymbolSetSessionTrade</td>
<td>Set the start and end time of the specified trading session for the specified symbol and week day</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomRatesDelete</td>
<td>Delete all bars from the price history of the custom symbol in the specified time interval</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomRatesReplace</td>
<td>Fully replace the price history of the custom symbol within the specified time interval with the data from the MqlRates type array</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomRatesUpdate</td>
<td>Add missing bars to the custom symbol history and replace existing data with the ones from the MqlRates type array</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomTicksAdd</td>
<td>Adds data from an array of the MqlTick type to the price history of a custom symbol. The custom symbol must be selected in the Market Watch window</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomTicksDelete</td>
<td>Delete all ticks from the price history of the custom symbol in the specified time interval</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>CustomTicksReplace</td>
<td>Fully replace the price history of the custom symbol within the specified time interval with the data from the MqlTick type array</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>CustomBookAdd</td>
<td>Passes the status of the Depth of Market for a custom symbol</td>
<td>Custom Symbols</td>
</tr>
<tr>
<td>DatabaseOpen</td>
<td>Opens or creates a database in a specified file</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseClose</td>
<td>Closes a database</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseImport</td>
<td>Imports data from a file into a table</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseExport</td>
<td>Exports a table or an SQL request execution result to a CSV file</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabasePrint</td>
<td>Prints a table or an SQL request execution result in the Experts journal</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseTableExists</td>
<td>Checks the presence of the table in a database</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseExecute</td>
<td>Executes a request to a specified database</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabasePrepare</td>
<td>Creates a handle of a request, which can then be executed using DatabaseRead()</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseReset</td>
<td>Resets a request, like after calling DatabasePrepare()</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseBind</td>
<td>Sets a parameter value in a request</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseBindArray</td>
<td>Sets an array as a parameter value</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseRead</td>
<td>Moves to the next entry as a result of a request</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseReadBind</td>
<td>Moves to the next record and reads data into the structure from it</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseFinalize</td>
<td>Removes a request created in DatabasePrepare()</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseTransactionBegin</td>
<td>Starts transaction execution</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseTransactionCommit</td>
<td>Completes transaction execution</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseTransactionRollback</td>
<td>Rolls back transactions</td>
<td>Working with databases</td>
</tr>
</tbody>
</table>
## List of MQL5 Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>DatabaseColumnsCount</td>
<td>Gets the number of fields in a request</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnName</td>
<td>Gets a field name by index</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnType</td>
<td>Gets a field type by index</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnSize</td>
<td>Gets a field size in bytes</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnText</td>
<td>Gets a field value as a string from the current record</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnInteger</td>
<td>Gets the int type value from the current record</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnLong</td>
<td>Gets the long type value from the current record</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnDouble</td>
<td>Gets the double type value from the current record</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DatabaseColumnBlob</td>
<td>Gets a field value as an array from the current record</td>
<td>Working with databases</td>
</tr>
<tr>
<td>DebugBreak</td>
<td>Program breakpoint in debugging</td>
<td>Common Functions</td>
</tr>
<tr>
<td>Digits</td>
<td>Returns the number of decimal digits determining the accuracy of the price value of the current chart symbol</td>
<td>Checkup</td>
</tr>
<tr>
<td>DoubleToString</td>
<td>Converting a numeric value to a text line with a specified accuracy</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>DXContextCreate</td>
<td>Creates a graphic context for rendering frames of a specified size</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXContextSetSize</td>
<td>Changes a frame size of a graphic context created in DXContextCreate()</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXContextSetSize</td>
<td>Gets a frame size of a graphic context created in DXContextCreate()</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXContextClearColors</td>
<td>Sets a specified color to all pixels for the rendering buffer</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXContextClearDepth</td>
<td>Clears the depth buffer</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXContextGetColors</td>
<td>Gets an image of a specified size and offset from a graphic</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>DXContextGetDepth</td>
<td>Gets the depth buffer of a rendered frame</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXBufferCreate</td>
<td>Creates a buffer of a specified type based on a data array</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXTextureCreate</td>
<td>Creates a 2D texture out of a rectangle of a specified size cut from a passed image</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXInputCreate</td>
<td>Creates shader inputs</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXInputSet</td>
<td>Sets shader inputs</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXShaderCreate</td>
<td>Creates a shader of a specified type</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXShaderSetLayout</td>
<td>Sets vertex layout for the vertex shader</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXShaderInputsSet</td>
<td>Sets shader inputs</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXShaderTexturesSet</td>
<td>Sets shader textures</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXDraw</td>
<td>Renders the vertices of the vertex buffer set in DXBufferSet()</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXDrawIndexed</td>
<td>Renders graphic primitives described by the index buffer from DXBufferSet()</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXPrimiveTopologySet</td>
<td>Sets the type of primitives for rendering using DXDrawIndexed()</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXBufferSet</td>
<td>Sets a buffer for the current rendering</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXShaderSet</td>
<td>Sets a shader for rendering</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXHandleType</td>
<td>Returns a handle type</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>DXRelease</td>
<td>Releases a handle</td>
<td>Working with DirectX</td>
</tr>
<tr>
<td>EnumToQString</td>
<td>Converting an enumeration value of any type to string</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>EventChartCustom</td>
<td>Generates a custom event for the specified chart</td>
<td>Working with Events</td>
</tr>
<tr>
<td>EventKillTimer</td>
<td>Stops the generation of events by the timer in the current chart</td>
<td>Working with Events</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>EventSetMillisecondTimer</td>
<td>Launches event generator of the high-resolution timer with a period less than 1 second for the current chart</td>
<td>Working with Events</td>
</tr>
<tr>
<td>EventSetTimer</td>
<td>Starts the timer event generator with the specified periodicity for the current chart</td>
<td>Working with Events</td>
</tr>
<tr>
<td>exp</td>
<td>Returns exponent of a number</td>
<td>Math Functions</td>
</tr>
<tr>
<td>ExpertRemove</td>
<td>Stops Expert Advisor and unloads it from the chart</td>
<td>Common Functions</td>
</tr>
<tr>
<td>fabs</td>
<td>Returns absolute value (modulus) of the specified numeric value</td>
<td>Math Functions</td>
</tr>
<tr>
<td>FileClose</td>
<td>Closes a previously opened file</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileCopy</td>
<td>Copies the original file from a local or shared folder to another file</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileDelete</td>
<td>Deletes a specified file</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileFindClose</td>
<td>Closes search handle</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileFindFirst</td>
<td>Starts the search of files in a directory in accordance with the specified filter</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileFindNext</td>
<td>Continues the search started by the FileFindFirst() function</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileFlush</td>
<td>Writes to a disk all data remaining in the input/output file buffer</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileGetInteger</td>
<td>Gets an integer property of a file</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileIsEnding</td>
<td>Defines the end of a file in the process of reading</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileIsExist</td>
<td>Checks the existence of a file</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileIsLineEnding</td>
<td>Defines the end of a line in a text file in the process of reading</td>
<td>File Functions</td>
</tr>
<tr>
<td>FileMove</td>
<td>Moves or renames a file</td>
<td>File Functions</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td><code>FileOpen</code></td>
<td>Opens a file with a specified name and flag</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadArray</code></td>
<td>Reads arrays of any type except for string from the file of the BIN type</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadBool</code></td>
<td>Reads from the file of the CSV type a string from the current position till a delimiter (or till the end of a text line) and converts the read string to a value of bool type</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadDateTime</code></td>
<td>Reads from the file of the CSV type a string of one of the formats: &quot;YYYY.MM.DD HH:MM:SS&quot;, &quot;YYYY.MM.DD&quot; or &quot;HH:MM:SS&quot; - and converts the read string into a datetime value</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadDouble</code></td>
<td>Reads a double value from the current position of the file pointer</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadFloat</code></td>
<td>Reads a float value from the current position of the file pointer</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadInteger</code></td>
<td>Reads int, short or char value from the current position of the file pointer</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadLong</code></td>
<td>Reads a long type value from the current position of the file pointer</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadNumber</code></td>
<td>Reads from the file of the CSV type a string from the current position till a delimiter (or till the end of a text line) and converts the read string into double value</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadString</code></td>
<td>Reads a string from the current position of a file pointer from a file</td>
<td>File Functions</td>
</tr>
<tr>
<td><code>FileReadStruct</code></td>
<td>Reads the contents from a binary file into a structure passed as a parameter, from</td>
<td>File Functions</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td></td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>FileSeek</td>
<td>Moves the position of the file pointer by a specified number of bytes relative to the specified position</td>
<td></td>
</tr>
<tr>
<td>FileSize</td>
<td>Returns the size of a corresponding open file</td>
<td></td>
</tr>
<tr>
<td>FileTell</td>
<td>Returns the current position of the file pointer of a corresponding open file</td>
<td></td>
</tr>
<tr>
<td>FileWrite</td>
<td>Writes data to a file of CSV or TXT type</td>
<td></td>
</tr>
<tr>
<td>FileWriteArray</td>
<td>Writes arrays of any type except for string into a file of BIN type</td>
<td></td>
</tr>
<tr>
<td>FileWriteDouble</td>
<td>Writes value of the double type from the current position of a file pointer into a binary file</td>
<td></td>
</tr>
<tr>
<td>FileWriteFloat</td>
<td>Writes value of the float type from the current position of a file pointer into a binary file</td>
<td></td>
</tr>
<tr>
<td>FileWriteInteger</td>
<td>Writes value of the int type from the current position of a file pointer into a binary file</td>
<td></td>
</tr>
<tr>
<td>FileWriteLong</td>
<td>Writes value of the long type from the current position of a file pointer into a binary file</td>
<td></td>
</tr>
<tr>
<td>FileWriteString</td>
<td>Writes the value of a string parameter into a BIN or TXT file starting from the current position of the file pointer</td>
<td></td>
</tr>
<tr>
<td>FileWriteStruct</td>
<td>Writes the contents of a structure passed as a parameter into a binary file, starting from the current position of the file pointer</td>
<td></td>
</tr>
<tr>
<td>floor</td>
<td>Returns integer numeric value closest from below</td>
<td></td>
</tr>
</tbody>
</table>

**Section**

- File Functions
- Math Functions
<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>fmax</td>
<td>Returns the maximal value of the two numeric values</td>
<td>Math Functions</td>

<tr>
<td>fmin</td>
<td>Returns the minimal value of the two numeric values</td>
<td>Math Functions</td>
</tr>
<tr>
<td>fmod</td>
<td>Returns the real remainder after the division of two numbers</td>
<td>Math Functions</td>
</tr>
<tr>
<td>FolderClean</td>
<td>Deletes all files in the specified folder</td>
<td>File Functions</td>
</tr>
<tr>
<td>FolderCreate</td>
<td>Creates a folder in the Files directory</td>
<td>File Functions</td>
</tr>
<tr>
<td>FolderDelete</td>
<td>Removes a selected directory. If the folder is not empty, then it can't be removed</td>
<td>File Functions</td>
</tr>
<tr>
<td>FrameAdd</td>
<td>Adds a frame with data</td>
<td>Working with Optimization Results</td>
</tr>
<tr>
<td>FrameFilter</td>
<td>Sets the frame reading filter and moves the pointer to the beginning</td>
<td>Working with Optimization Results</td>
</tr>
<tr>
<td>FrameFirst</td>
<td>Moves a pointer of frame reading to the beginning and resets the previously set filter</td>
<td>Working with Optimization Results</td>
</tr>
<tr>
<td>FrameInputs</td>
<td>Receives input parameters, on which the frame is formed</td>
<td>Working with Optimization Results</td>
</tr>
<tr>
<td>FrameNext</td>
<td>Reads a frame and moves the pointer to the next one</td>
<td>Working with Optimization Results</td>
</tr>
<tr>
<td>GetLastError</td>
<td>Returns the last error</td>
<td>Checkup</td>
</tr>
<tr>
<td>GetPointer</td>
<td>Returns the object pointer</td>
<td>Common Functions</td>
</tr>
<tr>
<td>GetTickCount</td>
<td>Returns the number of milliseconds that have elapsed since the system was started</td>
<td>Common Functions</td>
</tr>
<tr>
<td>GlobalVariableCheck</td>
<td>Checks the existence of a global variable with the specified name</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariableDel</td>
<td>Deletes a global variable</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariableGet</td>
<td>Returns the value of a global variable</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>Function</td>
<td>Action</td>
<td>Section</td>

<td>Returns the name of a global variable by its ordinal number in the list of global variables</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariablesDeleteAll</td>
<td>Deletes global variables with the specified prefix in their names</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariableSet</td>
<td>Sets the new value to a global variable</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariableSetOnCondition</td>
<td>Sets the new value of the existing global variable by condition</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariablesFlush</td>
<td>Forcibly saves contents of all global variables to a disk</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariablesTotal</td>
<td>Returns the total number of global variables</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariableTemp</td>
<td>Sets the new value to a global variable, that exists only in the current session of the terminal</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>GlobalVariableTime</td>
<td>Returns time of the last accessing the global variable</td>
<td>Global Variables of the Terminal</td>
</tr>
<tr>
<td>HistoryDealGetDouble</td>
<td>Returns the requested property of a deal in the history (double)</td>
<td>Trade Functions</td>
</tr>
<tr>
<td>HistoryDealGetInteger</td>
<td>Returns the requested property of a deal in the history (datetime or int)</td>
<td>Trade Functions</td>
</tr>
<tr>
<td>HistoryDealGetString</td>
<td>Returns the requested property of a deal in the history (string)</td>
<td>Trade Functions</td>
</tr>
<tr>
<td>HistoryDealGetTicket</td>
<td>Returns a ticket of a corresponding deal in the history</td>
<td>Trade Functions</td>
</tr>
<tr>
<td>HistoryDealSelect</td>
<td>Selects a deal in the history for further calling it through appropriate functions</td>
<td>Trade Functions</td>
</tr>
<tr>
<td>HistoryDealsTotal</td>
<td>Returns the number of deals in the history</td>
<td>Trade Functions</td>

<td>HistorySelect</td>
<td>Retrieves the history of transactions and orders for the specified period of the server time</td>
<td>Trade Functions</td>
</tr>
<tr>
<td>HistorySelectByPosition</td>
<td>Requests the history of deals with a specified position identifier.</td>
<td>Trade Functions</td>
</tr>
<tr>
<td>iBars</td>
<td>Returns the number of bars of a corresponding symbol and period, available in history</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iBarShift</td>
<td>Returns the index of the bar corresponding to the specified time</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iClose</td>
<td>Returns the Close price of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iHigh</td>
<td>Returns the High price of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iHighest</td>
<td>Returns the index of the highest value found on the corresponding chart (shift relative to the current bar)</td>
<td>Timeseries and Indicators Access</td>
</tr>

<td>Returns the index of the smallest value found on the corresponding chart (shift relative to the current bar)</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iOpen</td>
<td>Returns the Open price of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iTime</td>
<td>Returns the opening time of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iTickVolume</td>
<td>Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iRealVolume</td>
<td>Returns the real volume of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iVolume</td>
<td>Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iSpread</td>
<td>Returns the spread value of the bar (indicated by the 'shift' parameter) on the corresponding chart</td>
<td>Timeseries and Indicators Access</td>
</tr>
<tr>
<td>iAD</td>
<td>Accumulation/Distribution</td>
<td>Technical Indicators</td>
</tr>
<tr>
<td>iADX</td>
<td>Average Directional Index</td>
<td>Technical Indicators</td>

### List of MQL5 Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>MarketBookGet</code></td>
<td>Returns a structure array <code>MqlBookInfo</code> containing records of the Depth of Market of a specified symbol</td>
<td><code>Market Info</code></td>
</tr>
<tr>
<td><code>MarketBookRelease</code></td>
<td>Provides closing of Depth of Market for a selected symbol, and cancels the subscription for receiving notifications of the DOM changes</td>
<td><code>Market Info</code></td>
</tr>
<tr>
<td><code>MathAbs</code></td>
<td>Returns absolute value (modulus) of the specified numeric value</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathArccos</code></td>
<td>Returns the arc cosine of x in radians</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathArcsin</code></td>
<td>Returns the arc sine of x in radians</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathArctan</code></td>
<td>Returns the arc tangent of x in radians</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathCeil</code></td>
<td>Returns integer numeric value closest from above</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathCos</code></td>
<td>Returns the cosine of a number</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathExp</code></td>
<td>Returns exponent of a number</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathFloor</code></td>
<td>Returns integer numeric value closest from below</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathIsValidNumber</code></td>
<td>Checks the correctness of a real number</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathLog</code></td>
<td>Returns natural logarithm</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathLog10</code></td>
<td>Returns the logarithm of a number by base 10</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathMax</code></td>
<td>Returns the maximal value of the two numeric values</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathMin</code></td>
<td>Returns the minimal value of the two numeric values</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathMod</code></td>
<td>Returns the real remainder after the division of two numbers</td>
<td><code>Math Functions</code></td>
</tr>
<tr>
<td><code>MathPow</code></td>
<td>Raises the base to the specified power</td>
<td><code>Math Functions</code></td>

<tr>
<td>StringGetCharacter</td>
<td>Returns the value of a number located in the specified string position</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringInit</td>
<td>Initializes string by specified symbols and provides the specified string length</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringLen</td>
<td>Returns the number of symbols in a string</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringReplace</td>
<td>Replaces all the found substrings of a string by a set sequence of symbols</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringSetCharacter</td>
<td>Returns a copy of a string with a changed value of a symbol in a specified position</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringSplit</td>
<td>Gets substrings by a specified separator from the specified string, returns the number of substrings obtained</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringSubstr</td>
<td>Extracts a substring from a text string starting from a specified position</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringToCharArray</td>
<td>Symbol-wise copying a string converted from Unicode to ANSI, to a selected place of array of uchar type</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>StringToColor</td>
<td>Converting “R,G,B” string or string with color name into color type value</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>StringToDouble</td>
<td>Converting a string containing a symbol representation of number into number of double type</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>StringToInteger</td>
<td>Converting a string containing a symbol representation of</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>Function</td>

</tr>
<tr>
<td>StringToLower</td>
<td>Transforms all symbols of a selected string to lowercase</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringToShortArray</td>
<td>Symbol-wise copying a string to a selected part of array of ushort type</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>StringToString</td>
<td>Converting a string containing time or date in “yyyy.mm.dd [hh:mm]” format into datetime type</td>
<td>Conversion Functions</td>
</tr>
<tr>
<td>StringToUpperCase</td>
<td>Transforms all symbols of a selected string into capitals</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringTrimLeft</td>
<td>Cuts line feed characters, spaces and tabs in the left part of the string</td>
<td>String Functions</td>
</tr>
<tr>
<td>StringTrimRight</td>
<td>Cuts line feed characters, spaces and tabs in the right part of the string</td>
<td>String Functions</td>
</tr>
<tr>
<td>StructToTime</td>
<td>Converts a variable of MqlDateTime structure type into a datetime value</td>
<td>Date and Time</td>
</tr>
<tr>
<td>Symbol</td>
<td>Returns the name of a symbol of the current chart</td>
<td>Checkup</td>
</tr>
<tr>
<td>SymbolInfoDouble</td>
<td>Returns the double value of the symbol for the corresponding property</td>
<td>Market Info</td>
</tr>
<tr>
<td>SymbolInfoInteger</td>
<td>Returns a value of an integer type (long, datetime, int or bool) of a specified symbol for the corresponding property</td>
<td>Market Info</td>
</tr>
<tr>
<td>SymbolInfoMarginRate</td>
<td>Returns the margin rates depending on the order type and direction</td>
<td>Market Info</td>
</tr>
<tr>
<td>SymbolInfoSessionQuote</td>
<td>Allows receiving time of beginning and end of the specified quoting sessions for a specified symbol and day of week.</td>
<td>Market Info</td>
</tr>
<tr>
<td>SymbolInfoSessionTrade</td>
<td>Allows receiving time of beginning and end of the</td>

</tr>
</tbody>
</table>
## List of MQL5 Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP_THREAD_ACP</td>
<td>The Windows ANSI code page for the current thread.</td>
<td>CryptArrayToString, StringToCharArray, FileOpen</td>
</tr>
<tr>
<td>CP_UTF7</td>
<td>UTF-7 code page.</td>
<td>CryptArrayToString, StringToCharArray, FileOpen</td>
</tr>
<tr>
<td>CP_UTF8</td>
<td>UTF-8 code page.</td>
<td>CryptArrayToString, StringToCharArray, FileOpen</td>
</tr>
<tr>
<td>CRYPT_AES128</td>
<td>AES encryption with 128 bit key (16 bytes)</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>CRYPT_AES256</td>
<td>AES encryption with 256 bit key (32 bytes)</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>CRYPT_ARCH_ZIP</td>
<td>ZIP archives</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>CRYPT_BASE64</td>
<td>BASE64</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>CRYPT_DES</td>
<td>DES encryption with 56 bit key (7 bytes)</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>CRYPT_HASH_MD5</td>
<td>MD5 HASH calculation</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>CRYPT_HASH_SHA1</td>
<td>SHA1 HASH calculation</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>CRYPT_HASH_SHA256</td>
<td>SHA256 HASH calculation</td>
<td>CryptEncode, CryptDecode</td>
</tr>
<tr>
<td>DBL_DIG</td>
<td>Number of significant decimal digits for double type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>DBL_EPSILON</td>
<td>Minimal value, which satisfies the condition: 1.0+DBL_EPSILON != 1.0 (for double type)</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>DBL_MANT_DIG</td>
<td>Bits count in a mantissa for double type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>DBL_MAX</td>
<td>Maximal value, which can be represented by double type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>DBL_MAX_10_EXP</td>
<td>Maximal decimal value of exponent degree for double type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>DBL_MAX_EXP</td>
<td>Maximal binary value of exponent degree for double type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>DBL_MIN</td>
<td>Minimal positive value, which can be represented by double type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>DBL_MIN_10_EXP</td>
<td>Minimal decimal value of exponent degree for double type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------</td>

</tr>
<tr>
<td>DEALCOMMENT</td>
<td>Deal comment</td>
<td>HistoryDealGetString</td>
</tr>
<tr>
<td>DEALCOMMISSION</td>
<td>Deal commission</td>
<td>HistoryDealGetDouble</td>
</tr>
<tr>
<td>DEAL_ENTRY</td>
<td>Deal entry - entry in, entry out, reverse</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_ENTRY_IN</td>
<td>Entry in</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_ENTRY_INOUT</td>
<td>Reverse</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_ENTRY_OUT</td>
<td>Entry out</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_MAGIC</td>
<td>Deal magic number (see ORDER_MAGIC)</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_ORDER</td>
<td>Deal order number</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_POSITION_ID</td>
<td>Identifier of a position, in the opening, modification or change of which this deal took part. Each position has a unique identifier that is assigned to all deals executed for the symbol during the entire lifetime of the position.</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_PRICE</td>
<td>Deal price</td>
<td>HistoryDealGetDouble</td>
</tr>
<tr>
<td>DEAL_PROFIT</td>
<td>Deal profit</td>
<td>HistoryDealGetDouble</td>
</tr>
<tr>
<td>DEAL_SWAP</td>
<td>Cumulative swap on close</td>
<td>HistoryDealGetDouble</td>
</tr>
<tr>
<td>DEAL_SYMBOL</td>
<td>Deal symbol</td>
<td>HistoryDealGetString</td>
</tr>
<tr>
<td>DEAL_TIME</td>
<td>Deal time</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TIME_MSC</td>
<td>The time of a deal execution in milliseconds since 01.01.1970</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE</td>
<td>Deal type</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_BALANCE</td>
<td>Balance</td>
<td>HistoryDealGetInteger</td>

<tr>
<td>----------</td>
<td>-------------</td>
<td>-------</td>
</tr>
<tr>
<td>DEAL_TYPE_BUY</td>
<td>previously executed buy deal is canceled. In this case, the type of the previously executed deal (DEAL_TYPE_BUY) is changed to DEAL_TYPE_BUY_CANCELED, and its profit/loss is zeroed. Previously obtained profit/loss is charged/withdrawn using a separated balance operation.</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_CHARGE</td>
<td>Additional charge</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_COMMISSION</td>
<td>Additional commission</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_COMMISSION_AGENT_DAILY</td>
<td>Daily agent commission</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_COMMISSION_AGENT_MONTHLY</td>
<td>Monthly agent commission</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_COMMISSION_DAILY</td>
<td>Daily commission</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_COMMISSION_MONTHLY</td>
<td>Monthly commission</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_CORRECTION</td>
<td>Correction</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_CREDIT</td>
<td>Credit</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_INTEREST</td>
<td>Interest rate</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_SELL</td>
<td>Sell</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_TYPE_SELL_CANCELED</td>
<td>Canceled sell deal. There can be a situation when a previously executed sell deal is canceled. In this case, the type of the previously executed deal (DEAL_TYPE_SELL) is changed to DEAL_TYPE_SELL_CANCELED, and its profit/loss is zeroed. Previously obtained profit/loss is charged/withdrawn using a separated balance operation.</td>
<td>HistoryDealGetInteger</td>
</tr>
<tr>
<td>DEAL_VOLUME</td>
<td>Deal volume</td>
<td>HistoryDealGetDouble</td>
</tr>
<tr>
<td>DRAW_ARROW</td>
<td>Drawing arrows</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>DRAW_BARS</td>
<td>Display as a sequence of bars</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_CANDLES</td>
<td>Display as a sequence of candlesticks</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_ARROW</td>
<td>Drawing multicolored arrows</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_BARS</td>
<td>Multicolored bars</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_CANDLES</td>
<td>Multicolored candlesticks</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_HISTOGRAM</td>
<td>Multicolored histogram from the zero line</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_HISTOGRAM2</td>
<td>Multicolored histogram of the two indicator buffers</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_LINE</td>
<td>Multicolored line</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_SECTION</td>
<td>Multicolored section</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_COLOR_ZIGZAG</td>
<td>Multicolored ZigZag</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_FILLING</td>
<td>Color fill between the two levels</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_HISTOGRAM</td>
<td>Histogram from the zero line</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_HISTOGRAM2</td>
<td>Histogram of the two indicator buffers</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_LINE</td>
<td>Line</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_NONE</td>
<td>Not drawn</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_SECTION</td>
<td>Section</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>DRAW_ZIGZAG</td>
<td>Style Zigzag allows vertical section on the bar</td>
<td>Drawing Styles</td>
</tr>
<tr>
<td>ELLIOTT_CYCLE</td>
<td>Cycle</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>ELLIOTT_GRAND_SUPERCYCLE</td>
<td>Grand Supercycle</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>ELLIOTT_INTERMEDIATE</td>
<td>Intermediate</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>ELLIOTT_MINOR</td>
<td>Minor</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>ELLIOTT_MINUETE</td>
<td>Minuette</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>ELLIOTT_MINUTE</td>
<td>Minute</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>ELLIOTT_PRIMARY</td>
<td>Primary</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>ELLIOTT_SUBMINUETTE</td>
<td>Subminuette</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>ELLIOTT_SUPERCYCLE</td>
<td>Supercycle</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
</tr>
<tr>
<td>EMPTY_VALUE</td>
<td>Empty value in an indicator buffer</td>
<td>Other Constants</td>
</tr>
<tr>
<td>ERR_ACCOUNT_WRONG_PROPERTY</td>
<td>Wrong account property ID</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_ARRAY_BAD_SIZE</td>
<td>Requested array size exceeds 2 GB</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_ARRAY_RESIZE_ERROR</td>
<td>Not enough memory for the relocation of an array, or an attempt to change the size of a static array</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_BOOKS_CANNOT_ADD</td>
<td>Depth Of Market can not be added</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_BOOKS_CANNOT_DELETE</td>
<td>Depth Of Market can not be removed</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_BOOKS_CANNOT_GET</td>
<td>The data from Depth Of Market can not be obtained</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_BOOKS_CANNOT_SUBSCRIBE</td>
<td>Error in subscribing to receive new data from Depth Of Market</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_BUFFERS_NO_MEMORY</td>
<td>Not enough memory for the distribution of indicator buffers</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_BUFFERS_WRONG_INDEX</td>
<td>Wrong indicator buffer index</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CANNOT_CLEANDIRECTORY</td>
<td>Failed to clear the directory (probably one or more files are blocked and removal operation failed)</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CANNOT_DELETEDIRECTORY</td>
<td>The directory cannot be removed</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CANNOT_DELETE_FILE</td>
<td>File deleting error</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CANNOT_OPEN_FILE</td>
<td>File opening error</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHAR_ARRAY_ONLY</td>
<td>Must be an array of type char</td>
<td>GetLastError</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>ERR_CHART_CANNOT_CHANGE</td>
<td>Failed to change chart symbol and period</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_CANNOT_CREATE_TIMER</td>
<td>Failed to create timer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_CANNOT_OPEN</td>
<td>Chart opening error</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_INDICATOR_ADD</td>
<td>Error adding an indicator to chart</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_INDICATOR_DEL</td>
<td>Error deleting an indicator from the chart</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_INDICATOR_NOT_FOUND</td>
<td>Indicator not found on the specified chart</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_NAVIGATE_FAILED</td>
<td>Error navigating through chart</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_NO_EXPERT</td>
<td>No Expert Advisor in the chart that could handle the event</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_NO_REPLY</td>
<td>Chart does not respond</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_NOT_FOUND</td>
<td>Chart not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_SCREENSHOT_FAILED</td>
<td>Error creating screenshots</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_TEMPLATE_FAILED</td>
<td>Error applying template</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_WINDOW_NOT_FOUND</td>
<td>Subwindow containing the indicator was not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_WRONG_ID</td>
<td>Wrong chart ID</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_WRONG_PARAMETER</td>
<td>Error value of the parameter for the function of working with charts</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CHART_WRONG_PROPERTY</td>
<td>Wrong chart property ID</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_CUSTOM_WRONG_PROPERTY</td>
<td>Wrong ID of the custom indicator property</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_DIRECTORY_NOT_EXIST</td>
<td>Directory does not exist</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_DOUBLE_ARRAY_ONLY</td>
<td>Must be an array of type double</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_BINSTRINGSIZE</td>
<td>String size must be specified, because the file is opened as binary</td>
<td>GetLastError</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>ERR_FILE_CACHEBUFFER_ERROR</td>
<td>Not enough memory for cache to read</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_CANT_REWRITE</td>
<td>File can not be rewritten</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_IS_DIRECTORY</td>
<td>This is not a file, this is a directory</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_ISNOT_DIRECTORY</td>
<td>This is a file, not a directory</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_NOT_EXIST</td>
<td>File does not exist</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_NOTBIN</td>
<td>The file must be opened as a binary one</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_NOTCSV</td>
<td>The file must be opened as CSV</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_NOTTORED</td>
<td>The file must be opened for reading</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_NOTTOWRITE</td>
<td>The file must be opened for writing</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_NOTTXT</td>
<td>The file must be opened as a text</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_NOTTXTORCSV</td>
<td>The file must be opened as a text or CSV</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_READERROR</td>
<td>File reading error</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FILE_WRITEERROR</td>
<td>Failed to write a resource to a file</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FLOAT_ARRAY_ONLY</td>
<td>Must be an array of type float</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FTP_SEND_FAILED</td>
<td>File sending via ftp failed</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_FUNCTION_NOT_ALLOWED</td>
<td>Function is not allowed for call</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_GLOBAL_VARIABLE_EXISTS</td>
<td>Global variable of the client terminal with the same name already exists</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_GLOBAL_VARIABLE_NOT_FOUND</td>
<td>Global variable of the client terminal is not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_HISTORY_NOT_FOUND</td>
<td>Requested history not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_HISTORY_WRONG_PROPERTY</td>
<td>Wrong ID of the history property</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INCOMPATIBLE ARRAYS</td>
<td>Copying incompatible arrays. String array can be copied only</td>
<td>GetLastError</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>ERR_INCOMPATIBLE_FILE</td>
<td>A text file must be for string arrays, for other arrays - binary</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_CANNOT_ADD</td>
<td>Error applying an indicator to chart</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_CANNOT_APPLY</td>
<td>The indicator cannot be applied to another indicator</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_CANNOT_CREATE</td>
<td>Indicator cannot be created</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_CUSTOM_NAME</td>
<td>The first parameter in the array must be the name of the custom indicator</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_DATA_NOT_FOUND</td>
<td>Requested data not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_NO_MEMORY</td>
<td>Not enough memory to add the indicator</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_PARAMETER_TYPE</td>
<td>Invalid parameter type in the array when creating an indicator</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_PARAMETERS_MISSING</td>
<td>No parameters when creating an indicator</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_UNKNOWN_SYMBOL</td>
<td>Unknown symbol</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_WRONG_HANDLE</td>
<td>Wrong indicator handle</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_WRONG_INDEX</td>
<td>Wrong index of the requested indicator buffer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INDICATOR_WRONG_PARAMETERS</td>
<td>Wrong number of parameters when creating an indicator</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INT_ARRAY_ONLY</td>
<td>Must be an array of type int</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INTERNAL_ERROR</td>
<td>Unexpected internal error</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INVALID_ARRAY</td>
<td>Array of a wrong type, wrong size, or a damaged object of a dynamic array</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INVALID_DATETIME</td>
<td>Invalid date and/or time</td>
<td>GetLastError</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>ERR_INVALID_FILEHANDLE</td>
<td>A file with this handle was closed, or was not opening at all</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INVALID_PARAMETER</td>
<td>Wrong parameter when calling the system function</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INVALID_POINTER</td>
<td>Wrong pointer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_INVALID_POINTER_TYPE</td>
<td>Wrong type of pointer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_LONG_ARRAY_ONLY</td>
<td>Must be an array of type long</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_MAIL_SEND_FAILED</td>
<td>Email sending failed</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_MARKET_LASTTIME_UNKNOWN</td>
<td>Time of the last tick is not known (no ticks)</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_MARKET_NOT_SELECTED</td>
<td>Symbol is not selected in MarketWatch</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_MARKET_SELECT_ERROR</td>
<td>Error adding or deleting a symbol in MarketWatch</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_MARKET_UNKNOWN_SYMBOL</td>
<td>Unknown symbol</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_MARKET_WRONG_PROPERTY</td>
<td>Wrong identifier of a symbol property</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_MQL5_WRONG_PROPERTY</td>
<td>Wrong identifier of the program property</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_NO_STRING_DATE</td>
<td>No date in the string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_NOT_ENOUGH_MEMORY</td>
<td>Not enough memory to perform the system function</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_NOTIFICATION_SEND_FAILED</td>
<td>Failed to send a notification</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_NOTIFICATION_TOO_FREQUENT</td>
<td>Too frequent sending of notifications</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_NOTIFICATION_WRONG_PARAMETER</td>
<td>Invalid parameter for sending a notification - an empty string or <strong>NULL</strong> has been passed to the SendNotification() function</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_NOTIFICATION_WRONG_SETTINGS</td>
<td>Wrong settings of notifications in the terminal (ID is not specified or permission is not set)</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_NOT_INITIALIZED_STRING</td>
<td>Not initialized string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>ERR_NUMBER_ARRAYS_ONLY</td>
<td>Must be a numeric array</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OBJECT_ERROR</td>
<td>Error working with a graphical object</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OBJECT_GETDATE_FAILED</td>
<td>Unable to get date corresponding to the value</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OBJECT_GETVALUE_FAILED</td>
<td>Unable to get value corresponding to the date</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OBJECT_NOT_FOUND</td>
<td>Graphical object was not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OBJECT_WRONG_PROPERTY</td>
<td>Wrong ID of a graphical object property</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_ONEDIM_ARRAYS_ONLY</td>
<td>Must be a one-dimensional array</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_BUFFER_CREATE</td>
<td>Failed to create an OpenCL buffer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_CONTEXT_CREATE</td>
<td>Error creating the OpenCL context</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_EXECUTE</td>
<td>OpenCL program runtime error</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_INTERNAL</td>
<td>Internal error occurred when running OpenCL</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_INVALID_HANDLE</td>
<td>Invalid OpenCL handle</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCLKERNEL_CREATE</td>
<td>Error creating an OpenCL kernel</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_NOT_SUPPORTED</td>
<td>OpenCL functions are not supported on this computer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_PROGRAM_CREATE</td>
<td>Error occurred when compiling an OpenCL program</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_QUEUE_CREATE</td>
<td>Failed to create a run queue in OpenCL</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_SET_KERNEL_PARAMETER</td>
<td>Error occurred when setting parameters for the OpenCL kernel</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_TOO_LONG_KERNEL_NAME</td>
<td>Too long kernel name</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_OPENCL_WRONG_BUFFER_OFFSET</td>
<td>Invalid offset in the OpenCL buffer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>-------</td>
</tr>
<tr>
<td>ERR_7OPEN_CL__WRONG_BUFFER_SIZE</td>
<td>Invalid size of the OpenCL buffer</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_PLAY_SOUND_FAILED</td>
<td>Sound playing failed</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERRRESOURCE_NAME_DUPLICATED</td>
<td>The names of the dynamic and the static resource match</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERRRESOURCE_NAME_IS_TOOLONG</td>
<td>The resource name exceeds 63 characters</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERRRESOURCE_NOT_FOUND</td>
<td>Resource with this name has not been found in EX5</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERRRESOURCE_UNSUPPORTED_TYPE</td>
<td>Unsupported resource type or its size exceeds 16 Mb</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_SERIES_ARRAY</td>
<td>Timeseries cannot be used</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_SHORT_ARRAY_ONLY</td>
<td>Must be an array of type short</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_SMALL_ARRAY</td>
<td>Too small array, the starting position is outside the array</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_SMALL ASERIES_ARRAY</td>
<td>The receiving array is declared as AS_SERIES, and it is of insufficient size</td>
<td>GetLastError</td>

<tr>
<td>ERR_STRING_OUT_OF_MEMORY</td>
<td>Not enough memory for the string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRING_RESIZE_ERROR</td>
<td>Not enough memory for the relocation of string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRING_SMALL_LEN</td>
<td>The string length is less than expected</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRING_TIME_ERROR</td>
<td>Error converting string to date</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRING_TOO_BIGNUMBER</td>
<td>Too large number, more than ULONG_MAX</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRING_UNKNOWNTYPE</td>
<td>Unknown data type when converting to a string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRING_ZEROADDED</td>
<td>0 added to the string end, a useless operation</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRINGPOS_OUTOFRANGE</td>
<td>Position outside the string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_STRUCT_WITHOBJECTS_ORCLASS</td>
<td>The structure contains objects of strings and/or dynamic arrays and/or structure of such objects and/or classes</td>
<td>GetLastError</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>ERR_SUCCESS</td>
<td>The operation completed successfully</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TERMINAL_WRONGPROPERTY</td>
<td>Wrong identifier of the terminal property</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TOO_LONG_FILENAME</td>
<td>Too long file name</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TOO_MANY_FILES</td>
<td>More than 64 files cannot be opened at the same time</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TOO_MANY_FORMATTERS</td>
<td>Amount of format specifiers more than the parameters</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TOO_MANY_PARAMETERS</td>
<td>Amount of parameters more than the format specifiers</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TRADE_DEAL_NOT_FOUND</td>
<td>Deal not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TRADE_DISABLED</td>
<td>Trading by Expert Advisors prohibited</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TRADE_ORDER_NOT_FOUND</td>
<td>Order not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TRADE_POSITION_NOT_FOUND</td>
<td>Position not found</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TRADE_SEND_FAILED</td>
<td>Trade request sending failed</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_TRADE_WRONG_PROPERTY</td>
<td>Wrong trade property ID</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_USER_ERROR_FIRST</td>
<td>User defined errors start with this code</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WEBREQUEST_CONNECT_FAILED</td>
<td>Failed to connect to specified URL</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WEBREQUEST_INVALIDADDRESS</td>
<td>Invalid URL</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WEBREQUEST_REQUEST_FAILED</td>
<td>HTTP request failed</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WEBREQUEST_TIMEOUT</td>
<td>Timeout exceeded</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WRONG_DIRECTORYNAME</td>
<td>Wrong directory name</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WRONG_FILEHANDLE</td>
<td>Wrong file handle</td>
<td>GetLastError</td>

<tr>
<td>ERR_WRONG_FILENAME</td>
<td>Invalid file name</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WRONG_FORMATSTRING</td>
<td>Invalid format string</td>
<td>GetLastError</td>
</tr>
</tbody>
</table>
### List of MQL5 Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERR_WRONG_INTERNAL_PARAMETER</td>
<td>Wrong parameter in the inner call of the client terminal function</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WRONG_STRING_DATE</td>
<td>Wrong date in the string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WRONG_STRING_OBJECT</td>
<td>Damaged string object</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WRONG_STRING_PARAMETER</td>
<td>Damaged parameter of string type</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_WRONG_STRING_TIME</td>
<td>Wrong time in the string</td>
<td>GetLastError</td>
</tr>
<tr>
<td>ERR_ZEROSIZE_ARRAY</td>
<td>An array of zero length</td>
<td>GetLastError</td>
</tr>
<tr>
<td>FILE_ACCESS_DATE</td>
<td>Date of the last access to the file</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_ANSI</td>
<td>Strings of ANSI type (one byte symbols). Flag is used in FileOpen().</td>
<td>FileOpen</td>
</tr>
<tr>
<td>FILE_BIN</td>
<td>Binary read/write mode (without string to string conversion). Flag is used in FileOpen().</td>
<td>FileOpen</td>
</tr>
<tr>
<td>FILE_COMMON</td>
<td>The file path in the common folder of all client terminals \Terminal\Common\Files. Flag is used in FileOpen(), FileCopy(), FileMove() and in FileIsExist() functions.</td>
<td>FileOpen, FileCopy, FileMove, FileIsExist</td>
</tr>
<tr>
<td>FILE_CREATE_DATE</td>
<td>Date of creation</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_CSV</td>
<td>CSV file (all its elements are converted to strings of the appropriate type, Unicode or ANSI, and separated by separator). Flag is used in FileOpen().</td>
<td>FileOpen</td>
</tr>
<tr>
<td>FILE_END</td>
<td>Get the end of file sign</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_EXISTS</td>
<td>Check the existence</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_IS_ANSI</td>
<td>The file is opened as ANSI (see FILE_ANSI)</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_IS_BINARY</td>
<td>The file is opened as a binary file (see FILE_BIN)</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_IS_COMMON</td>
<td>The file is opened in a shared folder of all terminals (see</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>FILE_COMMON</td>
<td></td>
<td></td>
</tr>
<tr>
<td>FILE_IS_CSV</td>
<td>The file is opened as CSV (see FILE_CSV)</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_IS_READABLE</td>
<td>The opened file is readable (see FILE_READ)</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_IS_TEXT</td>
<td>The file is opened as a text file (see FILE_TXT)</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_IS_WRITABLE</td>
<td>The opened file is writable (see FILE_WRITE)</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_LINE_END</td>
<td>Get the end of line sign</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_MODIFY_DATE</td>
<td>Date of the last modification</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_POSITION</td>
<td>Position of a pointer in the file</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_READ</td>
<td>File is opened for reading. Flag is used in FileOpen(). When opening a file specification of FILE_WRITE and/or FILE_READ is required.</td>
<td>FileOpen</td>
</tr>
<tr>
<td>FILE_REWRITE</td>
<td>Possibility for the file rewrite using functions FileCopy() and FileMove(). The file should exist or should be opened for writing, otherwise the file will not be opened.</td>
<td>FileCopy, FileMove</td>
</tr>
<tr>
<td>FILE_SHARE_READ</td>
<td>Shared access for reading from several programs. Flag is used in FileOpen(), but it does not replace the necessity to indicate FILE_WRITE and/or the FILE_READ flag when opening a file.</td>
<td>FileOpen</td>
</tr>
<tr>
<td>FILE_SHARE_WRITE</td>
<td>Shared access for writing from several programs. Flag is used in FileOpen(), but it does not replace the necessity to indicate FILE_WRITE and/or the FILE_READ flag when opening a file.</td>
<td>FileOpen</td>
</tr>
<tr>
<td>FILE_SIZE</td>
<td>File size in bytes</td>
<td>FileGetInteger</td>
</tr>
<tr>
<td>FILE_TXT</td>
<td>Simple text file (the same as csv file, but without taking</td>
<td>FileOpen</td>
</tr>
</tbody>
</table>

<tr>
<td>IND_RVI</td>
<td>Relative Vigor Index</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_SAR</td>
<td>Parabolic SAR</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_STDDEV</td>
<td>Standard Deviation</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_STOCHASTIC</td>
<td>Stochastic Oscillator</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_TEMA</td>
<td>Triple Exponential Moving Average</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_TRIX</td>
<td>Triple Exponential Moving Averages Oscillator</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_VIDYA</td>
<td>Variable Index Dynamic Average</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_VOLUMES</td>
<td>Volumes</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>IND_WPR</td>
<td>Williams' Percent Range</td>
<td>IndicatorCreate, IndicatorParameters</td>
</tr>
<tr>
<td>INDICATOR_CALCULATIONS</td>
<td>Auxiliary buffers for intermediate calculations</td>
<td>SetIndexBuffer</td>
</tr>
<tr>
<td>INDICATOR_COLOR_INDEX</td>
<td>Color</td>
<td>SetIndexBuffer</td>
</tr>
<tr>
<td>INDICATOR_DATA</td>
<td>Data to draw</td>
<td>SetIndexBuffer</td>
</tr>
<tr>
<td>INDICATOR_DIGITS</td>
<td>Accuracy of drawing of indicator values</td>
<td>IndicatorSetInteger</td>
</tr>
<tr>
<td>INDICATOR_HEIGHT</td>
<td>Fixed height of the indicator's window (the preprocessor command #property indicator_height)</td>
<td>IndicatorSetInteger</td>
</tr>
<tr>
<td>INDICATOR_LEVELCOLOR</td>
<td>Color of the level line</td>
<td>IndicatorSetInteger</td>
</tr>
<tr>
<td>INDICATOR_LEVELS</td>
<td>Number of levels in the indicator window</td>
<td>IndicatorSetInteger</td>
</tr>
<tr>
<td>INDICATOR_LEVELSTYLE</td>
<td>Style of the level line</td>
<td>IndicatorSetInteger</td>
</tr>
<tr>
<td>INDICATOR_LEVELTEXT</td>
<td>Level description</td>
<td>IndicatorSetString</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>

<tr>
<td>INDICATOR_LEVELVALUE</td>
<td>Level value</td>
<td>IndicatorSetDouble</td>
</tr>
<tr>
<td>INDICATOR_LEVELWIDTH</td>
<td>Thickness of the level line</td>
<td>IndicatorSetInteger</td>
</tr>
<tr>
<td>INDICATOR_MAXIMUM</td>
<td>Maximum of the indicator window</td>
<td>IndicatorSetDouble</td>
</tr>
<tr>
<td>INDICATOR_MINIMUM</td>
<td>Minimum of the indicator window</td>
<td>IndicatorSetDouble</td>
</tr>
<tr>
<td>INDICATOR_SHORTNAME</td>
<td>Short indicator name</td>
<td>IndicatorSetString</td>
</tr>
<tr>
<td>INT_MAX</td>
<td>Maximal value, which can be represented by int type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>INT_MIN</td>
<td>Minimal value, which can be represented by int type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>INVALID_HANDLE</td>
<td>Incorrect handle</td>
<td>Other Constants</td>
</tr>
<tr>
<td>IS_DEBUG_MODE</td>
<td>Flag that a mql5-program operates in debug mode</td>
<td>Other Constants</td>
</tr>
<tr>
<td>IS_PROFILE_MODE</td>
<td>Flag that a mql5-program operates in profiling mode</td>
<td>Other Constants</td>
</tr>
<tr>
<td>KIJUNSEN_LINE</td>
<td>Kijun-sen line</td>
<td>Indicators Lines</td>
</tr>
<tr>
<td>LICENSE_DEMO</td>
<td>A trial version of a paid product from the Market. It works only in the strategy tester</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>LICENSE_FREE</td>
<td>A free unlimited version</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>LICENSE_FULL</td>
<td>A purchased licensed version allows at least 5 activations. The number of activations is specified by seller. Seller may increase the allowed number of activations</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>LICENSE_TIME</td>
<td>A version with a limited term license</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>LONG_MAX</td>
<td>Maximal value, which can be represented by long type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>LONG_MIN</td>
<td>Minimal value, which can be represented by long type</td>
<td>Numerical Type Constants</td>
</tr>
<tr>
<td>LOWER_BAND</td>
<td>Lower limit</td>
<td>Indicators Lines</td>
</tr>
<tr>
<td>LOWER_HISTOGRAM</td>
<td>Bottom histogram</td>
<td>Indicators Lines</td>
</tr>
<tr>
<td>LOWER_LINE</td>
<td>Bottom line</td>
<td>Indicators Lines</td>

<td>MB_ICONEXCLAMATION, MB_ICONWARNING</td>
<td>The exclamation/warning sign icon</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MB_ICONINFORMATION, MB_ICONASTERISK</td>
<td>The encircled i sign</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MB_ICONQUESTION</td>
<td>The question sign icon</td>
<td>MessageBox</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------------------------------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>MB_ICONSTOP, MB_ICONERROR, MB_ICONHAND</td>
<td>The STOP sign icon</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MB_OK</td>
<td>Message window contains only one button: OK. Default</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MB_OKCANCEL</td>
<td>Message window contains two buttons: OK and Cancel</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MB_RETRYSUCCESS</td>
<td>Message window contains two buttons: Retry and Cancel</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MB_YESNO</td>
<td>Message window contains two buttons: Yes and No</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MB_YESNOCANCEL</td>
<td>Message window contains three buttons: Yes, No and Cancel</td>
<td>MessageBox</td>
</tr>
<tr>
<td>MINUSD_LINE</td>
<td>Line - DI</td>
<td>Indicators Lines</td>
</tr>
<tr>
<td>MODE_EMA</td>
<td>Exponential averaging</td>
<td>Smoothing Methods</td>
</tr>
<tr>
<td>MODE_LWMA</td>
<td>Linear-weighted averaging</td>
<td>Smoothing Methods</td>
</tr>
<tr>
<td>MODE_SMA</td>
<td>Simple averaging</td>
<td>Smoothing Methods</td>
</tr>
<tr>
<td>MODE_SMMA</td>
<td>Smoothed averaging</td>
<td>Smoothing Methods</td>
</tr>
<tr>
<td>MONDAY</td>
<td>Monday</td>
<td></td>
</tr>
<tr>
<td>MQL_DEBUG</td>
<td>The flag, that indicates the debug mode</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_DLLS_ALLOWED</td>
<td>The permission to use DLL for the given executed program</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_FRAME_MODE</td>
<td>The flag, that indicates the Expert Advisor operating in gathering optimization result frames mode</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_LICENSE_TYPE</td>
<td>Type of license of the EX5 module. The license refers to the EX5 module, from which a request is made using MQLInfoInteger(MQL_LICENSE_TYPE).</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_MEMORY_LIMIT</td>
<td>Maximum possible amount of dynamic memory for MQL5 program in MB</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>Constant</td>
<td>Description</td>
<td>Usage</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>MQL_MEMORY_USED</td>
<td>The memory size used by MQL5 program in MB</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_OPTIMIZATION</td>
<td>The flag, that indicates the optimization process</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_PROFILER</td>
<td>The flag, that indicates the program operating in the code profiling mode</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_PROGRAM_NAME</td>
<td>Name of the mql5-program executed</td>
<td>MQLInfoString</td>
</tr>
<tr>
<td>MQL_PROGRAM_PATH</td>
<td>Path for the given executed program</td>
<td>MQLInfoString</td>
</tr>
<tr>
<td>MQL_PROGRAM_TYPE</td>
<td>Type of the mql5 program</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_SIGNALS_ALLOWED</td>
<td>The permission to modify the Signals for the given executed program</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_TESTER</td>
<td>The flag, that indicates the tester process</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_TRADE_ALLOWED</td>
<td>The permission to trade for the given executed program</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>MQL_VISUAL_MODE</td>
<td>The flag, that indicates the visual tester process</td>
<td>MQLInfoInteger</td>
</tr>
<tr>
<td>NULL</td>
<td>Zero for any types</td>
<td>Other Constants</td>
</tr>
<tr>
<td>OBJ_ALL_PERIODS</td>
<td>The object is drawn in all timeframes</td>
<td>ObjectSetInteger, ObjectGetInteger</td>
