CalendarValueLast, CalendarValueHistory, CalendarValueHistoryByEvent, CalendarValueById
**CalendarValueLast**

Get the array of values for all events with the ability to sort by country and/or currency since the calendar database status with a specified change_id.

```c
int CalendarValueLast(
    ulong& change_id, // change ID
    MqlCalendarValue& values[], // array for value descriptions
    const string country_code=NULL, // country code name (ISO 3166-1 alpha-2)
    const string currency=NULL // country currency code name
);
```

**Parameters**

- `change_id`  
  [in][out] Change ID.
- `values[]`  
  [out] `MqlCalendarValue` type array for receiving event values.
- `country_code=NULL`  
  [in] Country code name (ISO 3166-1 alpha-2)
- `currency=NULL`  

**Return Value**

Number of received event values. To get information about an error, call the `GetLastError()` function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 4004 - ERR_NOT_ENOUGH_MEMORY (not enough memory for executing a request),
- 5401 - ERR CALENDAR_TIMEOUT (request time limit exceeded),
- 5400 - ERR CALENDAR MORE_DATA (array size is insufficient for receiving descriptions of all values, only the ones that managed to fit in were received),
- errors of failed execution of `ArrayResize()`

**Note**

If the `events[]` array of fixed length was passed to the function and there was not enough space to save the entire result, the ERR_CALENDAR_MORE_DATA (5400) error is activated.

If `change_id = 0` is passed to the function, you will get the current `change_id` of the calendar database to that parameter; and the function returns 0

For the `country code` and `currency` filters, NULL and "" values are equivalent and mean the absence of the filter.

For `country code`, the `code` field of the `MqlCalendarCountry` structure, for example "US", "RU" or "EU", should be used.

For `currency`, the `currency` field of the `MqlCalendarCountry` structure, for example "USD", "RUB" or "EUR", should be used.
The filters are applied by conjunction, i.e. logical 'AND' is used to select only the values of events both conditions (country and currency) are simultaneously met for.

The function returns the array for a specified news and a new change_id that can be used for subsequent calls of the function to receive the new values of the news. Thus, it is possible to update values for a specified news by calling this function with the last known change_id.

If an event value does not have any of the fields specified below:

```
struct MqlCalendarValue {
    ...
    long actual_value; // event's actual value
    long prev_value;  // event's previous value
    long revised_prev_value;  // event's revised previous value
    long forecast_value; // event's forecast value
    ...
};
```

then the value of the missing field is returned as INT64_MIN (-9223372036854775808).

The sample EA listening for the economic calendar events:

```c
#define Description "Example of using the CalendarValueLast function"
#define Description "To develop the economic calendar events listener."

Access to Timeseries and Indicator Data

These are functions for working with timeseries and indicators. A timeseries differs from the usual data array by its reverse ordering - elements of timeseries are indexed from the end of an array to its begin (from the most recent data to the oldest ones). To copy the time-series values and indicator data, it’s recommended to use dynamic arrays only, because copying functions are designed to allocate the necessary size of arrays that receive values.

There is an important exception to this rule: if timeseries and indicator values need to be copied often, for example at each call of OnTick() in Expert Advisors or at each call of OnCalculate() in indicators, in this case one should better use statically distributed arrays, because operations of memory allocation for dynamic arrays require additional time, and this will have effect during testing and optimization.

When using functions accessing timeseries and indicator values, indexing direction should be taken into account. This is described in the Indexing Direction in Arrays, Buffers and Timeseries section.

Access to indicator and timeseries data is implemented irrespective of the fact whether the requested data are ready (the so called asynchronous access). This is critically important for the calculation of custom indicator, so if there are no data, functions of Copy...() type immediately return an error. However, when accessing form Expert Advisors and scripts, several attempts to receive data are made in a small pause, which is aimed at providing some time necessary to download required timeseries or to calculate indicator values.

The Organizing Data Access section describes details of receiving, storing and requesting price data in the MetaTrader 5 client terminal.

It is historically accepted that an access to the price data in an array is performed from the end of the data. Physically, the new data are always written at the array end, but the index of the array is always
equal to zero. The 0 index in the timeseries array denotes data of the current bar, i.e. the bar that corresponds to the unfinished time interval in this timeframe.

A timeframe is the time period, during which a single price bar is formed. There are 21 predefined standard timeframes.

</table>
Despite the fact that by using the `ArraySetAsSeries()` function it is possible to set up in arrays access to elements like that in timeseries, it should be remembered that the array elements are physically stored in one and the same order - only indexing direction changes. To demonstrate this fact let's perform an example:

```c
datetime TimeAsSeries[];
//--- set access to the array like to a timeseries
ArraySetAsSeries(TimeAsSeries, true);
ResetLastError();
int copied=CopyTime(NULL,0,0,10,TimeAsSeries);
if(copied<=0)
{
    Print("The copy operation of the open time values for last 10 bars has failed"),
    return;
}
Print("TimeCurrent =", TimeCurrent());
Print("ArraySize(Time) =", ArraySize(TimeAsSeries));
int size=ArraySize(TimeAsSeries);
for(int i=0;i<size;i++)
{
    Print("TimeAsSeries["+i"] =", TimeAsSeries[i]);
}

datetime ArrayNotSeries[];
ArraySetAsSeries(ArrayNotSeries, false);
ResetLastError();
copied=CopyTime(NULL,0,0,10,ArrayNotSeries);
if(copied<=0)
{
    Print("The copy operation of the open time values for last 10 bars has failed"),
    return;
}
size=ArraySize(ArrayNotSeries);
for(int i=size-1;i>=0;i--)
{
    Print("ArrayNotSeries["+i"] =", ArrayNotSeries[i]);
}
```

As a result we will get the output like this:

```
TimeCurrent = 2009.06.11 14:16:23
ArraySize(Time) = 10
TimeAsSeries[0] = 2009.06.11 14:00:00
TimeAsSeries[1] = 2009.06.11 13:00:00
TimeAsSeries[2] = 2009.06.11 12:00:00
```
As we see from the output, as the index of TimeAsSeries array increases, the time value of the index decreases, i.e. we move from the present to the past. For the common array ArrayNotSeries the result is different - as index grows, we move from past to present.

Indexing Direction in Arrays, Buffers and Timeseries

The default indexing of all arrays and indicator buffers is left to right. The index of the first element is always equal to zero. Thus, the very first element of an array or indicator buffer with index 0 is by default on the extreme left position, while the last element is on the extreme right position.

An indicator buffer is a dynamic array of type double, whose size is managed by the client terminals, so that it always corresponds to the number of bars the indicator is calculated on. A usual dynamic array of type double is assigned as an indicator buffer using the `SetIndexBuffer()` function. Indicator buffers do not require setting of their size using function `ArrayResize()` - this will be done by the executing system of the terminal.

**Timeseries** are arrays with reverse indexing, i.e. the first element of a timeseries is in the extreme right position, and the last element is in the extreme left position. Timeseries being used for storing history price data and contain the time information, we can say that the newest data are placed in the extreme right position of the timeseries, while the oldest data are in the extreme left position.

So the timeseries element with index 0 contains the information about the latest quote of a symbol. If a timeseries contains data on a daily timeframe, data of the current yet uncompleted day are located on the zero position, and the position with index 1 contains yesterday data.

Changing the Indexing Direction

Function `ArraySetAsSeries()` allows changing the method of accessing elements of a dynamic array; the physical order of data storing in the computer memory is not changed at that. This function simply changes the method of addressing array elements, so when copying one array to another using function `ArrayCopy()`, the contents of the recipient array will not depend on the indexing direction in the source array.

Direction of indexing cannot be changed for statically distributed arrays. Even if an array was passed as a parameter to a function, attempts to change the indexing direction inside this function will bring no effect.

For indicator buffers, like for usual arrays, indexing direction can also be set as backward (like in timeseries), i.e. reference to the zero position in the indicator buffer will mean reference to the last value on the corresponding indicator buffer and this will correspond to the value of the indicator on the latest bar. Still, the physical location of indicator bars will be unchanged.

Receiving Price Data in Indicators

Each custom indicator must necessarily contain the `OnCalculate()` function, to which price data required for calculating values in indicator buffers are passed. Indexing direction in these passed arrays can be found out using function `ArrayGetAsSeries()`.

Arrays passed to the function reflect price data, i.e. these arrays have the sign of a timeseries and function `ArrayIsSeries()` will return true when checking these arrays. However, in any case indexing direction should be checked only by function `ArrayGetAsSeries()`.

In order not to be dependent on default values, `ArraySetAsSeries()` should be unconditionally called for the arrays you are going to work with, and set the required direction.

Receiving Price Data and Indicator Values
Default indexing direction of all arrays in Expert Advisors, indicators and scripts is left-to-right. If necessary, in any MQL program you can request timeseries values on any symbol and timeframe, as well as values of indicators calculated on any symbol and timeframe.

Use functions Copy...() for these purposes:

- **CopyBuffer** - copy values of an indicator buffer to an array of double type;
- **CopyRates** - copy price history to an array of structures MqlRates;
- **CopyTime** - copy Time values to an array of datetime type;
- **CopyOpen** - copy Open values to an array of double type;
- **CopyHigh** - copy High values to an array of double type;
- **CopyLow** - copy Low values to an array of double type;
- **CopyClose** - copy Close values to an array of double type;
- **CopyTickVolume** - copy tick volumes to an array of long type;
- **CopyRealVolume** - copy equity volumes to a long type array;
- **CopySpread** - copy the spread history to an array of int type;

All these functions work in a similar way. Let's consider the data obtaining mechanism on the example of CopyBuffer(). It is implied that the indexing direction of requested data is that of timeseries, and the position with index 0 (zero) stores data of the current yet uncompleted bar. In order to get access to these data we need to copy the necessary volume of data into the recipient array, e.g. into array buffer.

When copying we need to specify the starting position in the source array, starting from which data will be copied to the recipient array. In case of success, the specified number of elements will be copied to the recipient array from the source array (from the indicator buffer in this case). Irrespective of the indexing value set in the recipient array, copying is always performed as is shown in the above figure.

If it is expected that price data will be handled in a loop with a large number of iterations, it is advisable that you check the fact of forced program termination using the `IsStopped()` function:

```c
int copied=CopyBuffer(ma_handle, // Indicator handle
0, // The index of the indicator buffer
0, // Start position for copying
number, // Number of values to copy
Buffer // The array that receives the values
```

© 2000-2019, MetaQuotes Software Corp.
if (copied<0) return;
int k=0;
while (k<copied && !IsStopped())
{
    //--- Get the value for the k index
    double value=Buffer[k];
    // ...
    // work with value
    k++;
}

Example:

input int per=10; // period of the exponent
int ma_handle;    // indicator handle

int OnInit()
{
    //---
    ma_handle=IMA(_Symbol,0,per,0,MODE_EMA,PRICE_CLOSE);
    //---
    return(INIT_SUCCEEDED);
}

void OnTick()
{
    //---
    double ema[10];
    int copied=CopyBuffer(ma_handle, // indicator handle
                          0,    // index of the indicator buffer
                          0,    // starting position to copy from
                          10,   // number of values for copying
                          ema   // value receiving array
                      );
    // ... further code
}

Organizing Data Access
Organizing Data Access

In this section questions connected with obtaining, storing and requesting price data (timeseries) are considered.

Receiving Data from a Trade Server

Before price data become available in the MetaTrader 5 terminal, they must be received and processed. To receive data, connection to the MetaTrader 5 trade server must be established. Data are received in the form of packed blocks of minute bars from the server upon the request of a terminal.

The mechanism of server reference for data doesn't depend on how the request has been initiated - by a user when navigating in a chart or in a program way in the MQL5 language.

Storing Intermediate Data

Data received from a server are automatically unpacked and saved in the HCC intermediate format. Data on each symbol are written into a separate folder: \terminal_directory\bases\server_name\history\symbol_name. For example, data on EURUSD received from the MetaQuotes-Demo server will be stored in \terminal_directory\bases\MetaQuotes-Demo\history\EURUSD\.

Data are written into files with .hcc extension. Each file stores data of minute bars for one year. For example, the file named 2009.hcc in the EURUSD folder contains minute bars of EURUSD for year 2009. These files are used for preparing price data for all timeframes and are not intended for direct access.

Obtaining Data on a Necessary Timeframe out of Intermediate Data

Intermediate HCC files are used as the data source for building price data for requested timeframes in the HC format. Data of HC format are timeseries that are maximally prepared for a quick access. They are created upon a request of a chart or a MQL5 program. The volume of data should not exceed the value of the "Max bars in charts" parameter. Data are stored for further using in files with hc extension.

To save resources, data on a timeframe are stored and saved in RAM only if necessary. If not called for a long time, they are released from RAM and saved into a file. For each timeframe, data are prepared regardless of whether there are ready data for other timeframes or not. Rules of forming and accessing data are the same for all timeframes. I.e., despite the fact that the unit data stored in HCC is one minute (M1), the availability of HCC data doesn't mean the availability of data on M1 timeframe as HC in the same volume.

Receipt of new data from a server calls automatic update of used price data in HC format of all timeframes. It also leads to the recalculation of all indicators that implicitly use them as input data for calculations.

Parameter "Max bars in chart"

The "Max bars in charts" parameter restricts number of bars in HC format available to charts, indicators and mql5 programs. This is valid for all available timeframes and serves, first of all, to save computer resources.
When setting a large value of this parameter, it should be remembered, that if deep history price data for small timeframes are available, memory used for storing timeseries and indicator buffers can become hundreds of megabytes and reach the RAM restriction for the client terminal program (2Gb for 32-bit applications of MS Windows).

Change of the "Max bars in charts" comes into effect after the client terminal is restarted. Change of this parameter causes neither automatic referring to a server for additional data, nor forming of additional bars of timeseries. Additional price data are requested from the server, and timeseries are updated taking into account the new limitation, in case of either chart scroll to the area with no data, or when data are requested by a mql5 program.

Volume of data requested from the server corresponds to the required number of bars of this timeframe with the "Max bars in charts" parameter taken into account. The restriction set by this parameter is not strict, and in some cases the number of available bars for a timeframe can be a little more than the current parameter value.

Data Availability

Presence of data on HCC format or even in the prepared for using HC format does not always denote the absolute availability of these data to be shown in a chart or to be used in MQL5 programs.

When accessing to price data or indicator values from a mql5 program it should be remembered that their availability in a certain moment of time or starting from a certain moment of time is not guaranteed. It is connected with the fact that with the purpose of saving resources, the full copy of data necessary for a mql5 program isn't stored in MetaTrader 5; only direct access to the terminal database is given.

The price history for all timeframes is built from common data of HCC format, and any update of data from a server leads to the update of data for all timeframes and to the recalculation of indicators. Due to this access to data can be closed, even if these data were available a moment ago.

Synchronization of the Terminal Data and Server Data

Since a mql5 program can call data from any symbol and timeframe, there is a possibility that data of a necessary timeseries are not formed yet in the terminal or the necessary price data aren’t synchronized with the trade server. In this case it’s hard to predict the latency time.

Algorithms using “do-nothing” loops are not the best solution. The only exception in this case are scripts, because they do not have any alternative algorithm choice due to not having event handling. For custom indicators such algorithms, as well as any other “do-nothing” loops are strongly not recommended, because they lead to termination of calculation of all indicators and any other handling of price data of the symbol.

For Expert Advisors and indicators, it is better to use the event model of handling. If during handling of OnTick() or OnCalculate() event, data receipt for the required timeseries failed, you should exit the event handler, relying on the access availability during the next call of the handler.

Example of a Script for Adding History

Let’s consider the example of a script that executes a request to receive history for the selected symbol from a trade server. The script is intended for running in a chart of a selected symbol;
timeframe doesn’t matter, because, as it was mentioned above, price data are received from a trade server as packed one minute data, from which any predefined timeseries is constructed then.

Write all actions concerning data receipt as a separate function CheckLoadHistory(symbol, timeframe, start_date):

```c
int CheckLoadHistory(string symbol, ENUM_TIMEFRAMES period, datetime start_date)
{
}
```

The CheckLoadHistory() function is designed as a universal function that can be called from any program (Expert Advisor, script or indicator); and therefore it requires three input parameters: symbol name, period and start date to indicate the beginning of price history you need.

Insert necessary checks into the function code before requesting the missing history. First of all, we should make sure that the symbol name and period value are correct:

```c
if(symbol==NULL || symbol=="") symbol=Symbol();
if(period==PERIOD_CURRENT) period=Period();
```

Then let’s make sure that the symbol is available in the MarketWatch window, i.e., the history for the symbol will be available when sending a request to a trade server. If there is no such a symbol in MarketWatch, add it using the SymbolSelect() function.

```c
if(!SymbolInfoInteger(symbol,SYMBOL_SELECT))
{
    if(GetLastError()==ERR_MARKET.UNKNOWN_SYMBOL) return(-1);
    SymbolSelect(symbol,true);
}
```

Now we should receive the start date of the available history for the indicated symbol/period pair. Perhaps, the value of the input parameter startdate, passed to CheckLoadHistory(), is within the available history; then request to a trade server is not needed. In order to obtain the very first date for the symbol-period as of the moment, the SeriesInfoInteger() function with the SERIES_FIRSTDATE modifier is used.

```c
SeriesInfoInteger(symbol,period,SERIES_FIRSTDATE,first_date);
if(first_date>0 && first_date<=start_date) return(1);
```

The next important check is checking the type of the program, from which the function is called. Note that it is not desirable to send a request to update the timeseries from indicator with the same period. The undesirability of requesting data on the same symbol-period as that of the indicator is conditioned by the fact that update of history data is performed in the same thread where the indicator operates. So the possibility of deadlock occurrence is high. To check this use the MQL5InfoInteger() function with the MQL5_PROGRAM_TYPE modifier.

```c
if(MQL5InfoInteger(MQL5_PROGRAM_TYPE)==PROGRAM_INDICATOR && Period()==period && Symbol()==symbol)
    return(-4);
```

If all the checks have been passed successfully, make the last attempt to do without referring to the trade server. First let’s find out the start date, for which minute data in HCC format are available. Request this value using the SeriesInfoInteger() function with the SERIES_TERMINAL_FIRSTDATE modifier and again compare it to the value of the start_date parameter.
if(SeriesInfoInteger(symbol, PERIOD_M1, SERIES_TERMINAL_FIRSTDATE, first_date))
{
    //--- there is loaded data to build timeseries
    if(first_date>0)
    {
        //--- force timeseries build
        CopyTime(symbol, period, first_date+PeriodSeconds(period), 1, times);
        //--- check date
        if(SeriesInfoInteger(symbol, period, SERIES_FIRSTDATE, first_date))
            if(first_date>0 && first_date<start_date) return(2);
    }
}

If after all the checks the execution thread is still in the body of the CheckLoadHistory() function, it means there is a necessity to request the missing price data from a trade server. First, return the value of "Max bars in chart" using the TerminalInfoInteger() function:

```
int max_bars=TerminalInfoInteger(TERMNAL_MAXBARS);
```

We'll need it to prevent requesting extra data. Then find the very first date in the symbol history on the trade server (regardless of the period) using already known function SeriesInfoInteger() with the SERIES_SERVER_FIRSTDATE modifier.

```
datetime first_server_date=0;
while(!SeriesInfoInteger(symbol, PERIOD_M1, SERIES_SERVER_FIRSTDATE, first_server_date)
    Sleep(5);
```

Since the request is an asynchronous operation, the function is called in the loop with a small delay of 5 milliseconds until the first_server_date variable receives a value, or the loop execution is terminated by a user (IsStopped() will return true in this case). Let's indicate a correct value of the start date, starting from which we request price data from a trade server.

```
if(first_server_date>start_date) start_date=first_server_date;
if(first_date>0 && first_date<first_server_date)
    Print("Warning: first server date ",first_server_date," for ",
        symbol," does not match to first series date ",first_date);
```

If the start date first_server_date of the server is lower than the start date first_date of the symbol in HCC format, the corresponding entry will be output in the journal.

Now we are ready to make a request to a trade server asking for missing price data. Make the request in the form of a loop and start filling out its body:

```
while(!IsStopped())
{
    //1. wait for synchronization between the re-built timeseries and intermediate
    //2. receive the current number of bars in this timeseries
    // if bars is larger than Max_bars_in_chart, we can exit, work is over
    //3. obtain the start date first_date in the re-built timeseries and compare it
    // if first_date is lower than start_date, we can exit, work is over
    //4. request from a server a new part of history - 100 bars starting from last
```
The first three points are implemented by already known means.

```c
while(!IsStopped())
{
    //--- 1.wait till timeseries re-build process is over
    while(!(SeriesInfoInteger(symbol,period,SERIES_SYNCHRONIZED) && !IsStopped()))
        Sleep(5);
    //--- 2.request how many bars we have
    int bars=Bars(symbol,period);
    if(bars>0)
    {
        //--- bars more than ones that can be drawn in the chart, exit
        if(bars>=max_bars) return(-2);
        //--- 3. return the current start date in the timeseries
        if(!SeriesInfoInteger(symbol,period,SERIES_FIRSTDATE,first_date))
            // start date was earlier than that requested, task completed
            if(first_date>0 && first_date<=start_date) return(0);
    }
    //4. Request from a server a new part of history - 100 bars starting from last available
}
```

The last fourth point is left - requesting history. We can't refer to a server directly, but any `Copy function` automatically initiates request sending to a server, if the history in HCC format is not enough. Since the time of the very first start date in the `first_date` variable is the simple and natural criterion to evaluate the request execution degree, then the easiest way is to use the `CopyTime()` function.

When calling functions that copy any data from timeseries, it should be noted that the `start` parameter (number of the bar, starting from which price data should be copied) must always be within the available terminal history. If you have only 100 bars, it meaningless to try copying 300 bars starting from the bar with the index 500. Such a request will be understood as an erroneous and won't be handled, i.e. no additional history will be loaded from a trade server.

That's why we'll copy bars in groups of 100 starting from the bar with the `bars` index. This will provide the smooth loading of missing history from a trade server. Actually a little more than the requested 100 bars will be loaded, while server sends oversized history.

```c
int copied=CopyTime(symbol,period,bars,100,times);
```

After the copying operation, we should analyze the number of copied elements. If the attempt fails, then value of the `copied` will be equal to null and the value of the `fail_cnt` counter will be increased by 1. After 100 failing attempts, the operation of the function will be stopped.

```c
int fail_cnt=0;
...
int copied=CopyTime(symbol,period,bars,100,times);
if(copied>0)
{
    //--- check data
    if(times[0]<=start_date) return(0); // the copied value is smaller, ready
    if(bars+copied>=max_bars) return(-2); // bars are more than can be drawn in the
```
So, not only correct handling of the current situation at each moment of execution is implemented in the function, but also the termination code is returned, that can be handled after calling the CheckLoadHistory() function for getting additional information. For example, this way:

```
int res=CheckLoadHistory(InpLoadedSymbol,InpLoadedPeriod,InpStartDate);
switch(res)
{
    case -1 : Print("Unknown symbol ",InpLoadedSymbol); break;
    case -2 : Print("More requested bars than can be drawn in the chart"); break;
    case -3 : Print("Execution stopped by user"); break;
    case -4 : Print("Indicator mustn't load its own data"); break;
    case -5 : Print("Loading failed"); break;
    case 0 : Print("All data loaded"); break;
    case 1 : Print("Already available data in timeseries are enough"); break;
    case 2 : Print("Timeseries is built from available terminal data"); break;
    default : Print("Execution result undefined");
}
```

The full code of the function can be found in the example of a script that shows the correct organization of access to any data with the handling of request's results.

**Code:**

```
//+------------------------------------------------------------------+

        case PERIOD_D1: return ("Daily");
        case PERIOD_W1: return ("Weekly");
        case PERIOD_MN1: return ("Monthly");
    }
    //---
    return ("unknown period");
}
SeriesInfoInteger

Returns information about the state of historical data. There are 2 variants of function calls.

Directly returns the property value.

```cpp
long SeriesInfoInteger(
    string symbol_name, // symbol name
    ENUM_TIMEFRAMES timeframe, // period
    ENUM_SERIES_INFO_INTEGER prop_id, // property identifier
);
```

Returns true or false depending on the success of the function run.

```cpp
bool SeriesInfoInteger(
    string symbol_name, // symbol name
    ENUM_TIMEFRAMES timeframe, // period
    ENUM_SERIES_INFO_INTEGER prop_id, // property ID
    long& long_var // variable for getting info
);
```

Parameters

- `symbol_name`  
  [in] Symbol name.
- `timeframe`  
  [in] Period.
- `prop_id`  
  [in] Identifier of the requested property, value of the `ENUM_SERIES_INFO_INTEGER` enumeration.
- `long_var`  
  [out] Variable to which the value of the requested property is placed.

Return Value

In the first case, it returns value of the long type.

For the second case, it returns true, if the specified property is available and its value has been placed into `long_var` variable, otherwise it returns false. For more details about an error, call `GetLastError()`.

Example:

```cpp
void OnStart()
{
    //---
    Print("Total number of bars for the symbol-period at this moment = ",
        SeriesInfoInteger(Symbol(), Period(), SERIES_BARS_COUNT));

    Print("The first date for the symbol-period at this moment = ",
        (datetime)SeriesInfoInteger(Symbol(), Period(), SERIES_FIRSTDATE));
}
Print("The first date in the history for the symbol-period on the server = ",
       (datetime)SeriesInfoInteger(Symbol(), Period(), SERIES_SERVER_FIRSTDATE));

Print("Symbol data are synchronized = ",
       (bool)SeriesInfoInteger(Symbol(), Period(), SERIES_SYNCHRONIZED));
}
Bars

Returns the number of bars count in the history for a specified symbol and period. There are 2 variants of functions calls.

Request all of the history bars

```c
int  Bars( 
    string  symbol_name,  // symbol name
    ENUM_TIMEFRAMES  timeframe  // period
);
```

Request the history bars for the selected time interval

```c
int  Bars( 
    string  symbol_name,  // symbol name
    ENUM_TIMEFRAMES  timeframe,  // period
    datetime  start_time,  // start date and time
    datetime  stop_time  // end date and time
);
```

Parameters

symbol_name
  [in] Symbol name.

timeframe
  [in] Period.

start_time
  [in] Bar time corresponding to the first element.

stop_time
  [in] Bar time corresponding to the last element.

Return Value

If the start_time and stop_time parameters are defined, the function returns the number of bars in the specified time interval, otherwise it returns the total number of bars.

Note

If data for the timeseries with specified parameters are not formed in the terminal by the time of the Bars() function call, or data of the timeseries are not synchronized with a trade server by the moment of the function call, the function returns a zero value.

When requesting the number of bars in a specified time interval, only bars with an open time falling within the interval are considered. For example, if the current day of the week is Saturday and the request is made for the number of W1 bars with start_time=last_tuesday and stop_time=last_friday, the function will return 0 since the open time of a W1 timeframe is always Sunday and not a single W1 bar falls within the specified interval.

Sample request for the number of all history bars:
```csharp
int bars = Bars(_Symbol, _Period);
if (bars > 0)
{
    Print("Number of bars in the terminal history for the symbol-period at the moment = ", bars);
}
else //no available bars
{
    //--- data on the symbol might be not synchronized with data on the server
    bool synchronized = false;
    //--- loop counter
    int attempts = 0;
    // make 5 attempts to wait for synchronization
    while (attempts < 5)
    {
        if (SeriesInfoInteger(Symbol(), 0, SERIES_SYNCHRONIZED))
        {
            //--- synchronization done, exit
            synchronized = true;
            break;
        }
        //--- increase the counter
        attempts++;
        //--- wait 10 milliseconds till the next iteration
        Sleep(10);
    }
    //--- exit the loop after synchronization
    if (synchronized)
    {
        Print("Number of bars in the terminal history for the symbol-period at the moment = ", bars);
        Print("The first date in the terminal history for the symbol-period at the moment = ",
            (datetime)SeriesInfoInteger(Symbol(), 0, SERIES_FIRSTDATE));
        Print("The first date in the history for the symbol on the server = ",
            (datetime)SeriesInfoInteger(Symbol(), 0, SERIES_SERVER_FIRSTDATE));
    }
    //--- synchronization of data didn't happen
    else
    {
        Print("Failed to get number of bars for ", _Symbol);
    }
}

Sample request for the number of bars in the specified interval:
```
```csharp
int n;
datetime date1 = D'2016.09.02 23:55'; // Friday
datetime date2 = D'2016.09.05 00:00'; // Monday
datetime date3 = D'2016.09.08 00:00'; // Thursday
//---
n = Bars(_Symbol, PERIOD_H1, D'2016.09.02 02:05', D'2016.09.02 10:55');
```
Print("Number of bars: ",n); // Output: "Number of bars: 8", H2 bar is considered 
\nPrint("Number of bars: ",n); // Output: "Number of bars: 1", since an open time of 
\nPrint("Number of bars: ",n); // Output: "Number of bars: 0", since not a single W1

Event Handling Functions
BarsCalculated

Returns the number of calculated data for the specified indicator.

```c
int BarsCalculated(
    int                  indicator_handle,  // indicator handle
    );
```

**Parameters**

`indicator_handle`

[in] The indicator handle, returned by the corresponding indicator function.

**Return Value**

Returns the amount of calculated data in the indicator buffer or -1 in the case of error (data not calculated yet).

**Note**

The function is useful when it's necessary to get the indicator data immediately after its creation (indicator handle is available).

**Example:**

```c
void OnStart()
{
    double Ups[];
    //--- set timeseries ordering for the arrays
    ArraySetAsSeries(Ups, true);
    //--- create handle for the Fractal Indicator
    int FractalsHandle=iFractals(NULL,0);
    //--- reset the error code
    ResetLastError();
    //--- try to copy the indicator values
    int i,copied=CopyBuffer(FractalsHandle,0,0,1000,Ups);
    if(copied<=0)
    {
        Sleep(50);
        for(i=0;i<100;i++)
        {
            if(BarsCalculated(FractalsHandle)>0)
            {
                break;
                Sleep(50);
            }
        }
        copied=CopyBuffer(FractalsHandle,0,0,1000,Ups);
        if(copied<=0)
        {
            Print("Failed to copy upper fractals. Error = ",GetLastError(),
                "i = ",i," copied = ",copied);
            return;
        }
    }
```
else
    Print("Upper fractals copied",
    "i = ",i," copied = ",copied);
}
else Print("Upper fractals copied. ArraySize = ",ArraySize(Ups));
}
**IndicatorCreate**

The function returns the handle of a specified technical indicator created based on the array of parameters of `MqlParam` type.

```cpp
int IndicatorCreate(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // timeframe
    ENUM_INDICATOR indicator_type, // indicator type from the enumeration
    int parameters_cnt=0, // number of parameters
    const MqlParam* parameters_array[]=NULL // array of parameters
);
```

**Parameters**

- **symbol**
  - [in] Name of a symbol, on data of which the indicator is calculated. `NULL` means the current symbol.

- **period**
  - [in] The value of the timeframe can be one of values of the `ENUM_TIMEFRAMES` enumeration, 0 means the current timeframe.

- **indicator_type**
  - [in] Indicator type, can be one of values of the `ENUM_INDICATOR` enumeration.

- **parameters_cnt**
  - [in] The number of parameters passed in the `parameters_array[]` array. The array elements have a special structure type `MqlParam`. By default, zero - parameters are not passed. If you specify a non-zero number of parameters, the parameter `parameters_array` is obligatory. You can pass no more than 64 parameters.

- **parameters_array[]=NULL**
  - [in] An array of `MqlParam` type, whose elements contain the type and value of each input parameter of a `technical indicator`.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`.

**Note**

If the indicator handle of IND_CUSTOM type is created, the `type` field of the first element of the array of input parameters `parameters_array` must have the `TYPE_STRING` value of the `ENUM_DATATYPE` enumeration, and the `string_value` field of the first element must contain the name of the custom indicator. The custom indicator must be compiled (file with EX5 extension) and located in the directory `MQL5/Indicators` of the client terminal or in a subdirectory.

Indicators that require testing are defined automatically from the call of the `iCustom()` function, if the corresponding parameter is set through a `constant string`. For all other cases (use of the `IndicatorCreate()` function or use of a non-constant string in the parameter that sets the indicator name) the property `#property tester_indicator` is required:

```cpp
#property tester_indicator "indicator_name.ex5"
```
If the first form of the call is used in a custom indicator, you can additionally indicate as the last parameter on what data it will be calculated when passing input parameters. If the "Apply to" parameter is not specified explicitly, the default calculation is based on the `PRICE_CLOSE` values.

**Example:**

```c
void OnStart ()
{
    MqlParam params[];
    int     h_MA, h_MACD;
    //--- create iMA("EURUSD",PERIOD_M15,8,0,MODE_EMA,PRICE_CLOSE);
    ArrayResize(params,4);
    //--- set ma_period
    params[0].type        =TYPE_INT;
    params[0].integer_value=8;
    //--- set ma_shift
    params[1].type        =TYPE_INT;
    params[1].integer_value=0;
    //--- set ma_method
    params[2].type        =TYPE_INT;
    params[2].integer_value=MODE_EMA;
    //--- set applied_price
    params[3].type        =TYPE_INT;
    params[3].integer_value=PRICE_CLOSE;
    //--- create MA
    h_MA=IndicatorCreate("EURUSD",PERIOD_M15,IND_MA,4,params);
    //--- create iMACD("EURUSD",PERIOD_M15,12,26,9,h_MA);
    ArrayResize(params,4);
    //--- set fast ma_period
    params[0].type        =TYPE_INT;
    params[0].integer_value=12;
    //--- set slow ma_period
    params[1].type        =TYPE_INT;
    params[1].integer_value=26;
    //--- set smooth period for difference
    params[2].type        =TYPE_INT;
    params[2].integer_value=9;
    //--- set indicator handle as applied_price
    params[3].type        =TYPE_INT;
    params[3].integer_value=h_MA;
    //--- create MACD based on moving average
    h_MACD=IndicatorCreate("EURUSD",PERIOD_M15,IND_MACD,4,params);
    //--- use indicators
    //--- . . .
    //--- release indicators (first h_MACD)
    IndicatorRelease(h_MACD);
    IndicatorRelease(h_MA);
}
```
**IndicatorParameters**

Based on the specified handle, returns the number of input parameters of the indicator, as well as the values and types of the parameters.

```c
int IndicatorParameters(
    int indicator_handle,  // indicator handle
    ENUM_INDICATOR indicator_type,  // a variable for receiving the indicator type
    MqlParam& parameters[]  // an array for receiving parameters
);
```

**Parameters**

- **indicator_handle**
  
  [in] The handle of the indicator, for which you need to know the number of parameters its is calculated on.

- **indicator_type**
  
  [out] A variable of the ENUM_INDICATOR type, into which the indicator type will be written.

- **parameters[]**
  
  [out] A dynamic array for receiving values of the MqlParam type, into which the list of indicator parameters will be written. The array size is returned by the IndicatorParameters() function.

**Return Value**

The number of input parameters of the indicator with the specified handle. In case of an error returns -1. For more details about the error call the GetLastError() function.

**Example:**

```c
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{

    //--- The number of windows on the chart (at least one main window is always present)
    int windows=(int)ChartGetInteger(0,CHART_WINDOWS_TOTAL);

    //--- Go through the chart windows
    for(int w=0;w<windows;w++)
    {
        //--- The number of indicators in this window/subwindow
        int total=ChartIndicatorsTotal(0,w);

        //--- Take all indicators in the window
        for(int i=0;i<total;i++)
        {
            //--- Get the short name of the indicator
            string name=ChartIndicatorName(0,w,i);

            //--- Get the indicator handle
            int handle=ChartIndicatorGet(0,w,name);

            //--- Add to log
```
PrintFormat("Window=%d, indicator #%d, handle=%d",w,i,handle);

//---
MqlParam parameters[];
ENUM_INDICATOR indicator_type;
int params=IndicatorParameters(handle,indicator_type,parameters);

//--- The header of the message
string par_info="Short name "+name+", type 

  +EnumToString(ENUM_INDICATOR(indicator_type))+"\n"

//---
for(int p=0;p<params;p++)
{
    par_info+=StringFormat("parameter %d: type=%s, long_value=%d, double_value

   EnumToString((ENUM_DATATYPE)parameters[p].type),
   parameters[p].integer_value,
   parameters[p].double_value,
   parameters[p].string_value

   );

}
Print(par_info);

//--- Done for all indicators in the window

//---
}

See also

ChartIndicatorGet()
IndicatorRelease

The function removes an indicator handle and releases the calculation block of the indicator, if it’s not used by anyone else.

```cpp
bool IndicatorRelease(  
    int indicator_handle  // indicator handle
);  
```

Return Value

Returns true in case of success, otherwise returns false.

Note

The function allows removing an indicator handle, if it’s no longer needed, thus saving memory. The handle is removed immediately, the calculation block is deleted in some time (if it’s not called anymore).

When working in the strategy tester, the IndicatorRelease() function is not executed.

Example:

```cpp
//+------------------------------------------------------------------+
//|                                        Test_IndicatorRelease.mq5  |
//|                        Copyright 2010, MetaQuotes Software Corp.    |
//|                                             https://www.mql5.com|

int MA_handle=INVALID_HANDLE;
//+------------------------------------------------------------------+
//| Expert initialization function                             |
//+------------------------------------------------------------------+
int OnInit()
{
    //--- create indicator handle
    MA_handle=IMA(Symbol(),0,MA_Period,MA_shift,MA_smooth,PRICE_CLOSE);
    //--- delete global variable
    if(GlobalVariableCheck("MA_value")
        GlobalVariableDel("MA_value");
    //---
    return(INIT_SUCCEEDED);
}
//+------------------------------------------------------------------+
```

© 2000-2019, MetaQuotes Software Corp.
void OnTick()
{
    //--- if the global variable value does not exist
    if(!GlobalVariableCheck("MA_value"))
    {
        //--- obtain the indicator value in the last two bars
        if(MA_handle!=INVALID_HANDLE)
        {
            //--- dynamic array for the indicator values
            double values[];
            if(CopyBuffer(MA_handle,0,0,2,values)==2 && values[0]!=EMPTY_VALUE)
            {
                //--- remember in the global variable value on the last but one bar
                if(GlobalVariableSet("MA_value",values[0]))
                {
                    //--- free the handle of the indicator
                    if(!IndicatorRelease(MA_handle))
                        Print("IndicatorRelease() failed. Error ",GetLastError());
                    else MA_handle=INVALID_HANDLE;
                }
                else
                    Print("GlobalVariableSet failed. Error ",GetLastError());
            }
            else
                Print("GlobalVariableSet failed. Error ",GetLastError());
        }
    }
}
CopyBuffer

Gets data of a specified buffer of a certain indicator in the necessary quantity.

Counting of elements of copied data (indicator buffer with the index buffer_num) from the starting position is performed from the present to the past, i.e., starting position of 0 means the current bar (indicator value for the current bar).

When copying the yet unknown amount of data, it is recommended to use a dynamic array as a buffer[] recipient buffer, because the CopyBuffer() function tries to allocate the size of the receiving array to the size of the copied data. If an indicator buffer (array that is pre-allocated for storing indicator values by the SetIndexBuffer() function) is used as the buffer[] recipient array, partial copying is allowed. An example can be found in the Awesome_Oscillator.mq5 custom indicator in the standard terminal package.

If you need to make a partial copy of the indicator values into another array (non-indicator buffer), you should use an intermediate array, to which the desired number is copied. After that conduct the element-wise copying of the required number of values into the required places of a receiving array from this intermediate one.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```c
int CopyBuffer(
    int indicator_handle,  // indicator handle
    int buffer_num,        // indicator buffer number
    int start_pos,         // start position
    int count,             // amount to copy
    double buffer[]        // target array to copy
);```

Call by the start date and the number of required elements

```c
int CopyBuffer(
    int indicator_handle,  // indicator handle
    int start_pos,         // start position
    int count,             // amount to copy
    double buffer[]        // target array to copy
);```
Call by the start and end dates of a required time interval

```c
int CopyBuffer(
    int indicator_handle,    // indicator handle
    int buffer_num,          // indicator buffer number
    datetime start_time,     // start date and time
    datetime stop_time,      // end date and time
    double buffer[]          // target array to copy
);
```

**Parameters**

- `indicator_handle`
  - [in] The indicator handle, returned by the corresponding indicator function.

- `buffer_num`
  - [in] The indicator buffer number.

- `start_pos`
  - [in] The position of the first element to copy.

- `count`
  - [in] Data count to copy.

- `start_time`
  - [in] Bar time, corresponding to the first element.

- `stop_time`
  - [in] Bar time, corresponding to the last element.

- `buffer[]`
  - [out] Array of `double` type.

**Return Value**

Returns the copied data count or -1 in case of an error.

**Note**

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration.
Example:

```mql5
//+------------------------------------------------------------------+
//|                                              TestCopyBuffer3.mq5  |
//|                        Copyright 2009, MetaQuotes Software Corp.  |
//|                                              https://www.mql5.com |
//+------------------------------------------------------------------+

#property version "1.00"

#property indicator_separate_window
#property indicator_buffers 1
#property indicator_plots 1
//---- plot MA
#property indicator_label1 "MA"
#property indicator_type1 DRAW_LINE
#property indicator_color1 clrRed
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
//--- input parameters
input bool AsSeries=true;
input int period=15;
input ENUM_MA_METHOD smootMode=MODE_EMA;
input ENUM_APPLIED_PRICE price=PRICE_CLOSE;
input int shift=0;
//--- indicator buffers
double MABuffer[];
int ma_handle;
//+------------------------------------------------------------------+
//| Custom indicator initialization function                         |
//+------------------------------------------------------------------+
int OnInit()
{
    //--- indicator buffers mapping
    SetIndexBuffer(0,MABuffer,INDICATOR_DATA);
    Print("Parameter AsSeries = ",AsSeries);
    Print("Indicator buffer after SetIndexBuffer() is a timeseries = ",
            ArrayGetAsSeries(MABuffer));
    //--- set short indicator name
    IndicatorSetString(INDEX_SHORTNAME,"MA(\"+period+\")")+AsSeries);
    //--- set AsSeries (depends on input parameter)
    ArraySetAsSeries(MABuffer,AsSeries);
    Print("Indicator buffer after ArraySetAsSeries(MABuffer,true) is a timeseries = ",
            ArrayGetAsSeries(MABuffer));
    //---
    ma_handle=iMA(Symbol(),0,period,shift,smootMode,price);
    return(INIT_SUCCEEDED);
}
```

© 2000-2019, MetaQuotes Software Corp.
The above example illustrates how an indicator buffer is filled out with the values of another indicator buffer from the indicator on the same symbol/period.

See a detailed example of history requesting data in section **Methods of Object Binding**. The script available in that section shows how to get the values of indicator **IFractals** on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following **styles**:

- **DRAW_SECTION**
- **DRAW_ARROW**
- **DRAW_ZIGZAG**
- **DRAW_COLOR_SECTION**
- **DRAW_COLOR_ARROW**
- **DRAW_COLOR_ZIGZAG**

Properties of Custom Indicators, SetIndexBuffer
CopyRates

Gets history data of MqlRates structure of a specified symbol-period in specified quantity into the rates_array array. The elements ordering of the copied data is from present to the past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

### Call by the first position and the number of required elements

```c
int CopyRates(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    int start_pos,  // start position
    int count,  // data count to copy
    MqlRates rates_array[]  // target array to copy
);
```

### Call by the start date and the number of required elements

```c
int CopyRates(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,  // start date and time
    int count,  // data count to copy
    MqlRates rates_array[]  // target array to copy
);
```

### Call by the start and end dates of a required time interval

```c
int CopyRates(
```
### Parameters

- **symbol_name**
  - [in] Symbol name.

- **timeframe**
  - [in] Period.

- **start_time**
  - [in] Bar time for the first element to copy.

- **start_pos**
  - [in] The start position for the first element to copy.

- **count**
  - [in] Data count to copy.

- **stop_time**
  - [in] Bar time, corresponding to the last element to copy.

- **rates_array[]**
  - [out] Array of **MqlRates** type.

### Return Value

Returns the number of copied elements or -1 in case of an error.

### Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside **TERMINAL_MAXBARS** (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, **downloading from the server** will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying start_time=Last_Tuesday and stop_time=Last_Friday the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying start_pos=0 and count=1.

Example:

```cpp
void OnStart()
{
//---
    MqlRates rates[];
    ArraySetAsSeries(rates, true);
    int copied=CopyRates(Symbol(), 0, 0, 100, rates);
    if (copied>0)
    {
        Print("Bars copied: "+copied);
        string format="open = %G, high = %G, low = %G, close = %G, volume = %d";
        string out;
        int size=fmin(copied,10);
        for (int i=0;i<size;i++)
        {
            out=i=""+TimeToString(rates[i].time);
            out=out+" "+StringFormat(format,
                rates[i].open,
                rates[i].high,
                rates[i].low,
                rates[i].close,
                rates[i].tick_volume);
            Print(out);
        }
    }
    else Print("Failed to get history data for the symbol ",Symbol());
}
```

See a detailed example of requesting history data in section Methods of Object Binding. The script available in that section shows how to get the values of indicator iFractals on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following styles:

- DRAW_SECTION
- DRAW_ARROW
- DRAW_ZIGZAG
- DRAW_COLOR_SECTION
Timeseries and Indicators Access

- `DRAW_COLOR_ARROW`
- `DRAW_COLOR_ZIGZAG`

CopyTime

The function gets to time_array history data of bar opening time for the specified symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```c
int CopyTime(
    string symbol_name,     // symbol name
    ENUM_TIMEFRAMES timeframe,     // period
    int start_pos,           // start position
    int count,               // data count to copy
    datetime time_array[]    // target array to copy open times
);
```

Call by the start date and the number of required elements

```c
int CopyTime(
    string symbol_name,     // symbol name
    ENUM_TIMEFRAMES timeframe,     // period
    datetime start_time,      // start date and time
    int count,                // data count to copy
    datetime time_array[]     // target array to copy open times
);
```

Call by the start and end dates of a required time interval

```c
int CopyTime(
    string symbol_name,     // symbol name
    ENUM_TIMEFRAMES timeframe,     // period
    datetime start_time,      // start date and time
    datetime end_time,        // end date and time
    int count,                // data count to copy
    datetime time_array[]     // target array to copy open times
);
string symbol_name, // symbol name
ENUM_TIMEFRAMES timeframe, // period
datetime start_time, // start date and time
datetime stop_time, // stop date and time
datetime time_array[] // target array to copy open times
);

Parameters

symbol_name
    [in] Symbol name.

timeframe
    [in] Period.

start_pos
    [in] The start position for the first element to copy.

count
    [in] Data count to copy.

start_time
    [in] The start time for the first element to copy.

stop_time
    [in] Bar time corresponding to the last element to copy.

time_array[]
    [out] Array of datetime type.

Return Value

Returns the copied data count or -1 in case of an error.

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying `start_time=Last_Tuesday` and `stop_time=Last_Friday` the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying `start_pos=0` and `count=1`.

See a detailed example of requesting history data in section **Methods of Object Binding**. The script available in that section shows how to get the values of indicator `iFractals` on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following **styles**:

- `DRAW_SECTION`,
- `DRAW_ARROW`,
- `DRAW_ZIGZAG`,
- `DRAW_COLOR_SECTION`,
- `DRAW_COLOR_ARROW`,
- `DRAW_COLOR_ZIGZAG`. 
CopyOpen

The function gets into open_array the history data of bar open prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```c
int CopyOpen(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    int start_pos,  // start position
    int count,  // data count to copy
    double open_array[]  // target array to copy open prices
);
```

Call by the start date and the number of required elements

```c
int CopyOpen(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,  // start date and time
    int count,  // data count to copy
    double open_array[]  // target array for bar open prices
);
```

Call by the start and end dates of a required time interval

```c
int CopyOpen(
```
string symbol_name, // symbol name
enum TimeFrames timeframe, // period
datetime start_time, // start date and time
datetime stop_time, // stop date and time
double open_array[] // target array for bar open values
);

Parameters

symbol_name
  [in] Symbol name.

timeframe
  [in] Period.

start_pos
  [in] The start position for the first element to copy.

count
  [in] Data count to copy.

start_time
  [in] The start time for the first element to copy.

stop_time
  [in] The start time for the last element to copy.

open_array[]
  [out] Array of double type.

Return Value

Returns the number of element in the array or -1 in case of an error.

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying start_time=Last_Tuesday and stop_time=Last_Friday the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying start_pos=0 and count=1.

See a detailed example of requesting history data in section **Methods of Object Binding**. The script available in that section shows how to get the values of indicator iFractals on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following **styles**:

- **DRAW_SECTION**,
- **DRAW_ARROW**,
- **DRAW_ZIGZAG**,
- **DRAW_COLOR_SECTION**,
- **DRAW_COLOR_ARROW**,
- **DRAW_COLOR_ZIGZAG**.
CopyHigh

The function gets into high_array the history data of highest bar prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```c
int CopyHigh(
    string symbol_name,     // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    int start_pos,         // start position
    int count,            // data count to copy
    double high_array[]   // target array to copy
);
```

Call by the start date and the number of required elements

```c
int CopyHigh(
    string symbol_name,     // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,    // start date and time
    int count,              // data count to copy
    double high_array[]    // target array to copy
);
```

Call by the start and end dates of a required time interval

```c
int CopyHigh(
    string symbol_name,     // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,    // start date and time
    datetime end_time,      // end date and time
    int count,              // data count to copy
    double high_array[]    // target array to copy
);
```
### Parameters

**symbol_name**

[in] Symbol name.

**timeframe**

[in] Period.

**start_pos**

[in] The start position for the first element to copy.

**count**

[in] Data count to copy.

**start_time**

[in] The start time for the first element to copy.

**stop_time**

[in] Bar time, corresponding to the last element to copy.

**high_array[]**

[out] Array of double type.

### Return Value

Returns the copied data count or -1 in case of an error.

### Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying \texttt{start\_time=Last\_Tuesday} and \texttt{stop\_time=Last\_Friday} the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying \texttt{start\_pos=0} and \texttt{count=1}.

Example:

```c
double High[],Low[];
//+------------------------------------------------------------------+
//| Get Low for specified bar index                                  |
//+------------------------------------------------------------------+
double iLow(string symbol,ENUM_TIMEFRAMES timeframe,int index)
{
    double low=0;
    ArraySetAsSeries(Low,true);
    int copied=CopyLow(symbol,timeframe,0,Bars(symbol,timeframe),Low);
    if(copied>0 && index<copied) low=Low[index];
    return (low);
}
//+------------------------------------------------------------------+
//| Get the High for specified bar index                             |
//+------------------------------------------------------------------+
double iHigh(string symbol,ENUM_TIMEFRAMES timeframe,int index)
{
    double high=0;
    ArraySetAsSeries(High,true);
    int copied=CopyHigh(symbol,timeframe,0,Bars(symbol,timeframe),High);
    if(copied>0 && index<copied) high=High[index];
    return (high);
}
//+------------------------------------------------------------------+
//| Expert tick function                                             |
//+------------------------------------------------------------------+
void OnTick()
{
```
//--- on every tick we output the High and Low values for the bar with index, 
//--- that is equal to the second, on which tick arrived

    datetime t=TimeCurrent();
    int sec=t%60;
    printf("High[%d] = %G Low[%d] = %G",
            sec,iHigh(Symbol(),0,sec),
            sec,iLow(Symbol(),0,sec));
CopyLow

The function gets into low_array the history data of minimal bar prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use a dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```c
int CopyLow(  
    string    symbol_name,    // symbol name  
    ENUM_TIMEFRAMES timeframe, // period  
    int start_pos, // start position  
    int count,    // data count to copy  
    double low_array[] // target array to copy  
);  
```

Call by the start date and the number of required elements

```c
int CopyLow(  
    string    symbol_name,    // symbol name  
    ENUM_TIMEFRAMES timeframe, // period  
    datetime start_time, // start date and time  
    int count,    // data count to copy  
    double low_array[] // target array to copy  
);  
```

Call by the start and end dates of a required time interval

```c
int CopyLow(  
    string    symbol_name,    // symbol name  
    ENUM_TIMEFRAMES timeframe, // period  
    datetime start_time, // start date and time  
    datetime end_time, // end date and time  
    int count,    // data count to copy  
    double low_array[] // target array to copy  
);  
```
string symbol_name,  // symbol name
ENUM_TIMEFRAMES timeframe,  // period
datetime start_time,   // start date and time
datetime stop_time,   // stop date and time
double low_array[]    // target array to copy
);

Parameters

symbol_name

timeframe
   [in] Period.

start_pos
   [in] The start position for the first element to copy.

count
   [in] Data count to copy.

start_time
   [in] Bar time, corresponding to the first element to copy.

stop_time
   [in] Bar time, corresponding to the last element to copy.

low_array[]
   [out] Array of double type.

Return Value

Returns the copied data count or -1 in case of an error.

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying start_time=Last_Tuesday and stop_time=Last_Friday the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying start_pos=0 and count=1.

See a detailed example of requesting history data in section Methods of Object Binding. The script available in that section shows how to get the values of indicator iFractals on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following styles:

- DRAW_SECTION,
- DRAW_ARROW,
- DRAW_ZIGZAG,
- DRAW_COLOR_SECTION,
- DRAW_COLOR_ARROW,
- DRAW_COLOR_ZIGZAG.

CopyHigh
CopyClose

The function gets into close_array the history data of bar close prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

**Call by the first position and the number of required elements**

```c
int CopyClose(
    string          symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,   // period
    int             start_pos,   // start position
    int             count,       // data count to copy
    double          close_array[] // target array to copy
);```

**Call by the start date and the number of required elements**

```c
int CopyClose(
    string          symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,   // period
    datetime        start_time,  // start date and time
    int             count,       // data count to copy
    double          close_array[] // target array to copy
);```

**Call by the start and end dates of a required time interval**

```c
int CopyClose(
    string          symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,   // period
    datetime        start_time,  // start date and time
    datetime        end_time,    // end date and time
    int             count,       // data count to copy
    double          close_array[] // target array to copy
);```
string symbol_name, // symbol name
ENUM TIMEFRAMES timeframe, // period
datetime start_time, // start date and time
datetime stop_time, // stop date and time
double close_array[] // target array to copy
);

Parameters

symbol_name
   [in] Symbol name.

timeframe
   [in] Period.

start_pos
   [in] The start position for the first element to copy.

count
   [in] Data count to copy.

start_time
   [in] The start time for the first element to copy.

stop_time
   [in] Bar time, corresponding to the last element to copy.

close_array[]
   [out] Array of double type.

Return Value

Returns the copied data count or -1 in case of an error.

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying start_time=Last_Tuesday and stop_time=Last_Friday the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying start_pos=0 and count=1.

See a detailed example of history data requesting in section Methods of Object Binding. The script available in that section shows how to get the values of indicator iFractals on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following styles:

- DRAW_SECTION,
- DRAW_ARROW,
- DRAW_ZIGZAG,
- DRAW_COLOR_SECTION,
- DRAW_COLOR_ARROW,
- DRAW_COLOR_ZIGZAG.
CopyTickVolume

The function gets into volume_array the history data of tick volumes for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```c
int CopyTickVolume(
    string symbol_name,   // symbol name
    ENUM_TIMEFRAMES timeframe, // period
    int start_pos,         // start position
    int count,             // data count to copy
    long volume_array[]    // target array for tick volumes
);
```

Call by the start date and the number of required elements

```c
int CopyTickVolume(
    string symbol_name,   // symbol name
    ENUM_TIMEFRAMES timeframe, // period
    datetime start_time,   // start date and time
    int count,             // data count to copy
    long volume_array[]    // target array for tick volumes
);
```

Call by the start and end dates of a required time interval

```c
int CopyTickVolume(
    string symbol_name,   // symbol name
    ENUM_TIMEFRAMES timeframe, // period
    datetime start_time,   // start date and time
    datetime end_time,     // end date and time
    int count,             // data count to copy
    long volume_array[]    // target array for tick volumes
);
```
string symbol_name, // symbol name
ENUM TIMEFRAMES timeframe, // period
datetime start_time, // start date and time
datetime stop_time, // stop date and time
long volume_array[] // target array for tick volumes
);

Parameters

symbol_name
[in] Symbol name.

timeframe
[in] Period.

start_pos
[in] The start position for the first element to copy.

count
[in] Data count to copy.

start_time
[in] The start time for the first element to copy.

stop_time
[in] Bar time, corresponding to the last element to copy.

volume_array[]
[out] Array of long type.

Return Value

Returns the copied data count or -1 in case of an error.

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying start\_time=Last\_Tuesday and stop\_time=Last\_Friday the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying start\_pos=0 and count=1.

Example:

```mql5
#property indicator_separate_window
#property indicator_buffers 1
#property indicator_plots 1
//---- plot TickVolume
#property indicator_label1 "TickVolume"
#property indicator_type1 DRAW_HISTOGRAM
#property indicator_color1 C'143,188,139'
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
//--- input parameters
input int bars=3000;
//--- indicator buffers
double TickVolumeBuffer[];

//+++ Custom indicator initialization function
void OnInit()
{
    //--- indicator buffers mapping
    SetIndexBuffer(0,TickVolumeBuffer,INDICATOR_DATA);
    IndicatorSetInteger([INDICATOR_DIGITS,0]);
}

//+++ Custom indicator iteration function
int OnCalculate(const int rates_total,
    const int prev_calculated,
    const datetime &time[],
    const double &open[],
    const double &high[],
    const double &low[],
    const double &close[],
    const long &tick_volume[],
    const long &volume[],
```
```c++
const int &spread[]
{
    //---
    if(prev_calculated==0)
    {
        long timeseries[];
        ArraySetAsSeries(timeseries, true);
        int prices=CopyTickVolume(Symbol(), 0, 0, bars, timeseries);
        for(int i=0; i<rates_total-prices; i++) TickVolumeBuffer[i]=0.0;
        for(int i=0; i<prices; i++) TickVolumeBuffer[rates_total-1-i]=timeseries[prices-1-i];
        Print("We have received the following number of TickVolume values: "+prices);
    }
    else
    {
        long timeseries[];
        int prices=CopyTickVolume(Symbol(), 0, 0, 1, timeseries);
        TickVolumeBuffer[rates_total-1]=timeseries[0];
    }
    //--- return value of prev_calculated for next call
    return(rates_total);
}
```

See a detailed example of history data requesting in section **Methods of Object Binding**. The script available in that section shows how to get the values of indicator **iFractals** on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following **styles**:

- **DRAW_SECTION**
- **DRAW_ARROW**
- **DRAW_ZIGZAG**
- **DRAW_COLOR_SECTION**
- **DRAW_COLOR_ARROW**
- **DRAW_COLOR_ZIGZAG**
CopyRealVolume

The function gets into volume_array the history data of trade volumes for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

Array with RealVolume values

Array volume_array

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```cpp
int CopyRealVolume(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    int start_pos,  // start position
    int count,  // data count to copy
    long volume_array[]  // target array for volumes values
);
```

Call by the start date and the number of required elements

```cpp
int CopyRealVolume(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,  // start date and time
    int count,  // data count to copy
    long volume_array[]  // target array for volumes values
);
```

Call by the start and end dates of a required time interval

```cpp
int CopyRealVolume(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,  // start date and time
    datetime end_time,  // end date and time
    int count,  // data count to copy
    long volume_array[]  // target array for volumes values
);
```
string symbol_name,  // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime start_time,        // start date and time
datetime stop_time,          // stop date and time
long volume_array[]         // target array for volumes values
);

Parameters

symbol_name
    [in] Symbol name.

timeframe
    [in] Period.

start_pos
    [in] The start position for the first element to copy.

count
    [in] Data count to copy.

start_time
    [in] The start time for the first element to copy.

stop_time
    [in] Bar time, corresponding to the last element to copy.

volume_array[]
    [out] Array of long type.

Return Value

Returns the copied data count or -1 in the case of error.

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying `start_time=Last_Tuesday` and `stop_time=Last_Friday` the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying `start_pos=0` and `count=1`.

See an example of history data requesting in section *Methods of Object Binding*. The script available in that section shows how to get the values of indicator *iFractals* on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following *styles*:

- `DRAW_SECTION`,
- `DRAW_ARROW`,
- `DRAW_ZIGZAG`,
- `DRAW_COLOR_SECTION`,
- `DRAW_COLOR_ARROW`,
- `DRAW_COLOR_ZIGZAG`. 
CopySpread

The function gets into spread_array the history data of spread values for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use dynamic array as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a statically allocated buffer, in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```c
int CopySpread(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    int start_pos,  // start position
    int count,  // data count to copy
    int spread_array[]  // target array for spread values
);
```

Call by the start date and the number of required elements

```c
int CopySpread(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,  // start date and time
    int count,  // data count to copy
    int spread_array[]  // target array for spread values
);
```

Call by the start and end dates of a required time interval

```c
int CopySpread(
    string symbol_name,  // symbol name
    ENUM_TIMEFRAMES timeframe,  // period
    datetime start_time,  // start date and time
    datetime end_time,  // end date and time
    int count,  // data count to copy
    int spread_array[]  // target array for spread values
);
```
string symbol_name, // symbol name
ENUM TIMEFRAMES timeframe, // period
datetime start_time, // start date and time
datetime stop_time, // stop date and time
int spread_array[] // target array for spread values
);

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

spread_array[]

[out] Array of int type.

Return Value

Returns the copied data count or -1 in case of an error.

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside TERMINAL_MAXBARS (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from an indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, downloading from the server will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.
When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying start_time=Last_Tuesday and stop_time=Last_Friday the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying start_pos=0 and count=1.

Example:

```mql5
#!/property indicator_separate_window
#!/property indicator_buffers = 1
#!/property indicator_plots = 1

//---- plot Spread
#!/property indicator_label = "Spread"
#!/property indicator_type = DRAW_HISTOGRAM
#!/property indicator_color = clrRed
#!/property indicator_style = STYLE_SOLID
#!/property indicator_width = 1

//--- input parameters
input int bars = 3000;

//--- indicator buffers
double SpreadBuffer[];

void OnInit()
{
  //--- indicator buffers mapping
  SetIndexBuffer(0, SpreadBuffer, IN_INDEX_DATA);
  IndicatorSetInteger(IN_INDEX_DIGITS, 0);
}

int OnCalculate(const int rates_total,
                const int prev_calculated,
                const datetime &time[],
                const double &open[],
                const double &high[],
                const double &low[],
                const double &close[],
                const long &tick_volume[],
                const long &volume[],
```
```c
const int &spread[]
{
  //---
  if(prev_calculated==0)
  {
    int spread_int[];
    ArraySetAsSeries(spread_int,true);
    int spreads=CopySpread(Symbol(),0,0,bars,spread_int);
    Print("We have received the following number of Spread values: ",spreads);
    for (int i=0;i<spreads;i++)
    {
      SpreadBuffer[rates_total-1-i]=spread_int[i];
      if(i<=30) Print("spread["+i+"] = ",spread_int[i]);
    }
  }
  else
  {
    double Ask,Bid;
    Ask=SymbolInfoDouble(Symbol(),SYMBOL_ASK);
    Bid=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    Comment("Ask = ",Ask," Bid = ",Bid);
    SpreadBuffer[rates_total-1]= (Ask-Bid)/Point();
  }
  //--- return value of prev_calculated for next call
  return(rates_total);
}
```

See an example of history data requesting in section Methods of Object Binding. The script available in that section shows how to get the values of indicator Fractals on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following styles:

- DRAW_SECTION,
- DRAW_ARROW,
- DRAW_ZIGZAG,
- DRAW_COLOR_SECTION,
- DRAW_COLOR_ARROW,
- DRAW_COLOR_ZIGZAG.
CopyTicks

The function receives ticks in the MqlTick format into ticks_array. In this case, ticks are indexed from the past to the present, i.e. the 0 indexed tick is the oldest one in the array. For tick analysis, check the flags field, which shows what exactly has changed in the tick.

```c
int CopyTicks(
    string symbol_name, // Symbol name
    MqlTick& ticks_array[], // Tick receiving array
    uint flags=COPY_TICKS_ALL, // The flag that determines the type of requested ticks
    ulong from=0, // The date from which you want to request
    uint count=0 // The number of ticks that you want to request
);
```

Parameters

symbol_name

ticks_array

[out] An array of the MqlTick type for receiving ticks.

flags

[in] A flag to define the type of the requested ticks. COPY_TICKS_INFO - ticks with Bid and/or Ask changes, COPY_TICKS_TRADE - ticks with changes in Last and Volume, COPY_TICKS_ALL - all ticks. For any type of request, the values of the previous tick are added to the remaining fields of the MqlTick structure.

from

[in] The date from which you want to request ticks. In milliseconds since 1970.01.01. If from=0, the last count ticks will be returned.

count

[in] The number of requested ticks. If the 'from' and 'count' parameters are not specified, all available recent ticks (but not more than 2000) will be written to ticks_array[].

Returned value

The number of copied tick or -1 in case of an error.

Note

The CopyTicks() function allows requesting and analyzing all received ticks. The first call of CopyTicks() initiates synchronization of the symbol's tick database stored on the hard disk. If the local database does not provide all the requested ticks, then missing ticks will be automatically downloaded from the trade server. Ticks beginning with the from date specified in CopyTicks() till the current moment will be synchronized. After that, all ticks arriving for this symbol will be added to the tick database thus keeping it in the synchronized state.

If the from and count parameters are not specified, all available recent ticks (but not more than 2000) will be written to ticks_array[]. The flags parameter allows specifying the type of required ticks.
COPY_TICKS_INFO - ticks with Bid and/or Ask price changes are returned. Data of other fields will also be added. For example, if only the Bid has changed, the ask and volume fields will be filled with last known values. To find out exactly what has changed, analyze the flags field, which will have the value of TICK_FLAG_BID and/or TICK_FLAG_ASK. If a tick has zero values of the Bid and Ask prices, and the flags show that these data have changed (flags=TICK_FLAG_BID|TICK_FLAG_ASK), this means that the order book (Market Depth) is empty. In other words, there are no buy and sell orders.

COPY_TICKS_TRADE - ticks with the Last price and volume changes are returned. Data of other fields will also be added, i.e. last known values of Bid and Ask will be specified in the appropriate fields. To find out exactly what has changed, analyze the flags field, which will have the TICK_FLAG_LAST and TICK_FLAG VOLUME value.

COPY_TICKS_ALL - all ticks with any change are returned. Unchanged fields will be filled with last known values.

Call of CopyTicks() with the COPY_TICKS_ALL flag immediately returns all ticks from the request interval, while calls in other modes require some time to process and select ticks, therefore they do not provide significant speed advantage.

When requesting ticks (either COPY_TICKS_INFO or COPY_TICKS_TRADE), every tick contains full price information as of the time of the tick (bid, ask, last and volume). This feature is provided for an easier analysis of the trade state at the time of each tick, so there is no need to request a deep tick history and search for the values of other fields.

In indicators, the CopyTicks() function returns the result: when called from an indicator, CopyTick() immediately returns all available ticks of a symbol, and will launch synchronization of the tick database, if available data is not enough. All indicators in one symbol operate in one common thread, so the indicator cannot wait for the completion of synchronization. After synchronization, CopyTicks() will return all requested ticks during the next call. In indicators, the OnCalculate() function is called after the arrival of each tick.

CopyTicks() can wait for the result for 45 seconds in Expert Advisors and scripts: as distinct from indicators, every Expert Advisor and script operate in a separate thread, and therefore can wait 45 seconds till the completion of synchronization. If the required amount of ticks fails to be synchronized during this time, CopyTicks() will return available ticks by timeout and will continue synchronization. OnTick() in Expert Advisor is not a handler of every tick, it only notifies an Expert Advisor about changes in the market. It can be a batch of changes: the terminal can simultaneously make a few ticks, but OnTick() will be called only once to notify the EA of the latest market state.

The rate of data return: the terminal stores in the fast access cache 4,096 last ticks for each instrument (65,536 ticks for symbols with a running Market Depth). If requested ticks for the current trading session are beyond the cache, CopyTicks() calls the ticks stored in the terminal memory. These requests require more time for execution. The slowest requests are those requesting ticks for other days, since the data is read from the disk in this case.

Example:

```plaintext
input int getticks=100000000; // The number of required ticks
```
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+

void OnStart()
{
    //---
    int attempts=0;    // Count of attempts
    bool success=false; // The flag of a successful copying of ticks
    MqlTick tick_array[]; // Tick receiving array
    MqlTick lasttick; // To receive last tick data
    SymbolInfoTick(_Symbol, lasttick);
    //--- Make 3 attempts to receive ticks
    while(attempts<3)
    {
        //--- Measuring start time before receiving the ticks
        uint start=GetTickCount();
        //--- Requesting the tick history since 1970.01.01 00:00.001 (parameter from=1 ms)
        int received=CopyTicks(_Symbol, tick_array, COPY_TICKS_ALL, 1, getticks);
        if(received!=-1)
        {
            //--- Showing information about the number of ticks and spent time
            PrintFormat("%s: received %d ticks in %d ms", _Symbol, received, GetTickCount() - start);
            //--- If the tick history is synchronized, the error code is equal to zero
            if(GetLastError()==0)
            {
                success=true;
                break;
            }
            else
            {
                PrintFormat("%s: Ticks are not synchronized yet, %d ticks received for %d ms.
                      %s: Last tick time = %s.%03I64u", _Symbol, received, GetTickCount() - start, _LastError);
            }
        }
        //--- Counting attempts
        attempts++;
        //--- A one-second pause to wait for the end of synchronization of the tick data
        Sleep(1000);
    }
    //--- Receiving the requested ticks from the beginning of the tick history failed in three attempts
    if(!success)
    {
        PrintFormat("Error! Failed to receive %d ticks of %s in three attempts", getticks, _Symbol);
        return;
    }
    int ticks=ArraySize(tick_array);
    //--- Showing the time of the first tick in the array
    datetime firstticktime=tick_array[ticks-1].time;
    PrintFormat("First tick time = %s.%03I64u", TimeToString(firstticktime, TIME_DATE | TIME_MINUTES | TIME_SECONDS), tick_array[ticks-1].time_msc % 1000);
    //--- Show the time of the last tick in the array
}
datetime lastticktime=tick_array[0].time;
Printf("First tick time = %s.%03I64u",
    TimeToString(lastticktime,TIME_DATE|TIME_MINUTES|TIME_SECONDS),tick_ar);

    //---
    MqlDateTime today;

SymbolInfoTick, Structure for Current Prices, OnTick()
CopyTicksRange

The function receives ticks in the **MqlTick** format within the specified date range to ticks_array. Indexing goes from the past to the present meaning that a tick with the index 0 is the oldest one in the array. For tick analysis, check the **flags** field, which shows what exactly has changed.

```
int CopyTicksRange(
    const string symbol_name,  // symbol name
    MqlTick& ticks_array[],    // tick receiving array
    uint flags=COPY_TICKS_ALL, // flag that defines the type of the ticks
    ulong from_msc=0,          // date, starting from which ticks are requested
    ulong to_msc=0             // date, up to which ticks are requested
);
```

**Parameters**

*symbol_name*

*ticks_array*

[out] **MqlTick** static or dynamic array for receiving ticks. If the static array cannot hold all the ticks from the requested time interval, the maximum possible amount of ticks is received. In this case, the function generates the error **ERR_HISTORY_SMALL_BUFFER** (4407).

*flags*

[in] A flag to define the type of the requested ticks. **COPY_TICKS_INFO** - ticks with Bid and/or Ask changes, **COPY_TICKS_TRADE** - ticks with changes in Last and Volume, **COPY_TICKS_ALL** - all ticks. For any type of request, the values of the previous tick are added to the remaining fields of the **MqlTick** structure.

*from_msc*

[in] The date, from which you want to request ticks. In milliseconds since 1970.01.01. If the *from_msc* parameter is not specified, ticks from the beginning of the history are sent. Ticks with the time >= from_msc are sent.

*to_msc*

[in] The date, up to which you want to request ticks. In milliseconds since 01.01.1970. Ticks with the time <= to_msc are sent. If the *to_msc* parameter is not specified, all ticks up to the end of the history are sent.

**Return Value**

The number of copied tick or -1 in case of an error. **GetLastErr** is able to return the following errors:

- **ERR_HISTORY_TIMEOUT** - ticks synchronization waiting time is up, the function has sent all it had.
- **ERR_HISTORY_SMALL_BUFFER** - static buffer is too small. Only the amount the array can store has been sent.
- **ERR_NOT_ENOUGH_MEMORY** - insufficient memory for receiving a history from the specified range to the dynamic tick array. Failed to allocate enough memory for the tick array.

**Note**
The CopyTicksRange() function is used for requesting ticks strictly from a specified range, for example, from a certain day in history. At the same time, CopyTicks() allows specifying only a start date, for example - receive all ticks from the beginning of the month till the current moment.

iBars

Returns the number of bars of a corresponding symbol and period, available in history.

```cpp
int iBars(
    const string symbol,  // Symbol
    ENUM_TIMEFRAMES timeframe // Period
);
```

### Parameters

**symbol**

- **[in]** The symbol name of the financial instrument. NULL means the current symbol.

**timeframe**

- **[in]** Period. It can be one of the values of the ENUM_TIMEFRAMES enumeration. 0 means the current chart period.

### Return Value

The number of bars of a corresponding symbol and period, available in history, but no more than allowed by the "Max bars in chart" parameter in platform settings.

### Example:

```cpp
Print("Bar count on the 'EURUSD,H1' is ", iBars("EURUSD", PERIOD_H1));
```

### See also

Bars
**iBarShift**

Search bar by time. The function returns the index of the bar corresponding to the specified time.

```cpp
int iBarShift(
    const string symbol, // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    datetime time, // Time
    bool exact=false // Mode
);
```

**Parameters**

- **symbol**
  
  [in] The symbol name of the financial instrument. **NULL** means the current symbol.

- **timeframe**
  
  [in] Period. It can be one of the values of the **ENUM_TIMEFRAMES** enumeration. **PERIOD_CURRENT** means the current chart period.

- **time**
  
  [in] Time value to search for.

- **exact=false**
  
  [in] A return value, in case the bar with the specified time is not found. If **exact=false**, **iBarShift** returns the index of the nearest bar, the Open time of which is less than the specified time (**time_open** < **time**). If such a bar is not found (history before the specified time is not available), then the function returns -1. If **exact=true**, **iBarShift** does not search for a nearest bar but immediately returns -1.

**Return Value**

The index of the bar corresponding to the specified time. If the bar corresponding to the specified time is not found (there is a gap in the history), the function returns -1 or the index of the nearest bar (depending on the 'exact' parameter).

**Example:**

```cpp
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
    //--- The date is on Sunday
    datetime time=D'2002.04.25 12:00';
    string symbol="GBPUSD";
    ENUM_TIMEFRAMES tf=PERIOD_H1;
    bool exact=false;
    //--- If there is no bar at the specified time, iBarShift will return the index of the
    int bar_index=iBarShift(symbol,tf,time,exact);
    //--- Check the error code after the call of iBarShift()
    int error=GetLastError();

```
if(error!=0)
{
    PrintFormat("iBarShift(): getLastError=%d - The requested date %s "+
        "for %s %s is not found in the available history",
        error,TimeToString(time),symbol,EnumToString(tf));
    return;
}
//--- The iBarShift() function was executed successfully, return a result for exact=false
PrintFormat("1. %s %s %s(%s): bar index is %d (exact=%s)",
    symbol,EnumToString(tf),TimeToString(time),
    DayOfWeek(time),bar_index,string(exact));
datetime bar_time=iTime(symbol,tf,bar_index);
PrintFormat("Time of bar #%d is %s (%s)",
    bar_index,TimeToString(bar_time),DayOfWeek(bar_time));
//--- Request the index of the bar with the specified time; if there is no bar -1 will:
    exact=true;
    bar_index=iBarShift(symbol,tf,time,exact);
//--- The iBarShift() function was executed successfully, return a result for exact=true
PrintFormat("2. %s %s %s (%s):bar index is %d (exact=%s)",
    symbol,EnumToString(tf),TimeToString(time),
    ,DayOfWeek(time),bar_index,string(exact));
}
//+------------------------------------------------------------------+
//| Returns the name of the day of the week                           |
//+------------------------------------------------------------------+
string DayOfWeek(const datetime time)
{
    MqlDateTime dt;
    string day="";
    TimeToStruct(time,dt);
    switch(dt.day_of_week)
    {
        case 0: day=EnumToString(SUNDAY);
        break;
        case 1: day=EnumToString(MONDAY);
        break;
        case 2: day=EnumToString(TUESDAY);
        break;
        case 3: day=EnumToString(WEDNESDAY);
        break;
        case 4: day=EnumToString(THURSDAY);
        break;
        case 5: day=EnumToString(FRIDAY);
        break;
        default:day=EnumToString(SATURDAY);
        break;
    }
    //---
    return day;
} //+------------------------------------------------------------------+
/* Execution result
1. GBPUSD PERIOD_H1 2018.06.10 12:00(SUNDAY): bar index is 64 (exact=false)
   Time of bar #64 is 2018.06.08 23:00 (FRIDAY)
2. GBPUSD PERIOD_H1 2018.06.10 12:00 (SUNDAY): bar index is -1 (exact=true)
*/
iClose

Returns the Close price of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```cpp
double iClose(
    const string symbol, // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    int shift // Shift
);```

**Parameters**

- `symbol`  
  [in] The symbol name of the financial instrument. `NULL` means the current symbol.

- `timeframe`  
  [in] Period. It can be one of the values of the `ENUM_TIMEFRAMES` enumeration. 0 means the current chart period.

- `shift`  
  [in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

**Return Value**

The Close price of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For error details, call the `GetLastError()` function.

**Note**

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

**Example:**

```cpp
input int shift=0;
//+------------------------------------------------------------------+
//| Function-event handler "tick"                                    |
//+------------------------------------------------------------------+
void OnTick()
{
    datetime time  = iTime(Symbol(),Period(),shift);
    double open  = iOpen(Symbol(),Period(),shift);
    double high  = iHigh(Symbol(),Period(),shift);
    double low   = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume= iVolume(Symbol(),0,shift);
    int bars   = iBars(NULL,0);

    Comment(Symbol(),"," ,EnumToString(Period()),"\n",
```
"Time: " , TimeToString{time,TIME_DATE|TIME_SECONDS},"\n",
"Open: " , DoubleToString(open,Digits()),"\n",
"High: " , DoubleToString(high,Digits()),"\n",
"Low: " , DoubleToString(low,Digits()),"\n",
"Close: " , DoubleToString(close,Digits()),"\n",
"Volume: ", IntegerToString(volume),"\n",
"Bars: " , IntegerToString(bars),"\n"
);

CopyClose, CopyRates
iHigh

Returns the High price of the bar (indicated by the ‘shift’ parameter) on the corresponding chart.

```c++
double iHigh(
    const string symbol,       // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    int shift                  // Shift
);
```

**Parameters**

- **symbol**
  - [in] The symbol name of the financial instrument. **NULL** means the current symbol.

- **timeframe**
  - [in] Period. It can be one of the values of the **ENUM_TIMEFRAMES** enumeration. 0 means the current chart period.

- **shift**
  - [in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

**Return Value**

The High price of the bar (indicated by the ‘shift’ parameter) on the corresponding chart or 0 in case of an error. For error details, call the **GetLastError()** function.

**Note**

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

**Example:**

```c++
input int shift=0;
//+-----------------------------------------------------------+
//| Function-event handler "tick"                             |
//+-----------------------------------------------------------+
void OnTick()
{
    datetime time  = iTime(Symbol(),Period(),shift);
    double  open  = iOpen(Symbol(),Period(),shift);
    double  high  = iHigh(Symbol(),Period(),shift);
    double  low   = iLow(Symbol(),Period(),shift);
    double  close = iClose(NULL,PERIOD_CURRENT,shift);
    long    volume= iVolume(Symbol(),0,shift);
    int     bars  = iBars(NULL,0);

    Comment(Symbol(),"","",EnumToString(Period()),"\n",
```
"Time: " , TimeToString(time, TIME_DATE|TIME_SECONDS),"\n",
"Open: " , DoubleToString(open, Digits()),"\n",
"High: " , DoubleToString(high, Digits()),"\n",
"Low: " , DoubleToString(low, Digits()),"\n",
"Close: " , DoubleToString(close, Digits()),"\n",
"Volume: ", IntegerToString(volume),"\n",
"Bars: ", IntegerToString(bars),"\n"
});

CopyHigh, CopyRates
iHighest

Returns the index of the highest value found on the corresponding chart (shift relative to the current bar).

```c
int iHighest(
    const string symbol, // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    ENUM_SERIESMODE type, // Timeseries identifier
    int count=WHOLE_ARRAY, // Number of elements
    int start=0 // Index
);
```

**Parameters**

- **symbol**
  - [in] The symbol, on which the search will be performed. **NULL** means the current symbol.

- **timeframe**
  - [in] Period. It can be one of the values of the **ENUM_TIMEFRAMES** enumeration. 0 means the current chart period.

- **type**
  - [in] The identifier of the timeseries, in which the search will be performed. Can be equal to any value from **ENUM_SERIESMODE**.

- **count=WHOLE_ARRAY**
  - [in] The number of elements in the timeseries (from the current bar towards index increasing direction), among which the search should be performed.

- **start=0**
  - [in] The index (shift relative to the current bar) of the initial bar, from which search for the highest value begins. Negative values are ignored and replaced with a zero value.

**Return Value**

The index of the highest value found on the corresponding chart (shift relative to the current bar) or -1 in case of an error. For error details, call the **GetLastError()** function.

**Example:**

```c
double val;
//--- Calculation of the highest Close value among 20 consecutive bars
//--- From index 4 to index 23 inclusive, on the current timeframe
int val_index=iHighest(NULL,0,MODE_CLOSE,20,4);
if(val_index!=-1)
    val=High[val_index];
else
    PrintFormat("iHighest() call error. Error code=%d",GetLastError());
```
iLow

Returns the Low price of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```c
double iLow(
    const string symbol,  // Symbol
    ENUM_TIMEFRAMES timeframe,  // Period
    int shift);  // Shift
```

### Parameters

**symbol**

[in] The symbol name of the financial instrument. NULL means the current symbol.

**timeframe**

[in] Period. It can be one of the values of the ENUM_TIMEFRAMES enumeration. 0 means the current chart period.

**shift**

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

### Return Value

The Low price of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For error details, call the GetLastError() function.

### Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

### Example:

```c
input int shift=0;

---

// Function-event handler "tick"
void OnTick()
{
    datetime time  = iTimeseries(Symbol(),Period(),shift);
    double open  = iOpen(Symbol(),Period(),shift);
    double high  = iHigh(Symbol(),Period(),shift);
    double low   = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume  = iVolume(Symbol(),0,shift);
    int bars     = iBars(NULL,0);

    Comment(Symbol(),"",EnumToString(Period()),"\n",
```
"Time: " , TimeToString(time, TIME_DATE|TIME_SECONDS), "\n",
"Open: " , DoubleToString(open, Digits()), "\n",
"High: " , DoubleToString(high, Digits()), "\n",
"Low: " , DoubleToString(low, Digits()), "\n",
"Close: " , DoubleToString(close, Digits()), "\n",
"Volume: ", IntegerToString(volume), "\n",
"Bars: ", IntegerToString(bars), "\n";
}

See also

CopyLow, CopyRates
## iLowest

Retrieves the index of the smallest value found on the corresponding chart (shift relative to the current bar).

```cpp
int iLowest(
    const string symbol, // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    ENUM_SERIESMODE type, // Timeseries identifier
    int count=WHOLE_ARRAY, // Number of elements
    int start=0 // Index
);
```

### Parameters

- **symbol**
  - `[in]` The symbol, on which the search will be performed. `NULL` means the current symbol.

- **timeframe**
  - `[in]` Period. It can be one of the values of the `ENUM_TIMEFRAMES` enumeration. 0 means the current chart period.

- **type**
  - `[in]` The identifier of the timeseries, in which the search will be performed. Can be equal to any value from `ENUM_SERIESMODE`.

- **count=WHOLE_ARRAY**
  - `[in]` The number of elements in the timeseries (from the current bar towards index increasing direction), among which the search should be performed.

- **start=0**
  - `[in]` The index (shift relative to the current bar) of the initial bar, from which search for the lowest value begins. Negative values are ignored and replaced with a zero value.

### Return Value

The index of the lowest value found on the corresponding chart (shift relative to the current bar) or -1 in case of an error. For error details, call the `GetLastError()` function.

### Example:

```cpp
double val;
//--- Search for a bar with the lowest value of the real volume among 15 consecutive bars
//--- From index 10 to index 24 inclusive, on the current timeframe
int val_index=iLowest(NULL,0,MODE_REAL_VOLUME,15,10);
if(val_index!=-1)
    val=Low[val_index];
else
    PrintFormat("iLowest() call error. Error code=%d",GetLastError());
```
# iOpen

Returns the Open price of the bar (indicated by the `shift` parameter) on the corresponding chart.

```c
double iOpen(
    const string symbol, // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    int shift // Shift
);```

## Parameters

- **symbol**
  - `[in]` The symbol name of the financial instrument. `NULL` means the current symbol.

- **timeframe**
  - `[in]` Period. It can be one of the values of the `ENUM_TIMEFRAMES` enumeration. 0 means the current chart period.

- **shift**
  - `[in]` The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

## Return Value

The Open price of the bar (indicated by the `shift` parameter) on the corresponding chart or 0 in case of an error. For error details, call the `GetLastError()` function.

## Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

## Example:

```c
input int shift=0;

//+------------------------------------------------------------------+
//| Function-event handler "tick"
//+------------------------------------------------------------------+
void OnTick()
{
    datetime time  = iTime(Symbol(), Period(), shift);
    double open  = iOpen(Symbol(), Period(), shift);
    double high  = iHigh(Symbol(), Period(), shift);
    double low   = iLow(Symbol(), Period(), shift);
    double close = iClose(NULL, PERIOD_CURRENT, shift);
    long volume  = iVolume(Symbol(), 0, shift);
    int bars     = iBars(NULL, 0);

    Comment(Symbol(),"","$,EnumToString(Period()),"\n",
```
"Time: " , TimeToString(time, TIME_DATE | TIME_SECONDS), "\n",
"Open: " , DoubleToString(open, Digits()), "\n",
"High: " , DoubleToString(high, Digits()), "\n",
"Low: " , DoubleToString(low, Digits()), "\n",
"Close: " , DoubleToString(close, Digits()), "\n",
"Volume: " , IntegerToString(volume), "\n",
"Bars: " , IntegerToString(bars), "\n"
};

CopyOpen, CopyRates
Returns the opening time of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```cpp
datetime iTime(
    const string symbol, // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    int shift // Shift
);
```

**Parameters**

- `symbol` [in]: The symbol name of the financial instrument. **NULL** means the current symbol.
- `timeframe` [in]: Period. It can be one of the values of the **ENUM_TIMEFRAMES** enumeration. 0 means the current chart period.
- `shift` [in]: The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

**Return Value**

The opening time of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For **error** details, call the **GetLastError()** function.

**Note**

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

**Example:**

```cpp
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
    //--- The date is on Sunday
    datetime time=D'2018.06.10 12:00';
    string symbol="GBPUSD";
    ENUM_TIMEFRAMES tf=PERIOD_H1;
    bool exact=false;
    //--- there is no bar at the specified time, iBarShift will return the index of the next
    int bar_index=iBarShift(symbol,tf,time,exact);
    PrintFormat("1. %s %s(%s): bar index is %d (exact=%s)",
        symbol,EnumToString(tf),TimeToString(time),DayOfWeek(time),bar_index,exact);
    datetime bar_time=iTime(symbol,tf,bar_index);
```

iTickVolume

Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```c
long iTickVolume(
    const string symbol,  // Symbol
    ENUM_TIMEFRAMES timeframe,  // Period
    int shift,  // Shift
);
```

**Parameters**

- **symbol**
  - [in] The symbol name of the financial instrument. **NULL** means the current symbol.

- **timeframe**
  - [in] Period. It can be one of the values of the **ENUM_TIMEFRAMES** enumeration. 0 means the current chart period.

- **shift**
  - [in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

**Return Value**

The tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For error details, call the **GetLastError()** function.

**Note**

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

**Example:**

```c
input int shift=0;
//+----------------------------------------+-----------------------------+
//| Function-event handler "tick"          |
//+----------------------------------------+-----------------------------+
void OnTick()
{
    datetime time  = iTime(Symbol(),Period(),shift);
    double open   = iOpen(Symbol(),Period(),shift);
    double high   = iHigh(Symbol(),Period(),shift);
    double low    = iLow(Symbol(),Period(),shift);
    double close  = iClose(NULL,PERIOD_CURRENT,shift);
    long  volume  = iVolume(Symbol(),0,shift);
    int   bars    = iBars(NULL,0);

    Comment(Symbol(),"","",EnumToString(Period()),"\n",
```
"Time: " ,TimeToString(time,TIME_DATE|TIME_SECONDS),"\n",

iRealVolume

Returns the real volume of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```cpp
long iRealVolume(
    const string symbol, // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    int shift // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. **NULL** means the current symbol.

timeframe

[in] Period. It can be one of the values of the **ENUM_TIMEFRAMES** enumeration. **0** means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The real volume of the bar (indicated by the 'shift' parameter) on the corresponding chart or **0** in case of an error. For **error** details, call the **GetLastError()** function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```cpp
input int shift=0;

// Function-event handler "tick"
void OnTick()
{
    datetime time  = iTime(Symbol(),Period(),shift);
    double open  = iOpen(Symbol(),Period(),shift);
    double high  = iHigh(Symbol(),Period(),shift);
    double low   = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume= iVolume(Symbol(),0,shift);
    int bars = iBars(NULL,0);

    Comment(Symbol(),"","toString(Period()),"n",
```
### Time Series and Indicators Access

```cpp
"Time: " , TimeToString(time, TIME_DATE | TIME_SECONDS), "\n",
"Open: " , DoubleToString(open, Digits()), "\n",
"High: " , DoubleToString(high, Digits()), "\n",
"Low: " , DoubleToString(low, Digits()), "\n",
"Close: " , DoubleToString(close, Digits()), "\n",
"Volume: " , IntegerToString(volume), "\n",
"Bars: " , IntegerToString(bars), "\n"
```

iVolume

Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```c
long iVolume(
    const string symbol,       // Symbol
    ENUM_TIMEFRAMES timeframe, // Period
    int shift                 // Shift
);
```

**Parameters**

- **symbol**
  - [in] The symbol name of the financial instrument. `NULL` means the current symbol.

- **timeframe**
  - [in] Period. It can be one of the values of the `ENUM_TIMEFRAMES` enumeration. 0 means the current chart period.

- **shift**
  - [in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

**Return Value**

The tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For error details, call the `GetLastError()` function.

**Note**

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

**Example:**

```c
input int shift=0;

void OnTick()
{
    datetime time  = iTime(Symbol(),Period(),shift);
    double open  = iOpen(Symbol(),Period(),shift);
    double high  = iHigh(Symbol(),Period(),shift);
    double low   = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume= iVolume(Symbol(),0,shift);
    int bars = iBars(NULL,0);

    Comment(Symbol(),"","",EnumToString(Period()),"\n",
```
"Time: " ,TimeToString(time,TIME_DATE|TIME_SECONDS),"\n",
"Open: " ,DoubleToString(open,Digits()),"\n",
"High: " ,DoubleToString(high,Digits()),"\n",
"Low: " ,DoubleToString(low,Digits()),"\n",
"Close: " ,DoubleToString(close,Digits()),"\n",
"Volume: " ,IntegerToString(volume),"\n",
"Bars: " ,IntegerToString(bars),"\n"
};
iSpread

Returns the spread value of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```c
long iSpread(
    const string symbol,  // Symbol
    ENUM_TIMEFRAMES timeframe,  // Period
    int shift // Shift
);
```

**Parameters**

- **symbol**
  - [in] The symbol name of the financial instrument. **NULL** means the current symbol.

- **timeframe**
  - [in] Period. It can be one of the values of the ENUM_TIMEFRAMES enumeration. 0 means the current chart period.

- **shift**
  - [in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

**Return Value**

The Spread value of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For error details, call the GetLastError() function.

**Note**

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

**Example:**

```c
input int shift=0;

void OnTick()
{
    datetime time  = iTerm(Symbol(), Period(), shift);
    double open  = iOpen(Symbol(), Period(), shift);
    double high  = iHigh(Symbol(), Period(), shift);
    double low   = iLow(Symbol(), Period(), shift);
    double close = iClose(NULL, Period_CURRENT, shift);
    long volume = iVolume(Symbol(), 0, shift);
    int bars     = iBars(NULL, 0);

    Comment(Symbol(),", ",EnumToString(Period()),"\n",
```
"Time: ", TimeToString(time, TIME_DATE|TIME_SECONDS), "\n",
"Open: ", DoubleToString(open, Digits()), "\n",
"High: ", DoubleToString(high, Digits()), "\n",
"Low: ", DoubleToString(low, Digits()), "\n",
"Close: ", DoubleToString(close, Digits()), "\n",
"Volume: ", IntegerToString(volume), "\n",
"Bars: ", IntegerToString(bars), "\n";
}

Custom Symbols

Custom symbols

Functions for creating and editing the custom symbol properties.

When connecting the terminal to a certain trade server, a user is able to work with time series of the financial symbols provided by a broker. Available financial symbols are displayed as a list in the Market Watch window. A separate group of functions allows receiving data on the symbol properties, trading sessions and market depth updates.

The group of functions described in this section allows creating custom symbols. To do this, users are able to apply the trade server’s existing symbols, text files or external data sources.

Custom Symbols

CustomSymbolCreate

Creates a custom symbol with the specified name in the specified group.

```c
bool CustomSymbolCreate(
    const string symbol_name,  // custom symbol name
    const string symbol_path=",  // name of a group a symbol is to be created
    const string symbol_origin=NULL  // name of a symbol used as a basis to create
);
```

Parameters

- **symbol_name**: Custom symbol name. It should not contain groups or subgroups the symbol is located in.
- **symbol_path**: 
  - [in] The group name a symbol is located in.
- **symbol_origin**: 
  - [in] Name of a symbol the properties of a created custom symbol are to be copied from. After creating a custom symbol, any property value can be changed to a necessary one using the appropriate functions.

Return Value

- true - success, otherwise - false. To get information about the error, call the **GetLastError()** function.

Note

All custom symbols are created in the special Custom section. If a group name is not specified (the **symbol_path** parameter in the CustomSymbolCreate function contains an empty string or NULL), a custom symbol is generated in the Custom section root. Here we can draw an analogy with the file system, where groups and subgroups can be viewed as folders and subfolders.

The symbol and group names may only contain Latin letters without punctuation, spaces or special characters (may only contain `.`, `_`, `&` and `#`). It is not recommended to use characters `<`, `>`, `:`, `~`, `/`, `|`, `?`, `*`.

The custom symbol name should be unique regardless of a group name it is created in. If a symbol with the same name already exists, the CustomSymbolCreate() function returns 'false', while the subsequent **GetLastError()** call returns the error 5300 (ERR_NOT_CUSTOM_SYMBOL) or 5304 (ERR_CUSTOM_SYMBOL_EXIST).

The length of the symbol name should not exceed 31 characters. Otherwise, CustomSymbolCreate() returns 'false' and the error 5302 - ERR_CUSTOM_SYMBOL_NAME_LONG is activated.

The **symbol_path** parameter can be set in two ways:

- only a group name without a name of the custom symbol, for example - "CFD\Metals". It is best to use this option to avoid errors.
- or <group> name + groups separator "\\"+<custom symbol name>, for example - "CFD\Metals\Platinum". In this case, the group name should end with the exact name of the custom symbol. In case of a mismatch, the custom symbol is still created, but not in the intended group. For example, if **symbol_path**="CFD\Metals\Platinum" and **symbol_name**="platinum" (register error),
then a custom symbol named “platinum” is created in the “Custom\CFD\Metals\Platinum” group. The `SymbolInfoGetString("platinum", SYMBOL_PATH)` function returns the “Custom\CFD\Metals\Platinum\platinum” value.

Note that the `SYMBOL_PATH` property returns the path with the symbol name at the end. Therefore, it cannot be copied without changes if you want to create a custom symbol in the exact same group. In this case, it is necessary to cut the symbol name in order not to get the result described above.

If a non-existent symbol is set as the `symbol_origin` parameter, then the custom symbol is created empty as if the `symbol_origin` parameter is not set. The error 4301 - ERR_MARKET_UNKNOWN_SYMBOL is activated in that case.

The `symbol_path` parameter length should not exceed 127 characters considering “Custom\”, “\” groups separators and the symbol name if it is specified at the end.

`SymbolName`, `SymbolSelect`, `CustomSymbolDelete`
CustomSymbolDelete

Deletes a custom symbol with the specified name.

```csharp
bool CustomSymbolDelete(
    const string symbol_name // custom symbol name
);
```

**Parameters**

*symbol*

[in] Custom symbol name. It should not match the name of an already existing symbol.

**Return Value**

true - success, otherwise - false. To get information about the error, call the `GetLastError()` function.

**Note**

The custom symbol displayed in the Market Watch or the one a chart is opened for cannot be deleted.

**See also**

`SymbolName`, `SymbolSelect`, `CustomSymbolCreate`
Custom Symbols

**CustomSymbolSetInteger**

Sets the integer type property value for a custom symbol.

```cpp
bool CustomSymbolSetInteger(
    const string symbol_name, // symbol name
    ENUM_SYMBOL_INFO_INTEGER property_id, // property ID
    long property_value // property value
);
```

**Parameters**

- `symbol_name`  
  [in] Custom symbol name.

- `property_id`  
  [in] Symbol property ID. The value can be one of the values of the `ENUM_SYMBOL_INFO_INTEGER` enumeration.

- `property_value`  
  [in] A long type variable containing the property value.

**Return Value**

- `true` - success, otherwise - `false`. To get information about the error, call the `GetLastError()` function.

**Note**

The minute and tick history of the custom symbol is completely removed if any of these properties is changed in the symbol specification:

- `SYMBOL_CHART_MODE` - price type for constructing bars (Bid or Last)
- `SYMBOL_DIGITS` - number of digits after the decimal point to display the price

After deleting the custom symbol history, the terminal attempts to create a new history using the updated properties. The same happens when the custom symbol properties are changed manually.

**See also**

- `SymbolInfoInteger`
CustomSymbolSetDouble

Sets the real type property value for a custom symbol.

```c
bool CustomSymbolSetDouble(
    const string symbol_name,  // symbol name
    ENUM_SYMBOL_INFO_DOUBLE property_id,  // property ID
    double property_value  // property value
);
```

**Parameters**

- `symbol_name`  
  [in] Custom symbol name.

- `property_id`  
  [in] Symbol property ID. The value can be one of the values of the `ENUM_SYMBOL_INFO_DOUBLE` enumeration.

- `property_value`  
  [in] A double type variable containing the property value.

**Return Value**

- `true` - success, otherwise - `false`. To get information about the error, call the `GetLastError()` function.

**Note**

The minute and tick history of the custom symbol is completely removed if any of these properties is changed in the symbol specification:
- `SYMBOL_POINT` - one point value
- `SYMBOL_TRADE_TICK_SIZE` - value of a tick that specifies the minimum allowable price change
- `SYMBOL_TRADE_TICK_VALUE` - one-tick price change value for a profitable position

After deleting the custom symbol history, the terminal attempts to create a new history using the updated properties. The same happens when the custom symbol properties are changed manually.

**See also**

- `SymbolInfoDouble`
Custom Symbols

CustomSymbolSetStringValue

Sets the string type property value for a custom symbol.

```cpp
bool CustomSymbolSetStringValue(
    const string symbol_name,  // symbol name
    ENUM_SYMBOL_INFO_STRING property_id,  // property ID
    string property_value, // property value
);
```

Parameters

- `symbol_name` [in] Custom symbol name.
- `property_id` [in] Symbol property ID. The value can be one of the values of the `ENUM_SYMBOL_INFO_STRING` enumeration.
- `property_value` [in] A string type variable containing the property value.

Return Value

- `true` - success, otherwise - `false`. To get information about the error, call the `GetLastError()` function.

Note

The minute and tick history of the custom symbol is completely removed if the SYMBOL_FORMULA property (setting the equation for the custom symbol price construction) is changed in the symbol specification. After deleting the custom symbol history, the terminal attempts to create a new history using the new equation. The same happens when the custom symbol equation is changed manually.

See also

- `SymbolInfoString`
# CustomSymbolSetMarginRate

Sets the margin rates depending on the order type and direction for a custom symbol.

```csharp
bool CustomSymbolSetMarginRate(
    const string symbol_name, // symbol name
    ENUM_ORDER_TYPE order_type, // order type
    double initial_margin_rate, // initial margin rate
    double maintenance_margin_rate // maintenance margin rate
);
```

## Parameters

- **symbol_name**
  
  [in] Custom symbol name.

- **order_type**
  
  [in] Order type.

- **initial_margin_rate**
  
  [in] A `double` type variable with an initial margin rate. Initial margin is a security deposit for 1 lot deal in the appropriate direction. Multiplying the rate by the initial margin, we receive the amount of funds to be reserved on the account when placing an order of the specified type.

- **maintenance_margin_rate**
  
  [in] A `double` type variable with a maintenance margin rate. Maintenance margin is a minimum amount for maintaining an open position of 1 lot in the appropriate direction. Multiplying the rate by the maintenance margin, we receive the amount of funds to be reserved on the account after an order of the specified type is activated.

## Return Value

- **true** – success, otherwise – false. To get information about the error, call the `GetLastError()` function.

## See also

- [SymbolInfoMarginRate](#)
CustomSymbolSetSessionQuote

Sets the start and end time of the specified quotation session for the specified symbol and week day.

```cpp
bool CustomSymbolSetSessionQuote(
    const string symbol_name,       // symbol name
    ENUM_DAY_OF_WEEK day_of_week,   // week day
    uint session_index,             // session index
    datetime from,                  // session start time
    datetime to                      // session end time
);
```

### Parameters

- **symbol name**
  - [in] Custom symbol name.

- **ENUM_DAY_OF_WEEK**
  - [in] Week day, value from the `ENUM_DAY_OF_WEEK` enumeration.

- **uint**
  - [in] Index of the session, for which start and end times are to be set. Session indexing starts from 0.

- **from**
  - [in] Session start time in seconds from 00:00, data value in the variable is ignored.

- **to**
  - [in] Session end time in seconds from 00:00, data value in the variable is ignored.

### Return Value

- `true` - success, otherwise `false`. To get information about the error, call the `GetLastError()` function.

### Note

If the session with the specified `session_index` already exists, the function simply edits the beginning and end of the session.

If zero start and end parameters have been passed for the session (`from=0` and `to=0`), the appropriate session with the `session_index` is deleted, while the session indexing is shifted downwards.

Sessions can be added only sequentially. In other words, you can add `session_index=1` only if the session with the index 0 already exists. If this rule is broken, a new session is not created, while the function itself returns 'false'.

### See also

- `SymbolInfoSessionQuote`, `Symbol info`, `TimeToStruct`, `Date structure`
**Custom Symbol Set Session Trade**

Sets the start and end time of the specified trading session for the specified symbol and week day.

```cpp
bool CustomSymbolSetSessionTrade(
    const string symbol_name,  // symbol name
    ENUM_DAY_OF WEEK day_of_week,  // week day
    uint session_index,  // session index
    datatime from,  // session start time
    datatime to  // session end time
);
```

**Parameters**

- **symbol_name**
  
  [in] Custom symbol name.

- **ENUM_DAY_OF_WEEK**
  
  [in] Week day, value from the ENUM_DAY_OF_WEEK enumeration.

- **uint**
  
  [in] Index of the session, for which start and end times are to be set. Session indexing starts from 0.

- **from**
  
  [in] Session start time in seconds from 00:00, data value in the variable is ignored.

- **to**
  
  [in] Session end time in seconds from 00:00, data value in the variable is ignored.

**Return Value**

- true - success, otherwise - false. To get information about the error, call the GetLastError() function.

**Note**

If the session with the specified session_index already exists, the function simply edits the beginning and end of the session.

If zero start and end parameters have been passed for the session (from=0 and to=0), the appropriate session with the session_index is deleted, while the session indexing is shifted downwards.

Sessions can be added only sequentially. In other words, you can add session_index=1 only if the session with the index 0 already exists. If this rule is broken, a new session is not created, while the function itself returns 'false'.

SymbolInfoSessionTrade, Symbol info, TimeToStruct, Date structure
**CustomRatesDelete**

Deletes all bars from the price history of the custom symbol in the specified time interval.

```cpp
int CustomRatesDelete(
    const string symbol,  // symbol name
    datetime from,        // start date
    datetime to           // end date
);
```

**Parameters**

- `symbol`
  - [in] Custom symbol name.

- `from`
  - [in] Time of the first bar in the price history within the specified range to be removed.

- `to`
  - [in] Time of the last bar in the price history within the specified range to be removed.

**Return Value**

Number of deleted bars or -1 in case of an error.

**See also**

- CustomRatesReplace, CustomRatesUpdate, CopyRates
CustomSymbols

CustomRatesReplace

Fully replaces the price history of the custom symbol within the specified time interval with the data from the MqlRates type array.

```c
int CustomRatesReplace(
    const string symbol, // symbol name
    datetime from, // start date
    datetime to, // end date
    const MqlRates& rates[], // array for the data to be applied to a cust:
    uint count=WHOLE_ARRAY // number of the rates[] array elements to be
);
```

Parameters

- `symbol` [in] Custom symbol name.
- `from` [in] Time of the first bar in the price history within the specified range to be updated.
- `to` [in] Time of the last bar in the price history within the specified range to be updated.
- `count=WHOLE_ARRAY` [in] Number of the `rates[]` array elements to be used for replacement.Whole_ARRAY means that all `rates[]` array elements should be used for replacement.

Return Value

- Number of updated bars or -1 in case of an error.

Note

If the bar from the `rates[]` array goes beyond the specified range, it is ignored. If such a bar is already present in the price history and enters the given range, it is replaced. All other bars in the current price history outside the specified range remain unchanged. The `rates[]` array data should be correct regarding OHLC prices, while the bars opening time should correspond to the M1 timeframe.

- CustomRatesDelete, CustomRatesUpdate, CopyRates
Custom Symbols

CustomRatesUpdate

Adds missing bars to the custom symbol history and replaces existing data with the ones from the MqlRates type array.

```c
int CustomRatesUpdate(
    const string symbol,  // custom symbol name
    const MqlRates & rates[],  // array for the data to be applied to a custom symbol
    uint count=WHOLE_ARRAY  // number of the rates[] array elements to be used
);```

Parameters

symbol

[in] Custom symbol name.

rates[]

count=WHOLE_ARRAY

[in] Number of the rates[] array elements to be used for update. WHOLE_ARRAY means that all rates[] array elements should be used.

Return Value

Number of updated bars or -1 in case of an error.

Note

If there is no bar from the rates[] array in the current custom symbol history, it is added. If such a bar already exists, it is replaced. All other bars in the current price history remain unchanged. The rates[] array data should be correct regarding OHLC prices, while the bars opening time should correspond to the M1 timeframe.

CustomRatesReplace, CustomRatesDelete, CopyRates
Custom Symbols

CustomTicksAdd

Adds data from an array of the MqlTick type to the price history of a custom symbol. The custom symbol must be *selected* in the Market Watch window.

```cpp
int CustomTicksAdd(
    const string symbol, // Symbol name
    const MqlTick& ticks[], // The array with tick data that should be applied to the custom symbol
    uint count=WHOLE_ARRAY // number of the ticks[] array elements to be
);
```

### Parameters

- **symbol**
  
  [in] The name of the custom symbol.

- **ticks[]**
  
  [in] An array of tick data of the MqlTick type arranged in order of time from earlier data to more recent ones, i.e. ticks[k].time_msc <= ticks[n].time_msc, if k<n.

- **count=WHOLE_ARRAY**
  
  [in] Number of the ticks[] array elements to be used for adding. WHOLE_ARRAY means that all ticks[] array elements should be used.

### Return Value

The number of added ticks or -1 in case of an *error*.

### Further Note

The CustomTicksAdd function only works for custom symbols opened in the Market Watch window. If the symbol is not selected in Market Watch, then you should add ticks using CustomTicksReplace.

The CustomTicksAdd function allows transmitting ticks as if they are delivered from the broker's server. Data are sent to the Market Watch window instead of being written directly to the tick database. The terminal then saves ticks from the Market Watch to a database. If the amount of data transmitted during one function call is large, the behavior of the function changes in order to reduce resource usage. If more than 256 ticks are passed, data is divided into two parts. The first, i.e. the larger part is written directly to the tick database (as it is done in CustomTicksReplace). The second part containing 128 ticks is passed to the Market Watch window, from which the terminal saves the ticks to a database.

The MqlTick structure has two fields with the time value: time (the tick time in seconds) and time_msc (the tick time in milliseconds), which are counted from January 1, 1970. These fields in the added ticks are processed in the following order:

1. If ticks[k].time_msc!=0, we use it to fill the ticks[k].time field, i.e. ticks[k].time=ticks[k].time_msc/1000 (integer division) is set for the tick
2. If ticks[k].time_msc==0 and ticks[k].time!=0, time in milliseconds is obtained by multiplying by 1000, i.e. ticks[k].time_msc=ticks[k].time*1000
3. If ticks[k].time_msc==0 and ticks[k].time==0, the current trade server time up to a millisecond as of the moment of CustomTicksAdd call is written to these fields.
Custom Symbols

If the value of ticks[k].bid, ticks[k].ask, ticks[k].last or ticks[k].volume is greater than zero, a combination of appropriate flags is written to the ticks[k].flags field:

- TICK_FLAG_BID - the tick has changed the bid price
- TICK_FLAG_ASK - the tick has changed the ask price
- TICK_FLAG_LAST - the tick has changed the last deal price
- TICK_FLAG_VOLUME - the tick has changed the volume

If the value of a field is less than or equal to zero, the corresponding flag is not written to the ticks[k].flags field.

Flags TICK_FLAG_BUY and TICK_FLAG_SELL are not added to the history of a custom symbol.

CustomRatesDelete, CustomRatesUpdate, CustomTicksReplace, CopyTicks, CopyTicksRange
Custom TicksDelete

Deletes all ticks from the price history of the custom symbol in the specified time interval.

```c
int CustomTicksDelete(
    const string symbol,   // symbol name
    long from_msc,         // start date
    long to_msc            // end date
);
```

**Parameters**

symbol

[in] Custom symbol name.

from_msc

[in] Time of the first tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.

to_msc

[in] Time of the last tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.

**Return Value**

Number of deleted ticks or -1 in case of an error.

**See also**

CustomRatesDelete, CustomRatesUpdate, CustomTicksReplace, CopyTicks, CopyTicksRange
Custom Symbols

CustomTicksReplace

Fully replaces the price history of the custom symbol within the specified time interval with the data from the MqlTick type array.

```cpp
int CustomTicksReplace(
    const string symbol, // symbol name
    long from_msc, // start date
    long to_msc, // end date
    const MqlTick& ticks[], // array for the data to be applied to a custom symbol
    uint count=WHOLE_ARRAY // number of the ticks[] array elements to be used
);
```

Parameters

symbol

[in] Custom symbol name.

from_msc

[in] Time of the first tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.

to_msc

[in] Time of the last tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.

ticks[]

[in] Array of the MqlTick type tick data ordered in time in ascending order.

count=WHOLE_ARRAY

[in] Number of the ticks[] array elements to be used for replacement in the specified time interval. WHOLE_ARRAY means that all ticks[] array elements should be used.

Return Value

Number of updated ticks or -1 in case of an error.

Note

Since several ticks may often have the same time up to a millisecond in a stream of quotes (accurate tick time is stored in the time_msc field of the MqlTick structure), the CustomTicksReplace function does not automatically sort out the ticks[] array elements by time. Therefore, the array of ticks must be pre-arranged in time ascending order.

The ticks are replaced consecutively, day after day, until the time specified in to_msc or until an error occurs. The first day from the specified range is processed followed by the next one, etc. As soon as the mismatch between the tick time and the ascending (non-descending) order is detected, the tick replacement stops on the current day. All ticks from the previous days are successfully replaced, while the current day (at the moment of a wrong tick) and all the remaining days in the specified interval remain unchanged.

If the ticks[] array contains no tick data for any day (generally, any time interval), a “hole” corresponding to the missing data appears in the custom symbol history after the tick data from ticks[] are applied. In other words, the call of CustomTicksReplace with missing ticks is
equivalent to deleting part of the tick history, as if **CustomTicksDelete** with the "hole" interval is called.

If the tick database has no data for the specified time interval, CustomTicksReplace will add to the database ticks from the ticks[] array.

The CustomTicksReplace function works directly with the tick database.

Custom Symbols

CustomBookAdd

Passes the status of the Depth of Market for a custom symbol. The function allows broadcasting the Depth of Market as if the prices arrive from a broker’s server.

```c
int CustomBookAdd( 
    const string symbol,    // symbol name
    const MqlBookInfo& books[] // array with descriptions of the Depth of Market elements
    uint count=WHOLE_ARRAY    // number of elements to be used
);
```

Parameters

- **symbol**
  - [in] Custom symbol name.

- **books[]**
  - [in] The array of MqlBookInfo type data fully describing the Depth of Market status — all buy and sell requests. The passed Depth of Market status completely replaces the previous one.
  - [in] The number of ‘books’ array elements to be passed to the function. The entire array is used by default.

Return Value

- Number of added ticks or -1 in case of an error.

Note

- The CustomBookAdd function works only for custom symbols the Depth of Market is opened for — via the platform interface or the MarketBookAdd function.
- When throwing the Depth of Market in, the symbol’s Bid and Ask prices are not updated. You should control the change of the best prices and throw in the ticks using CustomTicksAdd.
- The passed data are checked for validity: prices and volumes should not be negative, as well as type, price and volume (MqlBookInfo.volume or MqlBookInfo.volume_real) should be specified for each element. If at least one Depth of Market element is described incorrectly, the system discards the passed status entirely.
- The MqlBookInfo.volume_real extended accuracy volume has a higher priority over the regular MqlBookInfo.volume. If both values are specified for the Depth of Market element, the volume_real one is used.
- The order of the MqlBookInfo elements in the ‘books’ array does not matter. When saving the data, the terminal sorts them by price on its own.
- When saving data, the “Book depth” (SYMBOL_TICKS_BOOKDEPTH) parameter of the recipient custom symbol is checked. If the number of sell requests exceeds this value in the passed Depth of Market, the excess levels are discarded. The same is true for buy requests.

Sample filling of the ‘books’ array:
### Example:

```c
//+------------------------------------------------------------------+
//| Expert initialization function                                   |
//+------------------------------------------------------------------+
int OnInit() {
    //--- enable the Depth of Market for a symbol we are to retrieve data from
    MarketBookAdd(Symbol());
    return INIT_SUCCEEDED;
}

//+------------------------------------------------------------------+
//| Expert deinitialization function                                 |
//+------------------------------------------------------------------+
void OnDeinit(const int reason) {
}

//+------------------------------------------------------------------+
//| Tick function                                                    |
//+------------------------------------------------------------------+
void OnTick(void) {
    MqlTick ticks[];
    ArrayResize(ticks,1);
}```
//--- copy the current prices from the common symbol to the custom one
if(SymbolInfoTick(Symbol(),ticks[0]))
{
    string symbol_name=Symbol()+".SYN";
    CustomTicksAdd(symbol_name,ticks);
}

//+------------------------------------------------------------------+
// Book function
//+------------------------------------------------------------------+
void OnBookEvent(const string &book_symbol)
{
    //--- copy the current Depth of Market status from the common symbol to the custom one
    if(book_symbol==Symbol())
    {
        MqlBookInfo book_array[];
        if(MarketBookGet(Symbol(),book_array))
        {
            string symbol_name=Symbol()+".SYN";
            CustomBookAdd(symbol_name,book_array);
        }
    }
    //+------------------------------------------------------------------+

Chart Operations

Functions for setting chart properties (ChartSetInteger, ChartSetDouble, ChartSetString) are asynchronous and are used for sending update commands to a chart. If these functions are executed successfully, the command is included in the common queue of the chart events. Chart property changes are implemented along with handling of the events queue of this chart.

Thus, do not expect an immediate update of the chart after calling asynchronous functions. Use the ChartRedraw() function toforcedly update the chart appearance and properties.

</table>
**ChartApplyTemplate**

Applies a specific template from a specified file to the chart. The command is added to chart messages queue and will be executed after processing of all previous commands.

```cpp
bool ChartApplyTemplate(
    long chart_id, // Chart ID
    const string filename // Template file name
);
```

**Parameters**

- `chart_id`
  - [in] Chart ID. 0 means the current chart.
- `filename`
  - [in] The name of the file containing the template.

**Return Value**

Returns true if the command has been added to chart queue, otherwise false. To get an information about the error, call the `GetLastError()` function.

**Note**

The Expert Advisor will be unloaded and will not be able to continue operating in case of successful loading of a new template to the chart it is attached to.

When applying the template to the chart, trade permissions may be limited due to security reasons:

```
Live trading permission cannot be extended for the Expert Advisors launched by applying the template using ChartApplyTemplate() function.
```

If the mql5-program calling `ChartApplyTemplate()` function has no permission to trade, the Expert Advisor launched via the template will also not be able to trade regardless of the template settings.

If the mql5-program calling `ChartApplyTemplate()` function has permission to trade, while there is no such permission in the template settings, the Expert Advisor launched via the template will not be able to trade.

**Using Templates**

The resources of the MQL5 language allow setting multiple chart properties, including colors using the `ChartSetInteger()` function:

- Chart background color;
- Color of the axes, scale and the OHLC line;
- Grid color;
- Color of volumes and position open levels;
- Color of the up bar, shadow and edge of a bullish candlestick;
- Color of the down bar, shadow and edge of a bearish candlestick;
- Color of the chart line and Doji candlesticks;
Chart Operations

- Color of the bullish candlestick body;
- Color of the bearish candlestick body;
- Color of the Bid price line;
- Color of the Ask price line;
- Color of the line of the last deal price (Last);
- Color of the stop order levels (Stop Loss and Take Profit).

Besides, there can be multiple graphical objects and indicators on a chart. You may set up a chart with all the necessary indicators once and then save it as a template. Such a template can be applied to any chart.

The ChartApplyTemplate() function is intended for using a previously saved template, and it can be used in any mql5 program. The path to the file that stores the template is passed as the second parameter to ChartApplyTemplate(). The template file is searched according to the following rules:

- if the backslash "\" separator (written as "\") is placed at the beginning of the path, the template is searched for relative to the path _terminal_data_directory\MQL5,
- if there is no backslash, the template is searched for relative to the executable EX5 file, in which ChartApplyTemplate() is called;
- if a template is not found in the first two variants, the search is performed in the folder _terminal_directory\Profiles\Templates_.

Here _terminal_directory_ is the folder from which the MetaTrader 5 Client Terminal is running, and _terminal_data_directory_ is the folder, in which editable files are stored, its location depends on the operating system, user name and computer's security settings. Normally they are different folders, but in some cases they may coincide.

The location of folders _terminal_data_directory_ and _terminal_directory_ can be obtained using the TerminalInfoString() function.

```cpp
//--- directory from which the terminal is started
string terminal_path=TerminalInfoString(TERMINAL_PATH);
Print("Terminal directory:",terminal_path);

//--- terminal data directory, in which the MQL5 folder with EAs and indicators is located
string terminal_data_path=TerminalInfoString(TERMINAL_DATA_PATH);
Print("Terminal data directory:",terminal_data_path);
```

For example:

```cpp
//--- search for a template in terminal_data_directory\MQL5\ChartApplyTemplate(0,\"\first_template.tpl\")
//--- search for a template in directory_of_EX5_file, then in folder terminal_data_directory\ChartApplyTemplate(0,\"second_template.tpl\")
//--- search for a template in directory_of_EX5_file\My_templates, then in folder terminal_data_directory\ChartApplyTemplate(0,\"My_templates\third_template.tpl\")
```

Templates are not resources, they cannot be included into an executable EX5 file.

Example:

```cpp
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
```
void OnStart()
{
    //--- example of applying template, located in MQL5\Files
    if(FileIsExist("my_template.tpl"))
    {
        Print("The file my_template.tpl found in MQL5\Files'"));
        //--- apply template
        if(ChartApplyTemplate(0,"MQL5\Files\my_template.tpl"))
        {
            Print("The template 'my_template.tpl' applied successfully");
            //--- redraw chart
            ChartRedraw();
        }
        else
        {
            Print("Failed to apply 'my_template.tpl', error code ",GetLastError());
        }
    }
    else
    {
        Print("File 'my_template.tpl' not found in 
            " + TerminalInfoString(TERMINAL_PATH) + "MQL5\Files");
    }
}

See also

Resources
ChartSaveTemplate

Saves current chart settings in a template with a specified name.

```cpp
bool ChartSaveTemplate(
    long   chart_id,  // Chart ID
    const string filename  // Filename to save the template
);
```

**Parameters**

- **chart_id**
  - [in] Chart ID. 0 means the current chart.

- **filename**
  - [in] The filename to save the template. The "*.tpl" extension will be added to the filename automatically; there is no need to specify it. The template is saved in `data_folder\Profiles\Templates` and can be used for manual application in the terminal. If a template with the same filename already exists, the contents of this file will be overwritten.

**Return Value**

If successful, the function returns true, otherwise it returns false. To get information about the error, call the `GetLastError()` function.

**Note**

Using templates, you can save chart settings with all applied indicators and graphical objects, to then apply it to another chart.

**Example:**

```cpp
void OnStart()
{
    //--- First attach indicators to the chart
    int handle;
    //--- Prepare the indicator for use
```
if (!PrepareZigzag(NULL, 0, handle)) return; // Failed, so exit

//--- Attach the indicator to the current chart, but in a separate window.
if (!ChartIndicatorAdd(0, 1, handle))
{
    PrintFormat("Failed to attach to chart %s/%s an indicator with the handle=%d. En
_Symbol,
    EnumToString(_Period),
    handle,
    GetLastError);
    //--- Terminate the program operation
    return;
}

//--- Refresh the chart to see the indicator
ChartRedraw();

//--- Find the last two last fractures of the zigzag
double two_values[];
datetime two_times[];
if (!GetLastTwoFractures(two_values, two_times, handle))
{
    PrintFormat("Failed to find two last fractures in the Zigzag!");
    //--- Terminate the program operation
    return;
}

//--- Now attach a standard deviation channel
string channel="StdDeviation Channel";
if (!ObjectCreate(0, channel, OBJ_STDDDEVCHANNEL, 0, two_times[1], 0))
{
    PrintFormat("Failed to create object %s. Error code %d",
        EnumToString(OBJ_STDDDEVCHANNEL), GetLastError();
        return;
}
else
{
    //--- The channel has been created, define the second point
    ObjectSetInteger(0, channel, OBJPROP_TIME, 1, two_times[0]);
    //--- Set a tooltip text for the channel
    ObjectSetString(0, channel, OBJPROP_TOOLTIP, "Demo from MQL5 Help");  
    //--- Refresh the chart
    ChartRedraw();
}

//--- Save the result in a template
ChartSaveTemplate(0, "StdDevChannelOnZigzag");

//--- Open a new chart and apply a saved template to it
long new_chart=ChartOpen(symbol, period);
//--- Enable tooltips for graphical objects
ChartSetInteger(new_chart, CHART_SHOW_OBJECT_DESCR, true);
if (new_chart!=0)
{
    //--- Apply the saved template to a chart
```cpp
ChartApplyTemplate(new_chart, "StdDevChannelOnZigzag");

Sleep(10000);

//@+------------------------------------------------------------------
//@| Creates a zigzag handle and ensures readiness of its data         |
//@+------------------------------------------------------------------
bool PrepareZigzag(string sym, ENUM_TIMEFRAMES tf, int &h)
{
    ResetLastError();
    //--- The Zigzag indicator must be located in terminal_data_folder\MQL5\Examples
    h=iCustom(sym, tf, "Examples\Zigzag");
    if (h==INVALID_HANDLE)
    {
        PrintFormat("%s: Failed to create the handle of the Zigzag indicator. Error code
__FUNCTION__,GetLastError());
        return false;
    }
    //--- When creating an indicator handle, it requires time to calculate values
    int k=0; // The number of attempts to wait for the indicator calculation
    //--- Wait for the calculation in a loop, pausing to 50 milliseconds if the calculation
    while (BarsCalculated(h)<=0)
    {
        k++;
        //--- Show the number of attempts
        PrintFormat("%s: k=%d", __FUNCTION__, k);
        //--- Wait 50 milliseconds to wait until the indicator is calculated
        Sleep(50);
        //--- If more than 100 attempt, then something is wrong
        if (k>100)
        {
            //--- Report a problem
            PrintFormat("Failed to calculate the indicator for %d attempts!");
            //--- Terminate the program operation
            return false;
        }
    }
    //--- Everything is ready, the indicator is created and values are calculated
    return true;
}
//@+------------------------------------------------------------------
//@| Searches for the last 2 zigzag fractures and places to arrays       |
//@+------------------------------------------------------------------
bool GetLastTwoFractures(double &get_values[], datetime &get_times[], int handle)
{
    double values[]; // An array for the values of the zigzag
    datetime times[]; // An array to get time
    int size=100; // Size of the array
    ResetLastError();
```

ChartApplyTemplate(), Resources
ChartWindowFind

The function returns the number of a subwindow where an indicator is drawn. There are 2 variants of the function.

1. The function searches in the indicated chart for the subwindow with the specified "short name" of the indicator (the short name is displayed in the left top part of the subwindow), and it returns the subwindow number in case of success.

```c
int ChartWindowFind( long chart_id, // chart identifier
         string indicator_shortname // short indicator name, see INDICATOR_SHORTNAME
);
```

2. The function must be called from a custom indicator. It returns the number of the subwindow where the indicator is working.

```c
int ChartWindowFind();
```

Parameters

- `chart_id`
  
  [in] Chart ID. 0 denotes the current chart.

- `indicator_shortname`
  
  [in] Short name of the indicator.

Return Value

Subwindow number in case of success. In case of failure the function returns -1.

Note

If the second variant of the function (without parameters) is called from a script or Expert Advisor, the function returns -1.

Don't mix up the short name of an indicator and a file name, which is specified when an indicator is created using `iCustom()` and `IndicatorCreate()` functions. If the indicator's short name is not set explicitly, then the name of the file containing the source code of the indicator, is specified in it during compilation.

It is important to correctly form the short name of an indicator, which is recorded in the `INDICATOR_SHORTNAME` property using the `IndicatorSetString()` function. It is recommended that the short name contains values of the indicator's input parameters, because the indicator deleted from a chart in the `ChartIndicatorDelete()` function is identified by its short name.

Example:

```c
#property script_show_inputs
//--- input parameters
input string  shortname="MACD(12,26,9)";
//+------------------------------------------------------------------+
//| Returns number of the chart window with this indicator           |
//+------------------------------------------------------------------+
int GetIndicatorSubWindowNumber(long chartID=0,string short_name="")
```
```csharp
{  
  int window=-1;
  //---
  if((ENUM_PROGRAM_TYPE)MQL5InfoInteger(MQL5_PROGRAM_TYPE)==PROGRAM_INDICATOR)
  {
    //--- the function is called from the indicator, name is not required
    window=ChartWindowFind();
  }
  else
  {
    //--- the function is called from an Expert Advisor or script
    window=ChartWindowFind(0,short_name);
    if(window==-1) Print(__FUNCTION__+"(): Error = ",GetLastError());
  }
  //---
  return(window);
}
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
  //---
  int window=GetIndicatorSubWindowNumber(0,shortname);
  if(window!=-1)
    Print("Indicator "+shortname+" is in the window "+(string)window);
  else
    Print("Indicator "+shortname+" is not found. window = "+(string)window);
}

ObjectCreate(), ObjectFind()
```
Chart Time Price To XY

Converts the coordinates of a chart from the time/price representation to the X and Y coordinates.

```cpp
bool ChartTimePriceToXY(
    long chart_id, // Chart ID
    int sub_window, // The number of the subwindow
    datetime time, // Time on the chart
    double price, // Price on the chart
    int& x, // The X coordinate for the time on the chart
    int& y // The Y coordinates for the price on the chart
);
```

**Parameters**

*chart_id*

[in] Chart ID. 0 means the current chart.

*sub_window*

[in] The number of the chart subwindow. 0 means the main chart window.

*time*

[in] The time value on the chart, for which the value in pixels along the X axis will be received. The origin is in the upper left corner of the main chart window.

*price*

[in] The price value on the chart, for which the value in pixels along the Y axis will be received. The origin is in the upper left corner of the main chart window.

*x*

[out] The variable, into which the conversion of time to X will be received.

*y*

[out] The variable, into which the conversion of price to Y will be received.

**Return Value**

Returns true if successful, otherwise false. To get information about the error, call the `GetLastError()` function.

**See also**

Chart XY To Time Price()
ChartXYToTimePrice

Converts the X and Y coordinates on a chart to the time and price values.

```csharp
bool ChartXYToTimePrice(
    long chart_id, // Chart ID
    int x, // The X coordinate on the chart
    int y, // The Y coordinate on the chart
    int& sub_window, // The number of the subwindow
    datetime& time, // Time on the chart
    double& price // Price on the chart
);
```

Parameters

- `chart_id` [in] Chart ID. 0 means the current chart.
- `x` [in] The X coordinate.
- `sub_window` [out] The variable, into which the chart subwindow number will be written. 0 means the main chart window.
- `time` [out] The time value on the chart, for which the value in pixels along the X axis will be received. The origin is in the upper left corner of the main chart window.
- `price` [out] The price value on the chart, for which the value in pixels along the Y axis will be received. The origin is in the upper left corner of the main chart window.

Return Value

Returns true if successful, otherwise false. To get information about the error, call the `GetLastError()` function.

Example:

```csharp
//+------------------------------------------------------------------+
//| ChartEvent function                                              |
//+------------------------------------------------------------------+
void OnChartEvent(const int id,
    const long siparam,
    const double &dparam,
    const string &sparam)
{
  //--- Show the event parameters on the chart
```
Comment(__FUNCTION__," id"," lparam"," lparam," dparam"," dparam," sparam"," sparam");

//--- If this is an event of a mouse click on the chart
if(id==CHARTEVENT_CLICK)
{
    //--- Prepare variables
    int x = (int)lparam;
    int y = (int)dparam;
    datetime dt = 0;
    double price = 0;
    int window=0;

    //--- Convert the X and Y coordinates in terms of date/time
    if(ChartXYToTimePrice(0,x,y,window,dt,price))
    {
        PrintFormat("Window=%d X=%d Y=%d => Time=%s Price=%G",window,x,y,TimeToString(dt),price);
        //--- Perform reverse conversion: (X,Y) => (Time,Price)
        if(ChartTimePriceToXY(0,window,dt,price,x,y))
            PrintFormat("Time=%s Price=%G => X=%d Y=%d",TimeToString(dt),price,x,y);
        else
            Print("ChartTimePriceToXY return error code: ",GetLastError());
    }
    else
        Print("ChartXYToTimePrice return error code: ",GetLastError());
    Print("+--------------------------------------------------------------+"); 
}

See also

ChartTimePriceToXY()
ChartOpen

Opens a new chart with the specified symbol and period.

```c
long ChartOpen(
    string symbol, // Symbol name
    ENUM_TIMEFRAMES period // Period
);
```

**Parameters**

- **symbol**
  
  [in] Chart symbol. **NULL** means the symbol of the current chart (the Expert Advisor is attached to).

- **period**
  
  [in] Chart period (timeframe). Can be one of the **ENUM_TIMEFRAMES** values. 0 means the current chart period.

**Return Value**

- If successful, it returns the opened chart ID. Otherwise returns 0.

**Note**

- The maximum possible number of simultaneously open charts in the terminal can't exceed the **CHARTS_MAX** value.
ChartFirst

Returns the ID of the first chart of the client terminal.

```c
long ChartFirst();
```

Return Value

Chart ID.
ChartNext

Returns the chart ID of the chart next to the specified one.

```
long ChartNext(
    long chart_id  // Chart ID
);
```

**Parameters**

`chart_id`

[in] Chart ID. 0 does not mean the current chart. 0 means "return the first chart ID".

**Return Value**

Chart ID. If this is the end of the chart list, it returns -1.

**Example:**

```
//--- variables for chart ID
    long currChart, prevChart=ChartFirst();
    int i=0, limit=100;
    Print("ChartFirst =", ChartSymbol(prevChart)," ID =", prevChart);
    while(i<limit) // We have certainly not more than 100 open charts
    {
        currChart=ChartNext(prevChart); // Get the new chart ID by using the previous chart
        if(currChart<0) break;              // Have reached the end of the chart list
        Print(i, ChartSymbol(currChart)," ID =", currChart);
        prevChart=currChart; // let's save the current chart ID for the ChartNext()
        i++; // Do not forget to increase the counter
    }
```
ChartClose

Closes the specified chart.

```cpp
bool ChartClose(
    long chart_id=0  // Chart ID
);
```

Parameters

- `chart_id=0` [in] Chart ID. 0 means the current chart.

Return Value

If successful, returns true, otherwise false.
ChartSymbol

Returns the symbol name for the specified chart.

```cpp
string ChartSymbol(
    long chart_id=0  // Chart ID
);
```

**Parameters**

- `chart_id=0`  
  [in] Chart ID. 0 means the current chart.

**Return Value**

- If chart does not exist, the result will be an empty string.

**See also**

ChartSetSymbolPeriod
ChartPeriod

Returns the timeframe period of specified chart.

```c
ENUM_TIMEFRAMES ChartPeriod(
    long chart_id=0  // Chart ID
);
```

Parameters

`chart_id=0`

[in] Chart ID. 0 means the current chart.

Return Value

The function returns one of the ENUM_TIMEFRAMES values. If chart does not exist, it returns 0.
Chart operations

ChartRedraw

This function calls a forced redrawing of a specified chart.

```c
void ChartRedraw(
    long chart_id=0 // Chart ID
);
```

Parameters

- `chart_id=0` [in] Chart ID. 0 means the current chart.

Note

- Usually it is used after changing the `object properties`.

See also

- `Objects functions`
Chart SetDouble

Sets a value for a corresponding property of the specified chart. Chart property should be of a double type. The command is added to chart messages queue and will be executed after processing of all previous commands.

```c
bool ChartSetDouble(
    long chart_id, // Chart ID
    int prop_id,   // Property ID
    double value,  // Value
);
```

**Parameters**

- `chart_id`
  - [in] Chart ID. 0 means the current chart.

- `prop_id`
  - [in] Chart property ID. Can be one of the `ENUM CHART_PROPERTY_DOUBLE` values (except the read-only properties).

- `value`
  - [in] Property value.

**Return Value**

Returns true if the command has been added to chart queue, otherwise false. To get an information about the error, call the `GetLastError()` function.

**Note**

The function is asynchronous, which means that the function does not wait for the execution of the command, which has been successfully added to the queue of specified the chart. Instead, it immediately returns control. The property will only change after the handling of the appropriate command from the chart queue. To immediately execute commands from the chart queue, call the `ChartRedraw` function.

If you want to immediately change several chart properties at once, then the corresponding functions (`ChartSetString`, `ChartSetDouble`, `ChartSetString`) should be executed in one code block, after which you should call `ChartRedraw` once.

To check the command execution result, you can use a function, which requests the specified chart property (`ChartGetInteger`, `ChartGetDouble`, `ChartSetString`). However, note that these functions are synchronous and wait for execution results.
ChartSetInteger

Sets a value for a corresponding property of the specified chart. Chart property must be \texttt{datetime, int, color, bool or char}. The command is added to chart messages queue and will be executed after processing of all previous commands.

```c
bool ChartSetInteger(
    long chart_id,  // Chart ID
    int prop_id,    // Property ID
    long value      // Value
);
```

Sets a value for a corresponding property of the specified subwindow.

```c
bool ChartSetInteger(
    long chart_id,  // Chart ID
    int prop_id,    // Property ID
    int sub_window, // Subwindow number
    long value      // Value
);
```

**Parameters**

- **chart_id**
  - [in] Chart ID. 0 means the current chart.

- **prop_id**
  - [in] Chart property ID. It can be one of the \texttt{ENUM_CHART_PROPERTY_INTEGER} value (except the read-only properties).

- **sub_window**
  - [in] Number of the chart subwindow. For the first case, the default value is 0 (main chart window). The most of the properties do not require a subwindow number.

- **value**
  - [in] Property value.

**Return Value**

Returns true if the command has been added to chart queue, otherwise false. To get an information about the error, call the \texttt{GetLastError()} function.

**Note**

The function is asynchronous, which means that the function does not wait for the execution of the command, which has been successfully added to the queue of specified the chart. Instead, it immediately returns control. The property will only change after the handling of the appropriate command from the chart queue. To immediately execute commands from the chart queue, call the \texttt{ChartRedraw} function.

If you want to immediately change several chart properties at once, then the corresponding functions (\texttt{ChartSetString}, \texttt{ChartSetDouble}, \texttt{ChartSetString}) should be executed in one code block, after which you should call \texttt{ChartRedraw} once.
To check the command execution result, you can use a function, which requests the specified chart property (ChartGetInteger, ChartGetDouble, ChartSetString). However, note that these functions are synchronous and wait for execution results.

Example:

```c
//+------------------------------------------------------------------+
//| Expert initialization function                                   |
//+------------------------------------------------------------------+
void OnInit()
{
/// Enabling events of mouse movements on the chart window
    ChartSetInteger(0, CHART_EVENT_MOUSE_MOVE, 1);
/// Forced updating of chart properties ensures readiness for event processing
    ChartRedraw();
}
//+------------------------------------------------------------------+
//| MouseState                                                       |
//+------------------------------------------------------------------+
string MouseState(uint state)
{
    string res;
    res+="\nML: " + (((state& 1)== 1) ? "DN": "UP");  // mouse left
    res+="\nMR: " + (((state& 2)== 2) ? "DN": "UP");  // mouse right
    res+="\nMM: " + (((state&16)==16) ? "DN": "UP");  // mouse middle
    res+="\nMX: " + (((state&32)==32) ? "DN": "UP");  // mouse first X key
    res+="\nMY: " + (((state&64)==64) ? "DN": "UP");  // mouse second X key
    res+="\nSHIFT: " + (((state&4)== 4) ? "DN": "UP");  // shift key
    res+="\nCTRL: " + (((state& 8)== 8) ? "DN": "UP");  // control key
    return(res);
}
//+------------------------------------------------------------------+
//| ChartEvent function                                              |
//+------------------------------------------------------------------+
void OnChartEvent(const int id, const long &lparam, const double &dparam, const string &sparam)
{
    if(id==CHARTEVENT_MOUSE_MOVE)
        Comment("POINT: ", {int}lparam,"", {int}dparam,"\n",MouseState({uint}sparam));
}
```
ChartSetString

Sets a value for a corresponding property of the specified chart. Chart property must be of the string type. The command is added to chart messages queue and will be executed after processing of all previous commands.

```c
bool ChartSetString(
    long chart_id,      // Chart ID
    int prop_id,        // Property ID
    string str_value    // Value
);
```

**Parameters**

- `chart_id`  
  [in] Chart ID. 0 means the current chart.

- `prop_id`  
  [in] Chart property ID. Its value can be one of the `ENUM CHART PROPERTY STRING` values (except the read-only properties).

- `str_value`  
  [in] Property value string. String length cannot exceed 2045 characters (extra characters will be truncated).

**Return Value**

Returns true if the command has been added to chart queue, otherwise false. To get an information about the error, call the `GetLastError()` function.

**Note**

ChartSetString can be used for a comment output on the chart instead of the `Comment` function.

The function is asynchronous, which means that the function does not wait for the execution of the command, which has been successfully added to the queue of specified the chart. Instead, it immediately returns control. The property will only change after the handling of the appropriate command from the chart queue. To immediately execute commands from the chart queue, call the `ChartRedraw` function.

If you want to immediately change several chart properties at once, then the corresponding functions (`ChartSetString`, `ChartSetDouble`, `ChartSetString`) should be executed in one code block, after which you should call `ChartRedraw` once.

To check the command execution result, you can use a function, which requests the specified chart property (`ChartGetInteger`, `ChartGetDouble`, `ChartSetString`). However, note that these functions are synchronous and wait for execution results.

**Example:**

```c
void OnTick()
{
//---
    double Ask,Bid;
```
```cpp
int Spread;
Ask=SymbolInfoDouble(Symbol(),SYMBOL_ASK);
Bid=SymbolInfoDouble(Symbol(),SYMBOL_BID);
Spread=SymbolInfoInteger(Symbol(),SYMBOL_SPREAD);
string comment=StringFormat("Printing prices:
Ask = %G
Bid = %G
Spread = %d",
    Ask,Bid,Spread);
    ChartSetString(0,CHART_COMMENT,comment);
}
```

- Comment
- ChartGetString
**ChartGetDouble**

Returns the value of a corresponding property of the specified chart. Chart property must be of double type. There are 2 variants of the function calls.

1. Returns the property value directly.

```c
double ChartGetDouble(
    long chart_id, // Chart ID
    int prop_id, // Property ID
    int sub_window=0 // subwindow number, if necessary
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable `double_var` passed by reference.

```c
bool ChartGetDouble(
    long chart_id, // Chart ID
    int prop_id, // Property ID
    int sub_window, // Subwindow number
    double& double_var // Target variable for the chart property
);
```

**Parameters**

- `chart_id`  
  [in] Chart ID. 0 means the current chart.

- `prop_id`  
  [in] Chart property ID. This value can be one of the `ENUM_CHARTPROPERTY_DOUBLE` values.

- `sub_window`  
  [in] Number of the chart subwindow. For the first case, the default value is 0 (main chart window). The most of the properties do not require a subwindow number.

- `double_var`  
  [out] Target variable of double type for the requested property.

**Return Value**

The value of double type.

For the second call case it returns true if the specified property is available and its value has been placed into `double_var` variable, otherwise returns false. To get an additional information about the error, it is necessary to call the function `GetLastError()`.

**Note**

The function is synchronous, which means that it waits for the execution of all the commands that have been added to the chart queue prior to its call.

**Example:**

```c
void OnStart()
```
Chart Operations

```plaintext
{
    double priceMin=ChartGetDouble(0,CHART_PRICE_MIN,0);
    double priceMax=ChartGetDouble(0,CHART_PRICE_MAX,0);
    Print("CHART_PRICE_MIN =",priceMin);
    Print("CHARTPRICE_MAX =",priceMax);
}
```
ChartGetInteger

Returns the value of a corresponding property of the specified chart. Chart property must be of `datetime`, `int` or `bool` type. There are 2 variants of the function calls.

1. Returns the property value directly.

```c
long ChartGetInteger(
    long chart_id,       // Chart ID
    int prop_id,         // Property ID
    int sub_window=0     // subwindow number, if necessary
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable `long_var` passed by reference.

```c
bool ChartGetInteger(
    long chart_id,       // Chart ID
    int prop_id,         // Property ID
    int sub_window,      // subwindow number
    long& long_var       // Target variable for the property
);
```

**Parameters**

- `chart_id`
  - [in] Chart ID. 0 means the current chart.

- `prop_id`
  - [in] Chart property ID. This value can be one of the `ENUM_CHART_PROPERTY_INTEGER` values.

- `sub_window`
  - [in] Number of the chart subwindow. For the first case, the default value is 0 (main chart window). The most of the properties do not require a subwindow number.

- `long_var`
  - [out] Target variable of long type for the requested property.

**Return Value**

The value of long type.

For the second call case it returns true if specified property is available and its value has been stored into `long_var` variable, otherwise returns false. To get additional information about the error, it is necessary to call the function `GetLastError()`.

**Note**

The function is synchronous, which means that it waits for the execution of all the commands that have been added to the chart queue prior to its call.

**Example:**

```c
void OnStart()
```
```c
{
    int height=ChartGetInteger(0, CHART_HEIGHT_IN_PIXELS, 0);
    int width=ChartGetInteger(0, CHART_WIDTH_IN_PIXELS, 0);
    Print("CHART_HEIGHT_IN_PIXELS =", height, "pixels");
    Print("CHART_WIDTH_IN_PIXELS =", width, "pixels");
}
```
Chart Operations

ChartGetString

Returns the value of a corresponding property of the specified chart. Chart property must be of string type. There are 2 variants of the function call.

1. Returns the property value directly.

```c
string.ChartGetString(
    long chart_id, // Chart ID
    int prop_id  // Property ID
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable string_var passed by reference.

```c
bool.ChartGetString(
    long chart_id, // Chart ID
    int prop_id, // Property ID
    string& string_var // Target variable for the property
);
```

Parameters

- `chart_id`
  - [in] Chart ID. 0 means the current chart.
- `prop_id`
  - [in] Chart property ID. This value can be one of the ENUM_CHART_PROPERTY_STRING values.
- `string_var`
  - [out] Target variable of string type for the requested property.

Return Value

The value of string type.

For the second call case it returns true if the specified property is available and its value has been stored into string_var variable, otherwise returns false. To get additional information about the error, it is necessary to call the function GetLastError().

Note

ChartGetString can be used for reading comments plotted on the chart using the Comment or ChartSetString functions.

The function is synchronous, which means that it waits for the execution of all the commands that have been added to the chart queue prior to its call.

Example:

```c
void OnStart()
{
    ChartSetString(0, CHART_COMMENT,"Test comment.\nSecond line.\nThird!");
    ChartRedraw();
}
```
```mql
Sleep(1000);
string comm=ChartGetString(0,CHART_COMMENT);
Print(comm);
}
```

- ChartSetString
ChartNavigate

Performs shift of the specified chart by the specified number of bars relative to the specified position in the chart.

```c
bool ChartNavigate(
    long chart_id, // Chart ID
    ENUM_CHART_POSITION position, // Position
    int shift=0 // Shift value
);
```

**Parameters**

- `chart_id` [in] Chart ID. 0 means the current chart.
- `position` [in] Chart position to perform a shift. Can be one of the `ENUM_CHART_POSITION` values.
- `shift=0` [in] Number of bars to shift the chart. Positive value means the right shift (to the end of chart), negative value means the left shift (to the beginning of chart). The zero shift can be used to navigate to the beginning or end of chart.

**Return Value**

Returns true if successful, otherwise returns false.

**Example:**

```c
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
    //--- get handle of the current chart
    long handle=ChartID();
    string comm=
        if(handle>0) // if successful, additionally set up the chart
        {
            //--- disable auto scroll
            ChartSetInteger(handle, CHART_AUTOSCROLL, false);
            //--- set a shift from the right chart border
            ChartSetInteger(handle, CHART_SHIFT, true);
            //--- draw candlesticks
            ChartSetInteger(handle, CHART_MODE, CHART_CANDLES);
            //--- set the display mode for tick volumes
            ChartSetInteger(handle, CHART_SHOW_VOLUMES, CHART_VOLUME_TICK);

            //--- prepare a text to output in Comment()
            comm="Scroll 10 bars to the right of the history start"
            //--- show comment
```
Comment (comm);
//--- scroll 10 bars to the right of the history start
ChartNavigate (handle, CHART_BEGIN, 10);
//--- get the number of the first bar visible on the chart (numeration like in timeseries)

//--- wait 5 seconds to see how the chart moves
Sleep (5000);

//--- new block of chart scrolling
comm = comm + "\r\n" + "Scroll 300 bars to the right of the history start";
Comment (comm);
//--- scroll 300 bars to the right of the history start
ChartNavigate (handle, CHART_BEGIN, 300);
first_bar = ChartGetInteger (0, CHART_FIRST_VISIBLE_BAR, 0);
comm = comm + "\r\n";
comm = comm + "The first bar on the chart is number " + IntegerToString (first_bar) + "\r\n";
Comment (comm);
//--- wait 5 seconds to see how the chart moves
Sleep (5000);

//--- new block of chart scrolling
comm = comm + "\r\n" + "Scroll 300 bars to the left of the right chart border";
Comment (comm);
//--- scroll 300 bars to the left of the right chart border
ChartNavigate (handle, CHART_END, -300);
first_bar = ChartGetInteger (0, CHART_FIRST_VISIBLE_BAR, 0);
comm = comm + "\r\n";
comm = comm + "The first bar on the chart is number " + IntegerToString (first_bar) + "\r\n";
Comment (comm);
ChartID

Returns the ID of the current chart.

```c
long ChartID();
```

Return Value

Value of `long` type.
**ChartIndicatorAdd**

Adds an indicator with the specified handle into a specified chart window. Indicator and chart should be generated on the same symbol and time frame.

```c
bool ChartIndicatorAdd(
    long chart_id,       // chart ID
    int sub_window       // number of the sub-window
    int indicator_handle // handle of the indicator
);
```

**Parameters**

- **chart_id**
  
  [in] Chart ID. 0 means the current chart.

- **sub_window**
  
  [in] The number of the chart sub-window. 0 means the main chart window. To add an indicator in a new window, the parameter must be one greater than the index of the last existing window, i.e. equal to `CHART_WINDOWS_TOTAL`. If the value of the parameter is greater than `CHART_WINDOWS_TOTAL`, a new window will not be created, and the indicator will not be added.

- **indicator_handle**
  
  [in] The handle of the indicator.

**Return Value**

The function returns true in case of success, otherwise it returns false. In order to obtain information about the error, call the `GetLastError()` function. Error 4114 means that a chart and an added indicator differ by their symbol or time frame.

**Note**

If an indicator that should be drawn in a separate subwindow (for example, built-in iMACD or a custom indicator with specified `#property indicator_separate_window` property) is applied to the main chart window, it may not be visible though it will still be present in the list of indicators. This means that the scale of the indicator is different from the scale of the price chart, and applied indicator's values do not fit in the displayed range of the price chart. In this case, `GetLastError()` returns zero code indicating the absence of an error. The values of such "invisible" indicator can be seen in Data Window and received from other MQL5 applications.

**Example:**

```c
#property description "Expert Advisor demonstrating the work with ChartIndicatorAdd()."
#property description "After launching on the chart (and receiving the error in Journal), open the Expert Advisor's properties and specify correct <symbol> and <period> parameters."
#property description "MACD indicator will be added on the chart."

//--- input parameters
input string symbol="AUDUSD";  // symbol name
input ENUM_TIMEFRAMES period=PERIOD_M12;  // time frame
input int fast_ema_period=12;      // fast MACD period
input int slow_ema_period=26;      // slow MACD period
```
input int signal_period=9;  // signal period
input ENUM_APPLIED_PRICE apr=PRICE_CLOSE; // price type for MACD calculation

int indicator_handle=INVALID_HANDLE;
//---------------------------------------------------------------+
//| Expert initialization function                                    |
//+------------------------------------------------------------------+
int OnInit()
{
    //---
    indicator_handle=iMACD(symbol,period,fast_ema_period,slow_ema_period,signal_period,
    //--- try to add the indicator on the chart
    if(!AddIndicator())
    {
        //--- AddIndicator() function refused to add the indicator on the chart
        int answer=MessageBox("Do you want to add MACD on the chart anyway?",
            "Incorrect symbol and/or time frame for adding the indicator",
            MB_YESNO, "Yes" and "No" selection buttons will be shown
        );
        //--- if a user still insists on incorrect usage of ChartIndicatorAdd()
        if(answer==IDYES)

ChartIndicatorDelete(), ChartIndicatorName(), ChartIndicatorsTotal(), iCustom(), IndicatorCreate()
Chart Operations

ChartIndicatorDelete

Removes an indicator with a specified name from the specified chart window.

```c
bool ChartIndicatorDelete(
    long chart_id, // chart id
    int sub_window // number of the subwindow
    const string indicator_shortname // short name of the indicator
);
```

Parameters

`chart_id`

[in] Chart ID. 0 denotes the current chart.

`sub_window`

[in] Number of the chart subwindow. 0 denotes the main chart subwindow.

`indicator_shortname`

[in] The short name of the indicator which is set in the `INDICATOR_SHORTNAME` property with the `IndicatorSetString()` function. To get the short name of an indicator use the `ChartIndicatorName()` function.

Return Value

Returns true in case of successful deletion of the indicator. Otherwise it returns false. To get error details use the `GetLastError()` function.

Note

If two indicators with identical short names exist in the chart subwindow, the first one in a row will be deleted.

If other indicators on this chart are based on the values of the indicator that is being deleted, such indicators will also be deleted.

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions `iCustom()` and `IndicatorCreate()`. If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

Deletion of an indicator from a chart doesn't mean that its calculation part will be deleted from the terminal memory. To release the indicator handle use the `IndicatorRelease()` function.

The indicator's short name should be formed correctly. It will be written to the `INDICATOR_SHORTNAME` property using the `IndicatorSetString()` function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the `ChartIndicatorDelete()` function is identified by the short name.

Example of deleting an indicator after initialization has failed:

IndicatorSetString()
ChartOperations

ChartIndicatorGet

Returns the handle of the indicator with the specified short name in the specified chart window.

```c
int ChartIndicatorGet(
    long chart_id,  // Chart ID
    int sub_window  // The number of the subwindow
    const string indicator_shortname  // Short name of the indicator
);
```

### Parameters

- **chart_id**
  
  [in] Chart ID. 0 means the current chart.

- **sub_window**
  
  [in] The number of the chart subwindow. 0 means the main chart window.

- **const indicator_shortname**
  
  [in] The short name if the indicator, which is set in the `INDICATOR_SHORTNAME` property using the `IndicatorSetString()` function. To get the short name of an indicator, use the `ChartIndicatorName()` function.

### Return Value

Returns an indicator handle if successful, otherwise returns `INVALID_HANDLE`. To get information about the error, call the `GetLastError()` function.

### Note

When creating an indicator, be careful forming its short name, which is written in the `INDICATOR_SHORTNAME` property using the `IndicatorSetString()` function. It is recommended that a short name should contain the values of input parameters of the indicator, since the indicator is identified in the `ChartIndicatorGet()` function based on its short name.

Another way to identify the indicator is to get a list of its parameters for a given handle using the `IndicatorParameters()` function and then to analyze the obtained values.

### Example:

```c
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
    //--- The number of windows on the chart (at least one main window is always presen
    int windows=(int)ChartGetInteger(0,CHART_WINDOWS_TOTAL);
    //--- Check all windows
    for(int w=0;w<windows;w++)
    {
        //--- the number of indicators in this window/subwindow
        int total=ChartIndicatorsTotal(0,w);
        //--- Go through all indicators in the window
```

© 2000-2019, MetaQuotes Software Corp.
for(int i=0;i<total;i++)
{
    //--- get the short name of an indicator
    string name=ChartIndicatorName(0,w,i);
    //--- get the handle of an indicator
    int handle=ChartIndicatorGet(0,w,name);
    //--- Add to log
    PrintFormat("Window=%d, index=%d, name=%s, handle=%d",w,i,name,handle);
    //--- You should obligatorily release the indicator handle when it is no long
    IndicatorRelease(handle);
}

See also
ChartIndicatorAdd(), ChartIndicatorName(), ChartIndicatorsTotal(), IndicatorParameters()
ChartIndicatorName

Returns the short name of the indicator by the number in the indicators list on the specified chart window.

```csharp
string ChartIndicatorName(
    long chart_id,       // chart id
    int sub_window,      // number of the subwindow
    int index            // index of the indicator in the list of indicators added to the window
);
```

**Parameters**

- `chart_id`  
  [in] Chart ID. 0 denotes the current chart.

- `sub_window`  
  [in] Number of the chart subwindow. 0 denotes the main chart subwindow.

- `index`  
  [in] the index of the indicator in the list of indicators. The numeration of indicators start with zero, i.e. the first indicator in the list has the 0 index. To obtain the number of indicators in the list use the `ChartIndicatorsTotal()` function.

**Return Value**

The short name of the indicator which is set in the `INDICATOR_SHORTNAME` property with the `IndicatorSetString()` function. To get error details use the `GetLastError()` function.

**Note**

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions `iCustom()` and `IndicatorCreate()`. If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

The indicator's short name should be formed correctly. It will be written to the `INDICATOR_SHORTNAME` property using the `IndicatorSetString()` function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the `ChartIndicatorDelete()` function is identified by the short name.

**See also**

`ChartIndicatorAdd()`, `ChartIndicatorDelete()`, `ChartIndicatorsTotal()`, `iCustom()`, `IndicatorCreate()`, `IndicatorSetString()`
ChartIndicatorsTotal

Returns the number of all indicators applied to the specified chart window.

```c
int ChartIndicatorsTotal(
  long chart_id,     // chart id
  int sub_window     // number of the subwindow
);
```

**Parameters**

- `chart_id`
  - [in] Chart ID. 0 denotes the current chart.

- `sub_window`
  - [in] Number of the chart subwindow. 0 denotes the main chart subwindow.

**Return Value**

The number of indicators in the specified chart window. To get error details use the `GetLastError()` function.

**Note**

The function allows going searching through all the indicators attached to the chart. The number of all the windows of the chart can be obtained from the `CHART_WINDOWS_TOTAL` property using the `ChartGetInteger()` function.

**See also**

- `ChartIndicatorAdd()`, `ChartIndicatorDelete()`, `iCustom()`, `IndicatorCreate()`, `IndicatorSetString()`
**ChartWindowOnDropped**

Returns the number (index) of the chart subwindow the Expert Advisor or script has been dropped to. 0 means the main chart window.

```c
int ChartWindowOnDropped();
```

**Return Value**

Value of `int` type.

**Example:**

```c
int myWindow=ChartWindowOnDropped();
int windowsTotal=ChartGetInteger(0,CHART_WINDOWS_TOTAL);
Print("Script is running on the window "+myWindow+
   ", Total windows on the chart "+ChartSymbol()+":",windowsTotal);
```

**See also**

[ChartPriceOnDropped](#), [ChartTimeOnDropped](#), [ChartXOnDropped](#), [ChartYOnDropped](#)
ChartPriceOnDropped

Returns the price coordinate corresponding to the chart point the Expert Advisor or script has been dropped to.

```cpp
double ChartPriceOnDropped();
```

Return Value

Value of `double` type.

Example:

```cpp
double p = ChartPriceOnDropped();
Print("ChartPriceOnDropped() = ", p);
```

See also

`ChartXOnDropped`, `ChartYOnDropped`
**ChartTimeOnDropped**

Returns the time coordinate corresponding to the chart point the Expert Advisor or script has been dropped to.

```mql5
datetime ChartTimeOnDropped();
```

**Return Value**

Value of `datetime` type.

**Example:**

```mql5
datetime t=ChartTimeOnDropped();
Print("Script was dropped on the "+t);
```

**See also**

[ChartXOnDropped](#), [ChartYOnDropped](#)
ChartXOnDropped

Returns the X coordinate of the chart point the Expert Advisor or script has been dropped to.

```c
int ChartXOnDropped();
```

Return Value

The X coordinate value.

Note

X axis direction from left to right.

Example:

```c
int X=ChartXOnDropped();
int Y=ChartYOnDropped();
Print("(X,Y) = ("+X+","+Y+")");
```

See also

ChartWindowOnDropped, ChartPriceOnDropped, ChartTimeOnDropped
ChartYOnDropped

Returns the Y coordinate of the chart point the Expert Advisor or script has been dropped to.

```c
int ChartYOnDropped();
```

Return Value

The Y coordinate value.

Note

Y axis direction from top to bottom.

See also

ChartWindowOnDropped, ChartPriceOnDropped, ChartTimeOnDropped
**ChartSetSymbolPeriod**

Changes the symbol and period of the specified chart. The function is asynchronous, i.e. it sends the command and does not wait for its execution completion. The command is added to chart messages queue and will be executed after processing of all previous commands.

```cpp
bool ChartSetSymbolPeriod(
    long chart_id,  // Chart ID
    string symbol,  // Symbol name
    ENUM_TIMEFRAMES period);  // Period
```

**Parameters**

- `chart_id`
  - [in] Chart ID. 0 means the current chart.

- `symbol`
  - [in] Chart symbol. `NULL` value means the current chart symbol (Expert Advisor is attached to)

- `period`
  - [in] Chart period (timeframe). Can be one of the `ENUM_TIMEFRAMES` values. 0 means the current chart period.

**Return Value**

Returns true if the command has been added to chart queue, otherwise false. To get an information about the error, call the `GetLastError()` function.

**Note**

The symbol/period change leads to the re-initialization of the Expert Advisor attached to a chart.

The call of ChartSetSymbolPeriod with the same symbol and timeframe can be used to update the chart (similar to the terminal's Refresh command). In its turn, the chart update triggers recalculation of the indicators attached to it. Thus, you are able to calculate an indicator on the chart even if there are no ticks (e.g., on weekends).

**See also**

- `ChartSymbol`, `ChartPeriod`
ChartScreenShot

The function provides a screenshot of the chart in its current state in the GIF, PNG or BMP format depending on specified extension.

```c
bool ChartScreenShot(
    long chart_id, // Chart ID
    string filename, // Symbol name
    int width, // Width
    int height, // Height
    ENUM_ALIGN_MODE align_mode=ALIGN_RIGHT // Alignment type
);
```

Parameters

- **chart_id**
  - [in] Chart ID. 0 means the current chart.

- **filename**
  - [in] Screenshot file name. Cannot exceed 63 characters. Screenshot files are placed in the \Files directory.

- **width**
  - [in] Screenshot width in pixels.

- **height**
  - [in] Screenshot height in pixels.

- **align_mode=ALIGN_RIGHT**
  - [in] Output mode of a narrow screenshot. A value of the `ENUM_ALIGN_MODE` enumeration. ALIGN_RIGHT means align to the right margin (the output from the end). ALIGN_LEFT means Left justify.

Return Value

Returns true if successful, otherwise false.

Note

If you need to take a screenshot from a chart from a certain position, first it's necessary to position the graph using the `ChartNavigate()` function. If the horizontal size of the screenshot is smaller than the chart window, either the right part of the chart window, or its left part is output, depending on the `align_mode` settings.

Example:

```c
#define WIDTH 800 // Image width to call ChartScreenShot()
#define HEIGHT 600 // Image height to call ChartScreenShot()
```

//--- input parameters
input int pictures=5; // The number of images in the series

Trade Functions

This is the group of functions intended for managing trading activities.

Before you proceed to study the trade functions of the platform, you must have a clear understanding of the basic terms: order, deal and position:

- An order is an instruction given to a broker to buy or sell a financial instrument. There are two main types of orders: Market and Pending. In addition, there are special Take Profit and Stop Loss levels.
- A deal is the commercial exchange (buying or selling) of a financial security. Buying is executed at the demand price (Ask), and Sell is performed at the supply price (Bid). A deal can be opened as a result of market order execution or pending order triggering. Note that in some cases, execution of an order can result in several deals.
- A position is a trade obligation, i.e. the number of bought or sold contracts of a financial instrument. A long position is financial security bought expecting the security price go higher. A short position is an obligation to supply a security expecting the price will fall in future.

General information about trading operations is available in the client terminal help.

Trading functions can be used in Expert Advisors and scripts. Trading functions can be called only if in the properties of the Expert Advisor or script the “Allow live trading” checkbox is enabled.

Trading can be allowed or prohibited depending on various factors described in the Trade Permission section.

</tbody>
</table>
**OrderCalcMargin**

The function calculates the margin required for the specified order type, on the current account, in the current market environment not taking into account current pending orders and open positions. It allows the evaluation of margin for the trade operation planned. The value is returned in the account currency.

```cpp
bool OrderCalcMargin(
  ENUM_ORDER_TYPE action,  // type of order
  string symbol,           // symbol name
  double volume,           // volume
  double price,            // open price
  double& margin           // variable for obtaining the margin value
);
```

**Parameters**

- **action**
  - [in] The order type, can be one of the values of the `ENUM_ORDER_TYPE` enumeration.
- **symbol**
  - [in] Symbol name.
- **volume**
  - [in] Volume of the trade operation.
- **price**
  - [in] Open price.
- **margin**
  - [out] The variable, to which the value of the required margin will be written in case the function is successfully executed. The calculation is performed as if there were no pending orders and open positions on the current account. The margin value depends on many factors, and can differ in different market environments.

**Return Value**

The function returns true in case of success; otherwise it returns false. In order to obtain information about the error, call the `GetLastError()` function.

**See also**

- `OrderSend()`, `Order Properties`, `Trade Operation Types`
OrderCalcProfit

The function calculates the profit for the current account, in the current market conditions, based on the parameters passed. The function is used for pre-evaluation of the result of a trade operation. The value is returned in the account currency.

```csharp
bool OrderCalcProfit(ENUM_ORDER_TYPE action, // type of the order (ORDER_TYPE_BUY or ORDER_TYPE_SELL)
                      string symbol, // symbol name
                      double volume, // volume
                      double price_open, // open price
                      double price_close, // close price
                      double& profit // variable for obtaining the profit value
                      );
```

Parameters

- **action**
  - [in] Type of the order, can be one of the two values of the `ENUM_ORDER_TYPE` enumeration: `ORDER_TYPE_BUY` or `ORDER_TYPE_SELL`.

- **symbol**
  - [in] Symbol name.

- **volume**
  - [in] Volume of the trade operation.

- **price_open**
  - [in] Open price.

- **price_close**
  - [in] Close price.

- **profit**
  - [out] The variable, to which the calculated value of the profit will be written in case the function is successfully executed. The estimated profit value depends on many factors, and can differ in different market environments.

Return Value

The function returns true in case of success; otherwise it returns false. If an invalid order type is specified, the function will return false. In order to obtain information about the error, call `GetLastError()`.

See also

- `OrderSend()`, `Order Properties`, `Trade Operation Types`
OrderCheck

The OrderCheck() function checks if there are enough money to execute a required trade operation. The check results are placed to the fields of the MqlTradeCheckResult structure.

```c
bool OrderCheck(
    MqlTradeRequest& request,       // request structure
    MqlTradeCheckResult& result     // result structure
);
```

Parameters

- **request**
  - [in] Pointer to the structure of the MqlTradeRequest type, which describes the required trade action.

- **result**
  - [in,out] Pointer to the structure of the MqlTradeCheckResult type, to which the check result will be placed.

Return Value

If funds are not enough for the operation, or parameters are filled out incorrectly, the function returns false. In case of a successful basic check of structures (check of pointers), it returns true. However, this is not an indication that the requested trade operation is sure to be successfully executed. For a more detailed description of the function execution result, analyze the fields of the result structure.

In order to obtain information about the error, call the GetLastError() function.

See also

- OrderSend(), Trade Operation Types, Trade Request Structure, Structure of Request Check Results, Structure of a Trade Request Result
OrderSend

The OrderSend() function is used for executing trade operations by sending requests to a trade server.

```c
bool OrderSend(
    MqlTradeRequest& request,  // query structure
    MqlTradeResult& result      // structure of the answer
);
```

Parameters

- **request**
  - [in] Pointer to a structure of `MqlTradeRequest` type describing the trade activity of the client.

- **result**
  - [in,out] Pointer to a structure of `MqlTradeResult` type describing the result of trade operation in case of a successful completion (if true is returned).

Return Value

In case of a successful basic check of structures (index checking) returns true. However, this is not a sign of successful execution of a trade operation. For a more detailed description of the function execution result, analyze the fields of `result` structure.

Note

The trade requests go through several stages of checking on a trade server. First of all, it checks if all the required fields of the `request` parameter are filled out correctly. If there are no errors, the server accepts the order for further processing. If the order is successfully accepted by the trade server, the OrderSend() function returns true.

It is recommended to check the request before sending it to a trade server. To check requests, use the `OrderCheck()` function. It checks if there are enough funds to execute the trade operation, and returns many useful parameters in the results of trade request checking:

- `return code` containing information about errors in the checked request;
- balance value that will appear after the trade operation is executed;
- equity value that will appear after the trade operation is executed;
- floating point value that will appear after the trade operation is executed;
- margin required for the trade operation;
- amount of free equity that will remain after the execution of the trade operation;
- the margin level that will be set after the trade operation is executed;
- comment to the reply code, error description.

When sending a market order (`MqlTradeRequest.action=TRADE_ACTION_DEAL`), the successful result of the OrderSend() function does not mean that the order has been executed (appropriate trades have been performed). In this case, 'true' means only that the order has been successfully placed in the trading system for further execution. The trade server can fill in the `deal or order` field values in the returned `result` structure, if it is aware of these data when forming a response to an OrderSend() call. Generally, event(s) of executing trades corresponding to an order may happen after sending a response to the OrderSend() call. Therefore, for any type of a trade request, when receiving the OrderSend() execution result, we should first check the `retcode` trade server response code and the
Trade Functions

*retcode_external* external system response code (if necessary) available in the obtained *result structure*.

Each accepted order is stored on the trade server awaiting processing until one of the conditions for its execution occurs:

- expiration,
- appearance of an opposite request,
- order execution when the execution price appears,
- a request to cancel the order is received.

At the moment of the order processing, the trade server sends to the terminal a message about the occurrence of the *Trade* event, which can be processed by the *OnTrade()* function.

The result of executing the trade request on a server sent by *OrderSend()* function can be tracked by *OnTradeTransaction* handler. It should be noted that *OnTradeTransaction* handler will be called several times when executing one trade request.

For example, when sending a market buy order, it is handled, an appropriate buy order is created for the account, the order is then executed and removed from the list of the open ones, then it is added to the orders history, an appropriate deal is added to the history and a new position is created. *OnTradeTransaction* function will be called for each of these events.

Example:

```csharp
//--- value for ORDER_MAGIC
input long order_magic=55555;

void OnStart()
{
    //--- make sure that the account is demo
    if(AccountInfoInteger(ACCOUNT_TRADE_MODE)==ACCOUNT_TRADE_MODE_REAL)
    {
        Alert("Script operation is not allowed on a live account!");
        return;
    }

    //--- place or delete order
    if(GetOrdersTotalByMagic(order_magic)==0)
    {
        //--- no current orders - place an order
        uint res=SendRandomPendingOrder(order_magic);
        Print("Return code of the trade server ",res);
    }
    else // there are orders - delete orders
    {
        DeleteAllOrdersByMagic(order_magic);
    }
}
```

Trade Operation Types, Trade Request Structure, Structure of Request Check Results, Structure of a Trade Request Result
**OrderSendAsync**

The `OrderSendAsync()` function is used for conducting asynchronous *trade operations* without waiting for the trade server's response to a sent *request*. The function is designed for high-frequency trading, when under the terms of the trading algorithm it is unacceptable to waste time waiting for a response from the server.

```csharp
bool OrderSendAsync(
    MqlTradeRequest& request, // Request structure
    MqlTradeResult& result     // Response structure
);
```

### Parameters

- `request`
  
  [in] A pointer to a structure of the `MqlTradeRequest` type that describes the trade action of the client.

- `result`
  
  [in,out] A pointer to a structure of the `MqlTradeResult` type that describes the result of a trade operation in case of successful execution of the function (if true is returned).

### Return Value

Returns true if the request is sent to a trade server. In case the request is not sent, it returns false. In case the request is sent, in the `result` variable the response code contains `TRADE_RETCODE_PLACED` value (code 10008) - "order placed". Successful execution means only the fact of sending, but does not give any guarantee that the request has reached the trade server and has been accepted for processing. When processing the received request, a trade server sends a reply to a client terminal notifying of change in the current state of positions, orders and deals, which leads to the generation of the *Trade* event.

The result of executing the trade request on a server sent by `OrderSendAsync()` function can be tracked by `OnTradeTransaction` handler. It should be noted that `OnTradeTransaction` handler will be called several times when executing one trade request.

For example, when sending a market buy order, it is handled, an appropriate buy order is created for the account, the order is then executed and removed from the list of the open ones, then it is added to the orders history, an appropriate deal is added to the history and a new position is created. `OnTradeTransaction` function will be called for each of these events. To get such a data, the function parameters should be analyzed:

- `trans` - this parameter gets `MqlTradeTransaction` structure describing a trade transaction applied to a trade account;
- `request` - this parameter gets `MqlTradeRequest` structure describing the trade request resulted in a trade transaction;
- `result` - this parameter gets `MqlTradeResult` structure describing a trade request execution result.

### Note

In terms of purposes and parameters, the function is similar to `OrderSend()`, but unlike it, it is asynchronous, i.e. does not hold the program operation while waiting for the function execution result. You can compare the rate of trade operations of these two functions using the sample Expert Advisor.
Example:

```mql5
//--- input parameters
input int MagicNumber=1234567; // Expert Advisor ID
input bool DescriptionModeFull=true; // Detailed output mode

//--- variable for using in HistorySelect() call
datetime history_start;

//--- initialization function
int OnInit()
{
    //--- check if autotrading is allowed
    if(!TerminalInfoInteger(TERMINAL_TRADE_ALLOWED))
    {
        Alert("Autotrading in the terminal is disabled, Expert Advisor will be removed.");
        ExpertRemove();
        return(-1);
    }

    //--- unable to trade on a real account
    if(AccountInfoInteger(ACCOUNT_TRADE_MODE)===ACCOUNT_TRADE_MODE_REAL)
    {
        Alert("Expert Advisor cannot trade on a real account!");
        ExpertRemove();
        return(-2);
    }

    //--- check if it is possible to trade on this account (for example, trading is impossible when using an investor password)
    if(!AccountInfoInteger(ACCOUNT_TRADE_ALLOWED))
    {
        Alert("Trading on this account is disabled");
        ExpertRemove();
        return(-3);
    }

    //--- save the time of launching the Expert Advisor for receiving trading history
    history_start=TimeCurrent();

    //---
    CreateBuySellButtons();
    return(INIT_SUCCEEDED);
}
```

```
//--- deinitialization function
```
void OnDeinit(const int reason)
{
    //--- delete all graphical objects
    ObjectDelete(0,"Buy");
    ObjectDelete(0,"Sell");
    //---
}

//+------------------------------------------------------------------+
//| TradeTransaction function                                        |
//+------------------------------------------------------------------+
void OnTradeTransaction(const MqlTradeTransaction &trans,
                        const MqlTradeRequest &request,
                        const MqlTradeResult &result)
{
    //--- heading named after trading event's handler function
    Print("= > " , __FUNCTION__, ", " , TimeToString(TimeCurrent()) , TIME_SECONDS));
    //--- receive transaction type as enumeration value
    ENUM_TRADE_TRANSACTION_TYPE type=trans.type;
    //--- if transaction is a result of request handling
    if(type==TRADE_TRANSACTION_REQUEST)
    {
        //--- display transaction name
        Print(EnumToString(type));
        //--- then display the string description of the handled request
        Print("---------- RequestDescription\r\n",
               RequestDescription(request,DescriptionModeFull));
        //--- and show description of the request result
        Print("---------- ResultDescription\r\n",
               TradeResultDescription(result,DescriptionModeFull));
    }
    else // display full description of the transaction for transactions of another ty
    {
        Print("---------- TransactionDescription\r\n",

</tbody>
</table>
PositionsTotal

Returns the number of open positions.

```
int PositionsTotal();
```

Return Value

Value of `int` type.

Note

For the "netting" interpretation of positions (`ACCOUNT_MARGIN_MODE_RETAIL_NETTING` and `ACCOUNT_MARGIN_MODE_EXCHANGE`), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (`ACCOUNT_MARGIN_MODE_RETAIL_HEDGING`), multiple positions can be open for one symbol.

See also

`GetPositionSymbol()`, `PositionSelect()`, `Position Properties`
PositionGetSymbol

Returns the symbol corresponding to the open position and automatically selects the position for further working with it using functions PositionGetDouble, PositionGetInteger, PositionGetString.

```c
string PositionGetSymbol(
    int index // Number in the list of positions
);
```

Parameters

index

[in] Number of the position in the list of open positions.

Return Value

Value of the string type. If the position was not found, an empty string will be returned. To get an error code, call the GetLastError() function.

Note

For the “netting” interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE.Exchange), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol.

See also

PositionsTotal(), PositionSelect(), Position Properties
**PositionSelect**

Chooses an open position for further working with it. Returns true if the function is successfully completed. Returns false in case of failure. To obtain information about the error, call `GetLastError()`.

```cpp
bool PositionSelect(
    string symbol // Symbol name
);
```

**Parameters**

`symbol`

[in] Name of the financial security.

**Return Value**

Value of the bool type.

**Note**

For the “netting” interpretation of positions (ACCOUNT\_MARGIN\_MODE\_RETAIL\_NETTING and ACCOUNT\_MARGIN\_MODE\_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT\_MARGIN\_MODE\_RETAIL\_HEDGING), multiple positions can be open for one symbol. In this case, PositionSelect will select a position with the lowest ticket.

Function `PositionSelect()` copies data about a position into the program environment, and further calls of `PositionGetDouble()`, `PositionGetInteger()` and `PositionGetString()` return the earlier copied data. This means that the position itself may no longer exist (or its volume, direction, etc. has changed), but data of this position still can be obtained. To ensure receipt of fresh data about a position, it is recommended to call `PositionSelect()` right before referring to them.

**See also**

`PositionGetSymbol()`, `PositionsTotal()`, `Position Properties`
PositionSelectByTicket

Selects an open position to work with based on the ticket number specified in the position. If successful, returns true. Returns false if the function failed. Call GetLastError() for error details.

```c
bool PositionSelectByTicket(
    ulong ticket    // Position ticket
);
```

Parameters

ticket

[in] Position ticket.

Return Value

A value of the bool type.

Note

The PositionSelectByTicket() function copies position data to the program environment. Further calls of PositionGetDouble(), PositionGetInteger() and PositionGetString() return the previously copied data. Even if a position does not exist already (or its size, direction etc. has changed), the data may still be received sometimes. To make sure that you receive valid position data, it is recommended to call PositionSelectByTicket() before you access the data.

Trade Functions

PositionGetDouble

The function returns the requested property of an open position, pre-selected using PositionGetSymbol or PositionSelect. The position property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```c
double PositionGetDouble(
    ENUM_POSITION_PROPERTY_DOUBLE property_id,  // Property identifier
);
```

2. Returns true or false, depending on the success of the function execution. If successful, the value of the property is placed in a receiving variable passed by reference by the last parameter.

```c
bool PositionGetDouble(
    ENUM_POSITION_PROPERTY_DOUBLE property_id,  // Property identifier
    double& double_var  // Here we accept the property value
);
```

Parameters

property_id

[in] Identifier of a position property. The value can be one of the values of the ENUM_POSITION_PROPERTY_DOUBLE enumeration.

double var

[out] Variable of the double type, accepting the value of the requested property.

Return Value

Value of the double type. If the function fails, 0 is returned.

Note

For the “netting” interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call PositionSelect() right before referring to them.

See also

PositionGetSymbol(), PositionSelect(), Position Properties
**PositionGetInteger**

The function returns the requested property of an open position, pre-selected using `PositionGetSymbol` or `PositionSelect`. The position property should be of datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

   ```
   long PositionGetInteger(
       ENUM_POSITION_PROPERTY_INTEGER property_id  // Property identifier
   );
   ```

2. Returns true or false, depending on the success of the function execution. If successful, the value of the property is placed in a receiving variables passed by reference by the last parameter.

   ```
   bool PositionGetInteger(
       ENUM_POSITION_PROPERTY_INTEGER property_id,  // Property identifier
       long& long_var  // Here we accept the property value
   );
   ```

**Parameters**

- `property_id`
  - [in] Identifier of a position property. The value can be one of the values of the `ENUM_POSITION_PROPERTY_INTEGER` enumeration.

- `long_var`
  - [out] Variable of the long type accepting the value of the requested property.

**Return Value**

Value of the `long` type. If the function fails, 0 is returned.

**Note**

For the “netting” interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call `PositionSelect()` right before referring to them.

**Example:**

```
//+------------------------------------------------------------------+
//| Trade function                                                   |
//+------------------------------------------------------------------+
void OnTrade()
{
    //--- check if a position is present and display the time of its changing
```
if(PositionSelect(_Symbol))
{
    //--- receive position ID for further work
    ulong position_ID=PositionGetInteger(POSITION_IDENTIFIER);
    Print(_Symbol," position ",position_ID);
    //--- receive the time of position forming in milliseconds since 01.01.1970
    long create_time_msc=PositionGetInteger(POSITION_TIME_MSC);
    PrintFormat("Position ",position_ID,
        create_time_msc,TimeToString(create_time_msc/1000));
    //--- receive the time of the position's last change in seconds since 01.01.1970
    long update_time_sec=PositionGetInteger(POSITION_TIME_UPDATE);
    PrintFormat("Position ",position_ID,
        update_time_sec,TimeToString(update_time_sec));
    //--- receive the time of the position's last change in milliseconds since 01.01.1970
    long update_time_msc=PositionGetInteger(POSITION_TIME_UPDATE_MSC);
    PrintFormat("Position ",position_ID,
        update_time_msc,TimeToString(update_time_msc/1000));
}
//---

PositionGetSymbol(), PositionSelect(), Position Properties
PositionGetString

The function returns the requested property of an open position, pre-selected using PositionGetSymbol or PositionSelect. The position property should be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```cpp
string PositionGetString(
    ENUM_POSITION_PROPERTY_STRING property_id, // Property identifier
);
```

2. Returns true or false, depending on the success of the function execution. If successful, the value of the property is placed in a receiving variables passed by reference by the last parameter.

```cpp
bool PositionGetString(
    ENUM_POSITION_PROPERTY_STRING property_id, // Property identifier
    string& string_var // Here we accept the property value
);
```

Parameters

- **property_id**
  
  [in] Identifier of a position property. The value can be one of the values of the ENUM_POSITION_PROPERTY_STRING enumeration.

- **string_var**
  
  [out] Variable of the string type accepting the value of the requested property.

Return Value

Value of the string type. If the function fails, an empty string is returned.

Note

For the “netting” interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE.Exchange), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE.RETAIL.HEDGING), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call PositionSelect() right before referring to them.

See also

- PositionGetSymbol(), PositionSelect(), Position Properties
PositionGetTicket

The function returns the ticket of a position with the specified index in the list of open positions and automatically selects the position to work with using functions PositionGetDouble, PositionGetInteger, PositionGetString.

```
ulong PositionGetTicket(
    int index    // The number of a position in the list
);
```

Parameters

index

[in] The index of a position in the list of open positions, numeration starts with 0.

Return Value

The ticket of the position. Returns 0 if the function fails.

Note

For the “netting” interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call PositionSelect() right before referring to them.

See also

PositionGetSymbol(), PositionSelect(), Position Properties
OrdersTotal

Returns the number of current orders.

```cpp
int OrdersTotal();
```

**Return Value**

Value of the `int` type.

**Note**

Do not confuse current pending orders with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal. An order is a request to conduct a transaction, while a position is a result of one or more deals.

For the "netting" interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol.

**See also**

OrderSelect(), OrderGetTicket(), Order Properties
OrderGetTicket

Returns ticket of a corresponding order and automatically selects the order for further working with it using functions.

```c
ulong OrderGetTicket(
    int index  // Number in the list of orders
);
```

**Parameters**

`index`

[in] Number of an order in the list of current orders.

**Return Value**

Value of the `ulong` type. If the function fails, 0 is returned.

**Note**

Do not confuse current pending orders with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal. An order is a request to conduct a transaction, while a position is a result of one or more deals.

For the "netting" interpretation of positions (ACCOUNT_Margin_Mode_RETAIL_NETTING and ACCOUNT_Margin_Mode_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_Margin_Mode_RETAIL_HEDGING), multiple positions can be open for one symbol.

Function OrderGetTicket() copies data about an order into the program environment, and further calls of `OrderGetDouble()`, `OrderGetInteger()`, `OrderGetString()` return the earlier copied data. This means that the order itself may no longer exist (or its open price, Stop Loss/Take Profit levels or expiration has changed), but data of this order still can be obtained. To ensure receipt of fresh data about an order, it is recommended to call OrderGetTicket() right before referring to them.

**Example:**

```c
void OnStart()
{
    //--- variables for returning values from order properties
    ulong ticket;
    double open_price;
    double initial_volume;
    datetime time_setup;
    string symbol;
    string type;
    long order_magic;
    long positionID;
    //--- number of current pending orders
    uint total=OrdersTotal();
```
//--- go through orders in a loop
for(uint i=0;i<total;i++)
{
    //--- return order ticket by its position in the list
    if((ticket=OrderGetTicket(i))>0)
    {
        //--- return order properties
        open_price =OrderGetDouble(ORDER_PRICE_OPEN);
        time_setup =datetime(OrderGetInteger(ORDER_TIME_SETUP));
        symbol =OrderGetString(ORDER_SYMBOL);
        order_magic =OrderGetInteger(ORDER_MAGIC);
        positionID =OrderGetInteger(ORDER_POSITION_ID);
        initial_volume=OrderGetDouble(ORDER_VOLUME_INITIAL);
        type =EnumToString(ENUM_ORDER_TYPE(OrderGetInteger(ORDER_TYPE)));
        //--- prepare and show information about the order
        printf("#ticket %d %s %G %s at %G was set up at %s",
            ticket, // order ticket
            type, // type
            initial_volume, // placed volume
            symbol, // symbol
            open_price, // specified open price
            TimeToString(time_setup);// time of order placing
        );
    }
}
//---

See also
OrdersTotal(), OrderSelect(), OrderGetInteger()
**OrderSelect**

Selects an order to work with. Returns true if the function has been successfully completed. Returns false if the function completion has failed. For more information about an error call `GetLastError()`.

```c
bool OrderSelect(
    ulong ticket // Order ticket
);
```

**Parameters**

- `ticket`
  

**Return Value**

Value of the bool type.

**Note**

Do not confuse current pending orders with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](https://www.mql5.com/ru/manual?func(serializer+ACCOUNT_MARGIN_MODE_RETAIL_NETTING)) and [ACCOUNT_MARGIN_MODE_EXCHANGE](https://www.mql5.com/ru/manual?func(serializer+ACCOUNT_MARGIN_MODE_EXCHANGE)), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](https://www.mql5.com/ru/manual?func(serializer+ACCOUNT_MARGIN_MODE_RETAIL_HEDGING)), multiple positions can be open for one symbol.

Function `OrderSelect()` copies data about an order into the program environment, and further calls of `OrderGetDouble()`, `OrderGetInteger()`, `OrderGetString()` return the earlier copied data. This means that the order itself may no longer exist (or its open price, Stop Loss/Take Profit levels or expiration has changed), but data of this order still can be obtained. To ensure receipt of fresh data about an order, it is recommended to call `OrderSelect()` right before referring to them.

**See also**

**OrderGetDouble**

Returns the requested property of an order, pre-selected using *OrderGetTicket* or *OrderSelect*. The order property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```c
double OrderGetDouble(
    ENUM_ORDER_PROPERTY_DOUBLE property_id // Property identifier
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable passed by reference by the last parameter.

```c
bool OrderGetDouble(
    ENUM_ORDER_PROPERTY_DOUBLE property_id, // Property identifier
double& double_var // Here we accept the property value
);
```

**Parameters**

- `property_id`

  [in] Identifier of the order property. The value can be one of the values of the `ENUM_ORDER_PROPERTY_DOUBLE` enumeration.

- `double_var`

  [out] Variable of the double type that accepts the value of the requested property.

**Return Value**

Value of the `double` type. If the function fails, 0 is returned.

**Note**

Do not confuse current *pending orders* with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions (`ACCOUNT_MARGIN_MODE_RETAIL_NETTING` and `ACCOUNT_MARGIN_MODE.Exchange`), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid *pending orders*, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (`ACCOUNT_MARGIN_MODE_RETAIL_HEDGING`), multiple positions can be open for one symbol.

To ensure receipt of fresh data about an order, it is recommended to call *OrderSelect()* right before referring to them.

**See also**

OrderGetInteger

Returns the requested order property, pre-selected using OrderGetTicket or OrderSelect. Order property must be of the datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

   ```cpp
   long OrderGetInteger(
   ENUM_ORDER_PROPERTY_INTEGER property_id       // Property identifier
   );
   ```

2. Returns true or false depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

   ```cpp
   bool OrderGetInteger(
   ENUM_ORDER_PROPERTY_INTEGER property_id,       // Property identifier
   long& long_var                                  // Here we accept the property value
   );
   ```

Parameters

- `property_id` [in] Identifier of the order property. The value can be one of the values of the ENUM_ORDER_PROPERTY_INTEGER enumeration.

- `long_var` [out] Variable of the long type that accepts the value of the requested property.

Return Value

Value of the long type. If the function fails, 0 is returned.

Note

Do not confuse current pending orders with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions (ACCOUNT_MARGIN_MODE_RETAIL_NETTING and ACCOUNT_MARGIN_MODE_EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE_RETAIL_HEDGING), multiple positions can be open for one symbol.

To ensure receipt of fresh data about an order, it is recommended to call OrderSelect() right before referring to them.

See also

OrdersTotal(), OrderGetTicket(), Order Properties
OrderGetString

Returns the requested order property, pre-selected using OrderGetTicket or OrderSelect. The order property must be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```cpp
string OrderGetString(
    ENUM_ORDER_PROPERTY_STRING property_id, // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```cpp
bool OrderGetString(
    ENUM_ORDER_PROPERTY_STRING property_id, // Property identifier
    string& string_var // Here we accept the property value
);
```

Parameters

`property_id`

[in] Identifier of the order property. The value can be one of the values of the ENUM_ORDER_PROPERTY_STRING enumeration.

`string_var`

[out] Variable of the string type that accepts the value of the requested property.

Return Value

Value of the string type.

Note

Do not confuse current pending orders with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions (ACCOUNT_MARGIN_MODE RETAIL_NETTING and ACCOUNT_MARGIN_MODE EXCHANGE), only one position can exist for a symbol at any moment of time. This position is a result of one or more deals. Do not confuse positions with valid pending orders, which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed (ACCOUNT_MARGIN_MODE RETAIL HEDGING), multiple positions can be open for one symbol.

To ensure receipt of fresh data about an order, it is recommended to call OrderSelect() right before referring to them.

Trade Functions

**HistorySelect**

Retrieves the history of deals and orders for the specified period of server time.

```csharp
bool HistorySelect(
    datetime from_date, // From date
    datetime to_date   // To date
);
```

**Parameters**

- **from_date**
  - [in] Start date of the request.

- **to_date**
  - [in] End date of the request.

**Return Value**

It returns true if successful, otherwise returns false.

**Note**

HistorySelect() creates a list of orders and a list of trades in a mql5-program, for further referring to the list elements using corresponding functions. The deals list size can be returned using the HistoryDealsTotal() function; the size of the list of orders in the history can be obtained using HistoryOrdersTotal(). Selection in the list of orders should be better performed by HistoryOrderGetTicket(), for items in the list of deals HistoryDealGetTicket() suits better.

After using HistoryOrderSelect(), the list of history orders available to the mql5 program is reset and filled again by the found order, if the search of an order by the ticket has been completed successfully. The same applies to the list of deals available to the mql5 program - it is reset by HistoryDealSelect() and filled again in case of a successful receipt of a deal by ticket number.

**Example:**

```csharp
void OnStart()
{
    color BuyColor = clrBlue;
    color SellColor = clrRed;
    //--- request trade history
    HistorySelect(0, TimeCurrent());
    //--- create objects
    string name;
    uint total=HistoryDealsTotal();
    ulong ticket=0;
    double price;
    double profit;
    datetime time;
    string symbol;
    long type;
    long entry;
    //--- for all deals
```
for (uint i=0; i<total; i++)
{
    //--- try to get deals ticket
    if ((ticket = HistoryDealGetTicket(i)) > 0)
    {
        //--- get deals properties
        price = HistoryDealGetDouble(ticket, DEAL_PRICE);
        time = (datetime) HistoryDealGetInteger(ticket, DEAL_TIME);
        symbol = HistoryDealGetString(ticket, DEAL_SYMBOL);
        type = HistoryDealGetInteger(ticket, DEAL_TYPE);
        entry = HistoryDealGetInteger(ticket, DEAL_ENTRY);
        profit = HistoryDealGetDouble(ticket, DEAL_PROFIT);
        //--- only for current symbol
        if (price && time && symbol == Symbol())
        {
            //--- create price object
            name = "TradeHistoryDeal" + string(ticket);
            if (entry) ObjectCreate(0, name, OBJ_ARROW_RIGHT_PRICE, 0, time, price, 0, 0);
            else ObjectCreate(0, name, OBJ_ARROW_LEFT_PRICE, 0, time, price, 0, 0);
            //--- set object properties
            ObjectSetInteger(0, name, OBJPROP_SELECTABLE, 0);
            ObjectSetInteger(0, name, OBJPROP_BACK, 0);
            ObjectSetInteger(0, name, OBJPROP_COLOR, type ? BuyColor : SellColor);
            if (profit != 0) ObjectSetString(0, name, OBJPROP_TEXT, "Profit: " + string(profit));
        }
    }
}
//--- apply on chart
ChartRedraw();

See also

HistoryOrderSelect(), HistoryDealSelect()
**HistorySelectByPosition**

Retrieves the history of deals and orders having the specified position identifier.

```cpp
bool HistorySelectByPosition(
    long position_id    // position identifier - POSITION_IDENTIFIER
);
```

**Parameters**

- `position_id`
  - [in] Position identifier that is set to every executed order and every deal.

**Return Value**

- It returns true if successful, otherwise returns false.

**Note**

Do not confuse orders of a trading history with current pending orders that appear on the “Trade” tab of the “Toolbox” bar. The list of orders that were canceled or have led to a transaction, can be viewed in the “History” tab of “Toolbox” of the client terminal.

HistorySelectByPosition() creates in a mql5 program a list of orders and a list of deals with a specified position identifier for further reference to the elements of the list using the appropriate functions. To know the size of the list of deals, use function HistoryDealsTotal(), the size of the list of orders in the history can be obtained using HistoryOrdersTotal(). To run through elements of the orders list, use HistoryOrderGetTicket(), for elements of the deals list - HistoryDealGetTicket().

After using HistoryOrderSelect(), list of history orders available to the mql5 program is reset and filled again with the found order, if search of an order by its ticket was successful. The same refers to the list of deals available to the mql5 program - it is reset by function HistoryDealSelect() and is filled out again if a deal was found successfully by the ticket number.

**See also**

- HistorySelect(), HistoryOrderGetTicket(), Order Properties
**HistoryOrderSelect**

Selects an order from the history for further calling it through appropriate functions. It returns true if the function has been successfully completed. Returns false if the function has failed. For more details on error call `GetLastError()`.

```cpp
bool HistoryOrderSelect(
    ulong ticket // Order ticket
);
```

**Parameters**

*ticket*

**Return Value**

Returns true if successful, otherwise false.

**Note**

Do not confuse orders of a trading history with current pending orders that appear on the “Trade” tab of the “Toolbox” bar. The list of orders that were canceled or have led to a transaction, can be viewed in the “History” tab of “Toolbox” of the client terminal.

HistoryOrderSelect() clears in a mql5-program the list of orders from a history, available for calls, and copies to it a single order, if the execution of `HistoryOrderSelect()` has been completed successfully. If you need to go through all deals selected by `HistorySelect()`, you should better use `HistoryOrderGetTicket()`.

**See also**

`HistorySelect()`, `HistoryOrderGetTicket()`, `Order Properties`
**HistoryOrdersTotal**

Returns the number of orders in the history. Prior to calling `HistoryOrdersTotal()`, first it is necessary to receive the history of deals and orders using the `HistorySelect()` or `HistorySelectByPosition()` function.

```c
int HistoryOrdersTotal();
```

**Return Value**

Value of the `int` type.

**Note**

Do not confuse orders of a trading history with current pending orders that appear on the "Trade" tab of the "Toolbox" bar. The list of orders that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

**See also**

`HistorySelect()`, `HistoryOrderSelect()`, `HistoryOrderGetTicket()`, `Order Properties`
HistoryOrderGetTicket

Return the ticket of a corresponding order in the history. Prior to calling HistoryOrderGetTicket(), first it is necessary to receive the history of deals and orders using the HistorySelect() or HistorySelectByPosition() function.

```csharp
ulong HistoryOrderGetTicket(
    int index // Number in the list of orders
);
```

Parameters

**index**
- [in] Number of the order in the list of orders.

Return Value

Value of the `ulong` type. If the function fails, 0 is returned.

Note

Do not confuse orders of a trading history with current pending orders that appear on the "Trade" tab of the "Toolbox" bar. The list of orders that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

Example:

```csharp
void OnStart()
{
    datetime from=0;
    datetime to=TimeCurrent();
    //--- request the entire history
    HistorySelect(from,to);
    //--- variables for returning values from order properties
    ulong ticket;
    double open_price;
    double initial_volume;
    datetime time_setup;
    datetime time_done;
    string symbol;
    string type;
    long order_magic;
    long positionID;
    //--- number of current pending orders
    uint total=HistoryOrdersTotal();
    //--- go through orders in a loop
    for(uint i=0;i<total;i++)
    {
        //--- return order ticket by its position in the list
        if((ticket=HistoryOrderGetTicket(i))>0)
        {
            //--- return order properties
```
Trade Functions

open_price = HistoryOrderGetDouble(ticket, ORDER_PRICE_OPEN);
time_setup = (datetime) HistoryOrderGetInteger(ticket, ORDER_TIME_SETUP);
time_done = (datetime) HistoryOrderGetInteger(ticket, ORDER_TIME_DONE);
symbol = HistoryOrderGetString(ticket, ORDER_SYMBOL);
order_magic = HistoryOrderGetInteger(ticket, ORDER_MAGIC);
positionID = HistoryOrderGetInteger(ticket, ORDER_POSITION_ID);
initial_volume = HistoryOrderGetDouble(ticket, ORDER_VOLUME_INITIAL);
type = GetOrderType(HistoryOrderGetInteger(ticket, ORDER_TYPE));

//--- prepare and show information about the order
printf("#ticket %d %s %G %s at %G was set up at %s -> done at %s, pos ID=%d",
    ticket,       // order ticket
type,         // type
initial_volume,  // placed volume
symbol,       // symbol
open_price,    // specified open price
TimeToString(time_setup), // time of order placing
TimeToString(time_done), // time of order execution or deletion
positionID     // ID of a position , to which the deal of t
)
;
}

string GetOrderType(long type)
{
    string str_type="unknown operation";
    switch(type)
    {
        case (ORDER_TYPE_BUY): return("buy");
        case (ORDER_TYPE_SELL): return("sell");
        case (ORDER_TYPE_BUY_LIMIT): return("buy limit");
        case (ORDER_TYPE_SELL_LIMIT): return("sell limit");
        case (ORDER_TYPE_BUY_STOP): return("buy stop");
        case (ORDER_TYPE_SELL_STOP): return("sell stop");
        case (ORDER_TYPE_BUY_STOP_LIMIT): return("buy stop limit");
        case (ORDER_TYPE_SELL_STOP_LIMIT): return("sell stop limit");
    }
    return(str_type);
}

HistorySelect(), HistoryOrdersTotal(), HistoryOrderSelect(), Order Properties
**HistoryOrderGetDouble**

Returns the requested order property. The order property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```c
double HistoryOrderGetDouble(
    ulong ticket_number, // Ticket
    ENUM_ORDER_PROPERTY_DOUBLE property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```c
bool HistoryOrderGetDouble(
    ulong ticket_number, // Ticket
    ENUM_ORDER_PROPERTY_DOUBLE property_id, // Property identifier
    double& double_var // Here we accept the property value
);
```

**Parameters**

- `ticket_number`  

- `property_id`  
  [in] Identifier of the order property. The value can be one of the values of the `ENUM_ORDER_PROPERTY_DOUBLE` enumeration.

- `double_var`  
  [out] Variable of the double type that accepts the value of the requested property.

**Return Value**

Value of the `double` type.

**Note**

Do not confuse orders of a trading history with current pending orders that appear on the “Trade” tab of the “Toolbox” bar. The list of orders that were canceled or have led to a transaction, can be viewed in the “History” tab of “Toolbox” of the client terminal.

**See also**

- `HistorySelect()`, `HistoryOrdersTotal()`, `HistoryOrderSelect()`, `Order Properties`
HistoryOrderGetInteger

Returns the requested property of an order. The order property must be of datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

```cpp
long HistoryOrderGetInteger(
    ulong ticket_number,  // Ticket
    ENUM_ORDER_PROPERTY_INTEGER property_id  // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```cpp
bool HistoryOrderGetInteger(
    ulong ticket_number,  // Ticket
    ENUM_ORDER_PROPERTY_INTEGER property_id,  // Property identifier
    long& long_var  // Here we accept the property value
);
```

Parameters

- `property_id` [in] Identifier of the order property. The value can be one of the values of the `ENUM_ORDER_PROPERTY_INTEGER` enumeration.
- `long_var` [out] Variable of the long type that accepts the value of the requested property.

Return Value

Value of the `long` type.

Note

Do not confuse orders of a trading history with current pending orders that appear on the “Trade” tab of the “Toolbox” bar. The list of orders that were canceled or have led to a transaction, can be viewed in the “History” tab of “Toolbox” of the client terminal.

Example:

```cpp
//+------------------------------------------------------------------+
//| Trade function                                                   |
//+------------------------------------------------------------------+
void OnTrade()
{
    //--- receive the last order's ticket from week's trading history
    ulong last_order=GetLastOrderTicket();
    if(HistoryOrderSelect(last_order))
```
 Trade Functions

```c
{
    //--- time of placing an order in milliseconds since 01.01.1970
    long time_setup_msc=HistoryOrderGetInteger(last_order, ORDER_TIME_SETUP_MSC);
    PrintFormat("Order #%d ORDER_TIME_SETUP_MSC=%ld -> %s",
                last_order, time_setup_msc, TimeToString(time_setup_msc/1000));
    //--- order execution/cancellation time in milliseconds since 01.01.1970
    long time_done_msc=HistoryOrderGetInteger(last_order, ORDER_TIME_DONE_MSC);
    PrintFormat("Order #%d ORDER_TIME_DONE_MSC=%ld -> %s",
                last_order, time_done_msc, TimeToString(time_done_msc/1000));
}
else // notify on failure
    PrintFormat("HistoryOrderSelect() failed for #%d. Error code=%ld",
                last_order, GetLastError());

//---
}

//+------------------------------------------------------------------+
//| Returns the last order ticket in history or -1                   |
//+------------------------------------------------------------------+

        Print(__FUNCTION__," HistorySelect() returned false");
        return -1;
    }
    //---
    ulong first_order,last_order,orders=HistoryOrdersTotal();
    //--- work with orders if there are any
    if(orders>0)
    {
        Print("Orders = ",orders);
        first_order=HistoryOrderGetTicket(0);
        PrintFormat("first_order = %d",first_order);
        if(orders>1)
        {
            last_order=HistoryOrderGetTicket((int)orders-1);
            PrintFormat("last_order = %d",last_order);
            return last_order;
        }
        return first_order;
    }
    //--- no order found, return -1
    return -1;
}
//+------------------------------------------------------------------+
//| Requests history for the last days and returns false in case of failure |
```

bool GetTradeHistory(int days)
{
    //--- set a week period to request trade history
    datetime to=TimeCurrent();
    datetime from=to-days*PeriodSeconds(PERIOD_D1);
    ResetLastError();
    //--- make a request and check the result
    if(!(HistorySelect(from,to))
    {
        Print(__FUNCTION__," HistorySelect=false. Error code=",GetLastError());
        return false;
    }
    //--- history received successfully
    return true;
}

HistorySelect(), HistoryOrdersTotal(), HistoryOrderSelect(), Order Properties
**HistoryOrderGetString**

Returns the requested property of an order. The order property must be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```csharp
string HistoryOrderGetString(
    ulong ticket_number,   // Ticket
    ENUM_ORDER_PROPERTY_STRING property_id  // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```csharp
bool HistoryOrderGetString(
    ulong ticket_number,   // Ticket
    ENUM_ORDER_PROPERTY_STRING property_id,  // Property identifier
    string& string_var    // Here we accept the property value
);
```

**Parameters**

- `ticket_number`  

- `property_id`  
  [in] Identifier of the order property. The value can be one of the values of the `ENUM_ORDER_PROPERTY_STRING` enumeration.

- `string_var`  
  [out] Variable of the string type.

**Return Value**

Value of the `string` type.

**Note**

Do not confuse orders of a trading history with current pending orders that appear on the “Trade” tab of the “Toolbox” bar. The list of orders that were canceled or have led to a transaction, can be viewed in the “History” tab of “Toolbox” of the client terminal.

**See also**

- `HistorySelect()`, `HistoryOrdersTotal()`, `HistoryOrderSelect()`, `Order Properties`
**HistoryDealSelect**

Selects a deal in the history for further calling it through appropriate functions. It returns true if the function has been successfully completed. Returns false if the function has failed. For more details on error call `GetLastError()`.

```c
bool HistoryDealSelect(
    ulong ticket  // Deal ticket
);
```

**Parameters**

*ticket*
  - [in] Deal ticket.

**Return Value**

Returns true if successful, otherwise false.

**Note**

Do not confuse *orders*, *deals* and *positions*. Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

`HistoryDealSelect()` clears in a mql5-program the list of deals available for reference, and copies the single deal, if the execution of `HistoryDealSelect()` has been completed successfully. If you need to go through all deals selected by the `HistorySelect()` function, you should better use `HistoryDealGetTicket()`.

**See also**

`HistorySelect()`, `HistoryDealGetTicket()`, `Deal Properties`
HistoryDealsTotal

Returns the number of deal in history. Prior to calling HistoryDealsTotal(), first it is necessary to receive the history of deals and orders using the HistorySelect() or HistorySelectByPosition() function.

```c
int HistoryDealsTotal();
```

Return Value

Value of the int type.

Note

Do not confuse orders, deals and positions. Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

See also

HistorySelect(), HistoryDealGetTicket(), Deal Properties
**HistoryDealGetTicket**

The function selects a deal for further processing and returns the deal ticket in history. Prior to calling HistoryDealGetTicket(), first it is necessary to receive the history of deals and orders using the HistorySelect() or HistorySelectByPosition() function.

```c
ulong HistoryDealGetTicket(
    int index         // ticket deal
);
```

**Parameters**

- **index**
  - [in] Number of a deal in the list of deals

**Return Value**

Value of the `ulong` type. If the function fails, 0 is returned.

**Note**

Do not confuse orders, deals and positions. Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

**Example:**

```c
void OnStart()
{
    ulong deal_ticket;         // deal ticket
    ulong order_ticket;        // ticket of the order the deal was executed on
    datetime transaction_time; // time of a deal execution
    long deal_type;            // type of a trade operation
    long position_ID;          // position ID
    string deal_description;   // operation description
    double volume;             // operation volume
    string symbol;             // symbol of the deal

    //--- set the start and end date to request the history of deals
    datetime from_date=0;      // from the very beginning
    datetime to_date=TimeCurrent(); // till the current moment

    //--- request the history of deals in the specified period
    HistorySelect(from_date, to_date);

    //--- total number in the list of deals
    int deals=HistoryDealsTotal();

    //--- now process each trade
    for(int i=0; i<deals; i++)
    {
        deal_ticket=HistoryDealGetTicket(i);
        volume=HistoryDealGetDouble(deal_ticket, DEAL_VOLUME);
        transaction_time=(datetime)HistoryDealGetInteger(deal_ticket, DEAL_TIME);
        order_ticket=HistoryDealGetInteger(deal_ticket, DEAL_ORDER);
        deal_type=HistoryDealGetInteger(deal_ticket, DEAL_TYPE);
        symbol=HistoryDealGetString(deal_ticket, DEAL_SYMBOL);
    }
}
```
position_ID= HistoryDealGetInteger(deal_ticket,DEAL_POSITION_ID);
deal_description= GetDealDescription(deal_type,volume,symbol,order_ticket,pos_ID);

//--- perform fine formatting for the deal number
string print_index=StringFormat("% 3d",i);
//--- show information on the deal
Print(print_index+": deal #",deal_ticket," at ",transaction_time,deal_description);
}
}

//+------------------------------------------------------------------+
//| Returns the string description of the operation                  |
//+------------------------------------------------------------------+
string GetDealDescription(long deal_type,double volume,string symbol,long ticket,long pos_ID)
{

**HistoryDealGetDouble**

Returns the requested property of a deal. The deal property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```csharp
double HistoryDealGetDouble(
    ulong ticket_number, // Ticket
    ENUM DEAL PROPERTY DOUBLE property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```csharp
bool HistoryDealGetDouble(
    ulong ticket_number, // Ticket
    ENUM DEAL PROPERTY DOUBLE property_id, // Property identifier
    double& double_var // Here we accept the property value
);
```

**Parameters**

- `ticket_number`
  
  [in] Deal ticket.

- `property_id`
  
  [in] Identifier of a deal property. The value can be one of the values of the `ENUM DEAL PROPERTY DOUBLE` enumeration.

- `double_var`
  
  [out] Variable of the double type that accepts the value of the requested property.

**Return Value**

Value of the `double` type.

**Note**

Do not confuse `orders`, `deals` and `positions`. Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

**See also**

- `HistorySelect()`, `HistoryDealsTotal()`, `HistoryDealGetTicket()`, `Deal Properties`
HistoryDealGetInteger

Returns the requested property of a deal. The deal property must be of the datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

```c
long HistoryDealGetInteger(
    ulong ticket_number,    // Ticket
    ENUM_DEALPROPERTYINTEGER property_id, // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```c
bool HistoryDealGetInteger(
    ulong ticket_number,    // Ticket
    ENUM_DEALPROPERTYINTEGER property_id, // Property identifier
    long& long_var,         // Here we accept the property value
);
```

Parameters

ticket_number

property_id
    [in] Identifier of the deal property. The value can be one of the values of the ENUM_DEALPROPERTYINTEGER enumeration.

long_var
    [out] Variable of the long type that accepts the value of the requested property.

Return Value

Value of the long type.

Note

Do not confuse orders, deals and positions. Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

Example:

```c
//+------------------------------------------------------------------+
//| Trade function                                                   |
//+------------------------------------------------------------------+
void OnTrade()
{
    //--- receive the last deal's ticket from week's trading history
    ulong last_deal=GetLastDealTicket();
    if(HistoryDealSelect(last_deal))
    {
```
//--- time of deal execution in milliseconds since 01.01.1970
long deal_time_msc=HistoryDealGetInteger(last_deal,DEAL_TIME_MSC);
PrintFormat("Deal #%d DEAL_TIME_MSC=%i64 => %s", last_deal,deal_time_msc,TimeToString(deal_time_msc/1000));
}
else
PrintFormat("HistoryDealSelect() failed for #%d. Error code=%d", last_deal,GetLastError());
//---

ulong GetLastDealTicket()
{
//--- request history for the last 7 days
if(!GetTradeHistory(7))
{
   //--- notify on unsuccessful call and return -1
   Print(__FUNCTION__," HistorySelect() returned false");
   return -1;
}
//---
ulong first_deal,last_deal,deals=HistoryOrdersTotal();
//--- work with orders if there are any
if(deals>0)
{
   Print("Deals = ",deals);
   first_deal=HistoryDealGetTicket(0);
   PrintFormat("first_deal = %d",first_deal);
   if(deals>1)
   {
      last_deal=HistoryDealGetTicket((int)deals-1);
      PrintFormat("last_deal = %d",last_deal);
      return last_deal;
   }
   return first_deal;
}
//--- no deal found, return -1
return -1;
//---
bool GetTradeHistory(int days)
{
//--- set a week period to request trade history
datetime to=TimeCurrent();
datetime from=to-days*PeriodSeconds(PERIOD_D1);
```
ResetLastError();
//--- make a request and check the result
if(!HistorySelect(from,to))
{
    Print(__FUNCTION__," HistorySelect=false. Error code=",GetLastError());
    return false;
}
//--- history received successfully
return true;
```

HistoryDealGetString

Returns the requested property of a deal. The deal property must be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```csharp
string HistoryDealGetString(ulong ticket_number, ENUM DEAL PROPERTY STRING property_id);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```csharp
bool HistoryDealGetString(ulong ticket_number, ENUM DEAL PROPERTY STRING property_id, string_var);
```

Parameters

ticket_number  [in]  Deal ticket.

property_id  [in]  Identifier of the deal property. The value can be one of the values of the ENUM DEAL PROPERTY STRING enumeration.

string var  [out]  Variable of the string type that accepts the value of the requested property.

Return Value

Value of the string type.

Note

Do not confuse orders, deals and positions. Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

# Trade Signals

This is the group of functions intended for managing trade signals. The functions allow:

- get information about trade signals, available for copying,
- get and set the signal copy settings,
- subscribe and unsubscribe to the signal copying using MQL5 language functions.

<table>

SignalBaseGetDouble

Returns the value of `double` type property for selected signal.

```c
double SignalBaseGetDouble(
    ENUM_SIGNAL_BASE_DOUBLE property_id,  // property identifier
);
```

Parameters

`property_id`

[in] Signal property identifier. The value can be one of the values of the `ENUM_SIGNAL_BASE_DOUBLE` enumeration.

Return Value

The value of `double` type property of the selected signal.
SignalBaseGetInteger

Returns the value of integer type property for selected signal.

```c
long SignalBaseGetInteger(
    ENUM_SIGNAL_BASE_INTEGER property_id,  // property identifier
);
```

Parameters

- `property_id`
  - [in] Signal property identifier. The value can be one of the values of the `ENUM_SIGNAL_BASE_INTEGER` enumeration.

Return Value

The value of integer type property of the selected signal.
**SignalBaseGetString**

Returns the value of `string` type property for selected signal.

```c
string SignalBaseGetString(
    ENUM_SIGNAL_BASE_STRING property_id,  // property identifier
);
```

**Parameters**

`property_id`

[in] Signal property identifier. The value can be one of the values of the `ENUM_SIGNAL_BASE_STRING` enumeration.

**Return Value**

The value of `string` type property of the selected signal.
**SignalBaseSelect**

Selects a signal from signals, available in terminal for further working with it.

```cpp
bool SignalBaseSelect(  
    int index  // signal index
);
```

**Parameters**

*index*  
[in] Signal index in base of trading signals.

**Return Value**

Returns true if successful, otherwise returns false. To read more about the error call `GetLastError()`.

**Example:**

```cpp
void OnStart()  
{  
    //--- get total amount of signals in the terminal  
    int total=SignalBaseTotal();  
    //--- process all signals  
    for(int i=0;i<total;i++)  
    {  
        //--- select the signal by index  
        if(SignalBaseSelect(i))  
        {  
            //--- get signal properties  
            long id   =SignalBaseGetInteger(SIGNAL_BASE_ID);    // signal id  
            long pips =SignalBaseGetInteger(SIGNAL_BASE_PIPS);  // profit in pips  
            long subscr=SignalBaseGetInteger(SIGNAL_BASE_SUBSCRIBERS);  // number of subscribers  
            string name =SignalBaseGetString(SIGNAL_BASE_NAME);  // signal name  
            double price =SignalBaseGetDouble(SIGNAL_BASE_PRICE);  // signal price  
            string curr  =SignalBaseGetString(SIGNAL_BASE_CURRENCY);  // signal currency  
            //--- print all profitable free signals with subscribers  
            if(price==0.0 && pips>0 && subscr>0)  
                PrintFormat("id=%d, name="%s", currency="%s", pips=%d, subscribers=%d",id,
            }  
        else PrintFormat("Error in call of SignalBaseSelect. Error code=%d",GetLastError());  
    }
}
```
**SignalBaseTotal**

Returns the total amount of signals, available in terminal.

```c
int SignalBaseTotal();
```

**Return Value**

The total amount of signals, available in terminal.
SignalInfoGetDouble

Returns the value of double type property of signal copy settings.

```c
double SignalInfoGetDouble(
    ENUM_SIGNAL_INFO_DOUBLE property_id,    // property identifier
);
```

Parameters

property_id

[in] Signal copy settings property identifier. The value can be one of the values of the ENUM_SIGNAL_INFO_DOUBLE enumeration.

Return Value

The value of double type property of signal copy settings.
**SignalInfoGetInteger**

Returns the value of *integer* type property of signal copy settings.

```c
long SignalInfoGetInteger(
    ENUM_SIGNAL_INFO_INTEGER property_id,  // property identifier
);
```

**Parameters**

*property_id*

[in] Signal copy settings property identifier. The value can be one of the values of the `ENUM_SIGNAL_INFO_INTEGER` enumeration.

**Return Value**

The value of *integer* type property of signal copy settings.
SignalInfoGetString

Returns the value of string type property of signal copy settings.

```cpp
string SignalInfoGetString(
    ENUM_SIGNAL_INFO_STRING property_id, // property identifier
);
```

**Parameters**

- `property_id`
  - [in] Signal copy settings property identifier. The value can be one of the values of the `ENUM_SIGNAL_INFO_STRING` enumeration.

**Return Value**

The value of string type property of signal copy settings.
**SignalInfoSetDouble**

Sets the value of double type property of signal copy settings.

```c
bool SignalInfoSetDouble(
    ENUM_SIGNAL_INFO_DOUBLE property_id, // property identifier
    double value // new value
);
```

**Parameters**

- `property_id`
  - `[in]` Signal copy settings property identifier. The value can be one of the values of the `ENUM_SIGNAL_INFO_DOUBLE` enumeration.

- `value`

**Return Value**

Returns true if property has been changed, otherwise returns false. To read more about the error call `GetLastError()`.
SignalInfoSetInteger

Sets the value of integer type property of signal copy settings.

```c
bool SignalInfoSetInteger(
    ENUM_SIGNAL_INFO_INTEGER property_id,  // property identifier
    long value);  // new value
```

**Parameters**

- `property_id`
  - [in] Signal copy settings property identifier. The value can be one of the values of the `ENUM_SIGNAL_INFO_INTEGER` enumeration.

- `value`

**Return Value**

Returns true if property has been changed, otherwise returns false. To read more about the error call `GetLastError()`.
SignalSubscribe

Subscribes to the trading signal.

```cpp
bool SignalSubscribe(
    long signal_id  // signal id
);
```

Parameters

* signal_id
  * [in] Signal identifier.

Return Value

Returns true if subscription was successful, otherwise returns false. To read more about the error call GetLastError().
SignalUnsubscribe

Cancels subscription.

```cpp
bool SignalUnsubscribe();
```

**Return Value**

Returns true if subscription has been canceled successfully, otherwise returns false. To read more about the error call GetLastError().
Network functions

MQL5 programs can exchange data with remote servers, as well as send push notifications, emails and data via FTP.

- The **Socket** group of functions allows establishing a TCP connection (including a secure TLS) with a remote host via system sockets. The operation principle is simple: create a socket, connect to the server and start reading and writing data.
- The **WebRequest** function is designed to work with web resources and allows sending HTTP requests (including GET and POST) easily.
- **SendFTP**, **SendMail** and **SendNotification** are more simple functions for sending files, emails and mobile notifications.

For end-user security, the list of allowed IP addresses is implemented on the client terminal side. The list contains IP addresses the MQL5 program is allowed to connect to via the Socket* and WebRequest functions. For example, if the program needs to connect to https://www.someserver.com, this address should be explicitly indicated by a terminal user in the list. An address cannot be added programmatically.

Add an explicit message to the MQL5 program to notify a user of the need for additional configuration. You can do that via #property description, Alert or Print.

</table>
SocketCreate

Create a socket with specified flags and return its handle.

```c
int SocketCreate(
    uint flags // flags
);
```

Parameters

flags
- [in] Combination of flags defining the mode of working with a socket. Currently, only one flag is supported – SOCKET_DEFAULT.

Return Value

In case of a successful socket creation, return its handle, otherwise INVALID_HANDLE.

Notes

To free up computer memory from an unused socket, call SocketClose for it.

You can create a maximum of 128 sockets from one MQL5 program. If the limit is exceeded, the error 5271 (ERR_NETSOCKET_TOO_MANY_OPENED) is written to GetLastError.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, GetLastError() returns the error 4014 – “Function is not allowed for call”.

Example:

```c
//+------------------------------------------------------------------+

            }  
         else  
            {  
               Print("Failed to create a socket, error ",GetLastError());  
            }  
      }  
   //+------------------------------------------------------------------+
```
SocketClose

Close a socket.

```cpp
bool SocketClose(
    const int socket  // socket handle
);
```

**Parameters**

*socket*

[in] Handle of a socket to be closed. The handle is returned by the `SocketCreate` function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to `LastError`.

**Return Value**

Returns true if successful, otherwise false.

**Note**

If a connection via `SocketConnect` was previously created for a socket, it is discontinued.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - “Function is not allowed for call”.

**Example:**

```cpp
//+------------------------------------------------------------------+
//|                                                SocketExample.mq5 |
//|                        Copyright 2018, MetaQuotes Software Corp. |
//|                                             https://www.mql5.com |
//+------------------------------------------------------------------+

bool HTTPSend(int socket, string request)
{
    char req[];
    int len=StringToCharArray(request, req)-1;
    if(len<0)
        return(false);
```
if (ExtTLS)
    return (SocketTlsSend(socket, req, len) == len);
if (ExtTLS)
    return (SocketTlsRead(socket, rsp, len) == len);
else
    return (SocketRead(socket, rsp, len, timeout) == len);

while (GetTickCount() < timeout_check && !IsStopped())
    return (false);

void OnStart()
{
int socket=SocketCreate();
//--- check the handle
if(socket!=INVALID_HANDLE)
{
    //--- connect if all is well
    if(SocketConnect(socket,Address,Port,1000))
    {
        Print("Established connection to ",Address,";",Port);

        string  subject, issuer, serial, thumbprint;
        datetime expiration;
        //--- if connection is secured by the certificate, display its data
        if(SocketTlsCertificate(socket,subject,issuer,serial,thumbprint,expiration))
        {
            Print("TLS certificate:");
            Print("   Owner:  ",subject);
            Print("   Issuer:  ",issuer);
            Print("   Number:     ",serial);
            Print("   Print: ",thumbprint);
            Print("   Expiration: ",expiration);
            ExtTLS=true;
        }
        //--- send GET request to the server
        if(HTTPSend(socket,"GET / HTTP/1.1\r\n\nHost: www.mql5.com\r\n\n"))
        {
            Print("GET request sent");
            //--- read the response
            if(!HTTPRecv(socket,1000))
                Print("Failed to get a response, error ",GetLastError());
            else
                Print("Failed to send GET request, error ",GetLastError());
        }
        else
        {
            Print("Connection to ",Address,";",Port," failed, error ",GetLastError());
        }
        //--- close a socket after using
        SocketClose(socket);
    }
    else
        Print("Failed to create a socket, error ",GetLastError());
}
//+------------------------------------------------------------------+
# SocketConnect

Connect to the server with timeout control.

```c
bool SocketConnect(
    int socket,         // socket
    const string server, // connection address
    uint port,          // connection port
    uint timeout_receive_ms // connection timeout
);
```

## Parameters

- **socket**
  - [in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to `__LastError`.

- **server**
  - [in] Domain name of the server you want to connect to or its IP address.

- **port**
  - [in] Connection port number.

- **timeout_receive_ms**
  - [in] Connection timeout in milliseconds. If connection is not established within that time interval, attempts are stopped.

## Return Value

If connection is successful, return true, otherwise false.

## Note

Connection address should be added to the list of allowed ones on the client terminal side (Tools \ Options \ Expert Advisors).

If connection fails, error 5272 (ERR_NETSOCKET_CANNOT_CONNECT) is written to `__LastError`.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - "Function is not allowed for call".

## Example:

```c
//+------------------------------------------------------------------+
//|                                                SocketExample.mq5 |

                Print(" Issuer: " , issuer);
                Print(" Number: " , serial);
                Print(" Print: " , thumbprint);
                Print(" Expiration: " , expiration);
                ExtTls = true;
            }
        }
        else
        {
            Print("Failed to send GET request, error ", GetLastError());
        }
    }
    else
    {
        Print("Connection to ", Address, ":", Port, " failed, error ", GetLastError());
    }
}
}  
//--- close a socket after using  
SocketClose(socket);  
}
else
    Print("Failed to create a socket, error ", GetLastError());

//+------------------------------------------------------------------+
SocketIsConnected

Checks if the socket is currently connected.

```c
bool SocketIsConnected(
    const int socket  // socket handle
);
```

**Parameters**

socket

[in] Socket handle returned by the `SocketCreate()` function. When an incorrect handle is passed to `LastError`, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

**Return Value**

Returns true if the socket is connected, otherwise - false.

**Note**

The `SocketIsConnected()` function allows checking the current socket connection status.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - "Function is not allowed for call".

**See also**

`SocketConnect`, `SocketIsWritable`, `SocketCreate`, `SocketClose`
SocketIsReadable

Get a number of bytes that can be read from a socket.

```c
uint SocketIsReadable(
    const int socket // socket handle
);
```

**Parameters**

socket:

- [in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed to `LastError`, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

**Return Value**

Number of bytes that can be read. In case of an error, 0 is returned.

**Note**

If an error occurs on a system socket when executing the function, connection established via `SocketConnect` is discontinued.

Before calling `SocketRead`, check if the socket features data for reading. Otherwise, if there are no data, the `SocketRead` function waits for data within `timeout_ms` delaying the program execution.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - “Function is not allowed for call”.

**Example:**

```c
//+------------------------------------------------------------------+
//|                                                SocketExample.mq5  |

                Print("   Expiration: ",expiration);
                ExtTLS=true;
            }
            //--- send GET request to the server
            if(HTTPSend(socket,"GET / HTTP/1.1\r\nHost: www.mql5.com\r\n\r\n"))
            {
                Print("GET request sent");
                //--- read the response
                if(!HTTPRecv(socket,1000))
                    Print("Failed to get a response, error ",GetLastError());
            }
            else
                Print("Failed to send GET request, error ",GetLastError());
        }
        else
            Print("Failed to create a socket, error ",GetLastError());
    }
    //--- close a socket after using
    SocketClose(socket);
}
else
    Print("Failed to create a socket, error ",GetLastError());
**SocketIsWritable**

Check whether data can be written to a socket at the current time.

```cpp
bool SocketIsWritable(
    const int socket // socket handle
);
```

**Parameters**

socket

[in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to `_LastError`.

**Return Value**

Return true if writing is possible, otherwise false.

**Note**

This function allows you to check whether it is possible to write data to a socket right now.

If an error occurs on a system socket when executing the function, connection established via `SocketConnect` is discontinued.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - "Function is not allowed for call".
SocketTimeouts

Set timeouts for receiving and sending data for a socket system object.

```cpp
bool SocketTimeouts(
    int socket,            // socket
    uint timeout_send_ms,  // data sending timeout
    uint timeout_receive_ms // data obtaining timeout
);
```

Parameters

- **socket**
  - [in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to `LastError`.

- **timeout_send_ms**
  - [in] Data sending timeout in milliseconds.

- **timeout_receive_ms**
  - [in] Data obtaining timeout in milliseconds.

Return Value

Returns true if successful, otherwise false.

Note

Do not confuse system object timeouts with the ones set when reading data via `SocketRead`. `SocketTimeout` sets timeouts once for a socket object in the operating system. These timeouts are to be applied to all functions for reading and sending data via this socket. In `SocketRead`, the timeout is set for a certain data reading operation.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - “Function is not allowed for call”.
**SocketRead**

Read data from a socket.

```c
int SocketRead(  
    int socket,        // socket  
    uchar& buffer[],   // buffer for reading data from socket  
    uint buffer_maxlen, // number of bytes to read  
    uint timeout_ms     // reading timeout  
);
```

**Parameters**

**socket**
- [in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed to `_LastError`, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

**buffer**
- [out] Reference to the `uchar` type array the data is read in. Dynamic array size is increased by the number of read bytes. The array size cannot exceed `INT_MAX` (2147483647).

**buffer_maxlen**
- [in] Number of bytes to read to the `buffer[]` array. Data not fitting into the array remain in the socket. They can be received by the next `SocketRead` call. `buffer_maxlen` cannot exceed `INT_MAX` (2147483647).

**timeout_ms**
- [in] Data reading timeout in milliseconds. If data is not obtained within this time, attempts are stopped and the function returns -1.

**Return Value**
- If successful, return the number of read bytes. In case of an error, -1 is returned.

**Note**

If an error occurs on a system socket when executing the function, connection established via `SocketConnect` is discontinued.

In case of a data reading error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written in `_LastError`.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - “Function is not allowed for call”.

**Example:**

```c

SocketSend

Write data to a socket.

```c
int SocketSend(
    int  socket,       // socket
    const uchar& buffer[], // data buffer
    uint  buffer_len   // buffer size
);
```

Parameters

**socket**
- [in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to `_LastError`.

**buffer**
- [in] Reference to the `uchar` type array with the data to be sent to the socket.

**buffer_len**
- [in] `buffer` array size.

Return Value

If successful, return the number of bytes written to a socket. In case of an error, -1 is returned.

Note

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

In case of a data writing error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written to `_LastError`.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError()](#) returns the error 4014 - "Function is not allowed for call".

Example:

```c
//+------------------------------------------------------------------+

SocketTimeouts, MathSwap, StringToCharArray
**SocketTlsHandshake**

Initiate secure TLS (SSL) connection to a specified host via TLS Handshake protocol. During Handshake, a client and a server agree on connection parameters: applied protocol version and data encryption method.

```c
bool SocketTlsHandshake(
    int socket,  // socket
    const string host  // host address
);
```

**Parameters**

- **socket**
  - [in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to `_LastError`.

- **host**
  - [in] Address of a host a secure connection is established with.

**Return Value**

Returns true if successful, otherwise false.

**Notes**

Before a secure connection, the program should establish a standard TCP connection with the host using `SocketConnect`.

If secure connection fails, the error 5274 (ERR_NETSOCKET_HANDSHAKE_FAILED) is written to `_LastError`.

There is no need to call the function when connecting to the port 443. This is a standard TCP port used for secure TLS (SSL) connections.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - "Function is not allowed for call".
SocketTlsCertificate

Get data on the certificate used to secure network connection.

```cpp
int SocketTlsCertificate(
    int socket, // socket
    string& subject, // certificate owner
    string& issuer, // certificate issuer
    string& serial, // certificate serial number
    string& thumbprint, // certificate print
    datetime& expiration // certificate expiration
);
```

Parameters

- **socket**
  - [in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to `_LastError`.

- **subject**
  - [in] Certificate owner name. Corresponds to the Subject field.

- **issuer**

- **serial**

- **thumbprint**
  - [in] Certificate print. Corresponds to the SHA-1 hash from the entire certificate file (all fields including the issuer signature).

- **expiration**
  - [in] Certificate expiration date in the `datetime` format.

Return Value

Returns true if successful, otherwise false.

Note

Certificate data can be requested only after establishing a secure connection using `SocketTlsHandshake`.

In case of a certificate obtaining error, the error 5275 (ERR_NETSOCKET_NO_CERTIFICATE) is written to `_LastError`.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - “Function is not allowed for call”.

Example:

```cpp
//+------------------------------------------------------------------+
```
```c
//|                                                SocketExample.mq5 |

    if(header_end>0)
    {
        Print("HTTP answer header received:");
        Print(StringSubstr(result,0,header_end));
        return(true);
    }
}
}

while(GetTickCount()<timeout_check & & !IsStopped());
return(false);

void OnStart()
{
    int socket=SocketCreate();
    //--- check the handle
    if(socket!=INVALID_HANDLE)
    {
        //--- connect if all is well
        if(SocketConnect(socket,Address,Port,1000))
        {
            Print("Established connection to ",Address,":",Port);
            string subject,issuer,serial,thumbprint;
            datetime expiration;
            //--- if connection is secured by the certificate, display its data
            if(SocketTlsCertificate(socket,subject,issuer,serial,thumbprint,expiration))
            {
                Print("TLS certificate:");
                Print(" Owner: ",subject);
                Print(" Issuer: ",issuer);
                Print(" Number: ",serial);
                Print(" Print: ",thumbprint);
                Print(" Expiration: ",expiration);
                ExtTLS=true;
            }
            //--- send GET request to the server
            if(HTTPSsend(socket,"GET / HTTP/1.1\r\nHost: www.mql5.com\r\n\n"))
            {
                Print("GET request sent");
                //--- read the response
if(!$HTTPRecv(socket,1000))
    Print("Failed to get a response, error ",GetLastError());
else
    Print("Failed to send GET request, error ",GetLastError());
else
{
    Print("Connection to ",Address,"\:",Port," failed, error ",GetLastError());
    //--- close a socket after using
    SocketClose(socket);
} else
    Print("Failed to create a socket, error ",GetLastError());
SocketTlsRead

Read data from secure TLS connection.

```c
int SocketTlsRead(
    int socket, // socket
    uchar& buffer[], // buffer for reading data from socket
    uint buffer_maxlen // number of bytes to read
);
```

**Parameters**

- **socket**
  - **[in]** Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed to `_LastError`, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

- **buffer**
  - **[out]** Reference to the `uchar` type array the data is read in. Dynamic array size is increased by the number of read bytes. The array size cannot exceed `INT_MAX` (2147483647).

- **buffer_maxlen**
  - **[in]** Number of bytes to read to the `buffer[]` array. Data not fitting into the array remain in the socket. They can be received by the next `SocketTLSRead` call. `buffer_maxlen` cannot exceed `INT_MAX` (2147483647).

**Return Value**

If successful, return the number of read bytes. In case of an error, -1 is returned.

**Note**

If an error occurs on a system socket when executing the function, connection established via `SocketConnect` is discontinued.

The function is executed till it receives the specified amount of data or the timeout is reached (`SocketTimeouts`).

In case of a data reading error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written in `_LastError`.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - “Function is not allowed for call”.

**Example:**

```c
//+------------------------------------------------------------------+
//|                                                SocketExample.mq5|

SocketTimeouts, MathSwap
SocketTlsReadAvailable

Read all available data from secure TLS connection.

```c
int SocketTlsReadAvailable(
    int socket,           // socket
    uchar& buffer[],      // buffer for reading data from socket
    const uint buffer_maxlen // number of bytes to read
);
```

**Parameters**

socket

[in] Socket handle returned by the `SocketCreate` function. When an incorrect handle is passed to `_LastError`, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

buffer

[out] Reference to the `uchar` type array the data is read in. Dynamic array size is increased by the number of read bytes. The array size cannot exceed `INT_MAX` (2147483647).

buffer_maxlen

[in] Number of bytes to read to the buffer[] array. Data not fitting into the array remain in the socket. They can be received by the next `SocketTlsReadAvailable` or `SocketTlsRead` call. `buffer_maxlen` cannot exceed `INT_MAX` (2147483647).

**Return Value**

If successful, return the number of read bytes. In case of an error, -1 is returned.

**Note**

If an error occurs on a system socket when executing the function, connection established via `SocketConnect` is discontinued.

In case of a data reading error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written in `_LastError`.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, `GetLastError()` returns the error 4014 - "Function is not allowed for call".

**See also**

`SocketTimeouts`, `MathSwap`
SocketTlsSend

Send data via secure TLS connection.

```c
int SocketTlsSend(
    int socket, // socket
    const uchar* buffer[], // data buffer
    uint buffer_len // buffer size
);
```

**Parameters**

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to _LastError_.

buffer

[in] Reference to the uchar type array with the data to be sent.

buffer_len

[in] `buffer` array size.

**Return Value**

If successful, return the number of bytes written to a socket. In case of an error, -1 is returned.

**Note**

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

In case of a data writing error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written to _LastError_.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError()](#) returns the error 4014 - "Function is not allowed for call".

**See also**

[SocketTimeouts](#), [MathSwap](#), [StringToCharArray](#)
**WebRequest**

The function sends an HTTP request to a specified server. The function has two versions:

1. **Sending simple requests of type “key=value” using the header Content-Type: application/x-www-form-urlencoded.**

   ```cpp
   int WebRequest(
       const string method,     // HTTP method
       const string url,        // URL
       const string cookie,     // cookie
       const string referer,    // referer
       int timeout,             // timeout
       const char *data[],      // the array of the HTTP message body
       int data_size,           // data[] array size in bytes
       char *result[],          // an array containing server response data
       string *result_headers   // headers of server response
   );
   ```

2. **Sending a request of any type specifying the custom set of headers for a more flexible interaction with various Web services.**

   ```cpp
   int WebRequest(
       const string method,     // HTTP method
       const string url,        // URL
       const string headers,    // headers
       int timeout,             // timeout
       const char *data[],      // the array of the HTTP message body
       char *result[],          // an array containing server response data
       string *result_headers   // headers of server response
   );
   ```

**Parameters**

- **method**
  
  [in] HTTP method.

- **url**
  
  [in] URL.

- **headers**
  
  [in] Request headers of type “key: value”, separated by a line break “\n”.

- **cookie**
  
  [in] Cookie value.

- **referer**
  
  [in] Value of the Referer header of the HTTP request.

- **timeout**
  
Network Functions

data[]
[in] Data array of the HTTP message body.

data_size
[in] Size of the data[] array.

result[]
[out] An array containing server response data.

result_headers
[out] Server response headers.

Return Value

HTTP server response code or -1 for an error.

Note

To use the WebRequest() function, add the addresses of the required servers in the list of allowed URLs in the “Expert Advisors” tab of the “Options” window. Server port is automatically selected on the basis of the specified protocol - 80 for “http://” and 443 for “https://”.

The WebRequest() function is synchronous, which means it breaks the program execution and waits for the response from the requested server. Since the delays in receiving a response can be large, the function is not available for calls from indicators, because indicators run in a common thread shared by all indicators and charts on one symbol. Indicator performance delay on one of the charts of a symbol may stop updating of all charts of the same symbol.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If you try to call the function from an indicator, GetLastError() will return error 4014 - “Function is not allowed for call”.

WebRequest() cannot be executed in the Strategy Tester.

Example:

```c
void OnStart()
{
    string cookie=NULL,headers;
    char post[],result[];
    string url="https://finance.yahoo.com";
    //--- To enable access to the server, you should add URL "https://finance.yahoo.com"
    //--- to the list of allowed URLs (Main Menu->Tools->Options, tab "Expert Advisors"):
    //--- Resetting the last error code
    ResetLastError();
    //--- Downloading a html page from Yahoo Finance
    int res=WebRequest("GET",url,cookie,NULL,500,post,0,result,headers);
    if(res==-1)
    {
        Print("Error in WebRequest. Error code =",GetLastError());
        //--- Perhaps the URL is not listed, display a message about the necessity to add
        MessageBox("Add the address "+url+" to the list of allowed URLs on tab 'Expert
```
else
{
    if(res==200)
    {
        //--- Successful download
        PrintFormat("The file has been successfully downloaded, File size %d byte.",
        //PrintFormat("Server headers: %s",headers);
        //--- Saving the data to a file
        int filehandle=FileOpen("url.htm",FILE_WRITE|FILE_BIN);
        if(filehandle!=INVALID_HANDLE)
        {
            //--- Saving the contents of the result[] array to a file
            FileWriteArray(filehandle,result,0,ArraySize(result));
            //--- Closing the file
            FileClose(filehandle);
        } else
            Print("Error in FileOpen. Error code =",GetLastError());
    } else
        PrintFormat("Downloading '%s' failed, error code %d",url,res);
}
}
SendFTP

Sends a file at the address, specified in the setting window of the "FTP" tab.

```csharp
bool SendFTP(
    string filename,    // file to be send by ftp
    string ftp_path=NULL  // ftp catalog
);
```

Parameters

- `filename`  
  [in] Name of sent file.

- `ftp_path=NULL`  
  [in] FTP catalog. If a directory is not specified, directory described in settings is used.

Return Value

In case of failure returns 'false'.

Note

Sent file must be located in the folder `terminal_directory\MQL5\files` or its subfolders. Sending isn't performed if FTP address and/or access password are not specified in settings.

SendFTP() function does not work in the Strategy Tester.
**SendMail**

Sends an email at the address specified in the settings window of the "Email" tab.

```c
bool SendMail(
    string subject, // header
    string some_text // email text
);
```

**Parameters**

- `subject`  
  [in] Email header.

- `some_text`  
  [in] Email body.

**Return Value**

- `true` - if an email is put into the send queue, otherwise - `false`.

**Note**

Sending can be prohibited in settings, email address can be omitted as well. For the error information call `GetLastError()`.

SendMail() function does not work in the **Strategy Tester**.

**SendNotification**

Sends push notifications to the mobile terminals, whose MetaQuotes IDs are specified in the "Notifications" tab.

```cpp
bool SendNotification(
    string text  // Text of the notification
);
```

**Parameters**

- `text`
  - [in] The text of the notification. The message length should not exceed 255 characters.

**Return Value**

- true if a notification has been successfully sent from the terminal; in case of failure returns false.

When checking after a failed push of notification, `GetLastError()` may return one of the following errors:

- 4515 - ERR_NOTIFICATION_SEND_FAILED,
- 4516 - ERR_NOTIFICATION_WRONG_PARAMETER,
- 4517 - ERR_NOTIFICATION_WRONG_SETTINGS,
- 4518 - ERR_NOTIFICATION_TOO_FREQUENT.

**Note**

Strict use restrictions are set for the `SendNotification()` function: no more than 2 calls per second and not more than 10 calls per minute. Monitoring the frequency of use is dynamic. The function can be disabled in case of the restriction violation.

`SendNotification()` function does not work in the Strategy Tester.
Global Variables of the Client Terminal

There is a group set of functions for working with global variables.

Global variables of the client terminal should not be mixed up with variables declared in the global scope of the mql5 program.

Global variables are kept in the client terminal for 4 weeks since the last access, then they will be deleted automatically. An access to a global variable is not only setting of a new value, but reading of the global variable value, as well.

Global variables of the client terminal are accessible simultaneously from all mql5 programs launched in the client terminal.

<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlobalVariableCheck</td>
<td>Checks the existence of a global variable with the specified name</td>
</tr>
<tr>
<td>GlobalVariableTime</td>
<td>Returns time of the last accessing the global variable</td>
</tr>
<tr>
<td>GlobalVariableDel</td>
<td>Deletes a global variable</td>
</tr>
<tr>
<td>GlobalVariableGet</td>
<td>Returns the value of a global variable</td>
</tr>
<tr>

<tr>
<td>GlobalVariablesDeleteAll</td>
<td>Deletes global variables with the specified prefix in their names</td>
</tr>
<tr>
<td>GlobalVariablesTotal</td>
<td>Returns the total number of global variables</td>
</tr>
</tbody>
</table>
Global Variable Check

Checks the existence of a global variable with the specified name

```c
bool GlobalVariableCheck(
    string name // Global variable name
);
```

Parameters

name

Return Value

Returns true, if the global variable exists, otherwise returns false.

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.

See also

GlobalVariableTime()
GlobalVariableTime

Returns the time when the global variable was last accessed.

```
datetime GlobalVariableTime(
    string name // name
);
```

**Parameters**

`name`

[in] Name of the global variable.

**Return Value**

The function returns time of last accessing the specified global variable. Addressing a variable for its value, for example using the `GlobalVariableGet()` and `GlobalVariableCheck()` functions, also modifies the time of last access. In order to obtain error details, call the `GetLastError()` function.

**Note**

Global variables exist in the client terminal during 4 weeks since they were called last. After that they are automatically deleted.

**See also**

`GlobalVariableCheck()`
**GlobalVariableDel**

Deletes a global variable from the client terminal.

```cpp
bool GlobalVariableDel(
    string name       // Global variable name
);
```

**Parameters**

- **name**

**Return Value**

If successful, the function returns true, otherwise it returns false. To obtain an information about the error it is necessary to call the function `GetLastError()`.

**Note**

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.
Global Variables of the Terminal

GlobalVariableGet

Returns the value of an existing global variable of the client terminal. There are 2 variants of the function.

1. Immediately returns the value of the global variable.

```c
double GlobalVariableGet(
    string name  // Global variable name
);
```

2. Returns true or false depending on the success of the function run. If successful, the global variable of the client terminal is placed in a variable passed by reference in the second parameter.

```c
bool GlobalVariableGet(
    string name,  // Global variable name
    double& double_var  // This variable will contain the value of the global variable
);
```

Parameters

name

double var

[out] Target variable of the double type, which accepts the value stored in a global variable of the client terminal.

Return Value

The value of the existing global variable or 0 in case of an error. For more details about the error, call GetLastError().

Note

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.
**GlobalVariableName**

Returns the name of a global variable by its ordinal number.

```cpp
string GlobalVariableName(
    int index // Global variable number in the list of global variables
);
```

**Parameters**

- **index**
  - [in] Sequence number in the list of global variables. It should be greater than or equal to 0 and less than `GlobalVariablesTotal()`.

**Return Value**

Global variable name by its ordinal number in the list of global variables. For more details about the error, call `GetLastError()`.

**Note**

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.
Global Variable Set

Sets a new value for a global variable. If the variable does not exist, the system creates a new global variable.

```cpp
datetime GlobalVariableSet(
    string name,  // Global variable name
    double value   // Value to set
);
```

**Parameters**

- **name**

- **value**

**Return Value**

If successful, the function returns the last modification time, otherwise 0. For more details about the error, call GetLastError().

**Note**

A global variable name should not exceed 63 characters. Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.
Global Variables of the Terminal

GlobalVariablesFlush

Forcibly saves contents of all global variables to a disk.

```c
void GlobalVariablesFlush();
```

Return Value

No return value.

Note

The terminal writes all the global variables when the work is over, but data can be lost at a sudden computer operation failure. This function allows independently controlling the process of saving global variables in case of contingency.
Global Variables of the Terminal

GlobalVariableTemp

The function attempts to create a temporary global variable. If the variable doesn't exist, the system creates a new temporary global variable.

```cpp
bool GlobalVariableTemp(
    string name       // Global variable name
);
```

Parameters

name

[in] The name of a temporary global variable.

Return Value

If successful, the function returns true, otherwise - false. To get details about the error, you should call the GetLastError() function.

Note

Temporary global variables exist only while the client terminal is running; after the terminal shutdown they are automatically deleted. Note that during the execution of GlobalVariablesFlush() temporary global variables are not written to a disk.

After a temporary global variable has been created, it can be accessed and modified the same as global variable of the client terminal.
Global Variables of the Terminal

GlobalVariableSetOnCondition

Sets the new value of the existing global variable if the current value equals to the third parameter check_value. If there is no global variable, the function will generate an error ERR_GLOBALVARIABLE_NOT_FOUND (4501) and return false.

```cpp
bool GlobalVariableSetOnCondition(
    string name,        // Global variable name
    double value,       // New value for variable if condition is true
    double check_value  // Check value condition
);
```

Parameters

- **name**
  - [in] The name of a global variable.

- **value**
  - [in] New value.

- **check_value**
  - [in] The value to check the current value of the global variable.

Return Value

If successful, the function returns true, otherwise it returns false. For details about the error call GetLastError(). If the current value of the global variable is different from check_value, the function returns false.

Note

Function provides atomic access to the global variable, so it can be used for providing of a mutex at interaction of several Expert Advisors working simultaneously within one client terminal.
Global Variables of the Terminal

GlobalVariablesDeleteAll

Deletes global variables of the client terminal.

```c
int GlobalVariablesDeleteAll(
    string prefix_name=NULL,  // All global variables with names beginning with
    datetime limit_data=0    // All global variables that were changed before this date
);
```

Parameters

- `prefix_name=NULL`  
  [in] Name prefix global variables to remove. If you specify a prefix NULL or empty string, then all variables that meet the data criterion will be deleted.

- `limit_data=0`  
  [in] Date to select global variables by the time of their last modification. The function removes global variables, which were changed before this date. If the parameter is zero, then all variables that meet the first criterion (prefix) are deleted.

Return Value

The number of deleted variables.

Note

If both options are equal to zero (`prefix_name = NULL` and `limit_data = 0`), then function deletes all global variables of the terminal. If both parameters are specified, then it deletes global variables corresponding to both parameters.

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.
Global Variables of the Terminal

GlobalVariablesTotal

Returns the total number of global variables of the client terminal.

```cpp
int GlobalVariablesTotal();
```

Return Value

Number of global variables.

Note

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted. Call of a global variable is not only setting a new value, but also reading the value of the global variable.
File Functions

This is a group of functions for working with files.

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means cannot be outside the file sandbox.

There are two directories (with subdirectories) in which working files can be located:

- `terminal_data_folder\MQL5\FILES` (in the terminal menu select to view “File” - “Open the data directory”);
- the common folder for all the terminals installed on a computer - usually located in the directory `C:\Documents and Settings\All Users\Application Data\MetaQuotes\Terminal\Common\Files`.

There is a program method to obtain names of these catalogs using the `TerminalInfoString()` function, using the `ENUM TERMINAL_INFO_STRING` enumeration:

```c
//--- Folder that stores the terminal data
string terminal_data_path=TerminalInfoString(TERMINAL_DATA_PATH);
//--- Common folder for all client terminals
string common_data_path=TerminalInfoString(TERMINAL_COMMONDATA_PATH);
```

Work with files from other directories is prohibited.

File functions allow working with so-called "named pipes". To do this, simply call `FileOpen()` function with appropriate parameters.

If the file is opened for writing using `FileOpen()`, all subfolders specified in the path will be created if there are no such ones.
FileFunctions

FileFindFirst

The function starts the search of files or subdirectories in a directory in accordance with the specified filter.

```c
long FileFindFirst(
    const string file_filter, // String - search filter
    string& returned_filename, // Name of the file or subdirectory found
    int common_flag=0 // Defines the search
);
```

Parameters

- `file_filter` [in] Search filter. A subdirectory (or sequence of nested subdirectories) relative to the \Files directory, in which files should be searched for, can be specified in the filter.

- `returned_filename` [out] The returned parameter, where, in case of success, the name of the first found file or subdirectory is placed. Only the file name is returned (including the extension), the directories and subdirectories are not included no matter if they are specified or not in the search filter.

- `common_flag` [in] Flag determining the location of the file. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals \Terminal\Common\Files. Otherwise, the file is located in a local folder.

Return Value

Returns handle of the object searched, which should be used for further sorting of files and subdirectories by the `FileFindNext()` function, or `INVALID_HANDLE` when there is no file and subdirectory corresponding to the filter (in the particular case - when the directory is empty). After searching, the handle must be closed using the `FileFindClose()` function.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

Example:
//--- display the window of input parameters when launching the script
#property script_show_inputs
//-- filter
input string InpFilter="Dir\**";
//-------------------------------
// | Script program start function
//-------------------------------
void OnStart()
{
    string file_name;
    string int_dir="";
    int i=1,pos=0,last_pos=-1;
    //--- search for the last backslash
    while(!IsStopped())
    {
        pos=StringFind(InpFilter,"\",pos+1);
        if(pos>=0)
            last_pos=pos;
        else
            break;
    }
    //--- the filter contains the folder name
    if(last_pos>0)
        int_dir=StringSubstr(InpFilter,0,last_pos+1);
    //--- get the search handle in the root of the local folder
    long search_handle=FileFindFirst(InpFilter,file_name);
    //--- check if the FileFindFirst() is executed successfully
    if(search_handle!=INVALID_HANDLE)
    {
        //--- in a loop, check if the passed strings are the names of files or director:
        do
        {
            ResetLastError();
            //--- if it's a file, the function returns true, and if it's a directory, it
            FileIsExist(int_dir+file_name);
            PrintFormat("%d : %s name = %s",i,GetLastError()==ERR_FILE_IS_DIRECTORY ? "D: " : "F: ",file_name);
            i++;
        }
        while(FileFindNext(search_handle,file_name));
        //--- close the search handle
        FileFindClose(search_handle);
    }
    else
        Print("Files not found!");
}

FileFindNext, FileFindClose
**File Functions**

**FileFindNext**

The function continues the search started by `FileFindFirst()`.

```cpp
bool FileFindNext(
  long search_handle,  // Search handle
  string& returned_filename  // Name of the file or subdirectory found
);
```

**Parameters**

- **search_handle**
  - [in] Search handle, retrieved by `FileFindFirst()`.

- **returned_filename**
  - [out] The name of the next file or subdirectory found. Only the file name is returned (including the extension), the directories and subdirectories are not included no matter if they are specified or not in the search filter.

**Return Value**

- If successful returns true, otherwise false.

**Example:**

```cpp
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- filter
input string InpFilter="*";
//| Script program start function
//|--------------------------------------------------------------------------------
void OnStart()
{
  string file_name;
  int i=1;
  //--- receive search handle in local folder's root
  long search_handle=FileFindFirst(InpFilter,file_name);
  //--- check if FileFindFirst() function executed successfully
  if(search_handle!=INVALID_HANDLE)
  {
    //--- check if the passed strings are file or directory names in the loop
    do
    {
      ResetLastError();
      //--- if this is a file, the function will return true, if it is a directory,
      FileIsExist(file_name);
      PrintFormat("%d : %s name = %s",i,GetLastError()==ERR_FILE_IS_DIRECTORY ? "D":
        i++;
    }
    while(FileFindNext(search_handle,file_name));
  }
}
//--- close search handle
FileFindClose(search_handle);
}
else
    Print("Files not found!");
}
File Functions

FileFindClose

The function closes the search handle.

```c
void FileFindClose(
    long search_handle // Search handle
);
```

Parameters

`search_handle`

[in] Search handle, retrieved by `FileFindFirst()`.

Return Value

No value returned.

Note

Function must be called to free up system resources.

Example:

```c
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- filter
input string InpFilter="*";
//| Script program start function
void OnStart()
{
    string file_name;
    int i=1;
    //--- receive search handle in local folder's root
    long search_handle=FileFindFirst(InpFilter,file_name);
    //--- check if FileFindFirst() function executed successfully
    if(search_handle!=INVALID_HANDLE)
    {
        //--- check if the passed strings are file or directory names in the loop
        do
        {
            ResetLastError();
            //--- if this is a file, the function will return true, if it is a directory, the function will generate error 5018
            FileIsExist(file_name);
            PrintFormat("%d : %s name = %s",i,GetLastError()==5018 ? "Directory" : "File", file_name);
            i++;
        }
        while(FileFindNext(search_handle,file_name));
        //--- close search handle
        FileFindClose(search_handle);
    }
}
else
    Print("Files not found");
}

FileFindFirst, FileFindNext
File Functions

**FileIsExist**

Checks the existence of a file.

```c
bool FileIsExist(
    const string file_name,  // File name
    int common_flag=0        // Search area
);
```

**Parameters**

- **file_name**
  
  [in] The name of the file being checked

- **common_flag=0**
  
  [in] Flag determining the location of the file. If common_flag = FILE_COMMON, then the file is located in a shared folder for all client terminals \Terminal\Common\Files. Otherwise, the file is located in a local folder.

**Return Value**

Returns true, if the specified file exists.

**Note**

Checked file can turn out to be a subdirectory. In this case, FileIsExist() function will return false, while error 5018 will be logged in _LastError variable - "This is a directory, not a file" (see example for FileFindFirst function).

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If common_flag = FILE_COMMON, then the function looks for the file in a shared folder for all client terminals \Terminal\Common\Files, otherwise the function looks for a file in a local folder (MQL5\Files or MQL5\Tester\Files in the case of testing).

**Example:**

```c
//--- show the window of input parameters when launching the script
#property script_show_inputs
//--- date for old files
input datetime InpFilesDate="D'2013.01.01 00:00';
//|Script program start function
//|==================================================================

void OnStart()
{
    string file_name;     // variable for storing file names
    string filter="*.txt"; // filter for searching the files
    datetime create_date; // file creation date
    string files[];       // list of file names
    int def_size=25;      // array size by default
    int size=0;           // number of files
```
//--- allocate memory for the array
ArrayResize(files, def_size);

//--- receive the search handle in the local folder's root
long search_handle=FileFindFirst(filter, file_name);

//--- check if FileFindFirst() executed successfully
if(search_handle!=INVALID_HANDLE)
{
    //--- searching files in the loop
do
    {
        file_name=
        //--- increase the array size
size++;
        if(size==def_size)
        {
            def_size+=25;
            ArrayResize(files, def_size);
        }
        //--- reset the error value
        ResetLastError();
        //--- receive the file creation date
        create_date=(datetime)FileGetInteger(file_name, FILE_CREATE_DATE, false);
        //--- check if the file is old
        if(create_date<InpFilesDate)
        {
            PrintFormat("%s file deleted!",file_name);
            //--- delete the old file
            FileDelete(file_name);
        }
    }
    while(FileFindNext(search_handle, file_name));
    //--- close the search handle
    FileFindClose(search_handle);
}
else
{
    Print("Files not found!");
    return;
}

//--- check what files have remained
PrintFormat("Results:");
for(int i=0;i<size;i++)
{
    if(FileIsExist(files[i]))
    PrintFormat("%s file exists!",files[i]);
    else
    PrintFormat("%s file deleted!",files[i]);
}
See also

`FileFindFirst`
FileOpen

The function opens the file with the specified name and flag.

```cpp
int FileOpen(
    string file_name,  // File name
    int open_flags,    // Combination of flags
    short delimiter='\t',  // Delimiter
    uint codepage=CP_ACP // Code page
);
```

Parameters

file_name

[in] The name of the file can contain subfolders. If the file is opened for writing, these subfolders will be created if there are no such ones.

open_flags

[in] **combination of flags** determining the operation mode for the file. The flags are defined as follows:
- FILE_READ file is opened for reading
- FILE_WRITE file is opened for writing
- FILE_BIN binary read-write mode (no conversion from a string and to a string)
- FILE_CSV file of csv type (all recorded items are converted to the strings of unicode or ansi type, and are separated by a delimiter)
- FILE_TXT a simple text file (the same as csv, but the delimiter is not taken into account)
- FILE_ANSI lines of ANSI type (single-byte symbols)
- FILE_UNICODE lines of UNICODE type (double-byte characters)
- FILE_SHARE_READ shared reading from several programs
- FILE_SHARE_WRITE shared writing from several programs
- FILE_COMMON location of the file in a shared folder for all client terminals \Terminal\Common\Files

delimiter='\t'

[in] value to be used as a separator in txt or csv-file. If the csv-file delimiter is not specified, it defaults to a tab. If the txt-file delimiter is not specified, then no separator is used. If the separator is clearly set to 0, then no separator is used.

codepage=CP_ACP

[in] The value of the code page. For the most-used code pages provide appropriate constants.

Return Value

If a file has been opened successfully, the function returns the file handle, which is then used to access the file data. In case of failure returns INVALID_HANDLE.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.
Make sure to set the FILE_ANSI flag if the file should be read in a specific encoding (the codepage parameter with a code page value is specified). If there is no specified FILE_ANSI flag, the text file is read in Unicode without any conversion.

The file is opened in the folder of the client terminal in the subfolder MQL5\files (or testing_agent_directory\MQL5\files in case of testing). If FILE_COMMON is specified among flags, the file is opened in a shared folder for all MetaTrader 5 client terminals.

"Named pipes" can be opened according to the following rules:

- Pipe name is a string, which should have the following look: "\\servername\pipe\pipename", where servername - server name in the network, while pipename is a pipe name. If the pipes are used on the same computer, the server name can be omitted but a point should be inserted instead of it: "\\.\pipe\pipename". A client trying to connect the pipe should know its name.
- FileFlush() and FileSeek() should be called to the beginning of a file between sequential operations of reading from the pipe and writing to it.

A special symbol "\" is used in shown strings. Therefore, "\" should be doubled when writing a name in MQL5 application. It means that the above example should have the following look in the code: "\\\\servername\\pipe\\pipename".

More information about working with named pipes can be found in the article "Communicating With MetaTrader 5 Using Named Pipes Without Using DLLs".

Example:

```c
#include <MQL5/MQLScript.h>

void OnStart()
{
    //--- incorrect file opening method
    string terminal_data_path=TerminalInfoString(TERMINAL_DATA_PATH);
    string filename=terminal_data_path+"\\MQL5\\Files\\"+"fractals.csv";
    int filehandle=FileOpen(filename,FILE_WRITE|FILE_CSV);
    if(filehandle<0)
    {
        Print("Failed to open the file by the absolute path ");
        Print("Error code ",GetLastError());
    }

    //--- correct way of working in the "file sandbox"
    ResetLastError();
    filehandle=FileOpen("fractals.csv",FILE_WRITE|FILE_CSV);
    if(filehandle!=INVALID_HANDLE)
    {
        FileWrite(filehandle,TimeCurrent(),Symbol(),EnumToString(_Period));
        FileClose(filehandle);
        Print("FileOpen OK");
    }
    else Print("Operation FileOpen failed, error ",GetLastError());
    //--- another example with the creation of an enclosed directory in MQL5\Files\"
```
string subfolder="Research";
filehandle=FileOpen(subfolder+"\fractals.txt",FILE_WRITE|FILE_CSV);
    if(filehandle!=INVALID_HANDLE)
    {
        FileWrite(filehandle,TimeCurrent(),Symbol(), EnumToString(_Period));
        FileClose(filehandle);
        Print("The file must be created in the folder "+terminal_data_path+"\"+subfolder);
    }
else Print("File open failed, error ",GetLastError());

See also

Use of a Codepage, FileFindFirst, FolderCreate, File opening flags
FileClose

Close the file previously opened by FileOpen().

```c
void FileClose(
    int file_handle    // File handle
);
```

**Parameters**

- `file_handle`
  - [in] File descriptor returned by FileOpen().

**Return Value**

No value returned.

**Example:**

```c
//--- show the window of input parameters when launching the script
#property script_show_inputs
//--- input parameters
input string InpFileName="file.txt";  // file name
input string InpDirectoryName="Data";  // directory name
input int InpEncodingType=FILE_ANSI;   // ANSI=32 or UNICODE=64

void OnStart()
{
    //--- print the path to the file we are going to use
    PrintFormat("Working %s\Files\ folder", TerminalInfoString(TERMINAL_DATA_PATH));
    //--- reset the error value
    ResetLastError();

    //--- open the file for reading (if the file does not exist, the error will occur)
    int file_handle=FileOpen(InpDirectoryName+"//"+InpFileName,FILE_READ|FILE_TEXT|InpEncodingType);
    if(file_handle!=INVALID_HANDLE)
    {
        //--- print the file contents
        while(!FileIsEnding(file_handle))
            Print(FileReadString(file_handle));
        //--- close the file
        FileClose(file_handle);
    }
    else
        PrintFormat("Error, code = %d", GetLastError());
}
```
File Functions

**FileCopy**

The function copies the original file from a local or shared folder to another file.

```cpp
bool FileCopy(
    const string src_file_name,  // Name of a source file
    int common_flag,             // Location
    const string dst_file_name,  // Name of the destination file
    int mode_flags               // Access mode
);
```

**Parameters**

- **src_file_name**
  - [in] File name to copy.

- **common_flag**
  - [in] Flag determining the location of the file. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals `\Terminal\Common\Files`. Otherwise, the file is located in a local folder (for example, `common_flag=0`).

- **dst_file_name**
  - [in] Result file name.

- **mode_flags**
  - [in] Access flags. The parameter can contain only 2 flags: FILE_REWRITE and/or FILE_COMMON - other flags are ignored. If the file already exists, and the FILE_REWRITE flag hasn't been specified, then the file will not be rewritten, and the function will return false.

**Return Value**

In case of failure the function returns false.

**Note**

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If the new file already exists, the copy will be made depending on the availability of the FILE_REWRITE flag in the mode_flags parameter.

**Example:**

```cpp
//--- display the window of input parameters when launching the script
#define script_show_inputs
//--- input parameters
input string InpSrc="source.txt"; // source
input string InpDst="destination.txt"; // copy
input int InpEncodingType=FILE_ANSI; // ANSI=32 or UNICODE=64
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
```
```cpp
{
    //--- display the source contents (it must exist)
    if(!FileDisplay(InpSrc))
        return;
    //--- check if the copy file already exists (may not be created)
    if(!FileDisplay(InpDst))
    {
        //--- the copy file does not exist, copying without FILE_REWRITE flag (correct copying)
        if(FileCopy(InpSrc, 0, InpDst, 0))
            Print("File is copied!");
        else
            Print("File is not copied!");
    }
    else
    {
        //--- the copy file already exists, try to copy without FILE_REWRITE flag (incorrect copying)
        if(FileCopy(InpSrc, 0, InpDst, 0))
            Print("File is copied!");
        else
            Print("File is not copied!");
        //--- InpDst file's contents remains the same
        FileDisplay(InpDst);
        //--- copy once more with FILE_REWRITE flag (correct copying if the file exists)
        if(FileCopy(InpSrc, 0, InpDst, FILE_REWRITE))
            Print("File is copied!");
        else
            Print("File is not copied!");
    }
    //--- receive InpSrc file copy
    FileDisplay(InpDst);
}
//+------------------------------------------------------------------+
//| Read the file contents                                           |
//+------------------------------------------------------------------+
bool FileDisplay(const string file_name)
{
    //--- reset the error value
    ResetLastError();
    //--- open the file
    int file_handle=FileOpen(file_name, FILE_READ|FILE_TEXT|InpEncodingType);
    if(file_handle!=INVALID_HANDLE)
    {
        //-- display the file contents in the loop
        Print("+---------------------+");
        PrintFormat("File name = %s", file_name);
        while(!FileIsEnding(file_handle))
            Print(FileReadString(file_handle));
        Print("+---------------------+");
        //--- close the file
    }
}
File Functions

```c
FileClose(file_handle);
return(true);
}

//-- failed to open the file
PrintFormat("%s is not opened, error = %d",file_name,GetLastError());
return(false);
```
**FileDelete**

Deletes the specified file in a local folder of the client terminal.

```plaintext
bool FileDelete(
    const string file_name, // File name to delete
    int common_flag=0       // Location of the file to delete
);
```

**Parameters**

- **file_name**
  
  [*in*] File name.

- **common_flag=0**
  
  [*in*] Flag determining the file location. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals \Terminal\Common\Files. Otherwise, the file is located in a local folder.

**Return Value**

In case of failure the function returns false.

**Note**

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

Deletes the specified file from a local folder of the client terminal (MQL5\Files or MQL5\Tester\Files in case of testing). If `common_flag = FILE_COMMON`, then the function removes the file from the shared folder for all client terminals \Terminal\Common\Files.

**Example:**

```plaintext
//--- show the window of input parameters when launching the script
@property script_show_inputs
//@ date for old files
input datetime InpFilesDate=D'2013.01.01 00:00';
//@------------------------------------------------------------------+
//@ Script program start function
//@------------------------------------------------------------------+
void OnStart()
{
    string file_name;       // variable for storing file names
    string filter="*.txt"; // filter for searching the files
    datetime create_date;   // file creation date
    string files[];         // list of file names
    int def_size=25;        // array size by default
    int size=0;             // number of files

    //--- allocate memory for the array
    ArrayResize(files,def_size);
    //--- receive the search handle in the local folder's root
    long search_handle=FileFindFirst(filter,file_name);
}  ```
//--- check if FileFindFirst() executed successfully
if (search_handle!=INVALID_HANDLE)
{
    //--- searching files in the loop
    do
    {
        files[size]=file_name;
        //--- increase the array size
        size++;        
        if (size==def_size)
        {
            def_size+=25;
            ArrayResize(files,def_size);
        }
        //--- reset the error value
        ResetLastError();
        //--- receive the file creation date
        create_date=(datetime)FileGetInteger(file_name,FILE_CREATE_DATE,false);
        //--- check if the file is old
        if (create_date < InpFilesDate)
        {
            PrintFormat("%s file deleted!",file_name);
            //--- delete the old file
            FileDelete(file_name);
        }
    }
    while (FileFindNext(search_handle,file_name));
    //--- close the search handle
    FileFindClose(search_handle);
}
else
{
    Print("Files not found!");
    return;
}

//--- check what files have remained
PrintFormat("Results:");
for (int i=0;i<size;i++)
{
    if (FileIsExist(files[i]))
        PrintFormat("%s file exists!",files[i]);
    else
        PrintFormat("%s file deleted!",files[i]);
}
FileMove

Moves a file from a local or shared folder to another folder.

```cpp
bool FileMove(
    const string src_file_name,  // File name for the move operation
    int common_flag,            // Location
    const string dst_file_name, // Name of the destination file
    int mode_flags              // Access mode
);```

**Parameters**

- `src_file_name`  
  `[in]` File name to move/rename.

- `common_flag`  
  `[in]` Flag determining the location of the file. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals `\Terminal\Common\Files`. Otherwise, the file is located in a local folder (`common_flag=0`).

- `dst_file_name`  
  `[in]` File name after operation

- `mode_flags`  
  `[in]` Access flags. The parameter can contain only 2 flags: `FILE_REWRITE` and/or `FILE_COMMON` - other flags are ignored. If the file already exists and the `FILE_REWRITE` flag isn’t specified, the file will not be rewritten, and the function will return false.

**Return Value**

In case of failure the function returns false.

**Note**

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If the new file already exists, the copy will be made depending on the availability of the `FILE_REWRITE` flag in the `mode_flags` parameter.

**Example:**

```cpp
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- input parameters
input string InpSrcName="data.txt";
input string InpDstName="newdata.txt";
input string InpSrcDirectory="SomeFolder";
input string InpDstDirectory="OtherFolder";
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
```
void OnStart()
{
    string local=TerminalInfoString(TERMINAL_DATA_PATH);
    string common=TerminalInfoString(TERMINAL_COMMONDATA_PATH);

    //--- receive file paths
    string src_path;
    string dst_path;
    StringConcatenate(src_path, InpSrcDirectory, "/", InpSrcName);
    StringConcatenate(dst_path, InpDstDirectory, "/", InpDstName);

    //--- check if the source file exists (if not - exit)
    if(FileIsExist(src_path))
    {
        PrintFormat("%s file exists in the %s\Files\%s folder", InpSrcName, local, InpSrcDirectory);
    }
    else
    {
        PrintFormat("Error, %s source file not found", InpSrcName);
        return;
    }

    //--- check if the result file already exists
    if(FileIsExist(dst_path, FILE_COMMON))
    {
        PrintFormat("%s file exists in the %s\Files\%s folder", InpDstName, common, InpDstDirectory);
        ResetLastError();
        if(FileMove(src_path, 0, dst_path, FILE_COMMON|FILE_REWRITE))
        {
            PrintFormat("%s file moved", InpSrcName);
        }
        else
        {
            PrintFormat("Error! Code = %d", GetLastError());
        }
    }
    else
    {
        PrintFormat("%s file does not exist in the %s\Files\%s folder", InpDstName, common, InpDstDirectory);
        ResetLastError();
        if(FileMove(src_path, 0, dst_path, FILE_COMMON))
        {
            PrintFormat("%s file moved", InpSrcName);
        }
        else
        {
            PrintFormat("Error! Code = %d", GetLastError());
        }
    }

    //--- the file is moved; let's check it out
    if(FileIsExist(dst_path, FILE_COMMON) && !FileIsExist(src_path, 0))
    {
        Print("Success!");
    }
    else
    {
        Print("Error!");
    }
}

FileIsExist
File Functions

FileFlush

Writes to a disk all data remaining in the input/output file buffer.

```c
void FileFlush(
    int file_handle  // File handle
);
```

Parameters

file_handle

Return Value

No value returned.

Note

When writing to a file, the data may be actually found there only after some time. To save the data in the file instantly, use `FileFlush()` function. If the function is not used, part of the data that has not been stored in the disk yet, will be forcibly written there only when the file is closed using `FileClose()` function.

The function should be used when written data is of a certain value. It should be kept in mind that frequent function call may affect the program operation speed.

Function `FileFlush()` must be called between the operations of reading from a file and writing to it.

Example:

```c
//--- show the window of input parameters when launching the script
#property script_show_inputs
//--- file name for writing
input string InpFileName="example.csv"; // file name

/**
 * Script program start function
 */

void OnStart()
{
    //--- reset error value
    ResetLastError();
    //--- open the file
    int file_handle=FileOpen(InpFileName,FILE_READ|FILE_WRITE|FILE_CSV);
    if(file_handle!=INVALID_HANDLE)
    {
        //--- write data to the file
        for(int i=0;i<1000;i++)
        {
            //--- call write function
            FileWrite(file_handle,TimeCurrent(),SymbolInfoDouble(Symbol(),SYMBOL_BID),Syr
            //--- save data on the disk at each 128th iteration
            if((i & 127)==127)
```
```c
{
    //--- now, data will be located in the file and will not be lost in case of a critical error
    FileFlush(file_handle);
    PrintFormat("i = %d, OK", i);
}
//--- 0.01 second pause
Sleep(10);
//--- close the file
FileClose(file_handle);
} else
    PrintFormat("Error, code = %d", GetLastError());
```

See also

FileClose
FileGetInteger

Gets an integer property of a file. There are two variants of the function.

1. Get a property by the handle of a file.

```c
long FileGetInteger(
    int file_handle,      // File handle
    ENUM_FILE_PROPERTY_INTEGER property_id // Property ID
);
```

2. Get a property by the file name.

```c
long FileGetInteger(
    const string file_name,   // File name
    ENUM_FILE_PROPERTY_INTEGER property_id,  // Property ID
    bool common_folder=false // The file is viewed in a local
    // or a common folder of all terminals
);
```

### Parameters

**file_handle**
- [in] File descriptor returned by `FileOpen()`.

**file_name**
- [in] File name.

**property_id**
- [in] File property ID. The value can be one of the values of the `ENUM_FILE_PROPERTY_INTEGER` enumeration. If the second variant of the function is used, you can receive only the values of the following properties: `FILE_EXISTS`, `FILE_CREATE_DATE`, `FILE_MODIFY_DATE`, `FILE_ACCESS_DATE` and `FILE_SIZE`.

**common_folder=false**
- [in] Points to the file location. If the parameter is false, terminal data folder is viewed. Otherwise it is assumed that the file is in the shared folder of all terminals `\Terminal\Common\Files` (`FILE_COMMON`).

### Return Value

The value of the property. In case of an error, -1 is returned. To get an error code use the `GetLastError()` function.

If a folder is specified when getting properties by the name, the function will have error 5018 (`ERR_MQL_FILE_IS_DIRECTORY`) in any case, though the return value will be correct.

### Note

The function always changes the error code. In case of successful completion the error code is reset to NULL.

### Example:

```c
//--- display the window of input parameters when launching the script
```
#property script_show_inputs

//--- input parameters
input string InpFileName="data.csv";
input string InpDirectoryName="SomeFolder";

//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
    string path=InpDirectoryName+"//"+InpFileName;
    long l=0;
    //--- open the file
    ResetLastError();
    int handle=FileOpen(path,FILE_READ|FILE_CSV);
    if(handle!=INVALID_HANDLE)
    {
        //--- print all information about the file
        Print(InpFileName," file info:"");
        FileInfo(handle,FILE_EXISTS,l,"bool");
        FileInfo(handle,FILE_CREATE_DATE,l,"date");
        FileInfo(handle,FILE_MODIFY_DATE,l,"date");
        FileInfo(handle,FILE_ACCESS_DATE,l,"date");
        FileInfo(handle,FILE_SIZE,l,"other");
        FileInfo(handle,FILE_POSITION,l,"other");
        FileInfo(handle,FILE_END,l,"bool");
        FileInfo(handle,FILE_IS_COMMON,l,"bool");
        FileInfo(handle,FILE_IS_TEXT,l,"bool");
        FileInfo(handle,FILE_IS_BINARY,l,"bool");
        FileInfo(handle,FILE_IS_CSV,l,"bool");
        FileInfo(handle,FILE_IS_ANSI,l,"bool");
        FileInfo(handle,FILE_IS_READABLE,l,"bool");
        FileInfo(handle,FILE_IS_WRITABLE,l,"bool");
        //--- close the file
        FileClose(handle);
    }
    else
    {
        PrintFormat("%s file is not opened, ErrorCode = %d",InpFileName,GetLastError());
    }
    //+------------------------------------------------------------------+
    //| Display the value of the file property                          |
    //+------------------------------------------------------------------+
    void FileInfo(const int handle,const ENUM_FILE_PROPERTY_INTEGER id,
                 long l,const string type)
    {
        //--- receive the property value
        ResetLastError();
        if((l=FileGetInteger(handle,id))!=-1)
        {
            //--- the value received, display it in the correct format
        }
if(!StringCompare(type,"bool"))
    Print(EnumToString(id)," = ",l ? "true" : "false");
if(!StringCompare(type,"date"))
    Print(EnumToString(id)," = ",(datetime)l); if(!StringCompare(type,"other"))
    Print(EnumToString(id)," = ",l);
}
else
    Print("Error, Code = ",GetLastError());
File Functions

FileIsEnding

Defines the end of a file in the process of reading.

```c
bool FileIsEnding(
    int file_handle    // File handle
);
```

Parameters

`file_handle`

Return Value

The function returns true if the file end has been reached in the process of reading or moving of the file pointer.

Note

To define the end of the file, the function tries to read the next string from it. If the string does not exist, the function returns true, otherwise it returns false.

Example:

```c
//--- show the window of input parameters when launching the script
#property script_show_inputs
//--- input parameters
input string InpFileName="file.txt";  // file name
input string InpDirectoryName="Data";  // directory name
input int InpEncodingType=FILE_ANSI;  // ANSI=32 or UNICODE=64
//| Script program start function |
//|--------------------------------|
void OnStart()
{
    //--- print the path to the file we are going to use
    PrintFormat("Working %s\Files\ folder", TerminalInfoString(TERMINAL_DATA_PATH));
    //--- reset the error value
    ResetLastError();
    //--- open the file for reading (if the file does not exist, the error will occur)
    int file_handle=FileOpen(InpDirectoryName+"//\"+InpFileName,FILE_READ|FILE_TEXT|InpEncodingType);
    if(file_handle!=INVALID_HANDLE)
    {
        //--- print the file contents
        while(!FileIsEnding(file_handle))
        {
            Print(FileReadString(file_handle));
        }
        //--- close the file
        FileClose(file_handle);
    }
    else
    {
        PrintFormat("Error, code = %d", GetLastError());
    }
}```
File Functions

}

File Functions

FileIsLineEnding

Defines the line end in a text file in the process of reading.

```c
bool FileIsLineEnding(
    int file_handle       // File handle
);
```

Parameters

`file_handle`

Return Value

Returns true if in the process of reading txt or csv-file reached the end of the line (the characters CR-LF).

Example (the file obtained during the execution of an example for `FileWriteString` function is used here)

```c
//+------------------------------------------------------------------+
//|                        Copyright 2013, MetaQuotes Software Corp. |
//|                                              https://www.mql5.com |
//+------------------------------------------------------------------+

FileWriteString
**FileReadArray**

Reads from a file of BIN type arrays of any type except string (may be an array of structures, not containing strings, and dynamic arrays).

```c
uint FileReadArray(
    int file_handle,       // File handle
    void* array[],         // Array to record
    int start=0,           // start array position to write
    int count=WHOLE_ARRAY  // count to read
);
```

**Parameters**

- `file_handle`
  - [in] File descriptor returned by `FileOpen()`.

- `array[]`
  - [out] An array where the data will be loaded.

- `start=0`
  - [in] Start position to read from the array.

- `count=WHOLE_ARRAY`
  - [in] Number of elements to read. By default, reads the entire array (count=WHOLE_ARRAY).

**Return Value**

Number of elements read.

**Note**

String array can be read only from the file of TXT type. If necessary, the function tries to increase the size of the array.

**Example** (the file obtained after execution of the example for `FileWriteArray` function is used here)

```c
//--- display the window of input parameters when launching the script
#region script_show_inputs
//--- input parameters
input string InpFileName="data.bin";
input string InpDirectoryName="SomeFolder";
//+------------------------------------------------------------------+
//| Structure for storing price data                                 |
//+------------------------------------------------------------------+
struct prices
{
    datetime date;         // date
    double bid;            // bid price
    double ask;            // ask price
};
//+------------------------------------------------------------------+
//| Script program start function                                   |
```
//+------------------------------------------------------------------+
void OnStart()
{
    //--- structure array
    prices arr[];
    //--- file path
    string path=InpDirectoryName+"//"+InpFileName;
    //--- open the file
    SetLastError();
    int file_handle=FileOpen(path,FILE_READ|FILE_BIN);
    if(file_handle!=INVALID_HANDLE)
    {
        //--- read all data from the file to the array
        FileReadArray(file_handle,arr);
        //--- receive the array size
        int size=ArraySize(arr);
        //--- print data from the array
        for(int i=0;i<size;i++)
            Print("Date = ",arr[i].date," Bid = ",arr[i].bid," Ask = ",arr[i].ask);
        Print("Total data = ",size);
        //--- close the file
        FileClose(file_handle);
    }
    else
        Print("File open failed, error ",GetLastError());
}

Variables, FileWriteArray
### FileReadBool

Reads from the file of CSV type string from the current position to a delimiter (or till the end of the text line) and converts the read string to a bool type value.

```cpp
bool FileReadBool(
    int    file_handle  // File handle
);
```

**Parameters**

- `file_handle`
  - [in] File descriptor returned by `FileOpen()`.

**Return Value**

Line read may be set to “true”, “false” or the symbolic representation of integers “0” or “1”. A nonzero value is converted to a logical true. The function returns the converted value.

**Example** (the file obtained after executing the example for `FileWrite` function is used here)

```cpp
//+------------------------------------------------------------------+
//|                        Copyright 2013, MetaQuotes Software Corp. |

Type bool, FileWrite
FileReadDatetime

Reads from the file of CSV type a string of one of the formats: "YYYY.MM.DD HH:MI:SS", "YYYY.MM.DD" or "HH:MI:SS" - and converts it into a value of datetime type.

```c
datetime FileReadDatetime(
    int file_handle // File handle
);
```

Parameters

`file_handle`

Return Value

The value of datetime type.

Example (the file obtained after executing the example for `FileWrite` function is used here)

```c

Real types (double, float), FileReadDouble, FileWriteFloat
FileReadInteger

The function reads int, short or char value from the current position of the file pointer depending on
the length specified in bytes.

```c
int FileReadInteger(
    int file_handle,  // File handle
    int size=INT_VALUE  // Size of an integer in bytes
);
```

**Parameters**

`file_handle`

[in] File descriptor returned by [FileOpen()](#).

`size=INT_VALUE`

[in] Number of bytes (up to 4 inclusive) that should be read. The corresponding constants are
provided: CHAR_VALUE = 1, SHORT_VALUE = 2 and INT_VALUE = 4, so the function can read the
whole value of char, short or int type.

**Return Value**

A value of the int type. The result of this function must be explicitly cast to a target type, i.e. to the
type of data that you need to read. Since a value of the int type is returned, it can be easily
converted to any integer value. The file pointer is shifted by the number of bytes read.

**Note**

When reading less than 4 bytes, the received result is always positive. If one or two bytes are read,
the sign of the number can be determined by explicit casting to type char (1 byte) or short (2 bytes).
Getting the sign for a three-byte number is not trivial, since there is no corresponding underlying
type.

**Example** (the file obtained after executing the example for [FileWriteInteger](#) function is used here)

**FileReadLong**

The function reads an integer of long type (8 bytes) from the current position of the binary file.

```c
long FileReadLong(
    int file_handle  // File handle
);
```

**Parameters**

`file_handle`
- [in] File descriptor returned by `FileOpen()`.

**Return Value**

The value of long type.

FileReadNumber

The function reads from the CSV file a string from the current position till a separator (or till the end of a text string) and converts the read string to a value of double type.

```
double FileReadNumber(
    int file_handle  // File handle
);
```

Parameters

- `file_handle`  

Return Value

The value of double type.

Example (the file obtained during the execution of an example for `FileWriteString` function is used here)

FileWriteString
FileReadString

The function reads a string from the current position of a file pointer in a file.

```c
string FileReadString(
    int file_handle,  // File handle
    int length=-1     // Length of the string
);
```

Parameters

- **file_handle**
  - [in] File descriptor returned by `FileOpen()`.

- **length**=1
  - [in] Number of characters to read.

Return Value

Line read (string).

Note

When reading from a bin-file, the length of a string to read must be specified. When reading from a txt-file the string length is not required, and the string will be read from the current position to the line feed character "\n\n". When reading from a csv-file, the string length isn't required also, the string will be read from the current position till the nearest delimiter or till the text string end character.

If the file is opened with FILE_ANSI flag, then the line read is converted to Unicode.

Example (the file obtained after executing the example for `FileWriteInteger` function is used here)

```c
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- parameters for data reading
input string InpFileName="Trend.bin"; // file name
input string InpDirectoryName="Data"; // directory name
//+---------------------------------------------------------------+
// | Script program start function                                  |
//+---------------------------------------------------------------+
void OnStart()
{
    //--- open the file
    ResetLastError();
    int file_handle=FileOpen(InpDirectoryName+"/"+InpFileName,FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle!=INVALID_HANDLE)
    {
        PrintFormat("%s file is available for reading",InpFileName);
        PrintFormat("File path: %s\Files\",TerminalInfoString(TERMINAL_DATA_PATH));
        //--- additional variables
        int str_size;
        string str;
```
//--- read data from the file
while(!FileIsEnding(file_handle))
{
    //--- find out how many symbols are used for writing the time
    str_size=FileReadInteger(file_handle,INT_VALUE);
    //--- read the string
    str=FileReadString(file_handle,str_size);
    //--- print the string
    PrintFormat(str);
}
//--- close the file
FileClose(file_handle);
PrintFormat("Data is read, %s file is closed",InpFileName);
else
    PrintFormat("Failed to open %s file, Error code = %d",InpFileName,GetLastError());

See also

String Type, Conversion Functions, FileWriteInteger
**FileReadStruct**

The function reads contents into a structure passed as a parameter from a binary-file, starting with the current position of the file pointer.

```c
uint FileReadStruct(
    int file_handle,  // file handle
    const void* struct_object,  // target structure to which the contents are read
    int size=-1  // structure size in bytes
);
```

**Parameters**

- `file_handle`  

- `struct_object`  
  [out] The object of this structure. The structure should not contain strings, **dynamic arrays** or **virtual functions**.

- `size=-1`  
  [in] Number of bytes that should be read. If size is not specified or the indicated value is greater than the size of the structure, the exact size of the specified structure is used.

**Return Value**

If successful the function returns the number of bytes read. File pointer is moved by the same number of bytes.

**Example** (the file obtained after using the example for `FileWriteStruct` function is used here)

```c

File Functions

FileSeek

The function moves the position of the file pointer by a specified number of bytes relative to the specified position.

```cpp
bool FileSeek(
    int file_handle,    // File handle
    long offset,       // In bytes
    ENUM_FILEgetPosition origin,   // Position for reference
);
```

Parameters

- `file_handle`
  - [in] File descriptor returned by `FileOpen()`.
- `offset`
  - [in] The shift in bytes (may take a negative value).
- `origin`
  - [in] The starting point for the displacement. Can be one of values of `ENUM_FILE_POSITION`.

Return Value

If successful the function returns true, otherwise false. To obtain information about the error call the `GetLastError()` function.

Note

If the execution of the `FileSeek()` function results in a negative shift (going beyond the “level boundary” of the file), the file pointer will be set to the file beginning.

If a position is set beyond the “right boundary” of the file (larger than the file size), the next writing to the file will be performed not from the end of the file, but from the position set. In this case indefinite values will be written for the previous file end and the position set.

Example:

```cpp
//+------------------------------------------------------------------+

        }
    }
    else
        break; // end of the file, exit
}
//--- define the actual size of the array
ArrayResize(arr,i);
The function returns the file size in bytes.

```c
ulong FileSize(  
    int file_handle  // File handle
);
```

**Parameters**

*file_handle*

[in] File descriptor returned by FileOpen().

**Return Value**

The value of type int.

**Note**

To obtain information about the error call GetLastError().

**Example:**

```c
//--- show the window of input parameters when launching the script
#property script_show_inputs
//--- input parameters
input ulong InpThresholdSize=20;       // file threshold size in kilobytes
input string InpBigFolderName="big";   // folder for large files
input string InpSmallFolderName="small"; // folder for small files
//-----------------------------+
//| Script program start function  |
//-----------------------------+
void OnStart()
{
    string file_name;   // variable for storing file names
    string filter="*.csv";  // filter for searching the files
    ulong file_size=0;   // file size in bytes
    int size=0;           // number of files

    //--- print the path to the file we are going to work with
    PrintFormat("Working in %s\files\ folder",TerminalInfoString(TERMinals COMMONDATA));
    //--- receive the search handle in common folder's root of all terminals
    long search_handle=FileFindFirst(filter,file_name,FILE_COMMON);
    //--- check if FileFindFirst() has been executed successfully
    if(search_handle!=INVALID_HANDLE)
    {
        //--- move files in the loop according to their size
        do
        {
            //--- open the file
            SetLastError();
            int file_handle=FileOpen(file_name,FILE_READ|FILE_CSV|FILE_COMMON);
            if(file_handle!=INVALID_HANDLE)
```

```c
{  //--- receive the file size
    file_size=FileSize(file_handle);
    //--- close the file
    FileClose(file_handle);
}  
else  
{
    PrintFormat("Failed to open %s file, Error code = %d",file_name,GetLastError);
    continue;
}

//--- print the file size
PrintFormat("Size of %s file is equal to %d bytes",file_name,file_size);
//--- define the path for moving the file
string path;
if(file_size>InpThresholdSize*1024)  
    path=InpBigFolderName+"//"+file_name;
else  
    path=InpSmallFolderName+"//"+file_name;
//--- move the file
ResetLastError();
if(FileMove(file_name,FILE_COMMON,path,FILE_REWRITE|FILE_COMMON))  
    PrintFormat("%s file is moved",file_name);
else  
    PrintFormat("Error, code = %d",GetLastError());
}
while(FileFindNext(search_handle,file_name));
//--- close the search handle
FileFindClose(search_handle);
}  
else  
Print("Files not found!");
}  
```
**FileTell**

The file returns the current position of the file pointer of an open file.

```c
ulong FileTell(
    int file_handle   // File handle
);
```

**Parameters**

`file_handle`

**Return Value**

Current position of the file descriptor in bytes from the beginning of the file.

**Note**

To obtain information about the `error` call `GetLastError()`.

**Example:**

```c
//+------------------------------------------------------------------+

//+-------------------------------------------------------------------------------+
void GetStringPositions(const int handle, ulong &arr[])
{
    //--- default array size
    int def_size=127;
    //--- allocate memory for the array
    ArrayResize(arr, def_size);
    //--- string counter
    int i=0;
    //--- if this is not the file's end, then there is at least one string
    if(!FileIsEnding(handle)) {
        arr[i]=FileTell(handle);
        i++;
    } else
        return; // the file is empty, exit
    //--- define the shift in bytes depending on encoding
    int shift;
    if(FileGetInteger(handle, FILE_IS_ANSI))
    ```
shift=1;
else
    shift=2;
//--- go through the strings in the loop
while(1)
{
//--- read the string
FileReadString(handle);
//--- check for the file end
if(!FileIsEnding(handle))
{
    //--- store the next string's position
    arr[i]=FileTell(handle)+shift;
i++;
    //--- increase the size of the array if it is overflowed
    if(i==def_size)
    {
        def_size+=def_size+1;
        ArrayResize(arr,def_size);
    }
    }
else
    break; // end of the file, exit
}
//--- define the actual size of the array
ArrayResize(arr,i);
FileWrite

The function is intended for writing of data into a CSV file, delimiter being inserted automatically unless it is equal to 0. After writing into the file, the line end character "\r\n" will be added.

```c
uint FileWrite(  
    int file_handle,  // File handle
    ...  // List of recorded parameters
);
```

Parameters

- ... [in] The list of parameters separated by commas, to write to the file. The number of written parameters can be up to 63.

Return Value

- Number of bytes written.

Note

Numbers will be converted into a text at output (see the `Print()` function). Data of the double type are output with the accuracy of 16 digits after the decimal point, and the data can be displayed either in traditional or in scientific format - depending on which format will be the most compact. The data of the float type are shown with 5 digits after the decimal point. To output real numbers with different precision or in a clearly specified format, use `DoubleToString()`.

Numbers of the bool type are displayed as "true" or "false" strings. Numbers of the datetime type are displayed as "YYYY.MM.DD HH:MI:SS".

Example:

```c
//+------------------------------------------------------------------+
//|                        Copyright 2013, MetaQuotes Software Corp. |
//|                                              https://www.mql5.com |

Comment, Print, StringFormat
**FileWriteArray**

The function writes arrays of any type except for string to a BIN file (can be an array of structures not containing strings or dynamic arrays).

```c
uint FileWriteArray(
    int file_handle, // File handle
    const void* array[], // Array
    int start=0, // Start index in the array
    int count=WHOLE_ARRAY // Number of elements
);
```

**Parameters**

- **file_handle**
  - [in] File descriptor returned by `FileOpen()`.

- **array[]**
  - [out] Array for recording.

- **start=0**
  - [in] Initial index in the array (number of the first recorded element).

- **count=WHOLE_ARRAY**
  - [in] Number of items to write (WHOLE_ARRAY means that all items starting with the number start until the end of the array will be written).

**Return Value**

Number of recorded items.

**Note**

String array can be recorded in a TXT file. In this case, strings are automatically ended by the line end characters "\n\n". Depending on the file type ANSI or UNICODE, strings are either converted to ansi-encoding or not.

**Example:**

```c
//+------------------------------------------------------------------+

Variables, FileSeek
FileWriteDouble

The function writes the value of a double parameter to a bin-file, starting from the current position of the file pointer.

```c
uint FileWriteDouble(
    int file_handle,  // File handle
    double value      // Value to write
);
```

**Parameters**

- `file_handle`
  

- `value`
  

**Return Value**

If successful the function returns the number of bytes written (in this case `sizeof(double)=8`). The file pointer is shifted by the same number of bytes.

**Example:**

```c
//--- show the window of input parameters when launching the script
#property script_show_inputs
//--- parameters for receiving data from the terminal
input string InpSymbolName="EURJPY";       // currency pair
input ENUM_TIMEFRAMES InpSymbolPeriod=PERIOD_M15; // time frame
input int InpMAPeriod=10;                   // smoothing period
input int InpMAShift=0;                     // indicator shift
input ENUM_MA_METHOD InpMAMethod=MODE_SMA;  // smoothing type
input ENUM_APPLIED_PRICE InpAppliedPrice=PRICE_CLOSE; // price type
input datetime InpDateStart=D'2013.01.01 00:00'; // data copying start date
//--- parameters for writing data to the file
input string InpFileName="MA.csv";         // file name
input string InpDirectoryName="Data";      // directory name

void OnStart()
{
```

File Functions

```c
}

//--- close the file
FileClose(file_handle);

PrintFormat("Data is written, %s file is closed", InpFileName);

else

    PrintFormat("Failed to open %s file, Error code = %d", InpFileName, GetLastError();
```

FileWriteFloat

The function writes the value of the float parameter to a bin-file, starting from the current position of the file pointer.

```c
uint FileWriteFloat(
    int   file_handle,   // File handle
    float value           // Value to be written
);
```

Parameters

Return Value

If successful the function returns the number of bytes written (in this case `sizeof(float)=4`). The file pointer is shifted by the same number of bytes.

Example:

```c
//+------------------------------------------------------------------+
//| Demo_FileWriteFloat.mq5 |
//| Copyright 2013, MetaQuotes Software Corp. |
//| https://www.mql5.com |
//+------------------------------------------------------------------+

//--- show the window of input parameters when launching the script
//--- parameters for receiving data from the terminal

Real types (double, float), FileWriteDouble
**FileWriteInteger**

The function writes the value of the int parameter to a bin-file, starting from the current position of the file pointer.

```cpp
uint FileWriteInteger(
    int file_handle,       // File handle
    int value,             // Value to be written
    int size=INT_VALUE    // Size in bytes
);
```

**Parameters**

- `file_handle`
  - [in] File descriptor returned by `FileOpen()`.
- `value`
  - [in] Integer value.
- `size=INT_VALUE`
  - [in] Number of bytes (up to 4 inclusive), that should be written. The corresponding constants are provided: `CHAR_VALUE=1`, `SHORT_VALUE=2` and `INT_VALUE=4`, so the function can write the integer value of char, uchar, short, ushort, int, or uint type.

**Return Value**

If successful the function returns the number of bytes written. The file pointer is shifted by the same number of bytes.

**Example:**

```cpp
//+------------------------------------------------------------------+
//| Demo_FileWriteInteger.mq5 | Copyright 2013, MetaQuotes Software Corp. |
//| hhttps://www.mql5.com | 
//+------------------------------------------------------------------+

FileWriteLong

The function writes the value of the long-type parameter to a bin-file, starting from the current position of the file pointer.

```c
uint FileWriteLong(  
    int file_handle,  // File handle
    long value        // Value to be written
);
```

**Parameters**

- `file_handle`
  

- `value`
  

**Return Value**

If successful the function returns the number of bytes written (in this case `sizeof(long)`=8). The file pointer is shifted by the same number of bytes.

**Example:**

```c
//+------------------------------------------------------------------+
//| Demo_FileWriteLong.mq5 | Copyright 2013, MetaQuotes Software Corp. |
//| https://www.mql5.com | +------------------------------------------------------------------+

int size;
void OnStart()
{
    datet ime date_finish=TimeCurrent();
    long volume_buff[];
    datet ime time_buff[];
    int size;
```
//--- reset the error value
ResetLastError();
//--- copy tick volumes for each bar
if(CopyTickVolume(InpSymbolName, InpSymbolPeriod, InpDateStart, date_finish, volume_buff)==-1)
{
    PrintFormat("Failed to copy values of the tick volume. Error code = %d", GetLastError());
    return;
}
//--- copy the time for each bar
if(CopyTime(InpSymbolName, InpSymbolPeriod, InpDateStart, date_finish, time_buff)==-1)
{
    PrintFormat("Failed to copy time values. Error code = %d", GetLastError());
    return;
}
//--- receive the buffer size
size=ArraySize(volume_buff);
//--- open the file for writing the indicator values (if the file is absent, it will be created automatically)
ResetLastError();
int file_handle=FileOpen(InpDirectoryName+"//"+InpFileName, FILE_READ|FILE_WRITE|FILE_BINARY);
if(file_handle!=INVALID_HANDLE)
{
    PrintFormat("%s file is available for writing", InpFileName);
    PrintFormat("File path: %s\Files\", TerminalInfoString(TERMINAL_DATA_PATH));
    //--- first, write the data sample size
    FileWriteLong(file_handle, (long)size);
    //--- write time and volume values to file
    for(int i=0;i<size;i++)
    {
        FileWriteLong(file_handle, (long)time_buff[i]);
        FileWriteLong(file_handle, volume_buff[i]);
    }
    //--- close the file
    FileClose(file_handle);
    PrintFormat("Data is written, %s file is closed", InpFileName);
}
else
    PrintFormat("Failed to open %s file, Error code = %d", InpFileName, GetLastError());

See also

Integer types, FileWriteInteger
**FileWriteString**

The function writes the value of a string-type parameter into a BIN, CSV or TXT file starting from the current position of the file pointer. When writing to a CSV or TXT file: if there is a symbol in the string \n (LF) without previous character \r (CR), then before \n the missing \r is added.

```c
uint FileWriteString(
    int file_handle,  // File handle
    const string text_string,  // string to write
    int length=-1  // number of symbols
);
```

**Parameters**

- **file_handle**
  

- **text_string**
  

- **length=-1**
  
  [in] The number of characters that you want to write. This option is needed for writing a string into a BIN file. If the size is not specified, then the entire string without the trailer 0 is written. If you specify a size smaller than the length of the string, then a part of the string without the trailer 0 is written. If you specify a size greater than the length of the string, the string is filled by the appropriate number of zeros. For files of CSV and TXT type, this parameter is ignored and the string is written entirely.

**Return Value**

If successful the function returns the number of bytes written. The file pointer is shifted by the same number of bytes.

**Note**

Note that when writing to a file opened by the FILE_UNICODE flag (or without a flag FILE_ANSI), then the number of bytes written will be twice as large as the number of string characters written. When recording to a file opened with the FILE_ANSI flag, the number of bytes written will coincide with the number of string characters written.

**Example:**

```c
//+------------------------------------------------------------------+
//|                        Copyright 2013, MetaQuotes Software Corp. |
//|                                              https://www.mql5.com |

String Type, StringFormat
FileWriteStruct

The function writes into a bin-file contents of a structure passed as a parameter, starting from the current position of the file pointer.

```c
uint FileWriteStruct(
    int  file_handle,       // File handle
    const void* struct_object, // link to an object
    int size=-1             // size to be written in bytes
);
```

Parameters

- **file_handle**
  - [in] File descriptor returned by `FileOpen()`.

- **struct_object**
  - [in] Reference to the object of this structure. The structure should not contain strings, **dynamic arrays** or **virtual functions**.

- **size=-1**
  - [in] Number of bytes that you want to record. If size is not specified or the specified number of bytes is greater than the size of the structure, the entire structure is written.

Return Value

If successful the function returns the number of bytes written. The file pointer is shifted by the same number of bytes.

Example:

```c
//+------------------------------------------------------------------+
//|                      Demo_FileWriteStruct.mq5                     |

if (file_handle != INVALID_HANDLE)
{
    PrintFormat("%s file is open for writing", InpFileName);
    PrintFormat("File path: %s\Files\", TerminalInfoString(TERMINAL_COMMONDATA_PATH));
    //--- prepare the counter of the number of bytes
    uint counter = 0;
    //--- write array values in the loop
    for (int i = 0; i < size; i++)
    {
        counter += FileWriteStruct(file_handle, cand_buff[i]);
    }
    PrintFormat("%d bytes of information is written to %s file", InpFileName, counter);
    PrintFormat("Total number of bytes: %d * %d * %d = %d, %s", size, 5, 8, size * 5 * 8, size * 5 * 8 == counter ? "Correct" : "Error");
    //--- close the file
    FileClose(file_handle);
    PrintFormat("Data is written, %s file is closed", InpFileName);
}
else
{
    PrintFormat("Failed to open %s file, Error code = %d", InpFileName, GetLastError());
}

File Functions

FileLoad

Reads all data of a specified binary file into a passed array of numeric types or simple structures. The function allows you to quickly read data of a known type into the appropriate array.

```c
long FileLoad(
    const string file_name, // File name
    void* buffer[], // An array of numeric types or simple structures
    int common_flag=0 // A file flag, is searched in <data_folder>MQL5\Files
);
```

Parameters

- **file name**
  - [in] The name of the file from which data will be read.

- **buffer**
  - [out] An array of numeric types or simple structures.

- **common_flag=0**
  - [in] A file flag indicating the operation mode. If the parameter is not specified, the file is searched in the subfolder MQL5\Files (or in <testing_agent_directory>MQL5\Files in case of testing).

Return Value

The number of elements read or -1 in case of an error.

Note

The FileLoad() function reads from a file the number of bytes multiple of the array element size. Suppose the file size is 10 bytes, and the function reads data into an array of type double (sizeof(double)=8). In this case the function will read only 8 bytes, the remaining 2 bytes at the end of the file will be dropped, and the function FileLoad() will return 1 (1 element read).

Example:

```c
//+------------------------------------------------------------------+
//|                        Copyright 2016, MetaQuotes Software Corp. |
//|                                             https://www.mql5.com |
//+------------------------------------------------------------------+
#
//--- input parameters
input int bars_to_save=10; // Number of bars
```

© 2000-2019, MetaQuotes Software Corp.
void OnStart()
{
    string filename=_Symbol+"_rates.bin";
    MqlRates rates[];
    //---
    int copied=CopyRates(_Symbol,_Period,0,bars_to_save,rates);
    if(copied!=-1)
    {
        PrintFormat("CopyRates(%s) copied %d bars",_Symbol,copied);
        //--- Writing quotes to a file
        if(!FileSave(filename,rates,FILE_COMMON))
            PrintFormat("FileSave() failed, error=%d",GetLastError());
    }
    else
        PrintFormat("Failed CopyRates(%s), error=",_Symbol,GetLastError());
    //--- Now reading these quotes back to the file
    ArrayFree(rates);
    long count=FileLoad(filename,rates,FILE_COMMON);
    if(count!=-1)
    {
        Print("Time\tOpen\tHigh\tLow\tClose\tTick Volume\tSpread\tReal Volume");
        for(int i=0;i<count;i++)
        {
            PrintFormat("%s\t%G\t%G\t%G\t%I64u\t%I64u", 
                          TimeToString(rates[i].time,TIME_DATE|TIME_SECONDS),
                          rates[i].open,rates[i].high,rates[i].low,rates[i].close,
                          rates[i].tick_volume,rates[i].spread,rates[i].real_volume);
        }
    }
}

Structures and Classes, FileReadArray, FileReadStruct, FileSave
## FileSave

Writes to a binary file all elements of an array passed as a parameter. The function allows you to quickly write arrays of numeric types or simple structures as one string.

```c
bool FileSave(
    const string file_name,  // File name
    void& buffer[],          // An array of numeric types or simple structures
    int common_flag=0         // A file flag, by default files are written to <data_folder>
);
```

### Parameters

- **file_name**
  - [in] The name of the file, to the data array will be written.

- **buffer**
  - [in] An array of numeric types or simple structures.

- **common_flag=0**
  - [in] A file flag indicating the operation mode. If the parameter is not specified, the file will be written to the subfolder MQL5\Files (or to <testing_agent_directory>MQL5\Files in case of testing).

### Return Value

In case of failure returns false.

### Example:

```c
//+------------------------------------------------------------------+
//|                        Copyright 2016, MetaQuotes Software Corp. |
//|                                             https://www.mql5.com |
//+------------------------------------------------------------------+

#property copyright "Copyright 2016, MetaQuotes Software Corp."
#property link "https://www.mql5.com"
#property version "1.00"
#property script_show_inputs
//--- input parameters
input int ticks_to_save=1000; // Number of ticks

void OnStart()
{
    string filename=_Symbol+"_ticks.bin";
    MqlTick ticks[];

    //---
    int copied=CopyTicks(_Symbol,ticks,COPY_TICKS_ALL,0,ticks_to_save);
    if(copied!=-1)
    {
```
PrintFormat("CopyTicks\(%s\) copied %d ticks", _Symbol, copied);

--- If the tick history is synchronized, the error code is equal to zero
if(!GetLastError()==0)
    PrintFormat("%s: Ticks are not synchronized, error=%d", _Symbol, copied, GetLastError());

--- Writing ticks to a file
if(!FileSave(filename, ticks, FILE_COMMON))
    PrintFormat("FileSave() failed, error=%d", GetLastError());
else
    PrintFormat("Failed CopyTicks(%s), Error=%", _Symbol, GetLastError());

--- Now reading the ticks back to the file
ArrayFree(ticks);
long count=FileLoad(filename, ticks, FILE_COMMON);
if(count!=-1)
{
    Print("Time\tBid\tAsk\tLast\tVolume\tTimed\flags");
    for(int i=0;i<count;i++)
    {
        PrintFormat("%s.%03I64u:\t\t%I64u\t%I64u\t%04x",
            TimeToString(ticks[i].time, TIME_DATE|TIME_SECONDS), ticks[i].time_msc%1000,
            ticks[i].bid, ticks[i].ask, ticks[i].last, ticks[i].volume, ticks[i].flags);
    }
}

FolderCreate

Creates a directory in the Files folder (depending on the common_flag value)

```cpp
bool FolderCreate(
    string folder_name, // line with the created folder name
    int common_flag=0    // action area
);
```

Parameters

folder_name

[in] Name of the directory to be created. Contains the relative path to the folder.

common_flag=0

[in] Flag defining the directory location. If common_flag=FILE_COMMON, the directory is located in the common folder of all client terminals \Terminal\Common\Files. Otherwise, the directory is in the local folder (MQL5\Files or MQL5\Tester\Files when testing).

Return Value

Returns true if successful, otherwise false.

Note

For reasons of security, working with files is strictly controlled in MQL5 language. Files used in file operations by means of MQL5 language cannot be located outside the file sandbox.

Example:

```cpp
#property copyright "Copyright 2011, MetaQuotes Software Corp."
#property link "https://www.mql5.com"
#property version "1.00"
//--- description
#property description "The script shows FolderCreate() application sample."
#property description "The external parameter defines the directory for creating folders."
#property description "The folder structure is created after executing the script"

//--- display window of the input parameters during the script's launch
#property script_show_inputs
//--- the input parameter defines the folder, in which the script works
input bool common_folder=false; // common folder for all terminals
  //---------------------------------------------------------------
  //| Script program start function
  //---------------------------------------------------------------
void OnStart()
{
  //--- folder to be created in MQL5\Files
  string root_folder="Folder_A";
  if(CreateFolder(root_folder,common_folder))
  {
    //--- create the Child_Folder_B1 sub-folder in it
```
string folder_B1="Child_Folder_B1";
string path=root_folder+"\"+folder_B1;    // create the folder name considering the structure

if(CreateFolder(path,common_folder))
{
    //--- create 3 more sub-directories in this folder
    string folder_C11="Child_Folder_C11";
    string child_path=root_folder+"\"+folder_C11; // create the folder name considering the structure
    CreateFolder(child_path,common_folder);
    //--- second sub-directory
    string folder_C12="Child_Folder_C12";
    child_path=root_folder+"\"+folder_C12;
    CreateFolder(child_path,common_folder);

    //--- third sub-directory
    string folder_C13="Child_Folder_C13";
    child_path=root_folder+"\"+folder_C13;
    CreateFolder(child_path,common_folder);
}

//---

bool CreateFolder(string folder_path,bool common_flag)
{
    int flag=common_flag?FILE_COMMON:0;
    string working_folder;

    //--- define the full path depending on the common_flag parameter
    if(common_flag)
        working_folder=TerminalInfoString(TERMIAL_COMMONDATA_PATH)+"\MQL5\Files";
    else
        working_folder=TerminalInfoString(TERMIAL_DATA_PATH)+"\MQL5\Files";

    //--- debugging message
    PrintFormat(\"folder_path=%s\",folder_path);

    //--- attempt to create a folder relative to the MQL5\Files path
    if(FolderCreate(folder_path,flag))
    {
        //--- display the full path for the created folder
        PrintFormat(\"Created the folder %s\",working_folder+\"\"+folder_path);
        //--- reset the error code
        ResetLastError();
        //--- successful execution
        return true;
    }

    else
        PrintFormat(\"Failed to create the folder %s. Error code %d\",working_folder+folder_path);

    //--- execution failed
    return false;
}

FileOpen(), FolderClean(), FileCopy()
FolderDelete

The function removes the specified directory. If the folder is not empty, then it can't be removed.

```cpp
bool FolderDelete(
    string folder_name, // String with the name of the folder to delete
    int common_flag=0   // Scope
);
```

Parameters

folder_name

[in] The name of the directory you want to delete. Contains the full path to the folder.

common_flag=0

[in] Flag determining the location of the directory. If common_flag=FILE_COMMON, then the directory is in the shared folder for all client terminals \Terminal\Common\Files. Otherwise, the directory is in a local folder (MQL5\Files or MQL5\Tester\Files in the case of testing).

Return Value

Returns true if successful, otherwise false.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If the directory contains at least one file and/or subdirectory, then this directory can't be deleted, it must be cleared first. FolderClean() is used to clear a folder of all its files or subfolders.

Example:

```cpp
//+------------------------------------------------------------------+
//|                                      Copyright 2011, MetaQuotes Software Corp. |
//|                                                          https://www.mql5.com |
//+------------------------------------------------------------------+
//--- Description
//--- Show the dialog of input parameters when starting the script
//--- Input parameters
input string firstFolder="empty"; // An empty folder
input string secondFolder="nonempty"; // The folder, in which one file will be created
string filename="delete_me.txt"; // The name of the file that will be created in secondFolder
```

© 2000-2019, MetaQuotes Software Corp.
```cpp
void OnStart()
{
    //--- Write the file handle here
    int handle;
    //--- Find out in what folder we are working
    string working_folder = TerminalInfoString(TERMINAL_DATA_PATH) + "\\MQL5\\Files";
    //--- A debug message
    PrintFormat("working_folder=%s", working_folder);
    //--- Trying to create an empty folder relative to path MQL5\Files
    if (FolderCreate(firstFolder, 0)) // 0 means that we are working in the local folder
    {
        //--- Enter the full path to the created folder
        PrintFormat("Folder %s has been created", working_folder + "\\" + firstFolder);
        //--- Reset the error code
        ResetLastError();
    }
    else
        PrintFormat("Failed to create folder %s. Error code %d", working_folder + "\\", GetLastError());

    //--- Now create a non-empty folder using the FileOpen() function
    string filepath = secondFolder + "\\" + filename; // Form path to file that we want to create
    handle = FileOpen(filepath, FILE_WRITE | FILE_TEXT); // Flag FILE_WRITE in this case is obligatory
    if (handle != INVALID_HANDLE)
        PrintFormat("File %s has been opened for reading", working_folder + "\\" + filepath);
    else
        PrintFormat("Failed to create file %s in folder %s. Error code %d", filename, secondFolder, GetLastError());

    //--- A small pause of 5 seconds to read a message in the chart
    Sleep(5000); // Sleep() cannot be used in indicators!

    //--- Show a dialog and ask the user
    int choice = MessageBox(StringFormat("Do you want to delete folders %s and %s?", firstFolder, secondFolder),
    MB_YESNO | MB_ICONQUESTION); // Two buttons - "Yes" and "No"

    //--- Run an action depending on the selected variant
    if (choice == IDYES)
    {
        //--- Delete the comment form the chart
        Comment(""); // Don't use the "Comment" function for deleting comments
        //--- Add a message into the "Experts" journal
        PrintFormat("Trying to delete folders %s and %s", firstFolder, secondFolder);
        ResetLastError();
        //--- Delete the empty folder
        if (!FolderDelete(firstFolder)) // The following message should appear since the folder is empty
            PrintFormat("Folder %s has been successfully deleted", firstFolder);
    }
```
else
    PrintFormat("Failed to delete folder %s. Error code=%d", firstFolder, GetLastError());
//--- Delete the folder that contains a file
if (FolderDelete(secondFolder))
    PrintFormat("Folder %s has been successfully deleted", secondFolder);
else
    //--- The following message should appear since the folder contains a file
    PrintFormat("Failed to delete folder %s. Error code=%d", secondFolder, GetLastError());
else
    Print("Deletion canceled");
//---

FileOpen(), FolderClean(), FileMove()
FolderClean

The function deletes all files in a specified folder.

```cpp
bool FolderClean(
    string folder_name, // String with the name of the deleted folder
    int common_flag=0   // Scope
);
```

**Parameters**

*folder_name*

- **[in]** The name of the directory where you want to delete all files. Contains the full path to the folder.

*common_flag=0*

- **[in]** Flag determining the location of the directory. If `common_flag = FILE_COMMON`, then the directory is in the shared folder for all client terminals \Terminal\Common\Files. Otherwise, the directory is in a local folder (MQL5\Files or MQL5\Tester\Files in case of testing).

**Return Value**

Returns true if successful, otherwise false.

**Note**

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

This function should be used with caution, since all the files and all subdirectories are deleted irretrievably.

**Example:**

```cpp
//--- Show the dialog of input parameters when starting the script
#property script_show_inputs
//--- Input parameters
input string foldername="demo_folder"; // Create a folder in MQL5/Files/
input int files=5; // The number of files to create and delete
```

© 2000-2019, MetaQuotes Software Corp.
// Script program start function
void OnStart()
{
    string name="testfile";
    //--- First open or create files in the terminal data folder
    for(int N=0;N<files;N++)
    {
        //--- The name of the file in the form of 'demo_folder\testfileN.txt'
        string filename=StringFormat("%s\%s%d.txt",foldername,name,N);
        //--- Open a file with the flag for writing, in this case the 'demo_folder' will be created automatically
        int handle=FileOpen(filename,FILE_WRITE);
        //--- Find out if the FileOpen() function was successful
        if(handle==INVALID_HANDLE)
        {
            PrintFormat("Failed to create file %s. Error code",filename,GetLastError());
            ResetLastError();
        }
        else
        {
            PrintFormat("File %s has been successfully opened",filename);
            //--- The opened file is not needed any more, so close it
            FileClose(handle);
        }
    }
    //--- Check the number of files in the folder
    int k=FilesInFolder(foldername:"\*.*",0);
    PrintFormat("Totally the folder %s contains %d files",foldername,k);
    //--- Show a dialog to ask the user
    int choice=MessageBox(StringFormat("You are going to delete %d files from folder %s:
    Deleting files from the folder",foldername,MB_YESNO|MB_ICONQUESTION)); // Two buttons - "Yes" and "No"
    ResetLastError();
    //--- Run an action depending on the selected variant
    if(choice==IDYES)
    {
        //--- Start to delete files
        PrintFormat("Trying to delete all files from folder %s",foldername);
        if(FolderClean(foldername,0))
        {
            PrintFormat("Files have been successfully deleted, %d files left in folder %s
            foldername,
            FilesInFolder(foldername:"\*.*",0));
        }
        else
        {
            PrintFormat("Failed to delete files from folder %s. Error code %d",foldername
            )
        }
    }
    else
    {
        PrintFormat("Deletion canceled");
    }
//---
}
//------------------------------------------------------------------+
//| Returns the number of files in the specified folder               |
//+------------------------------------------------------------------+

int FilesInFolder(string path, int flag)
{
    int count=0;
    long handle;
    string filename;
    //---
    handle=FileFindFirst(path, filename, flag);
    //--- If at least one file found, search for more files
    if(handle!=INVALID_HANDLE)
    {
        //--- Show the name of the file
        PrintFormat("File %s found", filename);
        //--- Increase the counter of found files/folders
        count++;
        //--- Start search in all files/folders
        while(FileFindNext(handle, filename))
        {
            PrintFormat("File %s found", filename);
            count++;
        }
        //--- Do not forget to close the search handle upon completion
        FileFindClose(handle);
    }
    else // Failed to get the handle
    {
        PrintFormat("Files search in folder %s failed", path);
    }
    //--- Return the result
    return count;
}

Custom Indicators

This is the group functions used in the creation of custom indicators. These functions can't be used when writing Expert Advisors and Scripts.

<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>SetIndexBuffer</td>
<td>Binds the specified indicator buffer with one-dimensional dynamic array of the double type</td>
</tr>
<tr>
<td>IndicatorSetDouble</td>
<td>Sets the value of an indicator property of the double type</td>
</tr>
<tr>
<td>IndicatorSetInteger</td>
<td>Sets the value of an indicator property of the int type</td>
</tr>
<tr>
<td>IndicatorSetString</td>
<td>Sets the value of an indicator property of the string type</td>
</tr>
<tr>
<td>PlotIndexSetDouble</td>
<td>Sets the value of an indicator line property of the double</td>
</tr>
<tr>
<td>PlotIndexSetInteger</td>
<td>Sets the value of an indicator line property of the int</td>
</tr>
<tr>
<td>PlotIndexSetString</td>
<td>Sets the value of an indicator line property of the string</td>
</tr>
<tr>
<td>PlotIndexGetInteger</td>
<td>Returns the value of an indicator line property of the integer type</td>
</tr>
</tbody>
</table>

Indicator properties can be set using the compiler directives or using functions. To better understand this, it is recommended that you study indicator styles in examples.

All the necessary calculations of a custom indicator must be placed in the predetermined function OnCalculate(). If you use a short form of the OnCalculate() function call, like

```c
int OnCalculate (const int rates_total, const int prev_calculated, const int begin, ...)
```

then the rates_total variable contains the value of the total number of elements of the price[] array, passed as an input parameter for calculating indicator values.

Parameter prev_calculated is the result of the execution of OnCalculate() at the previous call; it allows organizing a saving algorithm for calculating indicator values. For example, if the current value rates_total = 1000, prev_calculated = 999, then perhaps it's enough to make calculations only for one value of each indicator buffer.

If the information about the size of the input array price would have been unavailable, then it would lead to the necessity to make calculations for 1000 values of each indicator buffer. At the first call of OnCalculate() value prev_calculated = 0. If the price[] array has changed somehow, then in this case prev_calculated is also equal to 0.

The begin parameter shows the number of initial values of the price array, which don't contain data for calculation. For example, if values of Accelerator Oscillator (for which the first 37 values aren't
calculated) were used as an input parameter, then begin = 37. For example, let's consider a simple indicator:

```mql5
#property indicator_chart_window
#property indicator_buffers 1
#property indicator_plots 1
//-- plot Labell
#property indicator_label1 "Labell"
#property indicator_type1 DRAW_LINE
#property indicator_color1 clrRed
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
//-- indicator buffers
double LabellBuffer[];
//-- Custom indicator initialization function
void OnInit()
{
    // indicator buffers mapping
    SetIndexBuffer(0, LabellBuffer, INDICATOR_DATA);
}
//-- Custom indicator iteration function
int OnCalculate(const int rates_total,
                const int prev_calculated,
                const int begin,
                const double &price[])
{
    //---
    Print("begin = ",begin," prev_calculated = ",prev_calculated," rates_total = ",rates_total);
    //--- return value of prev_calculated for next call
    return(prev_calculated);
}
```

Drag it from the "Navigator" window to the window of the Accelerator Oscillator indicator and we indicate that calculations will be made based on the values of the previous indicator:
As a result, the first call of OnCalculate() the value of prev_calculated will be equal to zero, and in further calls it will be equal to the rates_total value (until the number of bars on the price chart increases).

The value of the begin parameter will be exactly equal to the number of initial bars, for which the values of the Accelerator indicator aren't calculated according to the logic of this indicator. If we look at the source code of the custom indicator Accelerator.mq5, we'll see the following lines in the OnInit() function:
Custom Indicators

```c
//--- sets first bar from which index will be drawn
PlotIndexSetInteger(0, PLOT_DRAW_BEGIN, 37);
```

Using the function `PlotIndexSetInteger(0, PLOT_DRAW_BEGIN, empty_first_values)`, we set the number of non-existing first values in the zero indicator array of a custom indicator, which we don't need to accept for calculation (empty_first_values). Thus, we have mechanisms to:

1. set the number of initial values of an indicator, which shouldn't be used for calculations in another custom indicator;
2. get information on the number of first values to be ignored when you call another custom indicator, without going into the logic of its calculations.
#Indicator Styles in Examples

The MetaTrader 5 Client Terminal includes 38 technical indicators that can be used in MQL5 programs using [appropriate functions](#). But the main advantage of the MQL5 language is the ability to create custom indicators, which can then be used in Expert Advisors or simply applied on price charts for the purpose of technical analysis.

The entire set of indicators can be derived from several base [drawing styles](#), known as plotting. Plotting denotes a way of displaying data, which the indicator calculates, stores and provides on request. There are seven such basic plotting types:

1. A line
2. A section (segment)
3. Histogram
4. Arrow (symbol)
5. A painted area (filled channel)
6. Bars
7. Japanese candlesticks

Each plotting requires one to five arrays of the double type, in which indicator values are stored. For the purpose of convenience, these arrays are associated with the indicator buffers. The number of buffers in an indicator must be declared in advance using [compiler directives](#), for example:

```cpp
#property indicator_buffers 3 // Number of buffers
#property indicator_plots 2 // number of plots
```

The number of buffers in the indicator is always greater than or equal to the number of plots in the indicator.

Since each basic plotting type can have color variation or construction specifics, the actual number of plotting types in the MQL5 is 18:

<table>
<thead>
<tr>
<th>Plotting</th>
<th>Description</th>
<th>Value buffers</th>
<th>Color buffers</th>
</tr>
</thead>
<tbody>
<tr>
<td>[DRAW_NONE]</td>
<td>Is not visually displayed in the chart, but the values of the corresponding buffer can be viewed in the Data Window</td>

<tr>
<td>DRAW_COLOR_SECTION</td>
<td>Similar to the style DRAW_SECTION, but the color of each section can be set</td>
<td>1</td>
<td>-</td>
</tr>
</tbody>
</table>
The difference between an indicator buffer and an array

In each indicator, on its global level, you should declare one or more arrays of the double type, which then must be used as an indicator buffer using the `SetIndexBuffer()` function. To draw indicator plots, only the values of the indicator buffers are used, any other arrays cannot be used for this purpose. In addition, buffer values are displayed in the Data Window.

An indicator buffer should be dynamic and does not require specification of the size - the size of the array used as the indicator buffer is set by the terminal execution subsystem automatically.
After the array is bound to the indicator buffer, the **indexing direction** is set by default like in ordinary arrays, but you can use the `ArraySetAsSeries()` function to change the way of access to the array elements. By default, the indicator buffer is used to store data used for plotting (`INDICATOR_DATA`).

If the calculation of indicator values requires holding intermediate calculations and storing the additional values for each bar, then such an array can be declared as a calculation buffer during binding (`INDICATOR_CALCULATIONS`). For the intermediate values, you can also use a regular array, but in this case, the programmer has to manage the size of the array.

Some plots allow setting a color for each bar. To store the information about color, color buffers are used (`INDICATOR_COLOR_INDEX`). The color is an integer type `color`, but all indicator buffers must be of type `double`. Values of color and auxiliary (`INDICATOR_CALCULATIONS`) buffers cannot be obtained by using `CopyBuffer()`.

The number of indicator buffers must be specified using the compiler directive `#property indicator_buffers number_of_buffers`:

```
#property indicator_buffers 3 // the indicator has 3 buffers
```

The maximum allowed number of buffers in one indicator is 512.

### Relevance of Indicator Buffers and Plotting

Each plotting is based on one or more indicator buffers. So, for displaying simple candlesticks, four values are required - Open, High, Low and Close prices. Accordingly, to display an indicator in the form of candlesticks, it is necessary to declare 4 indicator buffers and 4 arrays of the double type for them. For example:

```mql
//--- The indicator has four indicator buffers
#property indicator_buffers 4
//--- The indicator has one plotting
#property indicator_plots 1
//--- Graphical plotting number 1 will appear as candlesticks
#property indicator_type1 DRAW_CANDLES
//--- Candlestick will be drawn in clrDodgerBlue
#property indicator_color1 clrDodgerBlue
//--- 4 arrays for the indicator buffers
double OBuffer[];
double HBuffer[];
double LBuffer[];
double CBuffer[];
```

Graphical plots automatically use indicator buffers in accordance with the plot number. Numbering of plots starts with 1, numbering of buffers starts with zero. If the first plotting requires 4 indicator buffers, then the first 4 indicator buffers will be used to draw it. These four buffers should be linked with the appropriate arrays with correct indexing using the `SetIndexBuffer()` function.

```
//--- Binding arrays with indicator buffers
SetIndexBuffer(0,OBuffer,INDICATOR_DATA); // The first buffer corresponds to the
```

© 2000-2019, MetaQuotes Software Corp.
The plotting candlesticks, the indicator will use just the first four buffers, because plotting of "candlesticks" was announced under the first number.

Change the example, and add plotting of a simple line - DRAW_LINE. Now suppose that the line is numbered 1, and the candlesticks are number 2. The number of buffers and the number of plots has increased.

```mql5
//--- The indicator has 5 indicator buffers
#property indicator_buffers 5
//--- The indicator has 2 plots
#property indicator_plots 2
//--- Plot 1 is a line
#property indicator_type1 DRAW_LINE
//--- The color of the line is clrDodgerRed
#property indicator_color1 clrDodgerRed
//--- Plot 2 is drawn as Japanese candlesticks
#property indicator_type2 DRAW_CANDLES
//--- The color of the candlesticks is clrDodgerBlue
#property indicator_color2 clrDodgerBlue
//--- 5 arrays for indicator buffers
double LineBuffer[];
double OBuffe[];
double HBuffer[];
double LBuffer[];
double CBuffer[];
```

The order of the plots has changed, and now the line comes first, followed by Japanese candlesticks. Therefore, the order of the buffers is appropriate - first we announce a buffer for the line with the zero index, and then four buffers for the candlesticks.

```mql5
SetIndexBuffer(0,LineBuffer,INDICATOR_DATA);  // The first buffer corresponds to index 0
SetIndexBuffer(1,OBuffe,INDICATOR_DATA);      // The second buffer corresponds to index 1
SetIndexBuffer(2,HBuffer,INDICATOR_DATA);      // The third buffer corresponds to index 2
SetIndexBuffer(3,LBuffer,INDICATOR_DATA);      // The fourth buffer corresponds to index 3
SetIndexBuffer(4,CBuffer,INDICATOR_DATA);      // The fifth buffer corresponds to index 4
```

The number of buffers and plots can be set only by using compiler directives, it is impossible to change these properties dynamically using functions.

**Color Versions of Styles**

As can be seen in the table, the styles are divided into two groups. The first group includes styles in whose name there is no word COLOR, we call these styles basic:
In the second group, the style names contain the word COLOR, let’s call them color versions:

- DRAW_COLOR_LINE
- DRAW_COLOR_SECTION
- DRAW_COLOR_HISTOGRAM
- DRAW_COLOR_HISTOGRAM2
- DRAW_COLOR_ARROW
- DRAW_COLOR_ZIGZAG
- DRAW_COLOR_BARS
- DRAW_COLOR_CANDLES

All color versions of styles differ from the basic ones in that they allow specifying a color for each part of the plotting. The minimal part of plotting is a bar, so we can say that the color versions allow setting the color on each bar.

Exceptions are styles DRAW_NONE and DRAW_FILLING, they do not have color versions.

To set the plotting color on each bar, an additional buffer for storing the color index has been added to the color version. These indices indicate the number of a color in a special array, which contains a predefined set of colors. The size of the array of colors is 64. This means that each color version of a style allows painting a plot in 64 different colors.

The set and the number of colors in the special array of colors can be set via a compiler directive #property indicator_color, where you can specify all the necessary colors separated by commas. For example, such an entry in an indicator:

```cpp
//--- Define 8 colors for coloring candlesticks (they are stored in the special array)
#property indicator_color1 clrRed,clrBlue,clrGreen,clrYellow,clrMagenta,clrCyan,clrL:
```

It states that for plotting 1, 8 colors are set, which will be placed in a special array. Further in the program we will not specify the color of the plotting, but only its index. If we want to set red color for the bar number K, the color index value from an array should be set in the color buffer of the indicator. The red color is specified first in the directive, it corresponds to the index number 0.

```cpp
//--- set the candlestick color clrRed
col_buffer[buffer_index]=0;
```

The set of colors is not given once and for all, it can be changed dynamically using PlotIndexSetInteger(). Example:
Properties of the indicator and plotting

For indicator plots, properties can be set by means of compiler directives and using the appropriate functions. Read more information about this in Connection between Indicator Properties and Functions. Dynamic change of indicator properties using special functions allows creating more flexible custom indicators.

Start of Indicator Drawing on the Chart

In many cases, according to the conditions of the algorithm, it is impossible to start calculating the indicator values immediately with the current bar, since it is necessary to provide a minimum number of previous bars available in history. For example, many types of smoothing imply using an array of prices over the previous N bars, and on the basis of these values, the indicator value on the current bar is calculated.

In such cases, either there is no way to calculate the indicator values for the first N bars, or these values are not intended to be displayed on the chart and are only subsidiary for calculating further values. To avoid plotting of the indicator on the first N bars of the history, set the N value to the PLOT_DRAW_BEGIN property for the corresponding plot:

//--- Binding arrays with indicator buffers for the candlesticks
PlotIndexSetInteger(number_of_plot, PLOT_DRAW_BEGIN, N);

Here:

- number_of_plot - a value from zero to indicator_plots-1 (numbering of plots starts with zero).
- N - the number of first bars in the history, on which the indicator should not be displayed on the chart.
Custom Indicators

DRAW_NONE

The DRAW_NONE style is designed for use in cases where it is necessary to calculate the values of a buffer and show them in the Data Window, but plotting on the chart is not required. To set up the accuracy use the expression IndicatorSetInteger(INTEGER_DIGITS,num_chars) in the OnInit() function:

```c
int OnInit()
{
    //--- indicator buffers mapping
    SetIndexBuffer(0,invisibleBuffer,INDICATOR_DATA);
    //--- Set the accuracy of values to be displayed in the Data Window
    IndicatorSetInteger(INTEGER_DIGITS,0);
    //---
    return(INIT_SUCCEEDED);
}
```

The number of buffers required for plotting DRAW_NONE is 1.

An example of the indicator that shows the number of the bar on which the mouse currently hovers in the Data Window. The numbering corresponds to the timeseries, meaning the current unfinished bar has the zero index, and the oldest bar has the largest index.

Note that despite the fact that, for red color is set plotting #1, the indicator does not draw anything on the chart.

{
    static datetime lastbar = 0;
    //--- If this is the first calculation of the indicator
    if (prev_calculated == 0)
    {
        //--- Renumber the bars for the first time
        CalcValues(rates_total, close);
        //--- Remember the opening time of the current bar in lastbar
        lastbar = (datetime) SeriesInfoInteger(_Symbol, _Period, SERIES_LASTBAR_DATE);
    }
}
} else {
    //--- If a new bar has appeared, its open time differs from lastbar
    if (lastbar != SeriesInfoInteger(_Symbol, _Period, SERIES_LASTBAR_DATE)) {
        //--- Renumber the bars once again
        CalcValues(rates_total, close);
        //--- Update the opening time of the current bar in lastbar
        lastbar = (datetime) SeriesInfoInteger(_Symbol, _Period, SERIES_LASTBAR_DATE);
    }

    //--- return value of prev_calculated for next call
    return (rates_total);
}

//+------------------------------------------------------------------+
//| Number the bars like in a timeseries                             |
//+------------------------------------------------------------------+
void CalcValues(int total, double const &array[])
{
    //--- Set indexing of the indicator buffer like in a timeseries
    ArraySetAsSeries(InvisibleBuffer, true);
    //--- Fill in each bar with its number
    for(int i=0; i<total; i++) InvisibleBuffer[i] = i;
}
DRAW_LINE

DRAW_LINE draws a line of the specified color by the values of the indicator buffer. The width, style and color of the line can be set using the compiler directives and dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows “to enliven” indicators, so that their appearance changes depending on the current situation.

The number of buffers required for plotting DRAW_LINE is 1.

An example of the indicator that draws a line using Close prices of bars. The line color, width and style change randomly every N=5 ticks.

Note that initially for plot1 with DRAW_LINE the properties are set using the compiler directive #property, and then in the OnCalculate() function these three properties are set randomly. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator’s Properties window).

//--- Write the line style
    comm = EnumToString(styles[style_index]) + "", " + comm;
//--- Show the information on the chart using a comment
    Comment(comm);
DRAW_SECTION

DRAW_SECTION draws sections of the specified color by the values of the indicator buffer. The width, color and style of the line can be specified like for the DRAW_LINE style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows “to enliven” indicators, so that their appearance changes depending on the current situation.

Sections are drawn from one non-empty value to another non-empty value of the indicator buffer, empty values are ignored. To specify what value should be considered as “empty”, set this value in the PLOT_EMPTY_VALUE property: For example, if the indicator should be drawn as a sequence of sections on non-zero values, then you need to set the zero value as an empty one:

```csharp
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_SECTION, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to the elements that should not be plotted.

The number of buffers required for plotting DRAW_SECTION is 1.

An example of the indicator that draws sections between the High and Low prices. The color, width and style of all sections change randomly every N ticks.

Note that initially for plot1 with DRAW_SECTION the properties are set using the compiler directive #property, and then in the OnCalculate() function these three properties are set randomly. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator’s Properties window).

```csharp
//+------------------------------------------------------------------+
//|                        Copyright 2011, MetaQuotes Software Corp.  |
//|                                              https://www.mql5.com |
```
//--- An indicator buffer for the plot
double SectionBuffer[];
//--- An auxiliary variable to calculate ends of sections
int divider;
//--- An array to store colors
color colors[]={clrRed,clrBlue,clrGreen};
//--- An array to store the line styles
ENUM_LINE_STYLE styles[]={STYLE_SOLID,STYLE_DASH,STYLE_DOT,STYLE_DASHDOT,STYLE_DASHDOTDASH};

int OnInit()
{
    //--- Binding an array and an indicator buffer
    SetIndexBuffer(0,SectionBuffer,INDICATOR_DATA);
    //--- The 0 (empty) value will not participate in drawing
    PlotIndexSetDouble(0,PLOT_EMPTY_VALUE,0);
    //--- Check the indicator parameter
    if(bars<=0)
    {
        PrintFormat("Invalid value of parameter bar=%d",bars);
        return(INIT_PARAMETERS_INCORRECT);
    }
    else divider=2*bars;
    //---
    return(INIT_SUCCEEDED);
}
//+------------------------------------------------------------------+
//| Custom indicator iteration function                              |
//+------------------------------------------------------------------+
int OnCalculate(const int rates_total,
    const int prev_calculated,
    const datetime &time[],
    const double &open[],
    const double &high[],

PlotIndexSetInteger(0,PLOT_LINE_STYLE,styles[style_index]);
// Write the line style
comm=comm+EnumToString(styles[style_index])++"\n"+comm;
// Show the information on the chart using a comment
Comment(comm);
}
**DRAW_HISTOGRAM**

The DRAW_HISTOGRAM style draws a histogram as a sequence of columns of a specified color from zero to a specified value. Values are taken from the indicator buffer. The width, color and style of the column can be specified like for the DRAW_LINE style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

Since a column from the zero level is drawn on each bar, DRAW_HISTOGRAM should better be used in a separate chart window. Most often this type of plotting is used to create indicators of the oscillator type, for example, Bears Power or OsMA. For the empty non-displayable values the zero value should be specified.

The number of buffers required for plotting DRAW_HISTOGRAM is 1.

An example of the indicator that draws a sinusoid of a specified color based on the MathSin() function. The color, width and style of all histogram columns change randomly each N ticks. The bars parameter specifies the period of the sinusoid, that is after the specified number of bars the sinusoid will repeat the cycle.

Note that initially for plot1 with DRAW_HISTOGRAM the properties are set using the compiler directive #property, and then in the OnCalculate() function these three properties are set randomly. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Comment(comm);
}
**DRAW_HISTOGRAM2**

The DRAW_HISTOGRAM2 style draws a histogram of a specified color - vertical segments using the values of two indicator buffers. The width, color and style of the segments can be specified like for the DRAW_LINE style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

The DRAW_HISTOGRAM2 style can be used in a separate subwindow of a chart and in its main window. For empty values nothing is drawn, all the values in the indicator buffers need to be set explicitly. Buffers are not initialized with a zero value.

The number of buffers required for plotting DRAW_HISTOGRAM2 is 2.

An example of the indicator that plots a vertical segment of the specified color and width between the Open and Close prices of each bar. The color, width and style of all histogram columns change randomly each N ticks. During the start of the indicator, in the OnInit() function, the number of the day of week for which the histogram will not be drawn - invisible_day - is set randomly. For this purpose an empty value is set PLOT EMPTY VALUE=0:

```plaintext
//--- Set an empty value
PlotIndexSetDouble(index_of_plot_DRAW_SECTION,PLOT_EMPTY_VALUE,0);
```

Note that initially for plot1 with DRAW_HISTOGRAM2 the properties are set using the compiler directive #property, and then in the OnCalculate() function these three properties are set randomly. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

    comm="\r\nNot plotted day - "+EnumToString((ENUM_DAY_OF_WEEK)invisible_day)+comm;
    //--- Show the information on the chart using a comment
    Comment(comm);
}
**DRAW_ARROW**

The DRAW_ARROW style draws arrows of the specified color (symbols of the set Wingdings) based on the value of the indicator buffer. The width and color of the symbols can be specified like for the DRAW_LINE style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows changing the look of an indicator based on the current situation.

The symbol code is set using the PLOT_ARROW property.

```cpp
//--- Define the symbol code from the Wingdings font to draw in PLOT_ARROW
PlotIndexSetInteger(0, PLOT_ARROW, code);
```

The default value of PLOT_ARROW=159 (a circle).

Each arrow is actually a symbol that has the height and the anchor point, and can cover some important information on a chart (for example, the closing price at the bar). Therefore, we can additionally specify the vertical shift in pixels, which does not depend on the scale of the chart. The arrows will be shifted down by the specified number of pixels, although the values of the indicator will remain the same:

```cpp
//--- Set the vertical shift of arrows in pixels
PlotIndexSetInteger(0, PLOT_ARROW_SHIFT, shift);
```

A negative value of PLOT_ARROW_SHIFT means the shift of arrows upwards, a positive values shifts the arrow down.

The DRAW_ARROW style can be used in a separate subwindow of a chart and in its main window. Empty values are not drawn and do not appear in the "Data Window", all the values in the indicator buffers should be set explicitly. Buffers are not initialized with a zero value.

```cpp
//--- Set an empty value
PlotIndexSetDouble(index_of_plot_DRAW_ARROW, PLOT_EMPTY_VALUE, 0);
```

The number of buffers required for plotting DRAW_ARROW is 1.

An example of the indicator, which draws arrows on each bar with the close price higher than the close price of the previous bar. The color, width, shift and symbol code of all arrows are changed randomly every N ticks.
In the example, for plot1 with the DRAW_ARROW style, the properties, color and size are specified using the compiler directive \#property, and then in the OnCalculate() function the properties are set randomly. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator’s Properties window).

}
DRAW_ZIGZAG

The DRAW_ZIGZAG style draws segments of a specified color based on the values of two indicator buffers. This style is very similar to DRAW_SECTION, but unlike the latter, it allows drawing vertical segments within one bar, if values of both indicator buffers are set for this bar. The segments are plotted from a value in the first buffer to a value in the second indicator buffer. None of the buffers can contain only empty values, since in this case nothing is plotted.

The width, color and style of the line can be specified like for the DRAW_SECTION style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

Sections are drawn from a non-empty value of one buffer to a non-empty value of another indicator buffer. To specify what value should be considered as "empty", set this value in the PLOT_EMPTY_VALUE property:

```c
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_ZIGZAG, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of buffers required for plotting DRAW_ZIGZAG is 2.

An example of the indicator that plots a saw based on the High and Low prices. The color, width and style of the zigzag lines change randomly every N ticks.

Note that initially for plot1 with DRAW_ZIGZAG the properties are set using the compiler directive #property, and then in the OnCalculate() function these properties are set randomly. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

**DRAW_FILLING**

The DRAW_FILLING style plots a colored area between the values of two indicator buffers. In fact, this style draws two lines and fills the space between them with one of two specified colors. It is used for creating indicators that draw channels. None of the buffers can contain only empty values, since in this case nothing is plotted.

You can set two fill colors:

- the first color is used for the areas where values in the first buffer are greater than the values in the second indicator buffer;
- the second color is used for the areas where values in the second buffer are greater than the values in the first indicator buffer.

The fill color can be set using the *compiler directives* or dynamically using the `PlotIndexSetInteger()` function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is calculated for all bars, for which the values of the both indicator buffers are equal neither to 0 nor to the empty value. To specify what value should be considered as "empty", set this value in `PLOT_EMPTY_VALUE` property:

```c
#define INDICATOR_EMPTY_VALUE -1.0
...
//--- INDICATOR_EMPTY_VALUE (empty value) will not participate in calculation of
PlotIndexSetDouble (DRAW_FILLING_creation_index, PLOT_EMPTY_VALUE, INDICATOR_EMPTY_VALUE);
```

Drawing on the bars that do not participate in the indicator calculation will depend on the values in the indicator buffers:

- Bars, for which the values of both indicator buffers are equal to 0, do not participate in drawing the indicator. It means that the area with zero values is not filled out.

- Bars, for which the values of the indicator buffers are equal to the "empty value", participate in drawing the indicator. The area with empty values will be filled out so that to connect the areas with significant values.
It should be noted that if the "empty value" is equal to zero, the bars that do not participate in the indicator calculation are also filled out.

The number of buffers required for plotting DRAW_FILLING is 2.

An example of the indicator that draws a channel between two MAs with different averaging periods in a separate window. The change of the colors at the crossing of moving averages visually shows the change of the upward and downward trends. The colors change randomly every N ticks. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator’s Properties window).

Note that initially for plot1 with DRAW_FILLING the properties are set using the compiler directive #property, and then in the OnCalculate() function new colors are set randomly.

DRAW_BARS

The DRAW_BARS style draws bars on the values of four indicator buffers, which contain the Open, High, Low and Close prices. It is used for creating custom indicators as bars, including those in a separate subwindow of a chart and on other financial instruments.

The color of bars can be set using the compiler directives or dynamically using the `PlotIndexSetInteger()` function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of all four indicator buffers are set. To specify what value should be considered as "empty", set this value in the `PLOT_EMPTY_VALUE` property:

```plaintext
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_BARS, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of required buffers for plotting DRAW_BARS is 4. All buffers for the plotting should go one after the other in the given order: Open, High, Low and Close. None of the buffers can contain only empty values, since in this case nothing is plotted.

An example of the indicator that draws bars on a selected financial instrument in a separate window. The color of bars changes randomly every N ticks. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator’s Properties window).

Please note that for plot1 with the DRAW_BARS style, the color is set using the compiler directive `#property`, and then in the `OnCalculate()` function the color is set randomly from an earlier prepared list.

**DRAW_CANDLES**

The DRAW_CANDLES style draws candlesticks on the values of four indicator buffers, which contain the Open, High, Low and Close prices. It is used for creating custom indicators as a sequence of candlesticks, including those in a separate subwindow of a chart and on other financial instruments.

The color of candlesticks can be set using the compiler directives or dynamically using the `PlotIndexSetInteger()` function. Dynamic changes of the plotting properties allows “to enliven” indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of all four indicator buffers are set. To specify what value should be considered as “empty”, set this value in the `PLOT_EMPTY_VALUE` property:

```
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_CANDLES, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of required buffers for plotting DRAW_CANDLES is 4. All buffers for the plotting should go one after the other in the given order: Open, High, Low and Close. None of the buffers can contain only empty values, since in this case nothing is plotted.

You can set up to three colors for the DRAW_CANDLES style affecting the candle look. If only one color is set, it is applied to all candles on a chart.

```
//--- identical candles with a single color applied to them
#property indicator_label1 "One color candles"
#property indicator_type1 DRAW_CANDLES
//--- only one color is specified, therefore all candles are of the same color
#property indicator_color1 clrGreen
```

If two comma-separated colors are specified, the first one is applied to candle outlines, while the second one is applied to the body.

```
//--- different colors for candles and wicks
#property indicator_label1 "Two color candles"
#property indicator_type1 DRAW_CANDLES
//--- green is applied to wicks and outlines, while white is applied to the body
#property indicator_color1 clrGreen,clrWhite
```

Specify three comma-separated colors so that rising and falling candles are displayed differently. In that case, the first color is applied to the candle outlines, while the second and third ones - to bullish and bearish candles.

```
//--- different colors for candles and wicks
#property indicator_label1 "One color candles"
#property indicator_type1 DRAW_CANDLES
//--- wicks and outlines are green, bullish candle body is white, while bearish candle
#property indicator_color1 clrGreen,clrWhite,clrRed
```

Thus, the DRAW_CANDLES style allows you to create custom candle coloring options. Besides, all colors can be changed dynamically during the indicator operation using the `PlotIndexSetInteger` function.
composition_index_DRAW_CANDLES, PLOT_LINE_COLOR, modifier_index, color), where modifier_index may have the following values:

- 0 - colors of outlines and wicks
- 1 - bullish candle body color
- 2 - bearish candle body color

//--- set the color of outlines and wicks
PlotIndexSetInteger(0, PLOT_LINE_COLOR, 0, clrBlue);
//--- set the bullish body color
PlotIndexSetInteger(0, PLOT_LINE_COLOR, 1, clrGreen);
//--- set the bearish body color
PlotIndexSetInteger(0, PLOT_LINE_COLOR, 2, clrRed);

}
```
**DRAW_COLOR_LINE**

The DRAW_COLOR_LINE value is a colored variant of the DRAW_LINE style; it also draws a line using the values of the indicator buffer. But this style, like all color styles with the word COLOR in their title has an additional special indicator buffer that stores the color index (number) from a specially set array of colors. Thus, the color of each line segment can be defined by specifying the color index of the index to draw the line at this bar.

The width, style and colors of lines can be set using the compiler directives and dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The number of buffers required for plotting DRAW_COLOR_LINE is 2.
- one buffer to store the indicator values used for drawing a line;
- one buffer to store the index of the color of the line on each bar.

Colors can be specified by the compiler directive `#property indicator_color1` separated by a comma. The number of colors cannot exceed 64.

```csharp
//--- Define 5 colors for coloring each bar (they are stored in the special array)
#property indicator_color1 clrRed, clrBlue, clrGreen, clrOrange, clrDeepPink // (Up to 64 colors can be specified)
```

An example of the indicator that draws a line using Close prices of bars. The line width and style change randomly every N=5 ticks.

The colors of the line segments also change randomly in the custom function ChangeColors().

```csharp
//+------------------------------------------------------------------+
//| Changes the color of line segments                              |
//+------------------------------------------------------------------+
void ChangeColors(color &cols[], int plot_colors)
```
```csharp
{ 
    //--- The number of colors
    int size=ArraySize(cols);

    //---
    string comm=ChartGetString(0,CHART_COMMENT)+"\n\n\n";

    //--- For each color index define a new color randomly
    for(int plot_color_ind=0;plot_color_ind<plot_colors;plot_color_ind++)
    {
        //--- Get a random value
        int number=MathRand();
        //--- Get an index in the col[] array as a remainder of the integer division
        int i=number%size;
        //--- Set the color for each index as the property PLOT_LINE_COLOR
        PlotIndexSetInteger(0, // The number of a graphical style
            PLOT_LINE_COLOR, // Property identifier
            plot_color_ind, // The index of the color, where we will set a new color
            cols[i]);

        //--- Write the colors
        comm=comm+StringFormat("LineColorIndex[%d]=%s \n",plot_color_ind,ColorToString(cols[i],true));
    }
    //---
}
```

The example shows the feature of the "color" versions of indicators - to change the color of a line segment, you do not need to change values in the ColorLineColors[] buffer (which contains the color indexes). All you need to do is set new colors in a special array. This allows you to quickly change the color once for the entire plotting, changing only a small array of colors using the PlotIndexSetInteger() function.

Note that initially for plot1 with DRAW_COLOR_LINE the properties are set using the compiler directive #property, and then in the OnCalculate() function these three properties are set randomly.

The N and Length (the length of color segments in bars) parameters are set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Custom Indicators

**DRAW_COLOR_SECTION**

The DRAW_COLOR_SECTION style is a color version of DRAW_SECTION, but unlike the latter, it allows drawing sections of different colors. The DRAW_COLOR_SECTION style, like all color styles with the word COLOR in their title, contains an additional special indicator buffer that stores the color index (number) from a specially set array of colors. Thus, the color of each section can be defined by specifying the color index of the index of the bar that corresponds to the section end.

The width, color and style of the sections can be specified like for the DRAW_SECTION style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

Sections are drawn from one non-empty value to another non-empty value of the indicator buffer, empty values are ignored. To specify what value should be considered as "empty", set this value in the PLOT_EMPTY.VALUE property: For example, if the indicator should be drawn as a sequence of sections on non-zero values, then you need to set the zero value as an empty one:

```plaintext
    //--- The 0 (empty) value will not participate in drawing
    PlotIndexSetDouble(index_of_plot_DRAW_COLOR_SECTION,PLOT_EMPTY_VALUE,0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to the elements that should not be plotted.

The number of buffers required for plotting DRAW_COLOR_SECTION is 2.

- one buffer to store the indicator values used for drawing a line;
- one buffer to store the color index, which is used to draw the section (it makes sense to set only non-empty values).

Colors can be specified by the compiler directive `#property indicator_color1` separated by a comma. The number of colors cannot exceed 64.

An example of the indicator that draws colored sections each 5 bars long, using the High price values. The color, width and style of sections change randomly every N ticks.
Note that initially for plot1 with DRAW_COLOR_SECTION 8 colors are set using the compiler directive #property. Then in the OnCalculate() function, colors are set randomly from the array of colors colors[].

The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```mql5
//--- Define 8 colors for coloring sections (they are stored in a special array)
#property indicator_color1 clrRed,clrGold,clrMediumBlue,clrLime,clrMagenta,clrBrown,clrAzure,clrCyan
#property indicator_style1 STYLE_SOLID
```
#property indicator_width 1
//--- input parameters
input int N=5;  // Number of ticks to change
input int bars_in_section=5;  // The length of sections in bars
//--- An auxiliary variable to calculate ends of sections
int divider;
int color_sections;
//--- A buffer for plotting
double ColorSectionBuffer[];
//--- A buffer for storing the line color on each bar
double ColorSectionColors[];
//--- An array for storing colors contains 14 elements
color colors[]={

```
DRAW_COLOR_HISTOGRAM

The DRAW_COLOR_HISTOGRAM style draws a histogram as a sequence of colored columns from zero to a specified value. Values are taken from the indicator buffer. Each column can have its own color from a predefined set of colors.

The width, color and style of the histogram can be specified like for the DRAW_HISTOGRAM style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

Since a column from the zero level is drawn on each bar, DRAW_COLOR_HISTOGRAM should better be used in a separate chart window. Most often this type of plotting is used to create indicators of the oscillator type, for example, Awesome Oscillator or Market Facilitation Index. For the empty non-displayable values the zero value should be specified.

The number of buffers required for plotting DRAW_COLOR_HISTOGRAM is 2.

- one buffer for storing a non-zero value of the vertical segment on each bar, the second end of the segment is always on the zero line of the indicator;
- one buffer to store the color index, which is used to draw the section (it makes sense to set only non-empty values).

Colors can be specified using the compiler directive #property indicator_color1 separated by a comma. The number of colors cannot exceed 64.

An example of the indicator that draws a sinusoid of a specified color based on the MathSin() function. The color, width and style of all histogram columns change randomly each N ticks. The bars parameter specifies the period of the sinusoid, that is after the specified number of bars the sinusoid will repeat the cycle.

Please note that for plot1 with the DRAW_COLOR_HISTOGRAM style, 5 colors are set using the compiler directive #property, and then in the OnCalculate() function the colors are selected randomly.
from the 14 colors stored in the colors[] array. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

//--- Show the information on the chart using a comment
Comment(comm);
```
**DRAW_COLOR_HISTOGRAM2**

The DRAW_COLOR_HISTOGRAM2 style draws a histogram of a specified color - vertical segments using the values of two indicator buffers. But unlike the one-color DRAW_HISTOGRAM2, in this style each column of the histogram can have its own color from a predefined set. The values of all the segments are taken from the indicator buffer.

The width, style and color of the histogram can be specified like for the DRAW_HISTOGRAM2 style - using [compiler directives](https://www.metaquotes.net) or dynamically using the `PlotIndexSetInteger()` function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

The DRAW_COLOR_HISTOGRAM2 style can be used in a separate subwindow of a chart and in its main window. For empty values nothing is drawn, all the values in the indicator buffers need to be set explicitly. Buffers are not initialized with empty values.

The number of buffers required for plotting DRAW_COLOR_HISTOGRAM2 is 3:
- two buffers to store the upper and lower end of the vertical segment on each bar;
- one buffer to store the color index, which is used to draw the segment (it makes sense to set only non-empty values).

An example of the indicator that draws a histogram of a specified color between the High and Low prices. For each day of week, the histogram lines have a different color. The color of the day, width and style of the histogram change randomly each $N$ ticks.

Please note that for plot1 with the DRAW_COLOR_HISTOGRAM2 style, 5 colors are set using the compiler directive `#property`, and then in the `OnCalculate()` function the colors are selected randomly from the 14 colors stored in the colors[] array.

The $N$ parameter is set in [external parameters](https://www.metaquotes.net) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).
### Custom indicator initialization function

```cpp
int OnInit()
{
    //--- indicator buffers mapping
    SetIndexBuffer(0, ColorHistogram_2Buffer1, INDICATOR_DATA);
    SetIndexBuffer(1, ColorHistogram_2Buffer2, INDICATOR_DATA);
    return 0;
}
```
## Custom Indicators

```cpp
SetIndexBuffer(2, ColorHistogram_2Colors, INDICATOR_COLOR_INDEX);
//--- Set an empty value
PlotIndexSetDouble(0, PLOT_EMPTY_VALUE, 0);
//---- The number of colors to color the sinusoid
color_sections=8;  // See a comment to #property indicator_color1
//---
return(INIT_SUCCEEDED);
}

//--- Calculate ticks to change the style, color and width of the line
ticks++;
//--- If a critical number of ticks has been accumulated
if(ticks>=N)
{
    //--- Change the line properties
    ChangeLineAppearance();
    //--- Change the colors used to draw the histogram
    ChangeColors(colors, color_sections);
    //--- Reset the counter of ticks to zero
    ticks=0;
}

//--- Calculate the indicator values
int start=0;
//--- To get the day of week by the open price of each bar
MqlDateTime dt;
//--- If already calculated during the previous starts of OnCalculate
if(prev_calculated>0)
    start=prev_calculated-1; // set the beginning of the calculate
//--- Fill in the indicator buffer with values
for(int i=start;i<rates_total;i++)
{
    TimeToStruct(time[i],dt);
    //--- value
    ColorHistogram_2Buffer1[i]=high[i];
    ColorHistogram_2Buffer2[i]=low[i];
}
```
```csharp
//--- Set the color index according to the day of week
int day = dt.day_of_week;
ColorHistogram_2Colors[i] = day;

//--- Return the prev_calculated value for the next call of the function
return (rates_total);

//+------------------------------------------------------------------+
//| Changes the color of line segments                              |
//+------------------------------------------------------------------+
void ChangeColors(color &cols[], int plot_colors)
{
    //--- The number of colors
    int size = ArraySize(cols);
    //---
    string comm = ChartGetString(0, CHART_COMMENT) + "\r\n\r\n";

    //--- For each color index define a new color randomly
    for (int plot_color_ind = 0; plot_color_ind < plot_colors; plot_color_ind++)
    {
        //--- Get a random value
        int number = MathRand();
        //--- Get an index in the col[] array as a remainder of the integer division
        int i = number % size;
        //--- Set the color for each index as the property PLOT_LINE_COLOR
        PlotIndexSetInteger(0, // The number of a graphical style
            PLOT_LINE_COLOR, // Property identifier
            plot_color_ind, // The index of the color, where we write the new color
            cols[i]);
        //--- Write the colors
        comm = comm + StringFormat("HistogramColorIndex[%d]=%s \r\n", plot_color_ind, ColorToString(cols[i], true));
    
    //---
    }

    //--- Changes the appearance of a displayed line in the indicator
    void ChangeLineAppearance()
    {
        //--- A string for the formation of information about the line properties
        string comm = ""
; 
        //--- A block for changing the width of the line
        int number = MathRand();
        //--- Get the width of the remainder of integer division
        int width = number % 5; // The width is set from 0 to 4
        //--- Set the color as the PLOT_LINE_WIDTH property
        PlotIndexSetInteger(0, PLOT_LINE_WIDTH, width);
        //--- Write the line width
    }
```
```csharp
comm=comm=" Width="+IntegerToString(width);

//--- A block for changing the style of the line
number=MathRand();
//--- The divisor is equal to the size of the styles array
int size=ArraySize(styles);
//--- Get the index to select a new style as the remainder of integer division
int style_index=number%size;
//--- Set the color as the PLOT_LINE_COLOR property
PlotIndexSetInteger(0,PLOT_LINE_STYLE,styles[style_index]);
//--- Write the line style
comm=EnumToString(styles[style_index])", "+comm;
//--- Show the information on the chart using a comment
Comment(comm);
```
**DRAW_COLOR_ARROW**

The DRAW_COLOR_ARROW style draws colored arrows (symbols of the set Wingdings) based on the value of the indicator buffer. In contrast to DRAW_ARROW, in this style it is possible to set a color from a predefined set of colors specified by the indicator_color1 property for each symbol.

The width and color of the symbols can be specified like for the DRAW_ARROW style - using compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows changing the look of an indicator based on the current situation.

The symbol code is set using the PLOT_ARROW property.

```cpp
//--- Define the symbol code from the Wingdings font to draw in PLOT_ARROW
PlotIndexSetInteger(0, PLOT_ARROW, code);
```

The default value of PLOT_ARROW=159 (a circle).

Each arrow is actually a symbol that has the height and the anchor point, and can cover some important information on a chart (for example, the closing price at the bar). Therefore, we can additionally specify the vertical shift in pixels, which does not depend on the scale of the chart. The arrows will be shifted down by the specified number of pixels, although the values of the indicator will remain the same:

```cpp
//--- Set the vertical shift of arrows in pixels
PlotIndexSetInteger(0, PLOT_ARROW_SHIFT, shift);
```

A negative value of PLOT_ARROW_SHIFT means the shift of arrows upwards, a positive values shifts the arrow down.

The DRAW_COLOR_ARROW style can be used in a separate subwindow of a chart and in its main window. Empty values are not drawn and do not appear in the "Data Window", all the values in the indicator buffers should be set explicitly. Buffers are not initialized with a zero value.

```cpp
//--- Set an empty value
PlotIndexSetDouble(DRAW_COLOR_ARROW_plot_index, PLOT_EMPTY_VALUE, 0);
```

The number of buffers required for plotting DRAW_COLOR_ARROW is 2.

- a buffer to store the value of the price which is used to draw the symbol (plus a shift in pixels, given in the PLOT_ARROW_SHIFT property);
- a buffer to store the color index, which is used to draw an arrow (it makes sense to set only non-empty values).

An example of the indicator, which draws arrows on each bar with the close price higher than the close price of the previous bar. The width, shift and symbol code of all arrows are changed randomly every N ticks. The color of the symbol depends on the number of the bar on which it is drawn.
In the example, for plot1 with the DRAW_COLOR_ARROW style, the properties, color and size are specified using the compiler directive #property, and then in the OnCalculate() function the properties are set randomly. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator’s Properties window).

Please note that initially 8 colors are set using the compiler directive #property, and then in the OnCalculate() function, the color is set randomly from the 14 colors that are stored in the colors[] array.

Comment (comm);
}
**DRAW_COLOR_ZIGZAG**

The DRAW_COLOR_ZIGZAG style draws segments of different colors, using the values of two indicator buffers. This style is a colored version of DRAW_ZIGZAG, i.e. allows specifying for each segment an individual color from the predefined set of colors. The segments are plotted from a value in the first buffer to a value in the second indicator buffer. None of the buffers can contain only empty values, since in this case nothing is plotted.

The width, color and style of the line can be specified like for the DRAW_ZIGZAG style - using compiler directives or dynamically using the `PlotIndexSetInteger()` function. Dynamic changes of the plotting properties allows “to enliven” indicators, so that their appearance changes depending on the current situation.

Sections are drawn from a non-empty value of one buffer to a non-empty value of another indicator buffer. To specify what value should be considered as “empty”, set this value in the `PLOT_EMPTY_VALUE` property:

```cpp
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_COLOR_ZIGZAG, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the of the indicator buffers, set an empty value in a buffer to skip bars.

The number of buffers required for plotting DRAW_COLOR_ZIGZAG is 3:

- two buffers to store the values of ends of the zigzag sections;
- one buffer to store the color index, which is used to draw the section (it makes sense to set only non-empty values).

An example of the indicator that plots a saw based on the High and Low prices. The color, width and style of the zigzag lines change randomly every N ticks.
Please note that for plot1 with the DRAW_COLOR_ZIGZAG style, 8 colors are set using the compiler directive #property, and then in the OnCalculate() function the color is selected randomly from the 14 colors stored in the colors[] array.

The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```c
//+------------------------------------------------------------------+
//| Custom indicator initialization function                         |
//+------------------------------------------------------------------+
```

```c
// Define 8 colors for coloring sections (they are stored in a special array)
#property indicator_color1 clrRed,clrBlue,clrGreen,clrYellow,clrMagenta,clrCyan,clrLime,clrOrange

// Define an array for storing colors contains 14 elements
#property colors[]= clrRed,clrBlue,clrGreen,clrChocolate,clrMagenta,clrDodgerBlue,clrGoldenrod,
clrIndigo,clrLightBlue,clrAliceBlue,clrMoccasin,clrWhiteSmoke,clrCyan,clrMediumPurple;
```

```c
//--- An array to store the line styles
ENUM_LINE_STYLE styles[]={STYLE_SOLID,STYLE_DASH,STYLE_DOT,STYLE_DASHDOT,STYLE_DASHDOTDOTTED};
```

```c
//--- input parameter
input int N=5; // Number of ticks to change
```
Custom Indicators

```cpp
//--- indicator buffers mapping
    SetIndexBuffer(0,Color_ZigzagBuffer1,INDICATOR_DATA);
    SetIndexBuffer(1,Color_ZigzagBuffer2,INDICATOR_DATA);
    SetIndexBuffer(2,Color_ZigzagColors,INDICATOR_COLOR_INDEX);

    //---Number of color for coloring the zigzag
    color_sections=8;  // see a comment to the #property indicator_color1 property
    //---
    return(INIT_SUCCEEDED);
} //+------------------------------------------------------------------+

    Comment(comm);
}
The DRAW_COLOR_BARS style draws bars on the values of four indicator buffers, which contain the Open, High, Low and Close prices. This style is an advanced version of DRAW_BARS and allows specifying for each bar an individual color from the predefined set of colors. It is used for creating custom indicators as bars, including those in a separate subwindow of a chart and on other financial instruments.

The color of bars can be set using the compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allow "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of all four indicator buffers are set. To specify what value should be considered as "empty", set this value in the PLOT_EMPTY_VALUE property:

```cpp
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_COLOR_BARS, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of buffers required for plotting DRAW_COLOR_BARS is 5:

- four buffer to store the values of Open, High, Low and Close;
- one buffer to store the color index, which is used to draw a bar (it makes sense to set it only for the bars that will be drawn).

All buffers for the plotting should go one after the other in the given order: Open, High, Low, Close and the color buffer. None of the price buffers can contain only null values, since in this case nothing is plotted.

An example of the indicator that draws bars on a selected financial instrument in a separate window. The color of bars changes randomly every N ticks. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).
Please note that for plot1 with the DRAW_COLOR_BARS style, 8 colors are set using the compiler directive #property, and then in the OnCalculate() function the color is selected randomly from the 14 colors stored in the colors[] array.

Custom Indicators

**DRAW_COLOR_CANDLES**

The DRAW_COLOR_CANDLES style, like DRAW_CANDLES, draws candlesticks using the values of four indicator buffers, which contain Open, High, Low and Close prices. In addition, it allows specifying a color for each candlestick from a given set. For this purpose, the style has a special color buffer that stores color indexes for each bar. It used for creating custom indicators as a sequence of candlesticks, including those in a separate subwindow of a chart and on other financial instruments.

The number of colors of candlesticks can be set using the compiler directives or dynamically using the PlotIndexSetInteger() function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of four price buffers of the indicator are set. To specify what value should be considered as "empty", set this value in the PLOT_EMPTY_VALUE property:

```cpp
    //--- The 0 (empty) value will not participate in drawing
    PlotIndexSetDouble(index_of_plot_DRAW_COLOR_CANDLES, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of required buffers for plotting DRAW_COLOR_CANDLES is 5:

- four buffer to store the values of Open, High, Low and Close;
- one buffer to store the color index, which is used to draw a candlestick (it makes sense to set it only for the candlesticks that will be drawn).

All buffers for the plotting should go one after the other in the given order: Open, High, Low, Close and the color buffer. None of the price buffers can contain only empty values, since in this case nothing is plotted.

An example of the indicator that draws candlesticks for a selected financial instrument in a separate window. The color of candlesticks changes randomly every N ticks. The N parameter is set in external parameters of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).
Please note that for plot1, the color is set using the compiler directive `#property`, and then in the `OnCalculate()` function the color is set randomly from an earlier prepared list.

```mql5
//--- Define 8 colors for coloring candlesticks (they are stored in the special array)
#property indicator_color1 clrRed,clrBlue,clrGreen,clrYellow,clrMagenta,clrCyan,clrLime,clrOrange
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
```
//--- input parameters

Connection between Indicator Properties and Corresponding Functions

Every custom indicator has numerous properties, some of which are obligatory and are always positioned at the beginning of description. They are the following properties:

- indication of a window to plot the indicator - indicator_separate_window or indicator_chart_window;
- number of indicator buffers - indicator_buffers;
- number of plots of the indicator - indicator_plots.

Also there are other properties that can be set both through preprocessor directives and through functions intended for custom indicator creation. These properties and corresponding functions are described in the following table.

<table>
<thead>
<tr>
<th>Directives for properties of indicator subwindow</th>
<th>Functions of IndicatorSet... () type</th>
<th>Description of the adjusted property of the subwindow</th>
</tr>
</thead>
</table>
| indicator_height                              | IndicatorSetInteger
   (INDICATOR_INDICATOR_HEIGHT, nHeight) | The fixed value of the subwindow height |
| indicator_minimum                             | IndicatorSetDouble
   (INDICATOR_MINIMUM, dMaxValue) | Minimal value of the vertical axis |
| indicator_maximum                             | IndicatorSetDouble
   (INDICATOR_MAXIMUM, dMinValue) | Maximal value of the vertical axis |
| indicator_levelN                              | IndicatorSetDouble
   (INDICATOR_LEVELVALUE, N-1, nLevelValue) | Vertical axis value for N level |
| no preprocessor directive                     | IndicatorSetString
   (INDICATOR_LEVELTEXT, N-1, sLevelName) | Name of a displayed level |
| indicator_levelcolor                          | IndicatorSetInteger
   (INDICATOR_LEVELCOLOR, N-1, nLevelColor) | Color of N level |
| indicator_levelwidth                          | IndicatorSetInteger
   (INDICATOR_LEVELWIDTH, N-1, nLevelWidth) | Line width for N level |
| indicator_levelstyle                          | IndicatorSetInteger

#### Common indicator properties

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IndicatorSetString()</td>
<td>Sets the convenient short name of the indicator that will be displayed in the list of indicators (opened in the terminal by pressing Ctrl+I).</td>
</tr>
<tr>
<td>IndicatorSetInteger()</td>
<td>Sets required accuracy of display of indicator values - number of decimal places</td>
</tr>
<tr>
<td>IndicatorSetInteger()</td>
<td>Sets number of levels in the indicator window</td>
</tr>
</tbody>
</table>

There are several directives, for which there are no corresponding functions:

<table>
<thead>
<tr>
<th>Directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>indicator_chart_window</td>
<td>Indicator is displayed in the main window</td>
</tr>
<tr>
<td>indicator_separate_window</td>
<td>Indicator is displayed in a separate subwindow</td>
</tr>
<tr>
<td>indicator_buffers</td>
<td>Number of required indicator buffers</td>
</tr>
</tbody>
</table>

It should be noted that numeration of levels and plots in preprocessor terms starts with one, while numeration of the same properties at using functions starts with zero, i.e. the indicated value must be by 1 less than that indicated for #property.
| indicator_plots | Number of plots in the indicator |
SetIndexBuffer

The function binds a specified indicator buffer with one-dimensional dynamic array of the double type.

```cpp
bool SetIndexBuffer(
    int index,       // buffer index
    double buffer[], // array
    ENUM_INDEXBUFFER_TYPE data_type  // what will be stored
);
```

**Parameters**

*index*

[in] Number of the indicator buffer. The numbering starts with 0. The number must be less than the value declared in `#property indicator_buffers`.

*buffer[]*

[in] An array declared in the custom indicator program.

*data_type*

[in] Type of data stored in the indicator array. By default it is `INDICATOR_DATA` (values of the calculated indicator). It may also take the value of `INDICATOR_COLOR_INDEX`; in this case this buffer is used for storing color indexes for the previous indicator buffer. You can specify up to 64 colors in the `#property indicator_colorN` line. The `INDICATOR_CALCULATIONS` value means that the buffer is used in intermediate calculations of the indicator and is not intended for drawing.

**Return Value**

If successful, returns `true`, otherwise - `false`.

**Note**

After binding, the dynamic array buffer[] will be indexed as in common arrays, even if the indexing of timeseries is pre-installed for the bound array. If you want to change the order of access to elements of the indicator array, use the `ArraySetAsSeries()` function after binding the array using the `SetIndexBuffer()` function. Please note that you can't change the size for dynamic arrays set as indicator buffers by the function `SetIndexBuffer()`. For indicator buffers, all operations of size changes are performed by the executing sub-system of the terminal.

**Example:**

```cpp
//+------------------------------------------------------------------+
//|                                              TestCopyBuffer1.mq5 |
//|                        Copyright 2009, MetaQuotes Software Corp. |
//|                                              https://www.mql5.com |
//+------------------------------------------------------------------+
```

```cpp
#property copyright "2009, MetaQuotes Software Corp."
#property link "https://www.mql5.com"
#property version "1.00"
```

#property indicator_separate_window
#property indicator_buffers 1
#property indicator_plots 1
//---- plot MA

Custom Indicator Properties, Access to timeseries and indicators
**IndicatorSetDouble**

The function sets the value of the corresponding indicator property. Indicator property must be of the double type. There are two variants of the function.

**Call with specifying the property identifier.**

```cpp
bool IndicatorSetDouble(
    int prop_id,       // identifier
    double prop_value  // value to be set
);
```

**Call with specifying the property identifier and modifier.**

```cpp
bool IndicatorSetDouble(
    int prop_id,       // identifier
    int prop_modifier, // modifier
    double prop_value  // value to be set
);
```

**Parameters**

- **prop_id**
  - [in] Identifier of the indicator property. The value can be one of the values of the `ENUM_CUSTOMIND_PROPERTY_DOUBLE` enumeration.

- **prop_modifier**
  - [in] Modifier of the specified property. Only level properties require a modifier. Numbering of levels starts from 0. It means that in order to set property for the second level you need to specify 1 (1 less than when using [compiler directive](#)).

- **prop_value**

**Return Value**

In case of successful execution, returns true, otherwise - false.

**Note**

Numbering of properties (modifiers) starts from 1 (one) when using the `#property` directive, while the function uses numbering from 0 (zero). In case the level number is set incorrectly, indicator display can differ from the intended one.

For example, the first level value for the indicator in a separate subwindow can be set in two ways:

- `property indicator_level1 50` - the value of 1 is used for specifying the level number,
- `IndicatorSetDouble(INDICATOR_LEVELVALUE, 0, 50)` - 0 is used for specifying the first level.

**Example:** indicator that turns upside down the maximum and minimum values of the indicator window and values of levels on which the horizontal lines are placed.
#property indicator_separate_window
//--- set the maximum and minimum values for the indicator window
#property indicator_minimum 0
#property indicator_maximum 100
//--- display three horizontal levels in a separate indicator window
#property indicator_level1 25
#property indicator_level2 50
#property indicator_level3 75
//--- set thickness of horizontal levels
#property indicator_levelwidth 1
//--- set style of horizontal levels
#property indicator_levelstyle STYLE_DOT

int OnInit()
{
    //--- set descriptions of horizontal levels
    IndicatorSetString(INDEX_LEVELTEXT, 0, "First Level (index 0)");
    IndicatorSetString(INDEX_LEVELTEXT, 1, "Second Level (index 1)");
    IndicatorSetString(INDEX_LEVELTEXT, 2, "Third Level (index 2)");
    //--- set the short name for indicator
    IndicatorSetString(INDEX_SHORTNAME, "IndicatorSetDouble() Demo");
    //--- set color for each level
    IndicatorSetInteger(INDEX_LEVELCOLOR, 0, clrBlue);
    IndicatorSetInteger(INDEX_LEVELCOLOR, 1, clrGreen);
    IndicatorSetInteger(INDEX_LEVELCOLOR, 2, clrRed);
}
//---
    return(INIT_SUCCEEDED);
}

//+------------------------------------------------------------------+
//| Custom indicator iteration function                           |
//+------------------------------------------------------------------+
int OnCalculate(const int rates_total,
    const int prev_calculated,
    const datetime &time[],
    const double &open[],
    const double &high[],
    const double &low[],
    const double &close[],
    const long &tick_volume[],
    const long &volume[],
    const int &spread[])
{
    static int tick_counter=0;
    static double level1=25,level2=50,level3=75;
    static double max=100,min=0, shift=100;
    //--- calculate ticks
    tick_counter++;
    //--- turn levels upside down on every 10th tick
    if(tick_counter%10==0)
    {
        //--- invert sign for the level values
        level1=-level1;
        level2=-level2;
        level3=-level3;
        //--- invert sign for the maximum and minimum values
        max-=shift;
        min-=shift;
        //--- invert the shift value
        shift=-shift;
        //--- set new level values
        IndicatorSetDouble(INDEXATOR_LEVELVALUE,0,level1);
        IndicatorSetDouble(INDEXATOR_LEVELVALUE,1,level2);
        IndicatorSetDouble(INDEXATOR_LEVELVALUE,2,level3);
        //--- set new values of maximum and minimum in the indicator window
        Print("Set up max = ",max,", min = ",min);
        IndicatorSetDouble(INDEXATOR_MAXIMUM,max);
        IndicatorSetDouble(INDEXATOR_MINIMUM,min);
    }
    //--- return value of prev_calculated for next call
    return(prev_calculated);
}
Indicator Styles in Examples, Connection between Indicator Properties and Functions, Drawing Styles
**IndicatorSetInteger**

The function sets the value of the corresponding indicator property. Indicator property must be of the int or color type. There are two variants of the function.

**Call with specifying the property identifier.**

```cpp
bool IndicatorSetInteger(
    int prop_id, // identifier
    int prop_value // value to be set
);
```

**Call with specifying the property identifier and modifier.**

```cpp
bool IndicatorSetInteger(
    int prop_id, // identifier
    int prop_modifier, // modifier
    int prop_value // value to be set
)
```

**Parameters**

- **prop_id**
  - **[in]** Identifier of the indicator property. The value can be one of the values of the `ENUM_CUSTOMIND_PROPERTY_INTEGER` enumeration.

- **prop_modifier**
  - **[in]** Modifier of the specified property. Only level properties require a modifier.

- **prop_value**
  - **[in]** Value of property.

**Return Value**

In case of successful execution, returns `true`, otherwise `false`.

**Note**

Numbering of properties (modifiers) starts from 1 (one) when using the `#property` directive, while the function uses numbering from 0 (zero). In case the level number is set incorrectly, indicator display can differ from the intended one.

For example, in order to set thickness of the first horizontal line use zeroth index:

- `IndicatorSetInteger(INJECTOR_LEVELWIDTH, 0, 5)` - index 0 is used to set thickness of the first level.

**Example:** indicator that sets color, style and thickness of the indicator horizontal lines.
```cpp
//--- display three horizontal levels in a separate indicator window
#property indicator_separate_window
#property indicator_minimum 0
#property indicator_maximum 100

//--- set thickness of horizontal levels
#property indicator_levelwidth 5

//--- set color of horizontal levels
#property indicator_levelcolor clrAliceBlue

//--- set style of horizontal levels
#property indicator_levelstyle STYLEDOT

// Custom indicator initialization function
int OnInit()
{
    //--- set descriptions of horizontal levels
    IndicatorSetString(INJECTOR_LEVELTEXT, 0, "First Level (index 0)" );
    IndicatorSetString(INJECTOR_LEVELTEXT, 1, "Second Level (index 1)" );
    IndicatorSetString(INJECTOR_LEVELTEXT, 2, "Third Level (index 2)" );

    //--- set the short name for indicator
    IndicatorSetString(INJECTOR_SHORTNAME, "IndicatorSetInteger() Demo" );
    return(INIT_SUCCEEDED);
}
```
```c
int OnCalculate( const int rates_total,
                 const int prev_calculated,
                 const datetime &time[],

**IndicatorSetString**

The function sets the value of the corresponding indicator property. Indicator property must be of the string type. There are two variants of the function.

**Call with specifying the property identifier.**

```cpp
bool IndicatorSetString(
    int prop_id,  // identifier
    string prop_value  // value to be set
);
```

**Call with specifying the property identifier and modifier.**

```cpp
bool IndicatorSetString(
    int prop_id,  // identifier
    int prop_modifier,  // modifier
    string prop_value  // value to be set
);
```

**Parameters**

- **prop_id**
  - [in] Identifier of the indicator property. The value can be one of the values of the `ENUM_CUSTOMIND_PROPERTY_STRING` enumeration.

- **prop_modifier**
  - [in] Modifier of the specified property. Only level properties require a modifier.

- **prop_value**

**Return Value**

In case of successful execution, returns true, otherwise - false.

**Note**

Numbering of properties (modifiers) starts from 1 (one) when using the `#property` directive, while the function uses numbering from 0 (zero). In case the level number is set incorrectly, `indicator display` can differ from the intended one.

For example, in order to set description of the first horizontal line use zeroth index:

- `IndicatorSetString(INDIicator_LEVELTEXT, 0, "First Level")` - index 0 is used to set text description of the first level.

**Example**: indicator that sets text labels to the indicator horizontal lines.
//--- display three horizontal levels in a separate indicator window
#property indicator_separate_window
#property indicator_minimum 0
#property indicator_maximum 100

//--- set color of horizontal levels
#property indicator_levelcolor clrRed

//--- set style of horizontal levels
#property indicator_levelstyle STYLE_SOLID

int OnInit()
{
    //--- set descriptions of horizontal levels
    IndicatorSetString(INDEX_LEVELTEXT,0,"First Level (index 0)");
    IndicatorSetString(INDEX_LEVELTEXT,1,"Second Level (index 1)");
    IndicatorSetString(INDEX_LEVELTEXT,2,"Third Level (index 2)");
    //--- set the short name for indicator
    IndicatorSetString(INDEX_SHORTNAME, "IndicatorSetString() Demo");
    //---
    return(INIT_SUCCEEDED);

    //---
}
//+------------------------------------------------------------------+

Custom Indicator Properties, Program Properties (#property)
PlotIndexSetDouble

The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the double type.

```c
bool PlotIndexSetDouble(
    int plot_index,  // plotting style index
    int prop_id,    // property identifier
    double prop_value  // value to be set
);
```

Parameters

- `plot_index`
  - [in] Index of the graphical plotting

- `prop_id`
  - [in] The value can be one of the values of the `ENUM_PLOT_PROPERTY_DOUBLE` enumeration.

- `prop_value`
  - [in] The value of the property.

Return Value

- If successful, returns `true`, otherwise `false`. 
**PlotIndexSetInteger**

The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the int, char, bool or color type. There are 2 variants of the function.

**Call indicating identifier of the property.**

```c
bool PlotIndexSetInteger(
    int plot_index, // plotting style index
    int prop_id,    // property identifier
    int prop_value  // value to be set
);
```

**Call indicating the identifier and modifier of the property.**

```c
bool PlotIndexSetInteger(
    int plot_index, // plotting style index
    int prop_id,    // property identifier
    int prop_modifier, // property modifier
    int prop_value  // value to be set
);
```

**Parameters**

plot_index

[in] Index of the graphical plotting

prop_id

[in] The value can be one of the values of the ENUM_PLOT_PROPERTY_INTEGER enumeration.

prop_modifier

prop_value

**Return Value**

If successful, returns true, otherwise false.

**Example:** an indicator that draws a three-color line. The color scheme changes every 5 ticks.
#property indicator_chart_window
#property indicator_buffers 2
#property indicator_plots 1

//---- plot ColorLine
#property indicator_label1 "ColorLine"
#property indicator_type1 DRAW_COLOR_LINE

        if(copied<=0) return(0);

        ticks++; // ticks counting
        if(ticks>=5) // it's time to change color scheme
        {
            ticks=0; // reset counter
            modified++; // counter of color changes
            if(modified>=3) modified=0; // reset counter
            ResetLastError();
            switch(modified)
            {
```cpp
    case 0:// first color scheme
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,0,clrRed);
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,1,clrBlue);
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,2,clrGreen);
        Print("Color scheme "+modified);
        break;
    case 1:// second color scheme
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,0,clrYellow);
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,1,clrPink);
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,2,clrLightSlateGray);
        Print("Color scheme "+modified);
        break;
    default:// third color scheme
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,0,clrLightGoldenrod);
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,1,clrOrchid);
        PlotIndexSetInteger(0,FLOT_LINE_COLOR,2,clrLimeGreen);
        Print("Color scheme "+modified);
    }
else
{
    //--- set start position
    limit=prev_calculated-1;
    //--- now we set line color for every bar
    for(int i=limit;i<rates_total;i++)
        ColorBuffer[i]=getIndexOfColor(i);
}
//--- return value of prev_calculated for next call
    return(rates_total);
}   
```
The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the string type.

```c
bool PlotIndexSetString(
    int plot_index,  // plotting style index
    int prop_id,     // property identifier
    string prop_value // value to be set
);
```

### Parameters

- **plot_index**
  - [in] Index of graphical plot

- **prop_id**
  - [in] The value can be one of the values of the `ENUM_PLOT_PROPERTY_STRING` enumeration.

- **prop_value**
  - [in] The value of the property.

### Return Value

If successful, returns `true`, otherwise `false`.
PlotIndexGetInteger

The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the int, color, bool or char type. There are 2 variants of the function.

Call indicating identifier of the property.

```c
int PlotIndexGetInteger(
    int plot_index,   // plotting style index
    int prop_id       // property identifier
);
```

Call indicating the identifier and modifier of the property.

```c
int PlotIndexGetInteger(
    int plot_index,   // plotting index
    int prop_id,      // property identifier
    int prop_modifier // property modifier
);
```

Parameters

- **plot_index**
  - [in] Index of the graphical plotting

- **prop_id**
  - [in] The value can be one of the values of the `ENUM_PLOT_PROPERTY_INTEGER` enumeration.

- **prop_modifier**
  - [in] Modifier of the specified property. Only color index properties require a modifier.

Note

Function is designed to extract the settings of drawing of the appropriate indicator line. The function works in tandem with the function `PlotIndexSetInteger` to copy the drawing properties of one line to another.

Example: an indicator that colors candles depending on the day of the week. Colors for each day are set in a programmatically.
#property indicator_separate_window
#property indicator_buffers 5
#property indicator_plots 1
//---- plot ColorCandles
#property indicator_label1 "ColorCandles"
#property indicator_type1 DRAW_COLOR_CANDLES
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
//--- indicator buffers
double OpenBuffer[];
double HighBuffer[];
double LowBuffer[];
double CloseBuffer[];
double ColorCandlesColors[];
color ColorOfDay[6] = {CLR_NONE, clrMediumSlateBlue,
                        clrDarkGoldenrod, clrForestGreen, clrBlueViolet, clrRed};

//+------------------------------------------------------------------+
//| Custom indicator initialization function                         |
//+------------------------------------------------------------------+
void OnInit()
{

    }
//--- return value of prev_calculated for next call
    return(rates_total);
}
Object Functions

This is the group of functions intended for working with graphic objects relating to any specified chart.

The functions defining the properties of graphical objects, as well as `ObjectCreate()` and `ObjectMove()` operations for creating and moving objects along the chart are actually used for sending commands to the chart. If these functions are executed successfully, the command is included in the common queue of the chart events. Visual changes in the properties of graphical objects are implemented when handling the queue of the chart events.

Thus, do not expect an immediate visual update of graphical objects after calling these functions. Generally, the graphical objects on the chart are updated automatically by the terminal following the change events - a new quote arrival, resizing the chart window, etc. Use `ChartRedraw()` function to forcefully update the graphical objects.

<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ObjectCreate</code></td>
<td>Creates an object of the specified type in a specified chart</td>
</tr>
<tr>
<td><code>ObjectName</code></td>
<td>Returns the name of an object of the corresponding type in the specified chart (specified chart subwindow)</td>
</tr>
<tr>
<td><code>ObjectDelete</code></td>
<td>Removes the object with the specified name from the specified chart (from the specified chart subwindow)</td>
</tr>
<tr>
<td><code>ObjectsDeleteAll</code></td>
<td>Removes all objects of the specified type from the specified chart (from the specified chart subwindow)</td>
</tr>
<tr>
<td><code>ObjectFind</code></td>
<td>Searches for an object with the specified ID by the name</td>
</tr>
<tr>
<td><code>ObjectGetTimeByValue</code></td>
<td>Returns the time value for the specified object price value</td>
</tr>
<tr>
<td><code>ObjectGetValueByTime</code></td>
<td>Returns the price value of an object for the specified time</td>
</tr>
<tr>
<td><code>ObjectMove</code></td>
<td>Changes the coordinates of the specified object anchor point</td>
</tr>

<td>Sets the value of the corresponding object property</td>
</tr>
<tr>
<td>TextSetFont</td>
<td>Sets the font for displaying the text using drawing methods (Arial 20 used by default)</td>
</tr>
<tr>
<td>TextOut</td>
<td>Transfers the text to the custom array (buffer) designed for creation of a graphical resource</td>
</tr>
<tr>
<td>TextGetSize</td>
<td>Returns the string's width and height at the current font settings</td>
</tr>
</tbody>
</table>

Every graphical object should have a name unique within one chart, including its subwindows. Changing of a name of a graphic object generates two events: event of deletion of an object with the old name, and event of creation of an object with a new name.

After an object is created or an object property is modified it is recommended to call the ChartRedraw() function, which commands the client terminal to forcibly draw a chart (and all visible objects in it).
ObjectCreate

The function creates an object with the specified name, type, and the initial coordinates in the specified chart subwindow. During creation up to 30 coordinates can be specified.

```c
bool ObjectCreate(
    long chart_id, // chart identifier
    string name,  // object name
    ENUM_OBJECT type, // object type
    sub_window nwin, // window index
    datetime time1, // time of the first anchor point
    double price1, // price of the first anchor point
    ...
    datetime timeN=0, // time of the N-th anchor point
    double priceN=0, // price of the N-th anchor point
    ...
    datetime time30=0, // time of the 30th anchor point
    double price30=0 // price of the 30th anchor point
);
```

**Parameters**

- **chart_id**
  - [in] Chart identifier. 0 means the current chart.

- **name**
  - [in] Name of the object. The name must be unique within a chart, including its subwindows.

- **type**
  - [in] Object type. The value can be one of the values of the `ENUM_OBJECT` enumeration.

- **sub_window**
  - [in] Number of the chart subwindow. 0 means the main chart window. The specified subwindow must exist, otherwise the function returns false.

- **time1**
  - [in] The time coordinate of the first anchor.

- **price1**
  - [in] The price coordinate of the first anchor point.

- **timeN=0**
  - [in] The time coordinate of the N-th anchor point.

- **priceN=0**
  - [in] The price coordinate of the N-th anchor point.

- **time30=0**
  - [in] The time coordinate of the thirtieth anchor point.

- **price30=0**
  - [in] The price coordinate of the thirtieth anchor point.
Object Functions

Return Value

The function returns true if the command has been successfully added to the queue of the specified chart, or false otherwise. If an object has already been created, an attempt is made to change its coordinates.

Note

An asynchronous call is always used for ObjectCreate(), that is why the function only returns the results of adding the command to a chart queue. In this case, true only means that the command has been successfully enqueued, but the result of its execution is unknown.

To check the command execution result, you can use the ObjectFind() function or any other function that requests object properties, such as ObjectGetXXX. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result (due to the synchronous call), and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

An object name should not exceed 63 characters.

The numbering of the chart subwindows (if there are subwindows with indicators in the chart) starts with 1. The main chart window of the chart is and always has index 0.

The large number of anchor points (up to 30) is implemented for future use. At the same time, the limit of 30 possible anchor points for graphical objects is determined by the limit on the number of parameters (not more than 64) that can be used when calling a function.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the OnChartEvent() function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.

There is a certain number of anchor points that must be specified when creating each object type:

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>

</tbody>
</table>
ObjectName

The function returns the name of the corresponding object in the specified chart, in the specified subwindow, of the specified type.

```c
string ObjectName(
    long chart_id,  // chart identifier
    int pos,        // number in the list of objects
    int sub_window=-1,  // window index
    int type=-1      // object type
);
```

**Parameters**

- `chart_id`  
  [in] Chart identifier. 0 means the current chart.

- `pos`  
  [in] Ordinal number of the object according to the specified filter by the number and type of the subwindow.

- `sub_window=-1`  
  [in] Number of the chart subwindow. 0 means the main chart window, -1 means all the subwindows of the chart, including the main window.

- `type=-1`  
  [in] Type of the object. The value can be one of the values of the `ENUM_OBJECT` enumeration. -1 means all types.

**Return Value**

Name of the object is returned in case of success.

**Note**

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the `OnChartEvent()` function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.
ObjectFunctions

ObjectDelete

The function removes the object with the specified name from the specified chart.

```c
bool ObjectDelete(
    long chart_id,    // chart identifier
    string name       // object name
);
```

Parameters

- `chart_id` ([in]) Chart identifier. 0 means the current chart.
- `name` ([in]) Name of object to be deleted.

Return Value

The function returns true if the command has been successfully added to the queue of the specified chart, or false otherwise.

Note

An asynchronous call is always used for ObjectDelete(), that is why the function only returns the results of adding the command to a chart queue. In this case, true only means that the command has been successfully enqueued, but the result of its execution is unknown.

To check the command execution result, you can use the `ObjectFind()` function or any other function that requests object properties, such as `ObjectGetXXX`. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result (due to the synchronous call), and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the `OnChartEvent()` function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.
ObjectsDeleteAll

Removes all objects from the specified chart, specified chart subwindow, of the specified type.

```c
int ObjectsDeleteAll(
    long chart_id,       // chart identifier
    int sub_window=-1,   // window index
    int type=-1          // object type
);
```

Removes all objects of the specified type using prefix in object names.

```c
int ObjectsDeleteAll(
    long chart_id,       // chart ID
    const string prefix, // prefix in object name
    int sub_window=-1,   // window index
    int object_type=-1   // object type
);
```

Parameters

- **chart_id**
  - [in] Chart identifier. 0 means the current chart.

- **prefix**
  - [in] Prefix in object names. All objects whose names start with this set of characters will be removed from chart. You can specify prefix as `name` or `name*` - both variants will work the same. If an empty string is specified as the prefix, objects with all possible names will be removed.

- **sub_window=-1**
  - [in] Number of the chart subwindow. 0 means the main chart window, -1 means all the subwindows of the chart, including the main window.

- **type=-1**
  - [in] Type of the object. The value can be one of the values of the `ENUM_OBJECT` enumeration. -1 means all types.

Return Value

Returns the number of deleted objects. To read more about the error call `GetLastError()`.

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.
Object Functions

ObjectFind

The function searches for an object with the specified name in the chart with the specified ID.

```cpp
int ObjectFind(
    long chart_id, // chart identifier
    string name    // object name
);
```

Parameters

- `chart_id` [in] Chart identifier. 0 means the current chart.
- `name` [in] The name of the searched object.

Return Value

If successful the function returns the number of the subwindow (0 means the main window of the chart), in which the object is found. If the object is not found, the function returns a negative number. To read more about the error call GetLastError().

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the OnChartEvent() function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.
Object Functions

ObjectGetTimeByValue

The function returns the time value for the specified price value of the specified object.

```c
datetime ObjectGetTimeByValue(
    long chart_id,    // chart identifier
    string name,     // object name
    double value,    // Price
    int line_id      // Line number
);
```

Parameters

- `chart_id` [in] Chart identifier. 0 means the current chart.
- `name` [in] Name of the object.
- `value` [in] Price value.
- `line_id` [in] Line identifier.

Return Value

The time value for the specified price value of the specified object.

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

An object can have several values in one price coordinate, therefore it is necessary to specify the line number. This function applies only to the following objects:

- Trendline (OBJ_TREND)
- Trendline by angle (OBJ_TRENDBYANGLE)
- Gann line (OBJ_GANLINE)
- Equidistant channel (OBJ_CHANNEL) - 2 lines
- Linear regression channel (OBJ_REGRESSION) - 3 lines
- Standard deviation channel (OBJ_STDDEVCHANNEL) - 3 lines
- Arrowed line (OBJ_ARROWED_LINE)

See also

Object Types
ObjectGetValueByTime

The function returns the price value for the specified time value of the specified object.

double ObjectGetValueByTime(
    long chart_id,   // chart identifier
    string name,     // object name
    datetime time,   // Time
    int line_id,     // Line number
);

Parameters

chart_id
    [in] Chart identifier. 0 means the current chart.

name
    [in] Name of the object.

time

line_id
    [in] Line ID.

Return Value

The price value for the specified time value of the specified object.

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

An object can have several values in one price coordinate, therefore it is necessary to specify the line number. This function applies only to the following objects:

- Trendline (OBJ_TREND)
- Trendline by angle (OBJ_TRENDBYANGLE)
- Gann line (OBJ_GANNLINE)
- Equidistant channel (OBJ_CHANNEL) - 2 lines
- Linear regression channel (OBJ_REGRESSION) - 3 lines
- Standard deviation channel (OBJ_STDDEVCHANNEL) - 3 lines
- Arrowed line (OBJ_ARROWED_LINE)

See also

Object Types
ObjectMove

The function changes coordinates of the specified anchor point of the object.

```c
bool ObjectMove(
    long  chart_id,  // chart identifier
    string name,     // object name
    int   point_index, // anchor point number
    datetime time,  // Time
    double price     // Price
);
```

**Parameters**

- **chart_id**
  - [in] Chart identifier. 0 means the current chart.

- **name**
  - [in] Name of the object.

- **point_index**
  - [in] Index of the anchor point. The number of anchor points depends on the type of object.

- **time**
  - [in] Time coordinate of the selected anchor point.

- **price**
  - [in] Price coordinate of the selected anchor point.

**Return Value**

The function returns true if the command has been successfully added to the queue of the specified chart, or false otherwise.

**Note**

An asynchronous call is always used for ObjectMove(), that is why the function only returns the results of adding the command to a chart queue. In this case, true only means that the command has been successfully enqueued, but the result of its execution is unknown.

To check the command execution result, you can use a function that requests object properties, such as ObjectGetXXX. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result (due to the synchronous call), and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.
ObjectsTotal

The function returns the number of objects in the specified chart, specified subwindow, of the specified type.

```c
int ObjectsTotal(
    long chart_id,      // chart identifier
    int sub_window=-1,  // window index
    int type=-1         // object type
);
```

**Parameters**

- **chart_id**
  
  [in] Chart identifier. 0 means the current chart.

- **sub_window=-1**
  
  [in] Number of the chart subwindow. 0 means the main chart window, -1 means all the subwindows of the chart, including the main window.

- **type=-1**
  
  [in] Type of the object. The value can be one of the values of the `ENUM_OBJECT` enumeration. -1 means all types.

**Return Value**

The number of objects.

**Note**

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.
Object Functions

ObjectSetDouble

The function sets the value of the corresponding object property. The object property must be of the *double* type. There are 2 variants of the function.

Setting property value, without modifier

```c
bool ObjectSetDouble{
    long chart_id, // chart identifier
    string name,  // object name
    ENUM_OBJECTPROPERTY_DOUBLE prop_id, // property
    double prop_value  // value
};
```

Setting a property value indicating the modifier

```c
bool ObjectSetDouble{
    long chart_id, // chart identifier
    string name,  // object name
    ENUM_OBJECTPROPERTY_DOUBLE prop_id, // property
    int prop_modifier, // modifier
    double prop_value  // value
};
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

prop_id

[in] ID of the object property. The value can be one of the values of the `ENUM_OBJECTPROPERTY_DOUBLE` enumeration.

prop_modifier

[in] Modifier of the specified property. It denotes the number of the level in Fibonacci tools and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

prop_value

Return Value

The function returns true only if the command to change properties of a graphical object has been sent to a chart successfully. Otherwise it returns false. To read more about the *error* call `GetLastError()`.

Note
The function uses an asynchronous call, which means that the function does not wait for the execution of the command that has been added to the queue of the specified chart. Instead, it immediately returns control.

To check the command execution result, you can use a function that requests the specified object property. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result, and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

Example of creating a Fibonacci object and adding a new level in it

```c
//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
  //--- auxiliary arrays
  double high[], low[], price1, price2;
  datetime time[], time1, time2;
  //--- Copy the open prices - 100 latest bars are enough
  int copied=CopyHigh(Symbol(), 0, 0, 100, high);
  if (copied<=0)
    {
      Print("Failed to copy the values of the High price series");
      return;
    }
  //--- Copy the close price - 100 latest bars are enough
  copied=CopyLow(Symbol(), 0, 0, 100, low);
  if (copied<=0)
    {
      Print("Failed to copy the values of the Low price series");
      return;
    }
  //--- Copy the open time for the last 100 bars
  copied=CopyTime(Symbol(), 0, 0, 100, time);
  if (copied<=0)
    {
      Print("Failed to copy the values of the price series of Time");
      return;
    }
  //--- Organize access to the copied data as to timeseries - backwards
  ArraySetAsSeries(high, true);
  ArraySetAsSeries(low, true);
  ArraySetAsSeries(time, true);

  //--- Coordinates of the first anchor point of the Fibo object
  price1=high[70];
  time1=time[70];
  //--- Coordinates of the second anchor point of the Fibo object
  price2=low[50];
```
time2=time[50];

//--- Time to create the Fibo object
bool created=ObjectCreate(0,"Fibo",OBJ_FIBO,0,timel,price1,time2,price2);
if(created) // If the object is created successfully
{
    //--- set the color of Fibo levels
    ObjectSetInteger(0,"Fibo",OBJPROP_LEVELCOLOR,Blue);
    //--- by the way, how much Fibo levels do we have?
    int levels=ObjectGetInteger(0,"Fibo",OBJPROP_LEVELS);
    Print("Fibo levels before = ",levels);
    //---output to the Journal => number of level:value level description
    for(int i=0;i<levels;i++)
    {
        Print(i," ",ObjectGetDouble(0,"Fibo",OBJPROP_LEVELVALUE,i),
            " ",ObjectGetString(0,"Fibo",OBJPROP_LEVELTEXT,i));
    }
    //--- Try to increase the number of levels per unit
    bool modified=ObjectSetInteger(0,"Fibo",OBJPROP_LEVELS,levels+1);
    if(!modified) // failed to change the number of levels
    { 
        Print("Failed to change the number of levels of Fibo, error ",GetLastError());
    }
    //--- just inform
    Print("Fibo levels after = ",ObjectGetInteger(0,"Fibo",OBJPROP_LEVELS));
    //--- set a value for a newly created level
    bool added=ObjectSetDouble(0,"Fibo",OBJPROP_LEVELVALUE,levels,133);
    if(added) // managed to set a value for the level
    {
        Print("Successfully set one more Fibo level");
        //--- Also do not forget to set the level description
        ObjectSetString(0,"Fibo",OBJPROP_LEVELTEXT,levels,"my level");
        ChartRedraw(0);
        //--- Get the actual value of the number of levels in the Fibo object
        levels=ObjectGetInteger(0,"Fibo",OBJPROP_LEVELS);
        Print("Fibo levels after adding = ",levels);
        //--- once again output all levels - just to make sure
        for(int i=0;i<levels;i++)
        {
            Print(i," ",ObjectGetDouble(0,"Fibo",OBJPROP_LEVELVALUE,i),
                " ",ObjectGetString(0,"Fibo",OBJPROP_LEVELTEXT,i));
        }
    }
else // Fails if you try to increase the number of levels in the Fibo object
{
    Print("Failed to set one more Fibo level. Error ",GetLastError());
}
}

**Object Functions**

**ObjectSetInteger**

The function sets the value of the corresponding object property. The object property must be of the `datetime`, `int`, `color`, `bool` or `char` type. There are 2 variants of the function.

**Setting property value, without modifier**

```cpp
bool ObjectSetInteger(
    long chart_id, // chart identifier
    string name, // object name
    ENUM_OBJECTPROPERTY_INTEGER prop_id, // property
    long prop_value // value
);
```

**Setting a property value indicating the modifier**

```cpp
bool ObjectSetInteger(
    long chart_id, // chart identifier
    string name, // object name
    ENUM_OBJECTPROPERTY_INTEGER prop_id, // property
    int prop_modifier, // modifier
    long prop_value // value
);
```

**Parameters**

- `chart_id`
  - `[in]` Chart identifier. 0 means the current chart.

- `name`
  - `[in]` Name of the object.

- `prop_id`
  - `[in]` ID of the object property. The value can be one of the values of the `ENUM_OBJECTPROPERTY_INTEGER` enumeration.

- `prop_modifier`
  - `[in]` Modifier of the specified property. It denotes the number of the level in Fibonacci tools and in the graphical object Andrews' pitchfork. The numeration of levels starts from zero.

- `prop_value`
  - `[in]` The value of the property.

**Return Value**

The function returns true only if the command to change properties of a graphical object has been sent to a chart successfully. Otherwise it returns false. To read more about the `error` call `GetLastError()`.

**Note**
The function uses an asynchronous call, which means that the function does not wait for the execution of the command that has been added to the queue of the specified chart. Instead, it immediately returns control.

To check the command execution result, you can use a function that requests the specified object property. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result, and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

An example of how to create a table of Web colors

```c
//+---------------------------------------------------------------+ // | Table of Web Colors | // | Copyright 2011, MetaQuotes Software Corp | // | https://www.metaquotes.net | //+---------------------------------------------------------------+
#define X_SIZE 140     // width of an edit object
#define Y_SIZE 33      // height of an edit object
//+-------------------------------------------------------------------+
// | Array of web colors | //+-------------------------------------------------------------------+
color ExtClr[140]=
{
    clrAliceBlue, clrAntiqueWhite, clrAqua, clrAquamarine, clrAzure, clrBeige, clrBlue, clrBlueViolet, clrBrown, clrBurlyWood, clrCadetBlue, clrChartreuse, clrChocolate, clrCornsilk, clrCrimson, clrCyan, clrDarkBlue, clrDarkCyan, clrDarkGoldenrod, clrDarkGray, clrDarkGreen, clrDarkKhaki, clrDarkMagenta, clrDarkOliveGreen, clrDarkOrange, clrDarkOrchid, clrDarkRed, clrDarkSalmon, clrDarkSlateBlue, clrDarkSlateGray, clrDarkTurquoise, clrDarkViolet, clrDeepPink, clrDeepSkyBlue, clrDodgerBlue, clrFireBrick, clrFloralWhite, clrForestGreen, clrFuchsia, clrGainsboro, clrGhostWhite, clrGold, clrGoldenrod, clrGray, clrGreen, clrGreenYellow, clrHoneydew, clrHotPink, clrIndianRed, clrIvory, clrLavender, clrLavenderBlush, clrLavenderBlue, clrLemonChiffon, clrLightBlue, clrLightGreen, clrLightGoldenrod, clrLightGray, clrLightGreen, clrLightPink, clrLightSalmon, clrLightSteelBlue, clrLightSteel, clrLightYellow, clrLime, clrLimeGreen, clrLinen, clrMagenta, clrMaroon, clrMediumAquamarine, clrMediumBlue, clrMediumOrchid, clrMediumPurple, clrMediumSeaGreen, clrMediumSpringGreen, clrMediumTurquoise, clrMediumVioletRed, clrMidnightBlue, clrMint, clrNavajoWhite, clrNavy, clrOldLace, clrOlive, clrOliveDrab, clrOrange, clrOrangeRed, clrOrchid, clrPaleGreen, clrPaleTurquoise, clrPaleVioletRed, clrPapayaWhip, clrPeachPuff, clrPeru, clrPuce, clrPurple, clrRed, clrRosyBrown, clrRoyalBlue, clrSaddleBrown, clrSalmon, clrSandyBrown, clrSeaGreen, clrSilver, clrSkyBlue, clrSlateBlue, clrSlateGray, clrSnow, clrSpringGreen, clrSteel, clrThistle, clrTomato, clrTurquoise, clrViolet, clrWheat, clrWhite, clrWhiteSmoke, clrYellow;
//+-------------------------------------------------------------------+
// | Creating and initializing an edit object | //+-------------------------------------------------------------------+

Object Functions

ObjectSetString

The function sets the value of the corresponding object property. The object property must be of the string type. There are 2 variants of the function.

**Setting property value, without modifier**

```cpp
def ObjectSetString(
    chart_id: long,  // chart identifier
    name: string,    // object name
    prop_id: ENUM_OBJECT_PROPERTY_STRING,  // property
    prop_value: string  // value
)
```

**Setting a property value indicating the modifier**

```cpp
def ObjectSetString(
    chart_id: long,  // chart identifier
    name: string,    // object name
    prop_id: ENUM_OBJECT_PROPERTY_STRING,  // property
    prop_modifier: int,  // modifier
    prop_value: string  // value
)
```

**Parameters**

- `chart_id` [in] Chart identifier. 0 means the current chart.
- `name` [in] Name of the object.
- `prop_id` [in] ID of the object property. The value can be one of the values of the `ENUM_OBJECT_PROPERTY_STRING` enumeration.
- `prop_modifier` [in] Modifier of the specified property. It denotes the number of the level in Fibonacci tools and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

**Return Value**

The function returns true only if the command to change properties of a graphical object has been sent to a chart successfully. Otherwise it returns false. To read more about the error call `GetLastError()`.

**Note**
Object Functions

The function uses an asynchronous call, which means that the function does not wait for the execution of the command that has been added to the queue of the specified chart. Instead, it immediately returns control.

To check the command execution result, you can use a function that requests the specified object property. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result, and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the `OnChartEvent()` function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.
Object Functions

ObjectGetDouble

The function returns the value of the corresponding object property. The object property must be of the `double` type. There are 2 variants of the function.

1. Immediately returns the property value.

```cpp
double ObjectGetDouble(
    long chart_id, // chart identifier
    string name, // object name
    ENUM_OBJECTPROPERTYDOUBLE prop_id, // property identifier
    int prop_modifier=0 // property modifier, if required
);
```

2. Returns true or false, depending on the success of the function. If successful, the property value is placed to a receiving variable passed by reference by the last parameter.

```cpp
bool ObjectGetDouble(
    long chart_id, // chart identifier
    string name, // object name
    ENUM_OBJECTPROPERTYDOUBLE prop_id, // property identifier
    int prop_modifier,
    double & double_var // here we accept the property value
);
```

Parameters

- `chart_id`  
  [in] Chart identifier. 0 means the current chart.

- `name`  
  [in] Name of the object.

- `prop_id`  
  [in] ID of the object property. The value can be one of the values of the `ENUM_OBJECTPROPERTYDOUBLE` enumeration.

- `prop_modifier`  
  [in] Modifier of the specified property. For the first variant, the default modifier value is equal to 0. Most properties do not require a modifier. It denotes the number of the level in Fibonacci tools and in the graphical object Andrew’s pitchfork. The numeration of levels starts from zero.

- `double_var`  
  [out] Variable of the double type that received the value of the requested property.

Return Value

Value of the double type for the first calling variant.

For the second variant the function returns true, if this property is maintained and the value has been placed into the `double_var` variable, otherwise returns false. To read more about the `error` call `GetLastError()`.
Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.
ObjectGetInteger

The function returns the value of the corresponding object property. The object property must be of the `datetime`, `int`, `color`, `bool` or `char` type. There are 2 variants of the function.

1. Immediately returns the property value.

```c
long ObjectGetInteger(
    long chart_id,       // chart identifier
    string name,         // object name
    ENUM_OBJECTPROPERTY_INTEGER prop_id,  // property identifier
    int prop_modifier=0   // property modifier, if required
);```

2. Returns true or false, depending on the success of the function. If successful, the property value is placed to a receiving variable passed by reference by the last parameter.

```c
bool ObjectGetInteger(
    long chart_id,       // chart identifier
    string name,         // object name
    ENUM_OBJECTPROPERTY_INTEGER prop_id,  // property identifier
    int prop_modifier,   // property modifier
    long& long_var       // here we accept the property value
);```

Parameters

`chart_id`  
[in] Chart identifier. 0 means the current chart.

`name`  
[in] Name of the object.

`prop_id`  
[in] ID of the object property. The value can be one of the values of the `ENUM_OBJECTPROPERTY_INTEGER` enumeration.

`prop_modifier`  
[in] Modifier of the specified property. For the first variant, the default modifier value is equal to 0. Most properties do not require a modifier. It denotes the number of the level in Fibonacci tools and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

`long_var`  
[out] Variable of the long type that receives the value of the requested property.

Return Value

The long value for the first calling variant.

For the second variant the function returns true, if this property is maintained and the value has been placed into the `long_var` variable, otherwise returns false. To read more about the error call `GetLastError()`.
Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.
Object Functions

ObjectGetString

The function returns the value of the corresponding object property. The object property must be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```c
string ObjectGetString(
    long chart_id,     // chart identifier
    string name,       // object name
    ENUM_OBJECTPROPERTY_STRING prop_id,  // property identifier
    int prop_modifier=0 // property modifier, if required
);
```

2. Returns true or false, depending on the success of the function. If successful, the property value is placed to a receiving variable passed by reference by the last parameter.

```c
bool ObjectGetString(
    long chart_id,     // chart identifier
    string name,       // object name
    ENUM_OBJECTPROPERTY_STRING prop_id,  // property identifier
    int prop_modifier, // property modifier
    string& string_var // here we accept the property value
);
```

Parameters

- **chart_id**
  - [in] Chart identifier. 0 means the current chart.

- **name**
  - [in] Name of the object.

- **prop_id**
  - [in] ID of the object property. The value can be one of the values of the ENUM_OBJECTPROPERTY_STRING enumeration.

- **prop_modifier**
  - [in] Modifier of the specified property. For the first variant, the default modifier value is equal to 0. Most properties do not require a modifier. It denotes the number of the level in Fibonacci tools and in the graphical object Andrew’s pitchfork. The numeration of levels starts from zero.

- **string_var**
  - [out] Variable of the string type that receives the value of the requested properties.

Return Value

- String value for the first version of the call.

For the second version of the call returns true, if this property is maintained and the value has been placed into the string_var variable, otherwise returns false. To read more about the error call GetLastError().
Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the `OnChartEvent()` function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.
TextSetFont

The function sets the font for displaying the text using drawing methods and returns the result of that operation. Arial font with the size -120 (12 pt) is used by default.

```cpp
bool TextSetFont(
    const string name, // font name or path to font file on the disk
    int size, // font size
    uint flags, // combination of flags
    int orientation=0 // text slope angle
);
```

Parameters

name

[in] Font name in the system or the name of the resource containing the font or the path to font file on the disk.

size

[in] The font size that can be set using positive and negative values. In case of positive values, the size of a displayed text does not depend on the operating system's font size settings. In case of negative values, the value is set in tenths of a point and the text size depends on the operating system settings (“standard scale” or “large scale”). See the Note below for more information about the differences between the modes.

flags

[in] Combination of flags describing font style.

orientation

[in] Text's horizontal inclination to X axis, the unit of measurement is 0.1 degrees. It means that orientation=450 stands for inclination equal to 45 degrees.

Return Value

Returns true if the current font is successfully installed, otherwise false. Possible code errors:

- ERR_INVALID_PARAMETER(4003) - name presents NULL or "" (empty string),
- ERR_INTERNAL_ERROR(4001) - operating system error (for example, an attempt to create a non-existent font).

Note

If "::" is used in font name, the font is downloaded from EX5 resource. If name font name is specified with an extension, the font is downloaded from the file, if the path starts from "\" or "/", the file is searched relative to MQL5 directory. Otherwise, it is searched relative to the path of EX5 file which called TextSetFont() function.

The font size is set using positive or negative values. This fact defines the dependence of the text size from the operating system settings (size scale).

- If the size is specified using a positive number, this size is transformed into physical measurement units of a device (pixels) when changing a logical font into a physical one, and this size corresponds to the height of the symbol glyphs picked from the available fonts. This case is not recommended when the texts displayed by TextOut() function and the ones displayed by OBJ_LABEL ("Label") graphical object are to be used together on the chart.
**Object Functions**

- If the size is specified using a negative number, this number is supposed to be set in tenths of a logical point and is divided by 10 (for example, -350 is equal to 35 logical points). An obtained value is then transformed into physical measurement units of a device (pixels) and corresponds to the absolute value of the height of a symbol picked from the available fonts. Multiply the font size specified in the object properties by -10 to make the size of a text on the screen similar to the one in **OBJ_LABEL** object.

The flags can be used as the combination of style flags with one of the flags specifying the font width. Flag names are shown below.

### Flags for specifying font style

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FONT_ITALIC</td>
<td>Italic</td>
</tr>
<tr>
<td>FONT_UNDERLINE</td>
<td>Underline</td>
</tr>
<tr>
<td>FONT_STRIKEOUT</td>
<td>Strikeout</td>
</tr>
</tbody>
</table>

### Flags for specifying font width

<table>
<thead>
<tr>
<th>Flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>FW_DONTCARE</td>
</tr>
<tr>
<td>FW_THIN</td>
</tr>
<tr>
<td>FW_EXTRALIGHT</td>
</tr>
<tr>
<td>FW_ULTRALIGHT</td>
</tr>
<tr>
<td>FW_LIGHT</td>
</tr>
<tr>
<td>FW_NORMAL</td>
</tr>
<tr>
<td>FW_REGULAR</td>
</tr>
<tr>
<td>FW_MEDIUM</td>
</tr>
<tr>
<td>FW_SEMIBOLD</td>
</tr>
<tr>
<td>FW_DEMIBOLD</td>
</tr>
<tr>
<td>FW_BOLD</td>
</tr>
<tr>
<td>FW_EXTRABOLD</td>
</tr>
<tr>
<td>FW_ULTRABOLD</td>
</tr>
<tr>
<td>FW_HEAVY</td>
</tr>
<tr>
<td>FW_BLACK</td>
</tr>
</tbody>
</table>

[Resources], [ResourceCreate()], [ResourceSave()], [TextOut()]
Object Functions

TextOut

The function displays a text in a custom array (buffer) and returns the result of that operation. The array is designed to create the graphical resource.

```cpp
bool TextOut(
    const string text,       // displayed text
    int x,                    // X coordinate
    int y,                    // Y coordinate
    uint anchor,              // anchor type
    uint &data[],             // output buffer
    uint width,               // buffer width in pixels
    uint height,              // buffer height in pixels
    uint color,               // text color
    ENUM_COLOR_FORMAT color_format)  // color format for output
);```

Parameters

text
   [in] Displayed text that will be written to the buffer. Only one-lined text is displayed.

x
   [in] X coordinate of the anchor point of the displayed text.

y
   [in] Y coordinate of the anchor point of the displayed text.

anchor
   [in] The value out of the 9 pre-defined methods of the displayed text's anchor point location. The value is set by a combination of two flags - flags of horizontal and vertical text align. Flag names are listed in the Note below.

data[]
   [in] Buffer, in which text is displayed. The buffer is used to create the graphical resource.

width
   [in] Buffer width in pixels.

height

color

color_format
   [in] Color format is set by ENUM_COLOR_FORMAT enumeration value.

Return Value

Returns true if successful, otherwise false.

Note
Object Functions

Anchor point specified by anchor is a combination of two flags of horizontal and vertical text align. Horizontal text align flags:
- TA_LEFT - anchor point on the left side of the bounding box
- TA_CENTER - horizontal anchor point is located at the center of the bounding box
- TA_RIGHT - anchor point on the right side of the bounding box

Vertical text align flags:
- TA_TOP - anchor point at the upper side of the bounding box
- TA_VCENTER - vertical anchor point is located at the center of the bounding box
- TA_BOTTOM - anchor point at the lower side of the bounding box

Possible combinations of flags and specified anchor points are shown in the image.

Object Functions

```c
//--- keeping a short pause between the frames
Sleep(10);

//--- delete CLOCK object when completing the script's operation
ObjectDelete(0,"CLOCK");
```

See also

Resources, ResourceCreate(), ResourceSave(), TextGetSize(), TextSetFont()
TextGetSize

The function returns the line width and height at the current font settings.

```cpp
bool TextGetSize(
    const string text,  // text string
    uint& width,        // buffer width in pixels
    uint& height)       // buffer height in pixels
);
```

Parameters

text
    [in] String, for which length and width should be obtained.

width
    [out] Input parameter for receiving width.

height
    [out] Input parameter for receiving height.

Return Value

Returns true if successful, otherwise false. Possible code errors:
- ERR_INTERNAL_ERROR(4001) - operating system error.

Technical Indicator Functions

All functions like iMA, iAC, iMACD, Ichimoku etc. create a copy of the corresponding technical indicator in the global cache of the client terminal. If a copy of the indicator with such parameters already exists, the new copy is not created, and the counter of references to the existing copy increases.

These functions return the handle of the appropriate copy of the indicator. Further, using this handle, you can receive data calculated by the corresponding indicator. The corresponding buffer data (technical indicators contain calculated data in their internal buffers, which can vary from 1 to 5, depending on the indicator) can be copied to a mql5-program using the `CopyBuffer()` function.

You can't refer to the indicator data right after it has been created, because calculation of indicator values requires some time, so it's better to create indicator handles in OnInit(). Function iCustom() creates the corresponding custom indicator, and returns its handle in case it is successfully create. Custom indicators can contain up to 512 indicator buffers, the contents of which can also be obtained by the `CopyBuffer()` function, using the obtained handle.

There is a universal method for creating any technical indicator using the `IndicatorCreate()` function. This function accepts the following data as input parameters:

- symbol name;
- timeframe;
- type of the indicator to create;
- number of input parameters of the indicator;
- an array of MqParam type containing all the necessary input parameters.

The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

Note. Repeated call of the indicator function with the same parameters within one mql5-program does not lead to a multiple increase of the reference counter; the counter will be increased only once by 1. However, it's recommended to get the indicators handles in function OnInit() or in the class constructor, and further use these handles in other functions. The reference counter decreases when a mql5-program is deinitialized.

All indicator functions have at least 2 parameters - symbol and period. The NULL value of the symbol means the current symbol, the 0 value of the period means the current timeframe.

iAC

The function creates Accelerator Oscillator in a global cache of the client terminal and returns its handle. It has only one buffer.

```c
int iAC(
    string symbol,  // symbol name
    ENUM_TIMEFRAMES period  // period
);
```

**Parameters**

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

- **period**
  - [in] The value of the period can be one of the ENUM_TIMEFRAMES enumeration values, 0 means the current timeframe.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

**Example:**

```c
//--- plotting of iAC

#property indicator_label1 "iAC"
#property indicator_type1 DRAW_COLOR_HISTOGRAM
#property indicator_color1 clrGreen, clrRed
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
```

iAD

The function returns the handle of the Accumulation/Distribution indicator. It has only one buffer.

```c
int iAD(
    string symbol,  // symbol name
    ENUM_TIMEFRAMES period,  // period
    ENUM_APPLIED_VOLUME applied_volume  // volume type for calculation
);
```

**Parameters**

`symbol`

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

`period`

[in] The value of the period can be one of the `ENUM_TIMEFRAMES` enumeration values, 0 means the current timeframe.

`applied_volume`

[in] The volume used. Can be any of `ENUM_APPLIED_VOLUME` values.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

### iADX

The function returns the handle of the Average Directional Movement Index indicator.

```c
int iADX(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int adx_period // averaging period
);
```

#### Parameters

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **adx_period**
  - [in] Period to calculate the index.

#### Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

#### Note

The buffer numbers are the following: 0 - MAIN_LINE, 1 - PLUSDI_LINE, 2 - MINUSDI_LINE.

//+------------------------------------------------------------------+

void OnDeinit(const int reason)
{
   //--- clear the chart after deleting the indicator
   Comment("");
The function returns the handle of Average Directional Movement Index by Welles Wilder.

```c
int iADXWilder(
    string symbol,       // symbol name
    ENUM_TIMEFRAMES period,  // period
    int adx_period       // averaging period
);
```

**Parameters**

- **symbol**
  - **[in]** The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - **[in]** The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

- **adx_period**
  - **[in]** Period to calculate the index.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

**Note**

The buffer numbers are the following: 0 - MAIN_LINE, 1 - PLUSDI_LINE, 2 - MINUSDI_LINE.

**Example:**

```c
//+------------------------------------------------------------------+
//|                                                   iADXWilder.mq5 |

iAlligator

The function returns the handle of the Alligator indicator.

```c
int iAlligator(
    string symbol,          // symbol name
    ENUM_TIMEFRAMES period, // period
    int jaw_period,         // period for the calculation of jaws
    int jaw_shift,          // horizontal shift of jaws
    int teeth_period,       // period for the calculation of teeth
    int teeth_shift,        // horizontal shift of teeth
    int lips_period,        // period for the calculation of lips
    int lips_shift,         // horizontal shift of lips
    ENUM_MA_METHOD ma_method, // type of smoothing
    ENUM_APPLIED_PRICE applied_price   // type of price or handle
);
```

**Parameters**

`symbol`

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

`period`

[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

`jaw_period`

[in] Averaging period for the blue line (Alligator's Jaw)

`jaw_shift`

[in] The shift of the blue line relative to the price chart.

`teeth_period`

`teeth_shift`

[in] The shift of the red line relative to the price chart.

`lips_period`

[in] Averaging period for the green line (Alligator's lips).

`lips_shift`

[in] The shift of the green line relative to the price chart.

`ma_method`

[in] The method of averaging. Can be any of the **ENUM_MA_METHOD** values.

`applied_price`

[in] The price used. Can be any of the price constants **ENUM_APPLIED_PRICE** or a handle of another indicator.
Technical Indicators

Return Value

Returns the handle of a specified technical indicator, in case of failure returns \texttt{INVALID\_HANDLE}. The computer memory can be freed from an indicator that is no more utilized, using the \texttt{IndicatorRelease()} function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - GATOR\_JAW\_LINE, 1 - GATOR\_TEETH\_LINE, 2 - GATOR\_LIPS\_LINE.

iAMA

The function returns the handle of the Adaptive Moving Average indicator. It has only one buffer.

```c
int iAMA(
    string symbol,       // symbol name
    ENUM_TIMEFRAMES period, // period
    int ama_period,      // average period for AMA
    int fast_ma_period,  // fast MA period
    int slow_ma_period,  // slow MA period
    int ama_shift,       // horizontal shift of the indicator
    ENUM_APPLIED_PRICE applied_price  // type of the price or handle
);
```

Parameters

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **ama_period**
  - [in] The calculation period, on which the efficiency coefficient is calculated.

- **fast_ma_period**
  - [in] Fast period for the smoothing coefficient calculation for a rapid market.

- **slow_ma_period**
  - [in] Slow period for the smoothing coefficient calculation in the absence of trend.

- **ama_shift**
  - [in] Shift of the indicator relative to the price chart.

- **applied_price**
  - [in] The price used. Can be any of the price constants **ENUM_APPLIED_PRICE** or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

Example:

```c
//+------------------------------------------------------------------+
//|  Demo_iAMA.mq5                                                   |
//|                        Copyright 2011, MetaQuotes Software Corp.     |
//|                                             https://www.mql5.com |
//+------------------------------------------------------------------+
```
The indicator demonstrates how to obtain data of indicator buffers for the iAMA technical indicator. A symbol and timeframe used for calculation of the indicator, are set by the symbol and period parameters. The method of creation of the handle is set through the 'type' parameter (function type). All the other parameters are similar to the standard AMA.

//--- plot iAMA
#property indicator_label1  "iAMA"
#property indicator_type1  DRAW_LINE
#property indicator_color1 clrRed
#property indicator_style1  STYLE_SOLID
#property indicator_width1  1

**iAO**

The function returns the handle of the Awesome Oscillator indicator. It has only one buffer.

```c
int iAO(const string& symbol, ENUM_TIMEFRAMES period);
```

**Parameters**

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

# Technical Indicators

## iBearsPower

The function returns the handle of the Bears Power indicator. It has only one buffer.

```c
int iBearsPower(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
);
```

### Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

**ma_period**

[in] The value of the averaging period for the indicator calculation.

### Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

### Example:

```c

}
iBands

The function returns the handle of the Bollinger Bands® indicator.

```c
int iBands(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int bands_period, // period for average line calculation
    int bands_shift, // horizontal shift of the indicator
    double deviation, // number of standard deviations
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

**Parameters**

- `symbol` [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- `period` [in] The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

- `bands_period` [in] The averaging period of the main line of the indicator.

- `bands_shift` [in] The shift the indicator relative to the price chart.

- `deviation` [in] Deviation from the main line.

- `applied_price` [in] The price used. Can be any of the price constants `ENUM_APPLIED_PRICE` or a handle of another indicator.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

**Note**

The buffer numbers are the following: 0 - `BASE_LINE`, 1 - `UPPER_BAND`, 2 - `LOWER_BAND`

**Example:**

```c
//+------------------------------------------------------------------+

The indicator demonstrates how to obtain data of indicator buffers for the iBands technical indicator.

A symbol and timeframe used for calculation of the indicator, are set by the symbol and period parameters.

The method of creation of the handle is set through the 'type' parameter (function type).

--- input parameters

input Creation type=Call_iBands; // type of the function
input int bands_period=20; // period of moving average
input int bands_shift=0; // shift
input double deviation=2.0; // number of standard deviations
input ENUM_APPLIED_PRICE applied_price=PRICE_CLOSE; // type of price
input string symbol= ""; // symbol
input ENUM_TIMEFRAMES period=PERIOD_CURRENT; // timeframe

--- indicator buffers

double UpperBuffer[];
double LowerBuffer[];
```c
double MiddleBuffer[];
//--- variable for storing the handle of the iBands indicator

The function returns the handle of the Bulls Power indicator. It has only one buffer.

```c
int iBullsPower(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
);
```

### Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**ma_period**

[in] The averaging period for the indicator calculation.

### Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**.

The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

### Example:

```c

```

iCCI

The function returns the handle of the Commodity Channel Index indicator. It has only one buffer.

```c
int iCCI(
    string symbol,              // symbol name
    ENUM_TIMEFRAMES period,    // period
    int ma_period,              // averaging period
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

period

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

ma_period

[in] The averaging period for the indicator calculation.

applied_price

[in] The price used. Can be any of the price constants ENUM_APPLIED_PRICE or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

iChaikin

The function returns the handle of the Chaikin Oscillator indicator. It has only one buffer.

```c
int iChaikin(
    string symbol,    // symbol name
    ENUM_TIMEFRAMES period,    // period
    int fast_ma_period,    // fast period
    int slow_ma_period,    // slow period
    ENUM_MA_METHOD ma_method,    // smoothing type
    ENUM_APPLIED_VOLUME applied_volume    // type of volume
);
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

**period**

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

**fast_ma_period**

**slow_ma_period**

[in] Slow averaging period for calculations.

**ma_method**

[in] Smoothing type. Can be one of the averaging constants of ENUM_MA_METHOD.

**applied_volume**

[in] The volume used. Can be one of the constants of ENUM_APPLIED_VOLUME.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

Example:

```c
//+------------------------------------------------------------------+
//|                        Copyright 2011, MetaQuotes Software Corp. |
//|                                             https://www.mql5.com |
//+------------------------------------------------------------------+

#include <mql5.h>

using namespace mql5::objects;

Indicator ind;

int main()
{
    int handle = iChaikin("symbol", ENUM_TIMEFRAMES::M_TIMEFRAME_H1, 1, 5, ENUM_MA_METHOD::MA_SMA, ENUM_APPLIED_VOLUME::APPLIED_VOLUME_VOLUME);
    // Use handle...
    return 0;
}
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

**period**

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

**fast_ma_period**

**slow_ma_period**

[in] Slow averaging period for calculations.

**ma_method**

[in] Smoothing type. Can be one of the averaging constants of ENUM_MA_METHOD.

**applied_volume**

[in] The volume used. Can be one of the constants of ENUM_APPLIED_VOLUME.

iCustom

The function returns the handle of a specified custom indicator.

```c
int iCustom(
    string symbol,  // symbol name
    ENUM_TIMEFRAMES period,  // period
    string name,  // folder/custom_indicator_name
    ...  // list of indicator input parameters
);
```

**Parameters**

- `symbol`
  - `[in]` The symbol name of the security, the data of which should be used to calculate the indicator. The `NULL` value means the current symbol.

- `period`
  - `[in]` The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

- `name`
  - `[in]` The name of the custom indicator, with path relative to the root directory of indicators (`MQL5/Indicators/`). If an indicator is located in a subdirectory, for example, in `MQL5/Indicators/Examples`, its name must be specified like: `"Examples\indicator_name"` (it is necessary to use a double slash instead of the single slash as a separator).

  - `...`
    - `[in]` `input-parameters` of a custom indicator, separated by commas. Type and order of parameters must match. If there is no parameters specified, then `default values` will be used.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

**Note**

A custom indicator must be compiled (with extension EX5) and located in the directory `MQL5/Indicators` of the client terminal or its subdirectory.

Indicators that require testing are defined automatically from the call of the `iCustom()` function, if the corresponding parameter is set through a constant string. For all other cases (use of the `IndicatorCreate()` function or use of a non-constant string in the parameter that sets the indicator name) the property `#property tester_indicator` is required:

```c
#property tester_indicator "indicator_name.ex5"
```

If the first call form is used in the indicator, then at the custom indicator start you can additionally indicate data for calculation in its "Parameters" tab. If the "Apply to" parameter is not selected explicitly, the default calculation is based on the values of "Close" prices.
When you call a custom indicator from mql5-program, the Applied_Price parameter or a handle of another indicator should be passed last, after all input variables of the custom indicator.

//--- Handle of the Custom Moving Average.mql5 custom indicator
int MA_handle;

//--- indicator buffers mapping
SetIndexBuffer(0,Label1Buffer,INDICATOR_DATA);
ResetLastError();
```
MA_handle=iCustom(NULL,0,"Examples\Custom Moving Average",
   MA_Period,
   MA_Shift,
   MA_Method,
   PRICE_CLOSE // using the close prices
);
Print("MA_handle = ",MA_handle," error = ",GetLastError());
//--
   return(INIT_SUCCEEDED);
}
//--| Custom indicator iteration function
//--|------------------------------------------------------------------
int OnCalculate(const int rates_total,
   const int prev_calculated,
   const datetime &time[],
   const double &open[],
   const double &high[],
   const double &low[],
   const double &close[],
   const long &tick_volume[],
   const long &volume[],
   const int &spread[])
{
   //--- Copy the values of the indicator Custom Moving Average to our indicator buffer
   int copy=CopyBuffer(MA_handle,0,0,rates_total,Label1Buffer);
   Print("copy = ",copy," rates_total = ",rates_total);
   //-- If our attempt has failed - Report this
   if(copy<=0)
      Print("An attempt to get the values if Custom Moving Average has failed");
   //-- return value of prev_calculated for next call
   return(prev_calculated);
}
The function returns the handle of the Double Exponential Moving Average indicator. It has only one buffer.

```c
int iDEMA(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    int ma_shift, // horizontal shift
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);```

**Parameters**

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **ma_period**
  - [in] Averaging period (bars count) for calculations.

- **ma_shift**
  - [in] Shift of the indicator relative to the price chart.

- **applied_price**
  - [in] The price used. Can be any of the price constants **ENUM_APPLIED_PRICE** or a handle of another indicator.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

idEmarker

The function returns the handle of the DeMarker indicator. It has only one buffer.

```c
int idEmarker(
    string symbol,    // symbol name
    ENUM_TIMEFRAMES period,    // period
    int ma_period     // averaging period
);
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**ma_period**

[in] Averaging period (bars count) for calculations.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

### iEnvelopes

The function returns the handle of the Envelopes indicator.

```c
int iEnvelopes(
    string symbol,              // symbol name
    ENUM_TIMEFRAMES period,     // period
    int ma_period,              // period for the average line calculation
    int ma_shift,               // horizontal shift of the indicator
    ENUM_MA_METHOD ma_method,   // type of smoothing
    ENUM_APPLIED_PRICE applied_price, // type of price or handle
    double deviation            // deviation of boundaries from the midline
);
```

#### Parameters

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

- **ma_period**
  - [in] Averaging period for the main line.

- **ma_shift**
  - [in] The shift of the indicator relative to the price chart.

- **ma_method**
  - [in] Smoothing type. Can be one of the values of `ENUM_MA_METHOD`.

- **applied_price**
  - [in] The price used. Can be any of the price constants `ENUM_APPLIED_PRICE` or a handle of another indicator.

- **deviation**
  - [in] The deviation from the main line (in percents).

#### Return Value

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

#### Note

The buffer numbers: 0 - UPPER_LINE, 1 - LOWER_LINE.

#### Example:

The function returns the handle of the Force Index indicator. It has only one buffer.

```c
int iForce(
    string symbol,         // symbol name
    ENUM_TIMEFRAMES period, // period
    int ma_period,         // averaging period
    ENUM_MA_METHOD ma_method, // smoothing type
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

**Parameters**

**symbol**
- [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**
- [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**ma_period**
- [in] Averaging period for the indicator calculations.

**ma_method**
- [in] Smoothing type. Can be one of the values of **ENUM_MA_METHOD**.

**applied_volume**
- [in] The volume used. Can be one of the values of **ENUM_APPLIED_VOLUME**.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

```
iFractals

The function returns the handle of the Fractals indicator.

```c
int iFractals(
    string symbol,  // symbol name
    ENUM_TIMEFRAMES period  // period
);
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - UPPER_LINE, 1 - LOWER_LINE.

Example:

iFrAMA

The function returns the handle of the Fractal Adaptive Moving Average indicator. It has only one buffer.

```c
int iFrAMA(
    string symbol,   // symbol name
    ENUM_TIMEFRAMES period,   // period
    int ma_period,    // averaging period
    int ma_shift,     // horizontal shift on the chart
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

**Parameters**

*symbol*

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

*period*

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

*ma_period*

[in] Period (bars count) for the indicator calculations.

*ma_shift*

[in] Shift of the indicator in the price chart.

*applied_price*

[in] The price used. Can be any of the price constants ENUM_APPLIED_PRICE or a handle of another indicator.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

**Example:**

```c

void OnDeinit(const int reason) {
}
iGator

The function returns the handle of the Gator indicator. The Oscillator shows the difference between the blue and red lines of Alligator (upper histogram) and difference between red and green lines (lower histogram).

```cpp
int iGator(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int jaw_period, // period for the calculation of the jaws
    int jaw_shift, // jaws horizontal shift
    int teeth_period, // period for the calculation of the teeth
    int teeth_shift, // teeth horizontal shift
    int lips_period, // period for the calculation of the lips
    int lips_shift, // lips horizontal shift
    ENUM_MA_METHOD ma_method, // type of smoothing
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**jaw_period**

**jaw_shift**

[in] The shift of the blue line relative to the price chart. It isn’t directly connected with the visual shift of the indicator histogram.

**teeth_period**

[in] Averaging period for the red line (Alligator’s Teeth).

**teeth_shift**

[in] The shift of the red line relative to the price chart. It isn’t directly connected with the visual shift of the indicator histogram.

**lips_period**

[in] Averaging period for the green line (Alligator’s lips).

**lips_shift**

[in] The shift of the green line relative to the price charts. It isn’t directly connected with the visual shift of the indicator histogram.

**ma_method**

[in] Smoothing type. Can be one of the values of **ENUM_MA_METHOD**.
**Technical Indicators**

*applied_price*

[in] The price used. Can be any of the price constants `ENUM_APPLIED_PRICE` or a handle of another indicator.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

**Note**

Buffer numbers: 0 - UPPER_HISTOGRAM, 1 - color buffer of the upper histogram, 2 - LOWER_HISTOGRAM, 3 - color buffer of the lower histogram.

ilchimoku

The function returns the handle of the Ichimoku Kinko Hyo indicator.

```c
int iIchimoku(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int tenkan_sen, // period of Tenkan-sen
    int kijun_sen, // period of Kijun-sen
    int senkou_span_b // period of Senkou Span B
);
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**tenkan_sen**

**kijun_sen**

**senkou_span_b**

[in] Averaging period for Senkou Span B.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

**Note**

The buffer numbers: 0 - TENKANSEN_LINE, 1 - KIJUNSEN_LINE, 2 - SENKOUSPANA_LINE, 3 - SENKOUSPANB_LINE, 4 - CHIKOUSPAN_LINE.

**iBWMFI**

The function returns the handle of the Market Facilitation Index indicator. It has only one buffer.

```c
int iBWMFI(
    string symbol,  // symbol name
    ENUM_TIMEFRAMES period,  // period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

### Parameters

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **applied_volume**
  - [in] The volume used. Can be one of the constants of **ENUM_APPLIED_VOLUME**.

### Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

### Example:

iMomentum

The function returns the handle of the Momentum indicator. It has only one buffer.

```c
int iMomentum(
    string symbol,       // symbol name
    ENUM_TIMEFRAMES period,  // period
    int mom_period,      // averaging period
    ENUM_APPLIED_PRICE applied_price  // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

period

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

mom_period

[in] Averaging period (bars count) for the calculation of the price change.

applied_price

[in] The price used. Can be any of the price constants ENUM_APPLIED_PRICE or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

Example:

//+------------------------------------------------------------------+
void OnDeinit(const int reason)
{
    //--- clear the chart after deleting the indicator
    Comment("");
}
The function returns the handle of the Money Flow Index indicator.

```c
int iMFI(
    string symbol,            // symbol name
    ENUM_TIMEFRAMES period,  // period
    int ma_period,            // averaging period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

**Parameters**

- **symbol**
  - `[in]` The symbol name of the security, the data of which should be used to calculate the indicator. The `NULL` value means the current symbol.

- **period**
  - `[in]` The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

- **ma_period**
  - `[in]` Averaging period (bars count) for the calculation.

- **applied_volume**
  - `[in]` The volume used. Can be any of the `ENUM_APPLIED_VOLUME` values.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

**Example:**

```c
//+------------------------------------------------------------------+
//|                        Copyright 2011, MetaQuotes Software Corp. |

### iMA

The function returns the handle of the Moving Average indicator. It has only one buffer.

```csharp
int iMA(
    string symbol,       // symbol name
    ENUM_TIMEFRAMES period, // period
    int ma_period,       // averaging period
    int ma_shift,        // horizontal shift
    ENUM_MA_METHOD ma_method, // smoothing type
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

#### Parameters

**symbol**  
[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**  
[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**ma_period**  
[in] Averaging period for the calculation of the moving average.

**ma_shift**  
[in] Shift of the indicator relative to the price chart.

**ma_method**  
[in] Smoothing type. Can be one of the **ENUM_MA_METHOD** values.

**applied_price**  
[in] The price used. Can be any of the price constants **ENUM_APPLIED_PRICE** or a handle of another indicator.

#### Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

    Comment("");
iOsMA

The function returns the handle of the Moving Average of Oscillator indicator. The OsMA oscillator shows the difference between values of MACD and its signal line. It has only one buffer.

```c
int iOsMA(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int fast_ema_period, // period for Fast Moving Average
    int slow_ema_period, // period for Slow Moving Average
    int signal_period, // averaging period for their difference
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

period

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

fast_ema_period

[in] Period for Fast Moving Average calculation.

slow_ema_period

[in] Period for Slow Moving Average calculation.

signal_period

applied_price

[in] The price used. Can be any of the price constants ENUM_APPLIED_PRICE or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

Note

In some systems this oscillator is also known as MACD histogram.

Example:

```c
//+------------------------------------------------------------------+
//|                        Copyright 2011, MetaQuotes Software Corp. |
//|                                             https://www.mql5.com |
The indicator demonstrates how to obtain data of indicator buffers for the iOsMA technical indicator. A symbol and timeframe used for calculation of the indicator, are set by the symbol and period parameters. The method of creation of the handle is set through the 'type' parameters. All the other parameters are similar to the standard Moving Average.

--- the iOsMA plot

--- input parameters

    Comment("");
}
iMACD

The function returns the handle of the Moving Averages Convergence/Divergence indicator. In systems where OsMA is called MACD Histogram, this indicator is shown as two lines. In the client terminal the Moving Averages Convergence/Divergence looks like a histogram.

```c
int iMACD(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int fast_ema_period, // period for Fast average calculation
    int slow_ema_period, // period for Slow average calculation
    int signal_period, // period for their difference averaging
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

- `symbol` [in] The symbol name of the security, the data of which should be used to calculate the indicator. The `NULL` value means the current symbol.

- `period` [in] The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

- `slow_ema_period` [in] Period for Slow Moving Average calculation.

- `applied_price` [in] The price used. Can be any of the price constants `ENUM_APPLIED_PRICE` or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - MAIN_LINE, 1 - SIGNAL_LINE.

Example:

iOBV

The function returns the handle of the On Balance Volume indicator. It has only one buffer.

```cpp
int iOBV(
    string symbol,    // symbol name
    ENUM_TIMEFRAMES period,   // period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

period

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

applied_volume

[in] The volume used. Can be any of the ENUM_APPLIED_VOLUME values.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE.

The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

iSAR

The function returns the handle of the Parabolic Stop and Reverse system indicator. It has only one buffer.

```c
int iSAR(
    string symbol,  // symbol name
    ENUM_TIMEFRAMES period,  // period
    double step,  // price increment step - acceleration factor
    double maximum  // maximum value of step
);
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**step**

[in] The step of price increment, usually 0.02.

**maximum**

[in] The maximum step, usually 0.2.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

Example:

```c

iRSI

The function returns the handle of the Relative Strength Index indicator. It has only one buffer.

```c
int iRSI(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

### Parameters

- **symbol**
  
  [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  
  [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **ma_period**
  
  [in] Averaging period for the RSI calculation.

- **applied_price**
  
  [in] The price used. Can be any of the price constants **ENUM_APPLIED_PRICE** or a handle of another indicator.

### Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

### Example:

The function returns the handle of the Relative Vigor Index indicator.

```
int iRVI(  
    string    symbol,  // symbol name  
    ENUM_TIMEFRAMES period,  // period  
    int       ma_period  // averaging period
);
```

**Parameters**

- `symbol` [in] The symbol name of the security, the data of which should be used to calculate the indicator. The `NULL` value means the current symbol.

- `period` [in] The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

- `ma_period` [in] Averaging period for the RVI calculation.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns `INVALID_HANDLE`. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

**Note**

The buffer numbers are the following: 0 - MAIN_LINE, 1 - SIGNAL_LINE.

iStdDev

The function returns the handle of the Standard Deviation indicator. It has only one buffer.

```c
int iStdDev(
    string symbol,      // symbol name
    ENUM_TIMEFRAMES period,  // period
    int ma_period,      // averaging period
    int ma_shift,      // horizontal shift
    ENUM_MA_METHOD ma_method,  // smoothing type
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

**symbol**

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**

[in] The value of the period can be one of the `ENUM_TIMEFRAMES` values, 0 means the current timeframe.

**ma_period**

[in] Averaging period for the indicator calculations.

**ma_shift**

[in] Shift of the indicator relative to the price chart.

**ma_method**

[in] Type of averaging. Can be any of the `ENUM_MA_METHOD` values.

**applied_price**

[in] The price used. Can be any of the price constants `ENUM_APPLIED_PRICE` or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the `IndicatorRelease()` function, to which the indicator handle is passed.

iStochastic

The function returns the handle of the Stochastic Oscillator indicator.

```c
int iStochastic(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int Kperiod, // K-period (number of bars for calculations)
    int Dperiod, // D-period (period of first smoothing)
    int slowing, // final smoothing
    ENUM_MA_METHOD ma_method, // type of smoothing
    ENUM_STO_PRICE price_field // stochastic calculation method
);
```

Parameters

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **Kperiod**
  - [in] Averaging period (bars count) for the %K line calculation.

- **Dperiod**
  - [in] Averaging period (bars count) for the %D line calculation.

- **slowing**
  - [in] Slowing value.

- **ma_method**
  - [in] Type of averaging. Can be any of the **ENUM_MA_METHOD** values.

- **price_field**
  - [in] Parameter of price selection for calculations. Can be one of the **ENUM_STO_PRICE** values.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

Note

The buffer numbers: 0 - MAIN_LINE, 1 - SIGNAL_LINE.

Example:

    PrintFormat("Failed to copy data from the iStochastic indicator, error code %d",
                GetLastError());
    //--- quit with zero result - it means that the indicator is considered as not calculated
    return(false);
}
//--- everything is fine
    return(true);
}
iTEMA

The function returns the handle of the Triple Exponential Moving Average indicator. It has only one buffer.

```c
int iTEMA(
    string symbol,       // symbol name
    ENUM_TIMEFRAMES period,     // period
    int ma_period,      // averaging period
    int ma_shift,       // horizontal shift of indicator
    ENUM_APPLIED_PRICE applied_price  // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

period

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

ma_period

[in] Averaging period (bars count) for calculation.

ma_shift

[in] Shift of indicator relative to the price chart.

applied_price

[in] The price used. Can be any of the price constants ENUM_APPLIED_PRICE or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

Example:

```c

The function returns the handle of the Triple Exponential Moving Averages Oscillator indicator. It has only one buffer.

```c
int iTriX(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int ma_period, // averaging period
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

### Parameters

**symbol**
- **[in]** The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

**period**
- **[in]** The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

**ma_period**
- **[in]** Averaging period (bars count) for calculations.

**applied_price**
- **[in]** The price used. Can be any of the price constants **ENUM_APPLIED_PRICE** or a handle of another indicator.

### Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

iWPR

The function returns the handle of the Larry Williams' Percent Range indicator. It has only one buffer.

```c
int iWPR(
    string symbol,       // symbol name
    ENUM_TIMEFRAMES period, // period
    int calc_period      // averaging period
);
```

Parameters

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **calc_period**
  - [in] Period (bars count) for the indicator calculation.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**. The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

//| Indicator deinitialization function | |
//+------------------------------------------------------------------+
void OnDeinit(const int reason)
{
//--- clear the chart after deleting the indicator
Comment("");
}
iVIDyA

The function returns the handle of the Variable Index Dynamic Average indicator. It has only one buffer.

```c
int iVIDyA(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    int cmo_period, // period for Chande Momentum
    int ema_period, // EMA smoothing period
    int ma_shift, // horizontal shift on the price chart
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The NULL value means the current symbol.

period

[in] The value of the period can be one of the ENUM_TIMEFRAMES values, 0 means the current timeframe.

cmo_period

[in] Period (bars count) for the Chande Momentum Oscillator calculation.

ema_period

[in] EMA period (bars count) for smoothing factor calculation.

ma_shift

[in] Shift of the indicator relative to the price chart.

applied_price

[in] The price used. Can be any of the price constants ENUM_APPLIED_PRICE or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns INVALID_HANDLE. The computer memory can be freed from an indicator that is no more utilized, using the IndicatorRelease() function, to which the indicator handle is passed.

Example:

    Comment(""");
}
**iVolumes**

The function returns the handle of the Volumes indicator. It has an only one buffer.

```c
int iVolumes(
    string symbol, // symbol name
    ENUM_TIMEFRAMES period, // period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
)
```

**Parameters**

- **symbol**
  - [in] The symbol name of the security, the data of which should be used to calculate the indicator. The **NULL** value means the current symbol.

- **period**
  - [in] The value of the period can be one of the **ENUM_TIMEFRAMES** values, 0 means the current timeframe.

- **applied_volume**
  - [in] The volume used. Can be any of the **ENUM_APPLIED_VOLUME** values.

**Return Value**

Returns the handle of a specified technical indicator, in case of failure returns **INVALID_HANDLE**.

The computer memory can be freed from an indicator that is no more utilized, using the **IndicatorRelease()** function, to which the indicator handle is passed.

**Example:**

```c

Working with Optimization Results

Functions for organizing custom processing of the optimization results in the strategy tester. They can be called during optimization in testing agents, as well as locally in Expert Advisors and scripts.

When you run an Expert Advisor in the strategy tester, you can create your own data array based on the simple types or simple structures (they do not contain strings, class objects or objects of dynamic arrays). This data set can be saved using the FrameAdd() function in a special structure called a frame. During the optimization of an Expert Advisor, each agent can send a series of frames to the terminal. All the received frames are written in the *.MQD file named as the Expert Advisor in the terminal_directory\MQL5\Files\Tester folder. They are written in the order they are received from the agents. Receipt of a frame in the client terminal from a testing agent generates the TesterPass event.

Frames can be stored in the computer memory and in a file with the specified name. The MQL5 language sets no limitations on the number of frames.

See also

Testing Statistics, Properties of a Running MQL5 Program
**FrameFirst**

Moves a pointer of frame reading to the beginning and resets a set filter.

```cpp
bool FrameFirst();
```

**Return Value**

Returns true if successful, otherwise false. To get information about the error, call the `GetLastError()` function.
FrameFilter

Sets the frame reading filter and moves the pointer to the beginning.

```cpp
bool FrameFilter(
    const string name, // Public name/label
    long id           // Public ID
);
```

Return Value

Returns true if successful, otherwise false. To get information about the error, call the `GetLastError()` function.

Note

If an empty string is passed as the first parameter, the filter will work only with a numeric parameter, i.e. only frames with the specified id will be viewed. If the value of the second parameter is `ULONG_MAX`, only a text filter works.

Call of `FrameFilter("", ULONG_MAX)` is equivalent to calling `FrameFirst()`, i.e. equal to not using any filter.
FrameNext

Reads a frame and moves the pointer to the next one. There are two variants of the function.

1. Calling to receive one numeric value

```cpp
bool FrameNext(
    ulong& pass, // The number of a pass in the optimization, during which the frame has been added
    string& name, // Public name/label
    long& id, // Public ID
    double& value // Value
);
```

2. Calling to receive all the data of a frame

```cpp
bool FrameNext(
    ulong& pass, // The number of a pass in the optimization, during which the frame has been added
    string& name, // Public name/label
    long& id, // Public ID
    double& value, // Value
    void& data[] // Array of any type
);
```

**Parameters**

- `pass`  
  [out] The number of a pass during optimization in the strategy tester.

- `name`  
  [out] The name of the identifier.

- `id`  
  [out] The value of the identifier.

- `value`  
  [out] A single numeric value.

- `data`  
  [out] An array of any type.

**Return Value**

Returns true if successful, otherwise false. To get information about the error, call the `GetLastError()` function.

**Note**

In the second version of the call, you must correctly handle the received data in the `data[]` array.
FrameInputs

Receives input parameters, on which the frame with the specified pass number is formed.

```cpp
bool FrameInputs(
    ulong pass,       // The number of a pass in the optimization
    string& parameters[],  // An array of strings of form "parameterN=valueN"
    uint& parameters_count // The total number of parameters
);
```

Parameters

- **pass**
  - [in] The number of a pass during optimization in the strategy tester.

- **parameters**
  - [out] A string array with the description of names and parameter values

- **parameters_count**
  - [out] The number of elements in the array `parameters[]`.

Return Value

Returns true if successful, otherwise false. To get information about the error, call the `GetLastError()` function.

Note

Having obtained the number of strings `parameters_count` in the `parameters[]` array, you can organize a loop to go through all records. This will help you find the values of input parameters of an Expert Advisor for the specified pass number.
FrameAdd

Adds a frame with data. There are two variants of the function.

1. Adding data from a file

```cpp
bool FrameAdd(
    const string name,       // Public name/label
    long id,                 // Public ID
    double value,            // Value
    const string filename    // Name of a data file
);
```

2. Adding data from an array of any type

```cpp
bool FrameAdd(
    const string name,       // Public name/label
    long id,                 // Public ID
    double value,            // Value
    const void* data[]       // Array of any type
);
```

Parameters

- **name**
  - [in] Public frame label. It can be used for a filter in the `FrameFilter()` function.

- **id**
  - [in] A public identifier of the frame. It can be used for a filter in the `FrameFilter()` function.

- **value**
  - [in] A numeric value to write into the frame. It is used to transmit a single pass result like in the `OnTester()` function.

- **filename**
  - [in] The name of the file that contains data to add to the frame. The file must be located in the folder `MQL5/Files`.

- **data**

Return Value

Returns true if successful, otherwise false. To get information about the error, call the `GetLastError()` function.
ParameterGetRange

Receives data on the values range and the change step for an input variable when optimizing an Expert Advisor in the Strategy Tester. There are 2 variants of the function.

1. Receiving data for the integer type input parameter

```cpp
bool ParameterGetRange(
    const string name,  // parameter (input variable) name
    bool& enable,       // parameter optimization enabled
    long& value,        // parameter value
    long& start,        // initial value
    long& step,         // change step
    long& stop          // final value
);
```

2. Receiving data for the real type input parameter

```cpp
bool ParameterGetRange(
    const string name,  // parameter (input variable) name
    bool& enable,       // parameter optimization enabled
    double& value,      // parameter value
    double& start,      // initial value
    double& step,       // change step
    double& stop        // final value
);
```

Parameters

name

[in] input variable ID. These variables are external parameters of an application. Their values can be specified when launching on a chart or during a single test.

enable

[out] Flag that this parameter can be used to enumerate the values during the optimization in the Strategy Tester.

value

[out] Parameter value.

start

[out] Initial parameter value during the optimization.

step

[out] Parameter change step when enumerating its values.

stop

[out] Final parameter value during the optimization.

Return Value
Returns true if successful, otherwise false. For information about the error, use the `GetLastError()` function.

**Note**

The function can be called only from `OnTesterInit()`, `OnTesterPass()` and `OnTesterDeinit()` handlers. It has been introduced to receive Expert Advisor input parameters' values and variation ranges during the optimization in the Strategy Tester.

When called in `OnTesterInit()`, the obtained data can be used to redefine the rules for enumeration of any `input variable` using `ParameterSetRange()` function. Therefore, new Start, Stop and Step values can be set and the input parameter can even be completely excluded from optimization regardless of the Strategy Tester settings. This allows you to manage the area of the input parameters during the optimization by excluding some parameters from the optimization depending on the Expert Advisor's key parameters' values.

**Example:**

```mql5
#property description "Expert Advisor for ParameterGetRange() function demonstration." #property description "Should be launched in the optimization mode of the Strategy Tester"

//--- input parameters
input int Input1 = 1;
input double Input2 = 2.0;
input bool Input3 = false;
input ENUM_DAY_OF_WEEK Input4 = SUNDAY;

//+------------------------------------------------------------------+

long par4,par4_start,par4_step,par4_stop;
ParameterGetRange(name,enable,par4,par4_start,par4_step,par4_stop);
Print("Fourth parameter");
PrintFormat("%s=%s enable=%s from %s to %s",
    name,EnumToString((ENUM_DAY_OF_WEEK)par4),(string)enable,
    EnumToString((ENUM_DAY_OF_WEEK)par4_start),
    EnumToString((ENUM_DAY_OF_WEEK)par4_stop));
```

//+------------------------------------------------------------------+
//| Tester Deinit function                                            |
//+------------------------------------------------------------------+
```
ParameterSetRange

Specifies the use of input variable when optimizing an Expert Advisor in the Strategy Tester: value, change step, initial and final values. There are 2 variants of the function.

1. Specifying the values for the integer type input parameter

```cpp
bool ParameterSetRange(  
    const string name,  // parameter (input variable) name  
    bool enable,       // parameter optimization enabled  
    long value,        // parameter value  
    long start,        // initial value  
    long step,         // change step  
    long stop          // final value
);
```

2. Specifying the values for the real type input parameter

```cpp
bool ParameterSetRange(  
    const string name,  // parameter (input variable) name  
    bool enable,       // parameter optimization enabled  
    double value,      // parameter value  
    double start,      // initial value  
    double step,       // change step  
    double stop        // final value
);
```

Parameters

name

[in] input or sinput variable ID. These variables are external parameters of an application. Their values can be specified when launching the program.

enable

[in] Enable this parameter to enumerate the values during the optimization in the Strategy Tester.

value

[in] Parameter value.

start

[in] Initial parameter value during the optimization.

step

[in] Parameter change step when enumerating its values.

stop

[in] Final parameter value during the optimization.

Return Value
Working with Optimization Results

Returns true if successful, otherwise false. For information about the error, use the GetLastError() function.

**Note**

The function can be called only from OnTesterInit() handler when launching optimization from the Strategy Tester. It is designed for specifying the parameter’s range and change step. The parameter can be completely excluded from optimization regardless of the Strategy Tester settings. It also allows using the variables declared with sinput modifier in the optimization process.

ParameterSetRange() function allows you to manage an Expert Advisor optimization in the Strategy Tester depending on its key parameters’ values by including or excluding required input parameters from the optimization and setting the required range and the change step.
Event Functions

This group contains functions for working with custom events and timer events. Besides this group, there are special functions for handling predefined events.

<table>
<thead>
<tr>
<th>Function</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>EventSetMillisecondTimer</td>
<td>Launches event generator of the high-resolution timer with a period less than 1 second for the current chart</td>
</tr>
<tr>
<td>EventSetTimer</td>
<td>Starts the timer event generator with the specified periodicity for the current chart</td>
</tr>
<tr>
<td>EventKillTimer</td>
<td>Stops the generation of events by the timer in the current chart</td>
</tr>
<tr>
<td>EventChartCustom</td>
<td>Generates a custom event for the specified chart</td>
</tr>
</tbody>
</table>

See also

Types of Chart Events
**EventSetMillisecondTimer**

The function indicates to the client terminal that timer events should be generated at intervals less than one second for this Expert Advisor or indicator.

```cpp
def EventSetMillisecondTimer(
    int milliseconds  // number of milliseconds
):
```

**Parameters**

milliseconds

[in] Number of milliseconds defining the frequency of timer events.

**Return Value**

In case of successful execution, returns true, otherwise - false. To receive an error code, `GetLastError()` function should be called.

**Note**

This feature is designed for the cases when high-resolution timer is required. In other words, timer events should be received more frequently than once per second. If a conventional timer with the period of more than one second is enough for you, use `EventSetTimer()`.

The minimum interval of 1000 milliseconds is used in the strategy tester. In general, when the timer period is reduced, the testing time is increased, as the handler of timer events is called more often. When working in real-time mode, timer events are generated no more than 1 time in 10-16 milliseconds due to hardware limitations.

Usually, this function should be called from `OnInit()` function or in class constructor. To handle events coming from the timer, an Expert Advisor or an indicator should have `OnTimer()` function.

Each Expert Advisor and each indicator work with its own timer receiving events solely from this timer. During mql5 application shutdown, the timer is forcibly destroyed in case it has been created but has not been disabled by `EventKillTimer()` function.

Only one timer can be launched for each program. Each mql5 application and chart have their own queue of events where all newly arrived events are placed. If the queue already contains Timer event or this event is in the processing stage, then the new Timer event is not added to mql5 application queue.
Working with Events

**EventSetTimer**

The function indicates to the client terminal, that for this indicator or Expert Advisor, events from the **timer** must be generated with the specified periodicity.

```cpp
bool EventSetTimer(
    int seconds // number of seconds
);
```

**Parameters**

*seconds*

[in] Number of seconds that determine the frequency of the timer event occurrence.

**Return Value**

In case of success returns true, otherwise false. In order to get an error code, the **GetLastError()** function should be called.

**Note**

Normally, this function must be called from the **OnInit()** function or from a class **constructor**. In order to handle events coming from the timer, the Expert Advisor must have the **OnTimer()** function.

Every Expert Advisor, as well as every indicator works with its own timer and receives events only from it. As soon as a mql5 program stops operating, the timer is destroyed forcibly if it was created but hasn't been disabled by the **EventKillTimer()** function.

For each program no more than one timer can be run. Each mql5 program and each chart has its own queue of events, in which all the newly received events are placed. If the **Timer** event is present in the queue or is being processed, the new Timer event will not be placed in the queue of the mql5 program.
EventKillTimer

Specifies the client terminal that is necessary to stop the generation of events from Timer.

```c
void EventKillTimer();
```

Return Value

No return value.

Note

Typically, this function must be called from a function `OnDeinit()`, if the `EventSetTimer()` function has been called from `OnInit()`. This function can also be called form the class destructor, if the `EventSetTimer()` function has been called in the constructor of this class.

Every Expert Advisor, as well as every indicator works with its own timer and receives events only from it. As soon as a mql5 program stops operating, the timer is destroyed forcibly if it was created but hasn't been disabled by the `EventKillTimer()` function.
EventChartCustom

The function generates a custom event for the specified chart.

```c
bool EventChartCustom(
    long chart_id, // identifier of the event receiving chart
    ushort custom_event_id, // event identifier
    long lparam, // parameter of type long
    double dparam, // parameter of type double
    string sparam // string parameter of the event
);
```

Parameters

`chart_id`

[in] Chart identifier. 0 means the current chart.

`custom_event_id`

[in] ID of the user events. This identifier is automatically added to the value `CHARTEVENT_CUSTOM` and converted to the integer type.

`lparam`

[in] Event parameter of the long type passed to the `OnChartEvent` function.

`dparam`

[in] Event parameter of the double type passed to the `OnChartEvent` function.

`sparam`

[in] Event parameter of the string type passed to the `OnChartEvent` function. If the string is longer than 63 characters, it is truncated.

Return Value

Returns true if a custom event has been successfully placed in the events queue of the chart that receives the events. In case of failure, it returns false. Use `GetLastError()` to get an error code.

Note

An Expert Advisor or indicator attached to the specified chart handles the event using the function `OnChartEvent` with parameters `int event_id, long& lparam, double& dparam, string& sparam`.

For each type of event, the input parameters of the `OnChartEvent()` function have definite values that are required for the processing of this event. The events and values passed through this parameters are listed in the below table.

<table>
<thead>
<tr>
<th>Event</th>
<th>Value of the id parameter</th>
<th>Value of the lparam parameter</th>
<th>Value of the dparam parameter</th>
<th>Value of the sparam parameter</th>
</tr>
</thead>
<tbody>
<tr>

Events of the client terminal, Event handler functions
**Working with OpenCL**

OpenCL programs are used for performing computations on video cards that support OpenCL 1.1 or higher. Modern video cards contain hundreds of small specialized processors that can simultaneously perform simple mathematical operations with incoming data streams. The OpenCL language organizes parallel computing and provides greater speed for a certain class of tasks.

In some graphic cards working with the `double` type numbers is disabled by default. This can lead to compilation error 5105. To enable support for the double type numbers, please add the following directive to your OpenCL program: `#pragma OPENCL EXTENSION cl_khr_fp64 : enable`. However if a graphic card doesn’t support double, enabling this directive won’t be of help.

It is recommended to write the source code for OpenCL in separate CL files, which can later be included in the MQL5 program using the `resource variables`.

CLHandleType

Returns the type of an OpenCL handle as a value of the ENUM_OPENCL_HANDLE_TYPE enumeration.

```c
ENUM_OPENCL_HANDLE_TYPE CLHandleType(
    int handle // Handle of an OpenCL object
);
```

Parameters

handle

[in] A handle to an OpenCL object: a context, a kernel or an OpenCL program.

Return Value

The type of the OpenCL handle as a value of the ENUM_OPENCL_HANDLE_TYPE enumeration.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPENCL_INVALID</td>

</tr>
<tr>
<td>OPENCL_KERNEL</td>
<td>A handle of the OpenCL kernel</td>
</tr>
<tr>
<td>OPENCL_BUFFER</td>
<td>A handle of the OpenCL buffer</td>
</tr>
</tbody>
</table>
CLGetInfoInteger

Returns the value of an integer property for an OpenCL object or device.

```c
long CLGetInfoInteger(
    int handle,          // The handle of the OpenCL object or the number of the OpenCL device
    ENUM_OPENCL_PROPERTY_INTEGER prop);  // Requested property
```

Parameters

- **handle**
  - [in] A handle to the OpenCL object or number of the OpenCL device. Numbering of OpenCL devices starts with zero.

- **prop**
  - [in] The type of a requested property from the `ENUM_OPENCL_PROPERTY_INTEGER` enumeration, the value of which you want to obtain.

Return Value

The value of the property if successful or -1 in case of an error. For information about the error, use the `GetLastError()` function.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CL_DEVICE_COUNT</td>
<td>The number of devices with OpenCL support. This property does not require specification of the first parameter, i.e. you can pass a zero value for the <code>handle</code> parameter.</td>
<td>int</td>
</tr>
<tr>

<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>CL_BUFFER_SIZE</td>
<td>Actual size of the OpenCL buffer in bytes</td>
<td></td>
</tr>
<tr>
<td>CL_DEVICE_MAX_WORK_GROUP_SIZE</td>
<td>The total number of the local working groups available for an OpenCL device.</td>
<td></td>
</tr>
<tr>
<td>CL_KERNEL_WORK_GROUP_SIZE</td>
<td>The total number of the local working groups available for an OpenCL program.</td>
<td></td>
</tr>
<tr>
<td>CL_KERNEL_LOCAL_MEM_SIZE</td>
<td>Size of the local memory (in bytes) used by an OpenCL program for solving all parallel tasks in a group. Use CL DEVICE LOCAL_MEM_SIZE to receive the maximum available value</td>
<td></td>
</tr>
<tr>
<td>CL_KERNEL_PRIVATE_MEM_SIZE</td>
<td>The minimum size of the private memory (in bytes) used by each task in the OpenCL program kernel.</td>
<td></td>
</tr>
</tbody>
</table>

The ENUM_CL_DEVICE_TYPE enumeration contains possible types of devices supporting OpenCL. You can receive the type of device by its number or the handle of the OpenCL object by calling CLGetInfoInteger(handle_or_deviceN, CL_DEVICE_TYPE).

### ENUM_CL_DEVICE_TYPE

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CL_DEVICE_ACCELERATOR</td>
<td>Dedicated OpenCL accelerators (for example, the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.</td>
</tr>
<tr>
<td>CL_DEVICE_CPU</td>
<td>An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.</td>
</tr>
<tr>
<td>CL_DEVICE_GPU</td>
<td>An OpenCL device that is a GPU.</td>
</tr>
<tr>
<td>CL_DEVICE_DEFAULT</td>
<td>The default OpenCL device in the system. The default device cannot be a CL DEVICE TYPE CUSTOM device.</td>
</tr>
<tr>
<td>CL_DEVICE_CUSTOM</td>
<td>Dedicated accelerators that do not support programs written in OpenCL C.</td>
</tr>
</tbody>
</table>

**Example:**

```c
void OnStart()
```
```c
{
    int cl_ctx;
    //--- initialize OpenCL context
    if((cl_ctx=CLContextCreate(CL_USE_GPU_ONLY))==INVALID_HANDLE)
    {
        Print("OpenCL not found");
        return;
    }
    //--- Display general information about OpenCL device
    Print("OpenCL type: ",EnumToString((ENUM_CL_DEVICE_TYPE)CLGetInfoInteger(cl_ctx,CL_DEVICE_TYPE)));  
    Print("OpenCL vendor ID: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_VENDOR_ID));
    Print("OpenCL units: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_MAX_COMPUTE_UNITS));
    Print("OpenCL freq: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_MAX_CLOCK_FREQUENCY)," MHz");
    Print("OpenCL global mem: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_GLOBAL_MEM_SIZE)," bytes");
    Print("OpenCL local mem: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_LOCAL_MEM_SIZE)," bytes");
    //---
}```
CLGetInfoString

Returns string value of a property for OpenCL object or device.

```cpp
bool CLGetInfoString(
    int handle,  // OpenCL object handle or OpenCL device number
    ENUM_OPENCL_PROPERTY_STRING prop,  // requested property
    string& value  // referenced string
);
```

**Parameters**

*handle*

[in] OpenCL object handle or OpenCL device number. The numbering of OpenCL devices starts with zero.

*prop*

[in] Type of requested property from `ENUM_OPENCL_PROPERTY_STRING` enumeration, the value of which should be obtained.

'value'*

[out] String for receiving the property value.

**Return Value**

true if successful, otherwise false. For information about the error, use the `GetLastError()` function.

Print("OpenCL local mem: ", CLGetInfoInteger(cl_ctx, CL_DEVICE_LOCAL_MEM_SIZE));
//--
CLContextCreate

Creates an OpenCL context and returns its handle.

```c
int CLContextCreate(
    int device       // Serial number of the OpenCL device or macro
);
```

Parameter

device

[in] The ordinal number of the OpenCL-device in the system. Instead of a specific number, you can specify one of the following values:

- CL_USE_ANY - any available device with OpenCL support is allowed;
- CL_USE_CPU_ONLY - only OpenCL emulation on CPU is allowed;
- CL_USE_GPU_ONLY - OpenCL emulation is prohibited and only specialized devices with OpenCL support (video cards) can be used.

Return Value

A handle to the OpenCL context if successful, otherwise -1. For information about the error, use the GetLastError() function.
CLContextFree

Removes an OpenCL context.

```c
void CLContextFree(
    int context  // Handle to an OpenCL context
);```

**Parameters**

`context`

[in] Handle of the OpenCL context.

**Return Value**

None. In the case of an internal error the value of `_LastError` changes. For information about the error, use the `GetLastError()` function.
CLGetDeviceInfo

The function receives device property from OpenCL driver.

```c
bool CLGetDeviceInfo(
    int handle,       // OpenCL device handle
    int property_id,  // requested property ID
    uchar* data[],    // array for receiving data
    uint& size        // shift in the array elements, default value is 0
);
```

Parameters

- `handle` [in] OpenCL device index or OpenCL handle created by `CLContextCreate()` function.
- `property_id` [in] ID of the OpenCL device property that should be received. The values can be one of the predetermined ones listed in the table below.
- `data[]` [out] The array for receiving data on the requested property.
- `size` [out] Size of the received data in the array `data[]`.

Return Value

- `true` if successful, otherwise `false`. For information about the error, use the `GetLastError()` function.

Note

For one-dimensional arrays, the number of the element, from which data reading for OpenCL buffer starts, is calculated considering `AS_SERIES` flag.

The list of available IDs of OpenCL device properties

Exact description of the property and its functions can be found at [the official OpenCL web site](https://www.khronos.org/opencl).

    //  2013.07.24 10:50:48   opencl (EURUSD,H1) 0: GeForce GTX 580
```
**CLProgramCreate**

Creates an OpenCL program from a source code.

```c
int CLProgramCreate(
    int context, // Handle to an OpenCL context
    const string source // Source code
);
```

An overloaded function version creates an OpenCL program and writes compiler messages into the passed string.

```c
int CLProgramCreate(
    int context, // Handle to an OpenCL context
    const string source, // Source code
    string &build_log // A string for receiving the compilation log
);
```

**Parameters**

- **context**
  - [in] Handle of the OpenCL context.

- **source**
  - [in] String with the source code of the OpenCL program.

- **build_log**
  - [in] A string for receiving the OpenCL compiler messages.

**Return Value**

A handle to an OpenCL object if successful. In case of error -1 is returned. For information about the error, use the [GetLastError()](#) function.

**Note**

At the moment, the following error codes are used:

- **ERR_OPENCL_INVALID_HANDLE** - invalid handle to the context OpenCL.
- **ERR_INVALID_PARAMETER** - invalid string parameter.
- **ERR_NOTENOUGH_MEMORY** - not enough memory to complete operation.
- **ERR_OPENCL_PROGRAM_CREATE** - internal error of OpenCL or compilation error.

In some graphic cards working with the `double` type numbers is disabled by default. This can lead to compilation error 5105. To enable support for the double type numbers, please add the following directive to your OpenCL program: `#pragma OPENCL EXTENSION cl_khr_fp64 : enable`. However if a graphic card doesn't support double, enabling this directive won't be of help.

**Example:**

```c
const string
```
cl_src=

```
//--- by default some GPU doesn't support doubles
//--- cl_khr_fp64 directive is used to enable work with doubles
#pragma OPENCL EXTENSION cl_khr_fp64 : enable

//_kernel void Test_GPU(__global double *data,
//                const    int N,
//                const    int total_arrays)
{
    uint kernel_index=get_global_id(0);
    if (kernel_index>total_arrays) return;
    uint local_start_offset=kernel_index*N;
    for(int i=0; i<N; i++)
    {
        data[i+local_start_offset] *= 2.0;
    }
}
```

//--- OpenCL handles
int cl_ctx; // OpenCL context handle
int cl_prg; // OpenCL program handle
int cl_krn; // OpenCL kernel handle
int cl_mem; // OpenCL buffer handle

//---
#define ARRAY_SIZE 100    // size of the array
#define TOTAL_ARRAYS 5    // total arrays

bool Test_CPU(double &dataArray[], const int N, const int id, const int total_arrays)
{
    //--- check array size
    if(ArraySize(dataArray)==0) return(false);
    //--- check array index
    if(id>total_arrays) return(false);
    //--- calculate local offset for array with index id
    int local_start_offset=id*N;
    //--- multiply elements by 2
    for(int i=0; i<N; i++)
    {
        dataArray[i+local_start_offset] *= 2.0;
    }
    return true;
}

//---
CLProgramFree

Removes an OpenCL program.

```c
void CLProgramFree(
    int program // Handle to an OpenCL object
);
```

Parameters

- `program`
  - [in] Handle of the OpenCL object.

Return Value

None. In the case of an internal error the value of `_LastError` changes. For information about the error, use the `GetLastError()` function.
**CLKernelCreate**

Creates the OpenCL program kernel and returns its handle.

```c
int CLKernelCreate(
    int program,  // Handle to an OpenCL object
    const string kernel_name  // Kernel name
);
```

**Parameters**

- **program**
  - [in] Handle to an object of the OpenCL program.

- **kernel_name**
  - [in] The name of the kernel function in the appropriate OpenCL program, in which execution begins.

**Return Value**

A handle to an OpenCL object if successful. In case of error -1 is returned. For information about the error, use the `GetLastError()` function.

**Note**

At the moment, the following error codes are used:

- **ERR_OPENCL_INVALID_HANDLE** - invalid handle to OpenCL program.
- **ERR_INVALID_PARAMETER** - invalid string parameter.
- **ERR_OPENCL_TOO_LONG_KERNEL_NAME** - kernel name contains more than 127 characters.
- **ERR_OPENCL_KERNEL_CREATE** - internal error occurred while creating an OpenCL object.
CLKernelFree

Removes an OpenCL start function.

```c
void CLKernelFree(
    int kernel       // Handle to the kernel of an OpenCL program
);
```

**Parameters**

`kernel_name`

- `[in]` Handle of the kernel object.

**Return Value**

None. In the case of an internal error the value of `_LastError` changes. For information about the error, use the `GetLastError()` function.
CLSetKernelArg

Sets a parameter for the OpenCL function.

```c
bool CLSetKernelArg(
    int kernel,       // Handle to the kernel of an OpenCL program
    uint arg_index,   // The number of the argument of the OpenCL function
    void* arg_value   // Source code
);
```

Parameters

kernel

[in] Handle to a kernel of the OpenCL program.

arg_index

[in] The number of the function argument, numbering starts with zero.

arg_value

[in] The value of the function argument.

Return Value

Returns true if successful, otherwise returns false. For information about the error, use the `GetLastError()` function.

Note

At the moment, the following error codes are used:

- ERR_INVALID_PARAMETER,
- ERR_OPENCL_INVALID_HANDLE - invalid handle to the OpenCL kernel
- ERR_OPENCL_SET KERNEL PARAMETER - internal error of OpenCL.
CLSetKernelArgMem

Sets an OpenCL buffer as a parameter of the OpenCL function.

```c
bool CLSetKernelArgMem(
    int kernel, // Handle to the kernel of an OpenCL program
    uint arg_index, // The number of the argument of the OpenCL function
    int cl_mem_handle // Handle to OpenCL buffer
);
```

**Parameters**

- `kernel`  
  [in] Handle to a kernel of the OpenCL program.

- `arg_index`  
  [in] The number of the function argument, numbering starts with zero.

- `cl_mem_handle`  
  [in] A handle to an OpenCL buffer.

**Return Value**

Returns true if successful, otherwise returns false. For information about the error, use the `GetLastError()` function.
CLSetKernelArgMemLocal

Sets the local buffer as an argument of the kernel function.

```c
bool CLSetKernelArgMemLocal(
    int kernel,        // handle to a kernel of an OpenCL program
    uint arg_index,    // number of the OpenCL function argument
    ulong local_mem_size // buffer size
);
```

Parameters

- `kernel` [in] Handle to a kernel of the OpenCL program.
- `arg_index` [in] The number of the function argument, numbering starts with zero.

Return Value

Returns true if successful, otherwise returns false. For information about the error, use the `GetLastError()` function.
CLBufferCreate

Creates an OpenCL buffer and returns its handle.

```c
int CLBufferCreate(
    int context,    // Handle to an OpenCL context
    uint size,      // Buffer size
    uint flags      // Flags combination which specify properties of OpenCL buffer
);
```

**Parameters**

- `context`
  - [in] A handle to context OpenCL.

- `size`
  - [in] Buffer size in bytes.

- `flags`
  - [in] Buffer properties that are set using a combination of flags: CL_MEM_READ_WRITE, CL_MEM_WRITE_ONLY, CL_MEM_READ_ONLY, CL_MEM_ALLOC_HOST_PTR.

**Return Value**

A handle to an OpenCL buffer if successful. In case of error -1 is returned. For information about the error, use the `GetLastError()` function.

**Note**

At the moment, the following error codes are used:
- ERR_OPENCL_INVALID_HANDLE - invalid handle to OpenCL context.
- ERR_NOT_ENOUGH_MEMORY - insufficient memory.
- ERR_OPENCL_BUFFER_CREATE - internal error creating buffers.
CLBufferFree

Deletes an OpenCL buffer.

```c
void CLBufferFree(
    int  buffer  // Handle to an OpenCL buffer
);
```

**Parameters**

*buffer*

[in] A handle to an OpenCL buffer.

**Return Value**

None. In the case of an internal error the value of `_LastError` changes. For information about the error, use the `GetLastError()` function.
### CLBufferWrite

Writes into the OpenCL buffer and returns the number of written elements.

```c
uint CLBufferWrite(
    int buffer,  // A handle to the OpenCL buffer
    const void* data[],  // An array of values
    uint buffer_offset=0,  // An offset in the OpenCL buffer in bytes,
    uint data_offset=0,   // An offset in the array in elements, 0 by default
    uint data_count=WHOLE_ARRAY  // The number of values from the array for
);
```

#### Parameters

- **buffer**

- **data[]**
  - [in] An array of values that should be written in the OpenCL buffer. Passed by reference.

- **buffer_offset**
  - [in] An offset in the OpenCL buffer in bytes, from which writing begins. By default, writing starts with the very beginning of the buffer.

- **data_offset**
  - [in] The index of the first array element, starting from which values from the array are written in the OpenCL buffer. By default, values from the very beginning of the array are taken.

- **data_count**
  - [in] The number of values that should be written. All the values of the array, by default.

#### Return Value

The number of written elements. 0 is returned in case of an error. For information about the error, use the `GetLastError()` function.

#### Note

For one-dimensional arrays, the number of the element, with which reading of data for writing into an OpenCL buffer begins, is calculated taking into account the `AS_SERIES` flags.

An array of two or more dimensions is presented as one-dimensional. In this case, `data_offset` is the number of elements that should be skipped in the presentation, not the number of elements in the first dimension.
CLBufferRead

Reads an OpenCL buffer into an array and returns the number of read elements.

```c
uint CLBufferRead(
    int buffer, // A handle to the OpenCL buffer
    const void& data[], // An array of values
    uint buffer_offset=0, // An offset in the OpenCL buffer in bytes
    uint data_offset=0, // An offset in the array in elements, 0 by default
    uint data_count=WHOLE_ARRAY // The number of values from the buffer for reading
);
```

Parameters

- **buffer**

- **data[]**

- **buffer_offset**
  - [in] An offset in the OpenCL buffer in bytes, from which reading begins. By default, reading starts with the very beginning of the buffer.

- **data_offset**
  - [in] The index of the first array element for writing the values of the OpenCL buffer. By default, writing of the read values into an array starts from the zero index.

- **data_count**
  - [in] The number of values that should be read. The whole OpenCL buffer is read by default.

Return Value

The number of read elements. 0 is returned in case of an error. For information about the error, use the GetLastError() function.

Note

For one-dimensional arrays, the number of the element, into which writing of data into an OpenCL buffer begins, is calculated taking into account the AS_SERIES flags.

An array of two or more dimensions is presented as one-dimensional. In this case, **data_offset** is the number of elements that should be skipped in the presentation, not the number of elements in the first dimension.
The function runs an OpenCL program. There are 3 versions of the function:

1. Launching kernel functions using one kernel

```cpp
bool CLEExecute(
    int kernel,  // Handle to the kernel of an OpenCL program
);
```

2. Launching several kernel copies (OpenCL function) with task space description

```cpp
bool CLEExecute(
    int kernel,  // Handle to the kernel of an OpenCL program
    uint work_dim,  // Dimension of the tasks space
    const uint& global_work_offset[],  // Initial offset in the tasks space
    const uint& global_work_size[]  // Total number of tasks
);
```

3. Launching several kernel copies (OpenCL function) with task space description and specification of the size of the group’s local task subset

```cpp
bool CLEExecute(
    int kernel,  // Handle to the kernel of an OpenCL program
    uint work_dim,  // Dimension of the tasks space
    const uint& global_work_offset[],  // Initial offset in the tasks space
    const uint& global_work_size[],  // Total number of tasks
    const uint& local_work_size[]  // Number of tasks in the local group
);
```

**Parameters**

- `kernel`  
  [in] Handle to the OpenCL kernel.

- `work_dim`  
  [in] Dimension of the tasks space.

- `global_work_offset[]`  
  [in] Initial offset in the tasks space.

- `global_work_size[]`  
  [in] The size of a subset of tasks.

- `local_work_size[]`  
  [in] The size of the group’s local task subset.

**Return Value**

Returns true if successful, otherwise returns false. For information about the error, use the `GetLastError()` function.

**Note**
Consider the use of the parameters in the following example:

- `work_dim` specifies the size of `work_items[]` array that describes the tasks. If `work_dim=3`, three-dimensional array `work_items[N1, N2, N3]` is used.
- `global_work_size[]` contains the values that set the `work_items[]` array size. If `work_dim=3`, `global_work_size[3]` array can be `{40, 100, 320}`. Then we have `work_items[40, 100, 320]`. So, the total number of tasks is `40 x 100 x 320 = 1 280 000`.
- `local_work_size[]` sets the subset of the tasks that will be executed by the specified kernel of OpenCL program. Its size is equal to `work_items[]` size and allows to split the common task subset into smaller subsets without loss of remainder in division. In fact, the size of `local_work_size[]` array should be selected so that the `work_items[]` global task set will be split into smaller subsets. In this example `local_work_size[3]=\{10, 10, 10\}` will be OK, as `work_items[40, 100, 320]` can be gathered from `local_items[10, 10, 10]` array without division remainder.
**CLEExecutionStatus**

**Description**

Returns the OpenCL program execution status.

```c
int CLEExecutionStatus(
    int kernel // handle to a kernel of an OpenCL program
);
```

**Parameters**

- `kernel`  
  - `[in]` Handle to a kernel of the OpenCL program.

**Return Value**

Returns the OpenCL program status. The value can be one of the following:

- **CL_COMPLETE=0** - program complete,
- **CL_RUNNING=1** - running,
- **CL_SUBMITTED=2** - submitted for execution,
- **CL_QUEUED=3** - queued,
- `\text{-1}` (minus one) - error occurred when executing CLEExecutionStatus().
MetaTrader integration with third-party programs

MQL5 is designed for the development of high-performance trading applications in the financial markets and is unparalleled among other specialized languages used in the algorithmic trading. The syntax and speed of MQL5 programs are as close to C++ as possible, there is support for OpenCL and integration with MS Visual Studio. Statistics, fuzzy logic and ALGLIB libraries are available as well. MetaEditor development environment features native support for .NET libraries with “smart” functions import eliminating the need to develop special wrappers. Third-party C++ DLLs can also be used. C++ source code files (CPP and H) can be edited and compiled into DLL directly from the editor. Microsoft Visual Studio installed on user’s PC can be used for that.

In addition to all the above advantages, the MetaTrader 5 platform provides MQL5 developers with the ability to integrate with other popular solutions for processing financial data. This allows specialists in statistics and machine learning to receive data directly from MetaTrader 5 without developing additional programs and adapters.

The following MetaTrader 5 integration solutions are described in this section:

- **MetaTrader for Python** - module for working with Python programs.

The presented functions allow connecting directly to the MetaTrader 5 terminal and requesting a price history in the required amount and form for any financial instruments available in the platform.
MetaTrader module for integration with Python

Python is a modern high-level programming language for developing scripts and applications. It contains multiple libraries for machine learning, process automation, as well as data analysis and visualization.

MetaTrader package for Python is designed for convenient and fast obtaining of exchange data via interprocessor communication directly from the MetaTrader 5 terminal. The data received this way can be further used for statistical calculations and machine learning.

Functions for integrating MetaTrader 5 and Python

Example of connecting Python to MetaTrader 5

1. Download the latest version of Python 3.7 from [https://www.python.org/downloads/windows](https://www.python.org/downloads/windows)
2. When installing Python, check "Add Python 3.7 to PATH%" to be able to run Python scripts from the command line.
3. Install the MetaTrader 5 module from the command line
   ```bash
   pip install MetaTrader5
   ```
4. Add matplotlib and pytz packages
   ```bash
   pip install matplotlib
   pip install pytz
   ```

© 2000-2019, MetaQuotes Software Corp.
5. Launch the test script

```python
from datetime import datetime
from MetaTrader5 import *
from pytz import timezone
import matplotlib.pyplot as plt
utc_tz = timezone('UTC')

# connect to MetaTrader 5
MT5Initialize()
# wait till MetaTrader 5 establishes connection to the trade server and synchronize
MT5WaitForTerminal()

# request connection status and parameters
print(MT5TerminalInfo())
# get data on MetaTrader 5 version
print(MT5Version())

# request 1000 ticks from EURAUD
euraud_ticks = MTSCopyTicksFrom("EURAUD", datetime(2019,4,1,0), 1000, MT5_COPY_TICK)
# request ticks from AUDUSD within 2019.04.01 13:00 - 2019.04.02 13:00
audusd_ticks = MTSCopyTicksRange("AUDUSD", datetime(2019,4,1,13), datetime(2019,4,2), 4, 1000)
# get bars from different symbols in a number of ways
eurusd_rates = MTSCopyRatesFrom("EURUSD", MT5_TIMEFRAME_M1, datetime(2019,4,5,15),
eurrub_rates = MTSCopyRatesFromPos("EURRUB", MT5_TIMEFRAME_M1, 0, 1000)
eurjpy_rates = MTSCopyRatesRange("EURJPY", MT5_TIMEFRAME_M1, datetime(2019,4,1,13),

# shut down connection to MetaTrader 5

**MT5Initialize**

Establish a connection with the MetaTrader 5 terminal.

```
MT5Initialize{
    path=None // path to the MetaTrader 5 terminal EXE file
}
```

**Parameters**

`path=None`

[in] Path to the metatrader.exe or metatrader64.exe file. If the path is not specified, the module attempts to find the executable file on its own.

**Return Value**

Returns True in case of successful connection to the MetaTrader 5 terminal, otherwise - False.

**Note**

If required, the MetaTrader 5 terminal is launched to establish connection when executing the `MT5Initialize()` call.

**Example:**

```python
from datetime import datetime
from MetaTrader5 import *

# connect to MetaTrader 5
MT5Initialize()

# wait till MetaTrader 5 connects to the trade server
MT5WaitForTerminal()

# display data on connection status, server name and trading account
print(MT5TerminalInfo())

# display data on MetaTrader 5 version
print(MT5Version())

# shut down connection to the MetaTrader 5 terminal
MT5Shutdown()
```

**See also**

`MT5Shutdown, MT5WaitForTerminal, MT5TerminalInfo, MT5Version`
**MT5Shutdown**

Close the previously established connection to the MetaTrader 5 terminal.

```
MT5Shutdown()
```

**Return Value**

None.

**Example:**

```python
from datetime import datetime
from MetaTrader5 import *

# connect to MetaTrader 5
MT5Initialize()
# wait till MetaTrader 5 connects to the trade server
MT5WaitForTerminal()
# display data on connection status, server name and trading account
print(MT5TerminalInfo())
# display data on MetaTrader 5 version
print(MT5Version())
# shut down connection to the MetaTrader 5 terminal
MT5Shutdown()
```

**See also**

*MT5Initialize, MT5WaitForTerminal, MT5TerminalInfo, MT5Version*
**MT5TerminalInfo**

Get status and parameters of the connected MetaTrader 5 terminal.

```python
MT5TerminalInfo()
```

**Return Value**

Returns connection status, trade server name and trading account number.

**Note**

The value is returned as a tuple of three values:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Sample value</th>
</tr>
</thead>
<tbody>
<tr>
<td>integer</td>
<td>Connection status to the trade server: 0 - no connection, 1 - the terminal has connected, but the trading environment has not yet been synchronized, 2 - the terminal has connected to the trade server</td>
<td>2</td>
</tr>
<tr>
<td>string</td>
<td>Trade server name</td>
<td>'MetaQuotes-Demo'</td>
</tr>
<tr>
<td>string</td>
<td>Trading account (login) index</td>
<td>'15185779'</td>
</tr>
</tbody>
</table>

**Example:**

```python
from datetime import datetime
from MetaTrader5 import *

# connect to MetaTrader 5
MT5Initialize()

# wait till MetaTrader 5 connects to the trade server
MT5WaitForTerminal()

# display data on connection status, server name and trading account
print(MT5TerminalInfo())

# display data on MetaTrader 5 version
print(MT5Version())

# shut down connection to the MetaTrader 5 terminal
MT5Shutdown()
```

Result:

```python
[2, 'MetaQuotes-Demo', '15185779']
```
>>> MT5Shutdown()
True

See also

MT5Initialize, MT5WaitForTerminal, MT5Shutdown, MT5Version
**MT5Version**

Return the MetaTrader 5 terminal version.

```
MT5Version()
```

**Return Value**

Returns the MetaTrader 5 terminal version, build and release date.

**Note**

The MT5Version() function returns connection status, trade server address and trading account number as a tuple.

The value is returned as a tuple of three values:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Sample value</th>
</tr>
</thead>
<tbody>
<tr>
<td>integer</td>
<td>MetaTrader 5 terminal version</td>
<td>500</td>
</tr>
<tr>
<td>string</td>
<td>Build</td>
<td>'2007'</td>
</tr>
<tr>
<td>string</td>
<td>Build release date</td>
<td>'25 Feb 2019'</td>
</tr>
</tbody>
</table>

**Example:**

```python
from datetime import datetime
from MetaTrader5 import *

# connect to MetaTrader 5
MT5Initialize()

# wait till MetaTrader 5 connects to the trade server
MT5WaitForTerminal()

# display data on connection status, server name and trading account
print(MT5TerminalInfo())

# display data on MetaTrader 5 version
print(MT5Version())

# shut down connection to the MetaTrader 5 terminal
MT5Shutdown()
```

Result:

```python
>>> from datetime import datetime
>>> from MetaTrader5 import *
>>> MT5Initialize()
True
>>> MT5WaitForTerminal()
True
>>> print(MT5TerminalInfo())
[2, 'MetaQuotes-Demo', '16167573']
>>> print(MT5Version())
>>> MT5Shutdown()
True
```

**See also**
MT5Initialize, MT5WaitForTerminal, MT5Shutdown, MT5TerminalInfo
**MT5WaitForTerminal**

Wait till the MetaTrader 5 terminal connects to the trade server.

```python
MT5WaitForTerminal()
```

**Return Value**

Returns True if the MetaTrader 5 terminal successfully connects to the trading server, otherwise False.

**Note**

The MT5Version() function returns connection status, trade server address and trading account number as a tuple.

The waiting time is 1 minute. MT5TerminalInfo() should be called to check the connection status after MT5WaitForTerminal().

**Example:**

```python
from datetime import datetime
from MetaTrader5 import *

# connect to MetaTrader 5
MT5Initialize()
# wait till MetaTrader 5 connects to the trade server
MT5WaitForTerminal()
# display data on connection status, server name and trading account
print(MT5TerminalInfo())
# display data on MetaTrader 5 version
print(MT5Version())
# shut down connection to the MetaTrader 5 terminal
MT5Shutdown()
```

**See also**

MT5Initialize, MT5TerminalInfo, MT5Version, MT5Shutdown
MT5CopyRatesFrom

Get bars from the MetaTrader 5 terminal starting from the specified date.

```c
MT5CopyRatesFrom(
    symbol,    // symbol name
    timeframe, // timeframe
    from,      // initial bar open date
    count      // number of bars
)
```

Parameters

- **symbol**
  - [in] Financial instrument name, for example, "EURUSD".
- **timeframe**
  - [in] Timeframe the bars are requested for. Set by a value from the `MT5_TIMEFRAME` enumeration.
- **from**
  - [in] Date of opening of the first bar from the requested sample. Set by the 'datetime' object or as a number of seconds elapsed since 1970.01.01.
- **count**
  - [in] Number of bars to receive.

Return Value

Returns bars as tuples (time, open, high, low, close, tick_volume, spread, real_volume).

Note

See the `CopyRates()` function for more information.

When creating the 'datetime' object, Python uses the local time zone, while MetaTrader 5 stores tick and bar open time in UTC time zone (without the shift). Therefore, 'datetime' should be created in UTC time for executing functions that use time. The data obtained from MetaTrader 5 have UTC time, but Python applies the local time shift again when trying to print them. Thus, the obtained data should also be corrected for visual presentation.

`MT5_TIMEFRAME` is an enumeration with possible chart period values

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>

</tbody>
</table>

Example:

```python
from datetime import datetime
from MetaTrader5 import *
import pandas as pd
pd.set_option('display.max_columns', 500)  # number of columns to be displayed
pd.set_option('display.width', 1500)       # max table width to display
import pytz  # import pytz module for working with time zone
```
# connect to MetaTrader 5
MT5Initialize()
# wait till MetaTrader 5 connects to the trade server
MT5WaitForTerminal()

# set time zone to UTC
timezone = pytz.timezone("Etc/UTC")
# create 'datetime' object in UTC time zone to avoid the implementation of a local time
time_from = datetime(2019, 4, 5, tzinfo=timezone)
# get 10 EURUSD H4 bars starting from 01.04.2019 in UTC time zone
rates = MTSCopyRatesFrom("EURUSD", MT5_TIMEFRAME_H4, utc_from, 10)

# shut down connection to MetaTrader 5
MT5Shutdown()
# display each element of obtained data in a new line
print("Display obtained data 'as is'")
for rate in rates:
    print(rate)

# create DataFrame out of the obtained data
rates_frame = pd.DataFrame(list(rates),
                           columns=['time', 'open', 'low', 'high', 'close', 'tick_volume', 'spread', 'real_volume'])
# display data
print("Display dataframe with data")
print(rates_frame)  # we can see that Python provides bars open time in the local time

# get a UTC time offset for the local PC
UTC_OFFSET_TIMEDELTA = datetime.utcnow() - datetime.now()

# create a simple function correcting the offset head-on
def local_to_utc(dt):
    return dt + UTC_OFFSET_TIMEDELTA

# apply the offset for the 'time' column in the rates_frame dataframe
rates_frame['time'] = rates_frame.apply(lambda rate: local_to_utc(rate['time']), axis=1)

# display the data once again and make sure the H4 candles open time is now multiple of 4
print("Display the dataframe after adjusting the time")
print(rates_frame)

Result:
Display obtained data 'as is'

See also

CopyRates, MT5CopyRatesFromPos, MT5CopyRatesRange, MT5CopyTicksFrom, MT5CopyTicksRange
**MT5CopyRatesFromPos**

Get bars from the MetaTrader 5 terminal starting from the specified index.

```mql
MT5CopyRatesFromPos(
    symbol,       // symbol name
    timeframe,    // timeframe
    start_pos,    // initial bar index
    count         // number of bars
)
```

**Parameters**

- **symbol**
  - [in] Financial instrument name, for example, "EURUSD".

- **timeframe**
  - [in] Timeframe the bars are requested for. Set by a value from the `MT5_TIMEFRAME` enumeration.

- **start_pos**
  - [in] Initial index of the bar the data are requested from. The numbering of bars goes from present to past. Thus, the zero bar means the current one.

- **count**
  - [in] Number of bars to receive.

**Return Value**

Returns bars as tuples: `(time, open, high, low, close, tick_volume, spread, real_volume)`.

**Note**

See the `CopyRates()` function for more information.

**Example:**

```mql
from datetime import datetime
from MetaTrader5 import *
```
# import the pandas module for displaying data obtained in the tabular form
import pandas as pd

pd.set_option('display.max_columns', 500)  # number of columns to be displayed
pd.set_option('display.width', 1500)       # max table width to display

# set connection to MetaTrader 5
MT5Initialize()

# wait till MetaTrader 5 connects to trade server

**MT5CopyRatesRange**

Get bars in the specified date range from the MetaTrader 5 terminal.

```plaintext
MT5CopyRatesRange(
    symbol,       // symbol name
    timeframe,    // timeframe
    date_from,    // date the bars are requested from
    date_to       // date, up to which the bars are requested
)
```

**Parameters**

- **symbol**
  
  [in] Financial instrument name, for example, "EURUSD".

- **timeframe**
  
  [in] Timeframe the bars are requested for. Set by a value from the `MT5_TIMEFRAME` enumeration.

- **date_from**
  
  [in] Date the bars are requested from. Set by the `datetime` object or as a number of seconds elapsed since 1970.01.01. Bars with the open time >= date_from are returned.

- **date_to**
  
  [in] Date, up to which the bars are requested. Set by the `datetime` object or as a number of seconds elapsed since 1970.01.01. Bars with the open time <= date_to are returned.

**Return Value**

Returns bars as tuples (time, open, high, low, close, tick_volume, spread, real_volume).

**Note**

See the [CopyRates()] function for more information.

When creating the `datetime` object, Python uses the local time zone, while MetaTrader 5 stores tick and bar open time in UTC time zone (without the shift). Therefore, `datetime` should be created in UTC time for executing functions that use time. The data obtained from MetaTrader 5 have UTC time, but Python applies the local time shift again when trying to print them. Thus, the obtained data should also be corrected for visual presentation.

**Example:**

```python
from datetime import datetime
from MetaTrader5 import *

# import the pandas module for displaying data obtained in the tabular form
import pandas as pd

pd.set_option('display.max_columns', 500)  # number of columns to be displayed
pd.set_option('display.width', 1500)       # max table width to display
```
Integration

```python
# connect to MetaTrader 5
MT5Initialize()
# wait till MetaTrader 5 connects to trade server
MT5WaitForTerminal()

# set time zone to UTC
timezone = pytz.timezone("Etc/UTC")
# create 'datetime' objects in UTC time zone to avoid the implementation of a local time
utc_from = datetime(2019, 4, 5, tzinfo=timezone)
utc_to = datetime(2019, 4, 5, hour = 13, tzinfo=timezone)
# get 10 EURPLN M5 bars starting from 01.04.2019 in UTC time zone
rates = MTSCopyRatesFrom("EURPLN", MT5_TIMEFRAME_M5, utc_from, utc_to)

# shut down connection to MetaTrader 5
MT5Shutdown()

# display each element of obtained data in a new line
print("Display obtained data 'as is'")
for rate in rates:
    print(rate)

# create DataFrame out of the obtained data
rates_frame = pd.DataFrame(list(rates),
                        columns=['time', 'open', 'low', 'high', 'close', 'tick_volume', 'spread', 'real_volume'])
print("Display dataframe with data")
print(rates_frame)  # we can see that Python provides the bar open time in a local time

# get UTC offset for the local PC
UTC_OFFSET_TIMEDELTA = datetime.utcnow() - datetime.now()

# create a simple function correcting the offset head-on
def local_to_utc(dt):
    return dt + UTC_OFFSET_TIMEDELTA

# apply the offset for the 'time' column in the rates_frame dataframe
rates_frame['time'] = rates_frame.apply(lambda rate: local_to_utc(rate['time']), axis=1)

# display the data once again and make sure the open time has changed
print("Display dataframe after correcting time")
print(rates_frame)
```

Result:
Display obtained data 'as is'

CopyRates, MT5CopyRatesFrom, MT5CopyRatesRange, MT5CopyTicksFrom, MT5CopyTicksRange
MT5CopyTicksFrom

Get ticks from the MetaTrader 5 terminal starting from the specified date.

```cpp
MT5CopyTicksFrom(
    symbol,  // symbol name
    from,    // date the ticks are requested from
    count,   // number of requested ticks
    flags,   // combination of flags defining the type of requested ticks
)
```

**Parameters**

- **symbol**
  - [in] Financial instrument name, for example, "EURUSD".

- **from**
  - [in] Date the ticks are requested from. Set by the 'datetime' object or as a number of seconds elapsed since 1970.01.01.

- **count**
  - [in] Number of ticks to receive.

- **flags**
  - [in] A flag to define the type of the requested ticks. **MT5_COPY_TICKS_INFO** - ticks with Bid and/or Ask price changes, **MT5_COPY_TICKS_TRADE** - ticks with changes in Last and Volume, **MT5_COPY_TICKS_ALL** - all ticks. Flag values are described in the **MT5_COPY_TICKS** enumeration.

**Return Value**

Returns ticks in the form of tuples (time, bid, ask, last, flags). In the tuple, the flags variable can be a combination of flags from the **MT5_TICK_FLAG** enumeration.

**Note**

See the CopyTicks function for more information.

When creating the 'datetime' object, Python uses the local time zone, while MetaTrader 5 stores tick and bar open time in UTC time zone (without the shift). Therefore, 'datetime' should be created in UTC time for executing functions that use time. The data obtained from MetaTrader 5 have UTC time, but Python applies the local time shift again when trying to print them. Thus, the obtained data should also be corrected for visual presentation.

**MT5_COPY_TICKS** defines the types of ticks that can be requested using the **MT5CopyTicksFrom()** and **MT5CopyTicksRange()** functions.

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MT5_COPY_TICKS_ALL</td>
<td>all ticks</td>
</tr>
<tr>
<td>MT5_COPY_TICKS_INFO</td>
<td>ticks containing Bid and/or Ask price changes</td>
</tr>
<tr>
<td>MT5_COPY_TICKS_TRADE</td>
<td>ticks containing Last and/or Volume price changes</td>
</tr>
</tbody>
</table>
MT5_TICK_FLAG defines possible flags for ticks. These flags are used to describe ticks obtained by the MT5CopyTicksFrom() and MT5CopyTicksRange() functions.

<table>
<thead>

</tbody>
</table>

Example:

```python
from datetime import datetime
from MetaTrader5 import *

# import the pandas module for displaying obtained data in the tabular form
import pandas as pd

# number of columns to be displayed
pd.set_option('display.max_columns', 500)

# max table width to display
pd.set_option('display.width', 1500)

# connect to MetaTrader 5
MT5Initialize()

# set time zone to UTC
timezone = pytz.timezone("Etc/UTC")

# create 'datetime' object in UTC time zone to avoid the implementation of a local time
utc_from = datetime(2019, 4, 1, tzinfo=timezone)

# request 100 000 EURUSD ticks from 01.04.2019 in UTC time zone
ticks = MT5CopyTicksFrom("EURUSD", utc_from, 100000, MT5_COPY_TICKS_ALL)
print("Ticks received:" , len(ticks))

# shut down connection to MetaTrader 5
MT5Shutdown()

# display data on each tick in a new line
for tick in ticks:
    print(tick)
    if(count >= 10):
        break

# create DataFrame out of the obtained data
ticks_frame = pd.DataFrame(list(ticks),
```

© 2000-2019, MetaQuotes Software Corp.
# display data
print("\nDisplay dataframe with ticks")
print(ticks_frame.head(10))  # we can see that Python provides ticks time in the local time zone with an offset

# get a UTC time offset for a local PC
UTC_OFFSET_TIMEDELTA = datetime.utcnow() - datetime.now()

# create a simple function correcting the offset head-on
def local_to_utc(dt):
    return dt + UTC_OFFSET_TIMEDELTA

# apply the offset for the 'time' column in the ticks_frame dataframe
ticks_frame['time'] = ticks_frame.apply(lambda tick: local_to_utc(tick['time']), axis=1)

# display the data once again and make sure the tick time changed
print("\nDisplay the dataframe with ticks after adjusting the time")
print(ticks_frame.head(10))

Result:
Ticks received: 100 000
Display obtained ticks 'as is'
MT5Tick(time=datetime.datetime(2019, 4, 1, 3, 2, 5, 745000), bid=1.12258, ask=1.12339, last=0.0, volume=0.0, flags=134)

**MT5CopyTicksRange**

Get ticks for the specified date range from the MetaTrader 5 terminal.

```csharp
MT5CopyTicksRange(
    symbol,        // symbol name
    from,          // date the ticks are requested from
    to,            // date, up to which the ticks are requested
    flags          // combination of flags defining the type of requested ticks
)
```

**Parameters**

- **symbol**
  
  [in] Financial instrument name, for example, "EURUSD".

- **from**
  
  [in] Date the ticks are requested from. Set by the 'datetime' object or as a number of seconds elapsed since 1970.01.01.

- **to**
  
  [in] Date, up to which the ticks are requested. Set by the 'datetime' object or as a number of seconds elapsed since 1970.01.01.

- **flags**
  
  [in] A flag to define the type of the requested ticks. `MT5_COPY_TICKS_INFO` - ticks with Bid and/or Ask changes, `MT5_COPY_TICKS_TRADE` - ticks with changes in Last and Volume, `MT5_COPY_TICKS_ALL` - all ticks. Flag values are described in the `MT5_COPY_TICKS` enumeration.

**Return Value**

Returns ticks in the form of tuples (time, bid, ask, last, flags). In the tuple, the flags variable can be a combination of flags from the `MT5_TICK_FLAG` enumeration.

**Note**

See the CopyTicks function for more information.

When creating the 'datetime' object, Python uses the local time zone, while MetaTrader 5 stores tick and bar open time in UTC time zone (without the shift). Therefore, 'datetime' should be created in UTC time for executing functions that use time. The data obtained from MetaTrader 5 have UTC time, but Python applies the local time shift again when trying to print them. Thus, the obtained data should also be corrected for visual presentation.

**Example:**

```python
from datetime import datetime
from MetaTrader5 import *
# import the pandas module for displaying obtained data in the tabular form
import pandas as pd
pd.set_option('display.max_columns', 500)  # number of columns to be displayed
pd.set_option('display.width', 1500)       # max table width to display
# import pytz module for working with time zone
import pytz
```
```python
# connect to MetaTrader 5
MT5Initialize()
# wait till MetaTrader 5 connects to the trade server
MT5WaitForTerminal()

# set time zone to UTC
timezone = pytz.timezone("Etc/UTC")
# create 'datetime' objects in UTC time zone to avoid the implementation of a local time
utc_from = datetime(2019, 4, 1, tzinfo=timezone)
utc_to = datetime(2019, 4, 5, tzinfo=timezone)
# request AUDUSD ticks within 01.04.2019 - 05.04.2019
ticks = MT5CopyTicksFrom("EURUSD", utc_from, utc_to, MT5_COPY_TICKS_ALL)
print("Ticks received:" , len(ticks))

# shut down connection to MetaTrader 5
MT5Shutdown()
# display data on each tick in a new line
print("Display obtained ticks 'as is'")
count = 0
for tick in ticks:
    print(tick)
    if(count >= 10):
        break

# create DataFrame out of the obtained data
ticks_frame = pd.DataFrame(list(ticks),
                           columns=['time', 'bid', 'ask', 'last', 'volume', 'flags'])

# display data
print("Display dataframe with ticks")
print(ticks_frame.head(10))  # we can see that Python provides ticks time in the local time

# get a UTC time offset for a local PC
UTC_OFFSET_TIMEDISETA = datetime.utcnow() - datetime.now()

# create a simple function correcting the offset head-on
def local_to_utc(dt):
    return dt + UTC_OFFSET_TIMEDISETA

# apply the offset for the 'time' column in the ticks_frame dataframe
ticks_frame['time'] = ticks_frame.apply(lambda tick: local_to_utc(tick['time']), axis=1)

# display the data once again and make sure the tick time changed
print("Display the dataframe with ticks after adjusting the time")
print(ticks_frame.head(10))

Result:
Ticks received: 243374
Display obtained ticks 'as is'
MT5Tick(time=datetime.datetime(2019, 4, 1, 3, 2, 2, 759000), bid=0.71155, ask=0.71223,

Standard Library

This group of chapters contains the technical details of the MQL5 Standard Library and descriptions of all its key components.

MQL5 Standard Library is written in MQL5 and is designed to facilitate writing programs (indicators, scripts, experts) for end users. Library provides convenient access to the most of the internal MQL5 functions.

MQL5 Standard Library is placed in the working directory of the terminal in the 'Include' folder.

Multiple libraries are provided to perform calculations in various areas of mathematics:

- **Statistics** - functions for working with various distributions of the Probability theory
- **Fuzzy logic** - library that implements Mamdani and Sugeno fuzzy inference systems
- **ALGLIB** - data analysis (clustering, decision trees, linear regression, neural networks), solving differential equations, Fourier transform, numerical integration, optimization problems, statistical analysis, and more.
Statistics

The Statistical Library provides a convenient way of working with the basic statistical distributions.

The library provides 5 functions for each distribution:

1. Calculation of probability density - functions of the form MathProbabilityDensityX()
2. Calculation of probabilities - functions of the form MathCumulativeDistributionX()
3. Calculation of distribution quantiles - functions of the form MathQuantileX()
4. Generation of random numbers with the specified distribution - functions of the form MathRandomX()
5. Calculation of the theoretical moments of the distributions - functions of the form MathMomentsX()

In addition to calculation of values for the individual random variables, the library also provides overloads for the functions, which perform the same calculations for arrays.

- Statistical Characteristics
- Normal Distribution
- Log-normal distribution
- Beta distribution
- Noncentral beta distribution
- Gamma distribution
- Chi-squared distribution
- Noncentral chi-squared distribution
- Exponential distribution
- F-distribution
- Noncentral F-distribution
- t-distribution
- Noncentral t-distribution
- Logistic distribution
- Cauchy distribution
- Uniform distribution
- Weibull distribution
- Binomial distribution
- Negative binomial distribution
- Geometric distribution
- Hypergeometric distribution
- Poisson distribution
- Subfunctions

}
```

Statistical Characteristics

This group of functions calculates the Statistical Characteristics of the array elements:

- mean,
- variance,
- skewness,
- kurtosis,
- median,
- root-mean-square and
- standard deviation.

</tbody>
</table>
MathMean

Calculates the mean (first moment) of array elements. Analog of the `mean()` in R.

```c
double MathMean(
    const double& array[] // array with data
);
```

Parameters

- **array**
  - [in] Array with data for calculation of the mean.
- **start=0**
  - [in] Initial index for calculation.
- **count=WHOLE_ARRAY**
  - [in] The number of elements for calculation.

Return Value

The mean of array elements. In case of error it returns NaN (not a number).
MathVariance

Calculates the variance (second moment) of array elements. Analog of the \texttt{var()} in R.

\begin{verbatim}
double MathVariance(
    const double& array[] // array with data
);
\end{verbatim}

Parameters

array

start=0
  [in] Initial index for calculation.

count=WHOLE_ARRAY
  [in] The number of elements for calculation.

Return Value

Variance of array elements. In case of error it returns \texttt{NaN} (not a number).
MathSkewness

Calculates the skewness (third moment) of array elements. Analog of the \texttt{skewness()} in R (e1071 library).

\begin{verbatim}
double MathSkewness(
    const double& array[] // array with data
);
\end{verbatim}

Parameters

\texttt{array}

\texttt{start=0}

[in] Initial index for calculation.

\texttt{count=WHOLE ARRAY}

[in] The number of elements for calculation.

Return Value

Skewness of array elements. In case of error it returns \texttt{NaN} (not a number).
MathKurtosis

Calculates the kurtosis (fourth moment) of array elements. Analog of the kurtosis() in R (e1071 library).

```c
double MathKurtosis(
    const double& array[]                          // array with data
);
```

Parameters

array

start=0
  [in] Initial index for calculation.

count=WHOLE_ARRAY
  [in] The number of elements for calculation.

Return Value

Kurtosis of array elements. In case of error it returns NaN (not a number).

Disclaimer

Calculation of the kurtosis is performed using the excess kurtosis around the normal distribution (excess kurtosis=kurtosis-3), i.e. the excess kurtosis of a normal distribution is zero.

It is positive if the peak of the distribution around the expected value is sharp, and negative if the peak is flat.
MathMoments

Calculates the first 4 moments (mean, variance, skewness, kurtosis) of array elements.

```c
double MathMoments(
    const double& array[], // array with data
    double& mean, // mean (1st moment)
    double& variance, // variance (2nd moment)
    double& skewness, // skewness (3rd moment)
    double& kurtosis, // kurtosis (4th moment)
    const int start=0, // initial index
    const int count=WHOLE_ARRAY // the number of elements
);
```

Parameters

- **array**
  - 

- **mean**
  - 
    [out] Variable for the mean (1st moment)

- **variance**
  - 
    [out] Variable for the variance (2nd moment)

- **skewness**
  - 
    [out] Variable for the skewness (3rd moment)

- **kurtosis**
  - 
    [out] Variable for the kurtosis (4th moment)

- **start=0**
  - 
    [in] Initial index for calculation.

- **count=WHOLE_ARRAY**
  - 
    [in] The number of elements for calculation.

Return Value

Returns true if the moments have been calculated successfully, otherwise false.

Disclaimer

Calculation of the kurtosis is performed using the excess kurtosis around the normal distribution (excess kurtosis=kurtosis-3), i.e. the excess kurtosis of a normal distribution is zero.

It is positive if the peak of the distribution around the expected value is sharp, and negative if the peak is flat.
MathMedian

Calculates the median value of array elements. Analog of the `median()` in R.

```cpp
double MathMedian(
    const double& array[] // array with data
);
```

**Parameters**

- `array`
  - [in] Array with data for calculation.

- `start=0`
  - [in] Initial index for calculation.

- `count=WHOLE_ARRAY`
  - [in] The number of elements for calculation.

**Return Value**

The median value of array elements. In case of error it returns `NaN` (not a number).
MathStandardDeviation

Calculates the standard deviation of array elements. Analog of the `sd()` in R.

```c
double MathStandardDeviation(
    const double& array[]); // array with data
```

**Parameters**

- `array`
  - [in] Array with data for calculation.

- `start`=0
  - [in] Initial index for calculation.

- `count`=WHOLE_ARRAY
  - [in] The number of elements for calculation.

**Return Value**

The standard deviation of array elements. In case of error it returns NaN (not a number).
**MathAverageDeviation**

Calculates the average absolute deviation of array elements. Analog of the `aad()` in R.

```cpp
double MathAverageDeviation(
    const double& array[] // array with data
);
```

**Parameters**

- **array**
  - [in] Array with data for calculation.

- **start=0**
  - [in] Initial index for calculation.

- **count=WHOLE_ARRAY**
  - [in] The number of elements for calculation.

**Return Value**

The average absolute deviation of array elements. In case of error it returns `NaN` (not a number).
Normal Distribution

This section contains functions for working with normal distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the normal law. The distribution is defined by the following formula:

\[ f_{\text{Normal}}(x \mid \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}} \]

where:
- \( x \) — value of the random variable
- \( \mu \) — expected value
- \( \sigma \) — root-mean-square deviation

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MathProbabilityDensityNormal</td>
<td>Calculates the probability density function of the normal distribution</td>
</tr>

<td>Generates a pseudorandom variable/array of pseudorandom variables distributed according to the normal law</td>
</tr>
</tbody>
</table>
**MathMomentsNormal**

Calculates the theoretical numerical values of the first 4 moments of the normal distribution

---

**Example:**

```csharp
#include <Graphics\Graphic.mqh>
#include <Math\Stat\Normal.mqh>

}
MathProbabilityDensityNormal

Calculates the value of the probability density function of normal distribution with the mu and sigma parameters for a random variable x. In case of error it returns NaN.

```c
double MathProbabilityDensityNormal(
    const double x, // value of random variable
    const double mu, // mean parameter of the distribution (expected value
    const double sigma, // sigma parameter of the distribution (root-mean-square deviation)
    const bool log_mode, // calculate the logarithm of the value
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability density function of normal distribution with the mu and sigma parameters for an array of random variables x[]. In case of error it returns NaN.

```c
bool MathProbabilityDensityNormal(
    const double& x[], // array with the values of random variable
    const double mu, // mean parameter of the distribution (expected value
    const double sigma, // sigma parameter of the distribution (root-mean-square deviation)
    const bool log_mode, // calculate the logarithm of the value
    double& result[] // array for values of the probability density function
);
```

Calculates the value of the probability density function of normal distribution with the mu and sigma parameters for an array of random variables x[]. In case of error it returns false.

```c
bool MathProbabilityDensityNormal(
    const double& x[], // array with the values of random variable
    const double mu, // mean parameter of the distribution (expected value
    const double sigma, // sigma parameter of the distribution (root-mean-square deviation)
    double& result[] // array for values of the probability density function
);
```

**Parameters**

x

x[]
[in] Array with the values of random variable.

\( \mu \)

[in] mean parameter of the distribution (expected value).

\( \sigma \)

[in] sigma parameter of the distribution (root-mean-square deviation).

log_mode

[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

error_code

[out] Variable to get the error code.

result[]

[out] Array to obtain the values of the probability density function.
MathCumulativeDistributionNormal

Calculates the value of the normal distribution function with the mu and sigma parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionNormal(
    const double x,               // value of random variable
    const double mu,              // expected value
    const double sigma,           // root-mean-square deviation
    const bool tail,              // flag for calculation of tail
    const bool log_mode,          // calculate the logarithm of the value
    int& error_code              // variable to store the error code
);
```

Calculates the value of the normal distribution function with the mu and sigma parameters for an array of random variables `x[]`. In case of error it returns false. Analog of the `dnorm()` in R.

```cpp
bool MathCumulativeDistributionNormal(
    const double& x[],           // array with the values of random variable
    const double mu,              // expected value
    const double sigma,           // root-mean-square deviation
    const bool tail,              // flag for calculation of tail
    const bool log_mode,          // calculate the logarithm of the value
    double& result[]             // array for values of the probability function
);
```

Calculates the value of the normal distribution function with the mu and sigma parameters for an array of random variables `x[]`. In case of error it returns false.

```cpp
bool MathCumulativeDistributionNormal(
    const double& x[],           // array with the values of random variable
    const double mu,              // expected value
    const double sigma,           // root-mean-square deviation
    double& result[]             // array for values of the probability function
);
```

**Parameters**

- `x`  
  
- `x[]`
[in] Array with the values of random variable.

mu

[in] mean parameter of the distribution (expected value).

sigma

[in] sigma parameter of the distribution (root-mean-square deviation).

tail

[in] Flag of calculation. If tail=true, then the probability of random variable not exceeding x is calculated.

log_mode

[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

error_code

[out] Variable to get the error code.

result[]

[out] Array to obtain the values of the probability function.
MathQuantileNormal

For the specified probability, the function calculates the value of inverse normal distribution function with the mu and sigma parameters. In case of error it returns NaN.

```cpp
double MathQuantileNormal(
    const double probability,  // probability value of random variable
    const double mu,          // expected value
    const double sigma,        // root-mean-square deviation
    const bool tail,           // flag for calculation of tail
    const bool log_mode,       // calculate the logarithm of the value
    int& error_code            // variable to store the error code
);
```

For the specified probability array of probability values, the function calculates the values of inverse normal distribution function with the mu and sigma parameters. In case of error it returns false. Analog of the `qnorm()` in R.

```cpp
bool MathQuantileNormal(
    const double& probability[],  // array with probability values of random variable
    const double mu,               // expected value
    const double sigma,            // root-mean-square deviation
    const bool tail,               // flag for calculation of tail
    const bool log_mode,           // calculate the logarithm of the value
    double& result[]              // array with values of quantiles
);
```

Parameters

**probability**

[in] Probability value of random variable.
probability[]
   [in] Array with probability values of random variable.

mu
   [in] mean parameter of the distribution (expected value).

sigma
   [in] sigma parameter of the distribution (root-mean-square deviation).

tail
   [in] Flag of calculation. If false, then calculation is performed for 1.0 - probability.

log_mode
   [in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of
   the probability density is returned.

error_code
   [out] Variable to get the error code.

result[]
   [out] Array to obtain the quantiles.
**MathRandomNormal**

Generates a pseudorandom variable distributed according to the normal law with the mu and sigma parameters. In case of error it returns NaN.

```c
double MathRandomNormal(
    const double mu,             // expected value
    const double sigma,          // root-mean-square deviation
    int& error_code              // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the normal law with the mu and sigma parameters. In case of error it returns false. Analog of the `rnorm()` in R.

```c
bool MathRandomNormal(
    const double mu,             // expected value
    const double sigma,          // root-mean-square deviation
    const int data_count,        // amount of required data
    double& result[]             // array to obtain the pseudorandom variables
);
```

**Parameters**

- **mu**  
  [in] mean parameter of the distribution (expected value).

- **sigma**  
  [in] sigma parameter of the distribution (root-mean-square deviation).

- **data_count**  
  [in] The number of pseudorandom variables to be obtained.

- **error_code**  
  [out] Variable to get the error code.

- **result[]**  
  [out] Array to obtain the values of pseudorandom variables.
MathMomentsNormal

Calculates the theoretical numerical values of the first 4 moments of the normal distribution.

```cpp
double MathMomentsNormal(
    const double  mu,  // expected value
    const double  sigma,  // root-mean-square deviation
    double&  mean,  // variable for the mean
    double&  variance,  // variable for the variance
    double&  skewness,  // variable for the skewness
    double&  kurtosis,  // variable for the kurtosis
    int&  error_code  // variable to store the error code
);
```

**Parameters**

- `mu`  
  [in] mean parameter of the distribution (expected value).

- `sigma`  
  [in] sigma parameter of the distribution (root-mean-square deviation).

- `mean`  
  [out] Variable to get the mean value.

- `variance`  
  [out] Variable to get the variance.

- `skewness`  
  [out] Variable to get the skewness.

- `kurtosis`  
  [out] Variable to get the kurtosis.

- `error_code`  
  [out] Variable to get the error code.

**Return Value**

Returns true if the moments have been calculated successfully, otherwise false.
Log-normal distribution

This section contains functions for working with log-normal distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the log-normal law. The log-normal distribution is defined by the following formula:

\[
    f_{\text{Lognormal}}(x|\mu, \sigma) = \frac{1}{x\sigma\sqrt{2\pi}} e^{-\frac{(\ln(x) - \mu)^2}{2\sigma^2}}
\]

where:
- \(x\) — value of the random variable
- \(\mu\) — logarithm of the expected value
- \(\sigma\) — logarithm of the root-mean-square deviation

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathMomentsLognormal

Calculates the theoretical numerical values of the first 4 moments of the log-normal distribution

Example:

```csharp
#include <Graphics\Graphic.mqh>
#include <Math\Stat\Lognormal.mqh>
#include <Math\Stat\Math.mqh>

//--- input parameters
input double mean_value=1.0; // logarithm of the expected value (log mean)
input double std_dev=0.25; // logarithm of the root-mean-square deviation (log standard deviation)

void OnStart()
{
    //--- hide the price chart
   .ChartSetInteger(0,CHART_SHOW,false);
    //--- initialize the random number generator
    MathSrand(GetTickCount());
    //--- generate a sample of the random variable
    long chart=0;
    string name="GraphicNormal";
    int n=1000000; // the number of values in the sample
    int ncells=51; // the number of intervals in the histogram
    double x[]; // centers of the histogram intervals
    double y[]; // the number of values from the sample falling within the intervals
    double data[]; // sample of random values
    double max,min; // the maximum and minimum values in the sample
    //--- obtain a sample from the log-normal distribution
    MathRandomLognormal(mean_value, std_dev, n, data);
    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data, x, y, max, min, ncells);
    //--- obtain the sequence boundaries and the step for plotting the theoretical curve
    double step;
    GetMaxMinStepValues(max, min, step);
    step=MathMin(step, (max-min)/ncells);
    //--- obtain the theoretically calculated data at the interval of [min,max]
    double x2[];
    double y2[];
    MathSequence(min, max, step, x2);
    MathProbabilityDensityLognormal(x2, mean_value, std_dev, false, y2);
    //--- set the scale
    double theor_max=y2[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
    double k=sample_max/theor_max;
}
```
for(int i=0; i<ncells; i++)
    y[i]/=k;
//--- output charts
CGraphic graphic;
if(ObjectFind(chart,name)<0)
    graphic.Create(chart,name,0,0,0,780,380);
else
    graphic.Attach(chart,name);

    //--- sequence generation step is also set based on the specified precision
    stepv=NormalizeDouble(MathPow(10,-degree),degree);  
    if((maxv-minv)/stepv<10)  
        stepv/=10.;  
}
MathProbabilityDensityLognormal

Calculates the value of the probability density function of log-normal distribution with the mu and sigma parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathProbabilityDensityLognormal(
    const double x,  // value of random variable
    const double mu, // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log std dev)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability density function of log-normal distribution with the mu and sigma parameters for an array of random variables x[]. In case of error it returns NaN. Analog of the dlnorm() in R.

```cpp
bool MathProbabilityDensityLognormal(
    const double& x[],  // array with the values of random variable
    const double mu, // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log std dev)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density function
    double& result[] // array for values of the probability density function
);
```

Calculates the value of the probability density function of log-normal distribution with the mu and sigma parameters for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathProbabilityDensityLognormal(
    const double& x[],  // array with the values of random variable
    const double mu, // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log std dev)
    double& result[] // array for values of the probability density function
);
```

**Parameters**

- **x**
  - *in* Value of random variable.
- **x[]**
**Standard Library**

[in] Array with the values of random variable.

\(\mu\)

[in] Logarithm of the expected value (\(\log_{\text{mean}}\)).

\(\sigma\)

[in] Logarithm of the root-mean-square deviation (\(\log_{\text{standard deviation}}\)).

\(\log_{\text{mode}}\)

[in] Flag to calculate the logarithm of the value. If \(\log_{\text{mode}}=\text{true}\), then the natural logarithm of the probability density is returned.

\(\text{error\_code}\)

[as] Variable to store the error code.

\(\text{result[]}\)

[as] Array to obtain the values of the probability density function.
MathCumulativeDistributionLognormal

Calculates the log-normal distribution function of probabilities with the mu and sigma parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionLognormal(
    const double x, // value of random variable
    const double mu, // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log std deviation)
    const bool tail, // flag of calculation, if true, then the probability is calculated for x
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is returned
    int& error_code // variable to store the error code
);
```

Calculates the log-normal distribution function of probabilities with the mu and sigma parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionLognormal(
    const double x, // value of random variable
    const double mu, // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log std deviation)
    const bool tail, // flag of calculation, if true, then the probability is calculated for x
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is returned
    int& error_code // variable to store the error code
);
```

Calculates the log-normal distribution function of probabilities with the mu and sigma parameters for an array of random variables x[]. In case of error it returns false. Analog of the `plnorm()` in R.

```cpp
bool MathCumulativeDistributionLognormal(
    const double& x[], // array with the values of random variable
    const double mu, // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log std deviation)
    const bool tail, // flag of calculation, if true, then the probability is calculated for x
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is returned
    double& result[] // array for values of the probability function
);
```

Calculates the log-normal distribution function of probabilities with the mu and sigma parameters for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathCumulativeDistributionLognormal(
    const double& x[], // array with the values of random variable
    const double mu, // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log std deviation)
    double& result[] // array for values of the probability function
);
```

**Parameters**

- **x**
  - [in] Value of random variable.
- **x[]**
[in] Array with the values of random variable.

\[ \text{mu} \]

[in] Logarithm of the expected value (\( \log \text{mean} \)).

\[ \text{sigma} \]

[in] Logarithm of the root-mean-square deviation (\( \log \text{standard deviation} \)).

\[ \text{tail} \]

[in] Flag of calculation, if true, then the probability of random variable not exceeding \( x \) is calculated.

\[ \text{log\_mode} \]

[in] Flag to calculate the logarithm of the value. If \( \text{log\_mode} = \text{true} \), then the natural logarithm of the probability is calculated.

\[ \text{error\_code} \]

[out] Variable to store the error code.

\[ \text{result}\[] \]

[out] Array to obtain the values of the probability function.
MathQuantileLognormal

For the specified probability, the function calculates the value of inverse log-normal distribution function with the mu and sigma parameters. In case of error it returns \texttt{NaN}.

```c
double MathQuantileLognormal(
    const double probability, // probability value of random variable occurrence
    const double mu,          // logarithm of the expected value (log mean)
    const double sigma,       // logarithm of the root-mean-square deviation (log std deviation)
    const bool tail,          // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,      // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code           // variable to store the error code
);
```

For the specified probability array of probability values, the function calculates the value of inverse log-normal distribution function with the mu and sigma parameters. In case of error it returns false. Analog of the \texttt{qlnorm()} in R.

```c
bool MathQuantileLognormal(
    const double probability[],   // array with probability values of random variable occurrence
    const double mu,              // logarithm of the expected value (log mean)
    const double sigma,           // logarithm of the root-mean-square deviation (log std deviation)
    const bool tail,              // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,          // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[]             // array with values of quantiles
);
```

Parameters

\textit{probability}

\begin{itemize}
  \item \texttt{[in]} Probability value of random variable occurrence.
\end{itemize}
**Standard Library**

`probability[]`

- **in** Array with probability values of random variable.

`mu`

- **in** Logarithm of the expected value (log\_mean).

`sigma`

- **in** Logarithm of the root-mean-square deviation (log\_standard deviation).

`tail`

- **in** Flag of calculation, if false, then calculation is performed for 1.0-probability.

`log_mode`

- **in** Flag of calculation, if log\_mode=true, calculation is performed for Exp(probability).

`error_code`

- **out** Variable to store the error code.

`result[]`

- **out** Array with values of quantiles.
MathRandomLognormal

Generates a pseudorandom variable distributed according to the log-normal law with the mu sigma parameters. In case of error it returns NaN.

```cpp
double MathRandomLognormal(
    const double mu,  // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log standard deviation)
    int& error_code    // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the log-normal law with the mu sigma parameters. In case of error it returns false. Analog of the `rlnorm()` in R.

```cpp
double MathRandomLognormal(
    const double mu,  // logarithm of the expected value (log mean)
    const double sigma, // logarithm of the root-mean-square deviation (log standard deviation)
    const int data_count, // amount of required data
    double& result[]    // array with values of pseudorandom variables
);
```

**Parameters**

*mu*

[in] Logarithm of the expected value (log mean).

*sigma*

[in] Logarithm of the root-mean-square deviation (log standard deviation).

*data_count*

[in] Amount of required data.

*error_code*

[out] Variable to store the error code.

*result[]*

[out] Array with values of pseudorandom variables.
MathMomentsLognormal

Calculates the theoretical numerical values of the first 4 moments of the log-normal distribution. Returns true if calculation of the moments has been successful, otherwise false.

```cpp
double MathMomentsLognormal(
    const double mu,  // logarithm of the expected value (log mean)
    const double sigma,  // logarithm of the root-mean-square deviation (log standard deviation)
    double& mean,  // variable for the mean
    double& variance,  // variable for the variance
    double& skewness,  // variable for the skewness
    double& kurtosis,  // variable for the kurtosis
    int& error_code  // variable to store the error code
);
```

Parameters

- **mu**
  - [in] Logarithm of the expected value (log mean).

- **sigma**
  - [in] Logarithm of the root-mean-square deviation (log standard deviation).

- **mean**
  - [in] Variable for the mean.

- **variance**
  - [out] Variable for the variance.

- **skewness**
  - [out] Variable for the skewness.

- **kurtosis**
  - [out] Variable for the kurtosis.

- **error code**
  - [out] Variable to store the error code.

Return Value

Returns true if the moments have been calculated successfully, otherwise false.
Beta distribution

This section contains functions for working with beta distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the corresponding law. The beta distribution is defined by the following formula:

\[ f_{\text{Beta}}(x | a, b) = \frac{1}{B(a, b)} x^{a-1} (1-x)^{b-1} \]

where:

- \( x \) — value of the random variable
- \( a \) — the first parameter of beta distribution
- \( b \) — the second parameter of beta distribution

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathMomentsBeta
Calculates the theoretical numerical values of the first 4 moments of the beta distribution

Example:

```csharp
#include <Graphics\Graphic.mqh>
#include <Math\Stat\Beta.mqh>
#include <Math\Stat\Math.mqh>

//--- input parameters
input double alpha=2; // the first parameter of beta distribution (shape1)
input double beta=5; // the second parameter of beta distribution (shape2)

void OnStart()
{
    //--- hide the price chart
    ChartSetInteger(0, CHART_SHOW, false);
    //--- initialize the random number generator
    MathSrand(GetTickCount());
    //--- generate a sample of the random variable
    long chart=0;
    int n=1000000; // the number of values in the sample
    int ncells=51; // the number of intervals in the histogram
    double x[]; // centers of the histogram intervals
    double y[]; // the number of values from the sample falling within the interval
    double data[]; // sample of random values
    double max,min;
    //--- obtain a sample from the beta distribution
    MathRandomBeta(alpha, beta, n, data);
    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data, x, y, min, max, ncells);
    //--- obtain the sequence boundaries and the step for plotting the theoretical curve
    double step;
    GetMaxMinStepValues(min, max, step);
    step=MaxMin(min, max, ncells);
    //--- obtain the theoretically calculated data at the interval of [min,max]
    double x2[]; double y2[];
    MathSequence(min, max, step,x2);
    MathProbabilityDensityBeta(x2, alpha, beta, false, y2);
    //--- set the scale
    double theor_max=y2[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
    double k=sample_max/theor_max;
    for(int i=0; i<ncells; i++)
```
y[i]=k; //--- output charts
CGraphic graphic;
if (ObjectFind(chart, name)<0)
    graphic.Create(chart, name, 0, 0, 0, 780, 380);
else
    graphic.Attach(chart, name);
graphic.BackgroundMain(StringFormat("Beta distribution alpha=%G beta=%G", alpha, beta);
graphic.BackgroundMainSize(16);

//--- plot all curves
graphic.CurveAdd(x, y, CURVE_HISTOGRAM, "Sample").HistogramWidth(6);
//--- and now plot the theoretical curve of the distribution density

{
    if (cells<=1) return (false);
    int size=ArraySize(data);
    if (size<=cells*10) return (false);
    minv=data[ArrayMinimum(data)];
    maxv=data[ArrayMaximum(data)];
    double range=maxv-minv;
    double width=range/cells;
    if (width==0) return false;
    ArrayResize(intervals, cells);
    ArrayResize(frequency, cells);
    //--- define the interval centers
    for (int i=0; i<cells; i++)
    {
        intervals[i]=minv+(i+0.5)*width;
        frequency[i]=0;
    }
    //--- fill the frequencies of falling within the interval
    for (int i=0; i<size; i++)
    {
        int ind=int((data[i]-minv)/width);
        if (ind>=cells) ind=cells-1;
        frequency[ind]++;
    }
    return (true);
} //+------------------------------------------------------------------+
/| Calculates values for sequence generation |

// Calculates values for sequence generation

void GetMaxMinStepValues(double &maxv, double &minv, double &stepv)
{
    //--- calculate the absolute range of the sequence to obtain the precision of normalization
    double range=MathAbs(maxv-minv);
    int degree=(int)MathRound(MathLog10(range));
    //--- normalize the maximum and minimum values to the specified precision
    maxv=NormalizeDouble(maxv,degree);
    minv=NormalizeDouble(minv,degree);
    //--- sequence generation step is also set based on the specified precision
    stepv=NormalizeDouble(MathPow(10,-degree),degree);
    if ((maxv-minv)/stepv<10)
        stepv/=10.;
}
**MathProbabilityDensityBeta**

Calculates the value of the probability density function of beta distribution with the a and b parameters for a random variable \(x\). In case of error it returns \text{NaN}\.

```cpp
double MathProbabilityDensityBeta(
    const double x, // value of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability density function of beta distribution with the a and b parameters for an array of random variables \(x[]\). In case of error it returns false. Analog of the \text{dbeta()}\ in R.

```cpp
bool MathProbabilityDensityBeta(
    const double x[], // array with the values of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);
```

Calculates the value of the probability density function of beta distribution with the a and b parameters for an array of random variables \(x[]\). In case of error it returns false.

```cpp
bool MathProbabilityDensityBeta(
    const double x[], // array with the values of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    double& result[] // array for values of the probability density function
);
```

**Parameters**

\(x\)

\(x[]\)
[in] Array with the values of random variable.

\( a \)

[in] The first parameter of beta distribution (shape 1).

\( b \)

[in] The second parameter of beta distribution (shape 2)

\( \text{log\_mode} \)

[in] Flag to calculate the logarithm of the value. If \( \text{log\_mode}=\text{true} \), then the natural logarithm of the probability density is returned.

\( \text{error\_code} \)

[out] Variable to store the error code.

\( \text{result[]} \)

[out] Array for values of the probability density function.
MathCumulativeDistributionBeta

Calculates the probability distribution function of beta distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionBeta(
    const double x, // value of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true
    int& error_code // variable to store the error code
);
[in] Array with the values of random variable.

\(a\)

[in] The first parameter of beta distribution (shape 1).

\(b\)

[in] The second parameter of beta distribution (shape 2)

\(tail\)

[in] Flag of calculation, if true, then the probability of random variable not exceeding \(x\) is calculated.

\(log\_mode\)

[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability is calculated.

\(error\_code\)

[out] Variable to store the error code.

\(result[]\)

[out] Array for values of the probability function.
MathQuantileBeta

For the specified probability, the function calculates the value of inverse beta distribution function with the a and b parameters. In case of error it returns NaN.

```c
double MathQuantileBeta(
    const double probability, // probability value of random variable occurrence
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code // variable to store the error code
);
```

For the specified probability[], array of probability values, the function calculates the values of inverse beta distribution function with the a and b parameters. In case of error it returns false. Analog of the qbeta() in R.

```c
double MathQuantileBeta(
    const double& probability[], // array with probability values of random variable occurrence
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[] // array with values of quantiles
);
```

For the specified probability[], array of probability values, the function calculates the values of inverse beta distribution function with the a and b parameters. In case of error it returns false.

```c
bool MathQuantileBeta(
    const double& probability[], // array with probability values of random variable occurrence
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    double& result[] // array with values of quantiles
);
```

Parameters

**probability**

[in] Probability value of random variable.
**Standard Library**

`probability[]`
- [in] Array with probability values of random variable.

`a`
- [in] The first parameter of beta distribution (shape1).

`b`
- [in] The second parameter of beta distribution (shape2).

`tail`
- [in] Flag of calculation, if lower_tail=false, then calculation is performed for 1.0-probability.

`log_mode`
- [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

`error_code`
- [out] Variable to get the error code.

`result[]`
- [out] Array with values of quantiles.
MathRandomBeta

Generates a pseudorandom variable distributed according to the law of beta distribution with the a and b parameters. In case of error it returns NaN.

```c
double MathRandomBeta(
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    int& error_code // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of beta distribution with the a and b parameters. In case of error it returns false. Analog of the `rbeta()` in R.

```c
bool MathRandomBeta(
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const int data_count, // amount of required data
    double& result[] // array to obtain the pseudorandom variables
);
```

**Parameters**

- **a**
  
  [in] The first parameter of beta distribution (shape1)

- **b**
  
  [in] The second parameter of beta distribution (shape2).

- **data_count**
  
  [in] The number of pseudorandom variables to be obtained.

- **error_code**
  
  [out] Variable to store the error code.

- **result[]**
  
  [out] Array to obtain the values of pseudorandom variables.
MathMomentsBeta

Calculates the theoretical numerical values of the first 4 moments of the beta distribution.

def MathMomentsBeta(
    a,  # The first parameter of beta distribution (shape1).
    b,  # The second parameter of beta distribution (shape2).
    mean,  # Variable for the mean.
    variance,  # Variable for the variance.
    skewness,  # Variable for the skewness.
    kurtosis,  # Variable for the kurtosis.
    error_code  # Variable for the error code.
):
    # The function code here.

Parameters

- a
  - [in] The first parameter of beta distribution (shape1).
- b
  - [in] The second parameter of beta distribution (shape2).
- mean
  - [out] Variable to get the mean value.
- variance
  - [out] Variable to get the variance.
- skewness
  - [out] Variable to get the skewness.
- kurtosis
  - [out] Variable to get the kurtosis.
- error_code
  - [out] Variable to get the error code.

Return Value

Returns true if the moments have been calculated successfully, otherwise false.
Noncentral beta distribution

This section contains functions for working with noncentral beta distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the corresponding law. The noncentral beta distribution is defined by the following formula:

\[ f_{\text{Noncentral Beta}}(x | a, b, \lambda) = \sum_{r=0}^{\infty} e^{-\lambda/2} \frac{(\lambda/2)^r}{r!} x^{a+r-1} (1-x)^{b-1} \frac{1}{B(a+r,b)} \]

where:

- \( x \) — value of the random variable
- \( a \) — the first parameter of beta distribution
- \( b \) — the second parameter of beta distribution
- \( \lambda \) — noncentrality parameter

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

    if ((maxv - minv) / stepv < 10)
        stepv /= 10.;
}
```
**MathProbabilityDensityNoncentralBeta**

Calculates the value of the probability density function of noncentral beta distribution with the \(a\), \(b\) and \(\lambda\) parameters for a random variable \(x\). In case of error it returns `NaN`.

```cpp
double MathProbabilityDensityNoncentralBeta(
    const double x, // value of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    const double log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability density function of noncentral beta distribution with the \(a\), \(b\) and \(\lambda\) parameters for an array of random variables \(x[]\). In case of error it returns `false`. Analog of the `dbeta()` in R.

```cpp
bool MathProbabilityDensityNoncentralBeta(
    const double x[], // array with the values of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    const double log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);
```

**Parameters**

- **x**: The value of the random variable.
- **a**: The first parameter of the beta distribution (shape 1).
- **b**: The second parameter of the beta distribution (shape 2).
- **lambda**: The noncentrality parameter.
- **log_mode**: A flag to calculate the logarithm of the value. If `true`, the natural logarithm of the probability density is calculated.
- **error_code**: A variable to store the error code.
- **result**: An array for the values of the probability density function.
x

x[]
  [in]  Array with the values of random variable.

a
  [in]  The first parameter of beta distribution (shape 1).

b
  [in]  The second parameter of beta distribution (shape 2)

lambda
  [in]  Noncentrality parameter

log_mode
  [in]  Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

error_code
  [out]  Variable to store the error code.

result[]
  [out]  Array for values of the probability density function.
MathCumulativeDistributionNoncentralBeta

Calculates the probability distribution function of noncentral beta distribution with the a, b and lambda parameters for a random variable x. In case of error it returns NaN.

```c
double MathCumulativeDistributionNoncentralBeta(
    const double x, // value of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is returned
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of noncentral beta distribution with the a, b and lambda parameters for an array of random variables x[]. In case of error it returns false. Analog of the pbeta() in R.

```c
bool MathCumulativeDistributionNoncentralBeta(
    const double x[], // array with the values of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[] // array for values of the probability function
);
```

Calculates the probability distribution function of noncentral beta distribution with the a, b and lambda parameters for an array of random variables x[]. In case of error it returns false.

```c
bool MathCumulativeDistributionNoncentralBeta(
    const double x[], // array with the values of random variable
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    double& result[] // array for values of the probability function
);`
Parameters

\( x \)
- [in] Value of random variable.

\( x[] \)
- [in] Array with the values of random variable.

\( a \)
- [in] The first parameter of beta distribution (shape 1).

\( b \)
- [in] The second parameter of beta distribution (shape 2)

\( \lambda \)
- [in] Noncentrality parameter

\( \text{tail} \)
- [in] Flag of calculation. If true, then the probability of random variable not exceeding \( x \) is calculated.

\( \text{log\_mode} \)
- [in] Flag to calculate the logarithm of the value. If \( \text{log\_mode}=\text{true} \), then the natural logarithm of the probability is calculated.

\( \text{error\_code} \)
- [out] Variable to store the error code.

\( \text{result[]} \)
- [out] Array for values of the probability function.
# MathQuantileNoncentralBeta

Calculates the value of the inverse probability distribution function of noncentral beta distribution with the a, b and lambda parameters for the occurrence probability of a random variable `probability`. In case of error it returns `NaN`.

```cpp
def MathQuantileNoncentralBeta(
    const double probability,  // probability value of random variable occurrence
    const double a,            // the first parameter of beta distribution (shape1)
    const double b,            // the second parameter of beta distribution (shape2)
    const double lambda,       // noncentrality parameter
    const bool tail,            // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,        // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code             // variable to store the error code
);
```

For the specified probability array of probability values, the function calculates the value of the inverse probability distribution function of noncentral beta distribution with the a, b and lambda parameters. In case of error it returns false. Analog of the `qbeta()` in R.

```cpp
def MathQuantileNoncentralBeta(
    const double &probability[],  // array with probability values of random variable occurrence
    const double a,                // the first parameter of beta distribution (shape1)
    const double b,                // the second parameter of beta distribution (shape2)
    const double lambda,           // noncentrality parameter
    const bool tail,               // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,           // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double & result[]              // array with values of quantiles
);
```

For the specified probability array of probability values, the function calculates the value of the inverse probability distribution function of noncentral beta distribution with the a, b and lambda parameters. In case of error it returns false.

```cpp
def MathQuantileNoncentralBeta(
    const double &probability[],  // array with probability values of random variable occurrence
    const double a,                // the first parameter of beta distribution (shape1)
    const double b,                // the second parameter of beta distribution (shape2)
    const double lambda,           // noncentrality parameter
    const bool tail,               // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,           // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double & result[]              // array with values of quantiles
);
```
```cpp
const double lambda, // noncentrality parameter
double& result[] // array with values of quantiles
);
```

### Parameters

**probability**
- `[in]` Probability value of random variable.

**probability[]**
- `[in]` Array with probability values of random variable.

**a**
- `[in]` The first parameter of beta distribution (shape1).

**b**
- `[in]` The second parameter of beta distribution (shape2).

**lambda**
- `[in]` Noncentrality parameter.

**tail**
- `[in]` Flag of calculation, if false, then calculation is performed for 1.0-probability.

**log_mode**
- `[in]` Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

**error_code**
- `[out]` Variable to get the error code.

**result[]**
- `[out]` Array with values of quantiles.
MathRandomNoncentralBeta

Generates a pseudorandom variable distributed according to the law of noncentral beta distribution the a, b and lambda parameters. In case of error it returns NaN.

double MathRandomNoncentralBeta(
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    int& error_code // variable to store the error code
);

Generates pseudorandom variables distributed according to the law of noncentral beta distribution the a, b and lambda parameters. In case of error it returns false. Analog of the rbeta() in R.

bool MathRandomNoncentralBeta(
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    const int data_count, // amount of required data
    double& result[] // array to obtain the pseudorandom variables
);

Parameters

a
[in] The first parameter of beta distribution (shape1)

b
[in] The second parameter of beta distribution (shape2).

lambda
[in] Noncentrality parameter

error_code
[out] Variable to store the error code.

data_count
[out] Amount of required data.

result[]
[out] Array to obtain the values of pseudorandom variables.
MathMomentsNoncentralBeta

Calculates the theoretical numerical values of the first 4 moments of the noncentral beta distribution with the \( a \), \( b \) and \( \lambda \) parameters.

```cpp
double MathMomentsNoncentralBeta(
    const double a, // the first parameter of beta distribution (shape1)
    const double b, // the second parameter of beta distribution (shape2)
    const double lambda, // noncentrality parameter
    double& mean, // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code // variable for the error code
);
```

**Parameters**

\( a \)

[in] The first parameter of beta distribution (shape1).

\( b \)

[in] The second parameter of beta distribution (shape2).

\( \lambda \)

[in] Noncentrality parameter

\( \text{mean} \)

[out] Variable to get the mean value.

\( \text{variance} \)

[out] Variable to get the variance.

\( \text{skewness} \)

[out] Variable to get the skewness.

\( \text{kurtosis} \)

[out] Variable to get the kurtosis.

\( \text{error\_code} \)

[out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Gamma distribution

This section contains functions for working with gamma distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the corresponding law. The gamma distribution is defined by the following formula:

\[ f_{\text{gamma}}(x|a,b) = \frac{1}{b^a \Gamma(a)} x^{a-1} e^{-\frac{x}{b}} \]

where:
- \( x \) — value of the random variable
- \( a \) — the first parameter of distribution
- \( b \) — the second parameter of distribution

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathMomentsGamma

Calculates the theoretical numerical values of the first 4 moments of the gamma distribution

Example:

```c
#include <Graphics\Graphic.mqh>
#include <Math\Stat\Gamma.mqh>
#include <Math\Stat\Math.mqh>

//--- input parameters
input double alpha=9; // the first parameter of distribution (shape)
input double beta=0.5; // the second parameter of distribution (scale)

void OnStart()
{
    //--- hide the price chart
    ChartSetInteger(0,CHART_SHOW,false);
    //--- initialize the random number generator
    MathSrand(GetTickCount());
    //--- generate a sample of the random variable
    long chart=0;
    string name="GraphicNormal";
    int n=1000000; // the number of values in the sample
    int ncells=51; // the number of intervals in the histogram
    double x[]; // centers of the histogram intervals
    double y[]; // the number of values from the sample falling within the interval
    double data[]; // sample of random values
    double max,min;
    //--- obtain a sample from the gamma distribution
    MathRandomGamma(alpha,beta,n,data);
    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data,x,y,max,min,ncells);
    //--- obtain the sequence boundaries and the step for plotting the theoretical curve
    double step;
    GetMaxMinStepValues(max,min,step);
    step=MathMin(step,(max-min)/ncells);
    //--- obtain the theoretically calculated data at the interval of [min,max]
    double x2[];
    double y2[];
    MathSequence(min,max,step,x2);
    MathProbabilityDensityGamma(x2,alpha,beta,false,y2);
    //--- set the scale
    double theor_max=y[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
    double k=sample_max/theor_max;
    for(int i=0; i<ncells; i++)
```
y[i] /= k;
//--- output charts
CGraphic graphic;
if (ObjectFind(chart, name) < 0)
    graphic.Create(chart, name, 0, 0, 0, 780, 380);
else
    graphic.Attach(chart, name);

    double range=MathAbs(maxv-minv);
    int degree=(int)MathRound(MathLog10(range));
    //--- normalize the maximum and minimum values to the specified precision
    maxv=NormalizeDouble(maxv,degree);
    minv=NormalizeDouble(minv,degree);
    //--- sequence generation step is also set based on the specified precision
    stepv=NormalizeDouble(MathPow(10,-degree),degree);
    if((maxv-minv)/stepv<10)
        stepv/=10.;
}
return (true);
}
MathProbabilityDensityGamma

Calculates the value of the probability density function of gamma distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathProbabilityDensityGamma(
    const double x, // value of random variable
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability density function of gamma distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false. Analog of the dgamma() in R.

```cpp
bool MathProbabilityDensityGamma(
    const double& x[], // array with the values of random variable
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    const bool log_mode, // flag to calculate the logarithm of the value, if true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);
```

Calculates the value of the probability density function of gamma distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathProbabilityDensityGamma(
    const double& x[], // array with the values of random variable
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    double& result[] // array for values of the probability density function
);
```

Parameters

- **x**
  - [in] Value of random variable.
  - [in] Value of array of random variables.
Array with the values of random variable.

The first parameter of the distribution (shape).

The second parameter of the distribution (scale).

Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

Variable to store the error code.

Array for values of the probability density function.
MathCumulativeDistributionGamma

Calculates the probability distribution function of gamma distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionGamma(
    const double x, // value of random variable
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is returned
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of gamma distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false. Analog of the pgamma() in R.

```cpp
bool MathCumulativeDistributionGamma(
    const double& x[], // array with the values of random variable
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[] // array for values of the probability function
);
```

Parameters

- `x` [in] Value of random variable.

- `x[]`
[in] Array with the values of random variable.

\( a \)
[in] The first parameter of the distribution (shape).

\( b \)
[in] The second parameter of the distribution (scale)

\( \text{tail} \)
[in] Flag of calculation. If true, then the probability of random variable not exceeding \( x \) is calculated.

\( \text{log_mode} \)
[in] Flag to calculate the logarithm of the value. If \( \text{log_mode} = \text{true} \), then the natural logarithm of the probability is calculated.

\( \text{error_code} \)
[out] Variable to store the error code.

\( \text{result[]} \)
[out] Array for values of the probability function.
MathQuantileGamma

For the specified probability, the function calculates the value of inverse gamma distribution function with the a and b parameters. In case of error it returns NaN.

```cpp
double MathQuantileGamma(
    const double probability, // probability value of random variable occurrence
    const double a,          // the first parameter of the distribution (shape)
    const double b,          // the second parameter of the distribution (scale)
    const bool tail,         // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,     // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code          // variable to store the error code
);
```

For the specified probability, the function calculates the value of inverse gamma distribution function with the a and b parameters. In case of error it returns NaN.

```cpp
double MathQuantileGamma(
    const double probability, // probability value of random variable occurrence
    const double a,          // the first parameter of the distribution (shape)
    const double b,          // the second parameter of the distribution (scale)
    const bool tail,         // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,     // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
);
```

For the specified probability[] array of probability values, the function calculates the value of inverse gamma distribution function with the a and b parameters. In case of error it returns false. Analog of the `qgamma()` in R.

```cpp
double MathQuantileGamma(
    const double& probability[], // array with probability values of random variable occurrence
    const double a,              // the first parameter of the distribution (shape)
    const double b,              // the second parameter of the distribution (scale)
    const bool tail,             // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,         // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[]            // array with values of quantiles
);
```

For the specified probability[] array of probability values, the function calculates the value of inverse gamma distribution function with the a and b parameters. In case of error it returns false.

```cpp
bool MathQuantileGamma(
    const double& probability[], // array with probability values of random variable occurrence
    const double a,               // the first parameter of the distribution (shape)
    const double b,               // the second parameter of the distribution (scale)
    double& result[]             // array with values of quantiles
);
```

Parameters

`probability`

[in] Probability value of random variable.
`probability[]`  
[in] Array with probability values of random variable.

`a`  
[in] The first parameter of the distribution (shape).

`b`  
[in] The second parameter of the distribution (scale).

`tail`  
[in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

`log_mode`  
[in] Flag of calculation, if log_mode=true, calculation is performed for \( \text{Exp}(\text{probability}) \).

`error_code`  
[out] Variable to get the error code.

`result[]`  
[out] Array with values of quantiles.
MathRandomGamma

Generates a pseudorandom variable distributed according to the law of gamma distribution with the a and b parameters. In case of error it returns NaN.

```cpp
double MathRandomGamma(
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    int& error_code // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of gamma distribution with the a and b parameters. In case of error it returns false. Analog of the rgamma() in R.

```cpp
bool MathRandomGamma(
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    const int data_count, // amount of required data
double& result[] // array with values of pseudorandom variables
);
```

### Parameters

- **a**
  - [in] The first parameter of the distribution (shape).

- **b**
  - [in] The second parameter of the distribution (scale).

- **error_code**
  - [out] Variable to store the error code.

- **data_count**
  - [out] Amount of required data.

- **result[]**
  - [out] Array to obtain the values of pseudorandom variables.
MathMomentsGamma

Calculates the theoretical numerical values of the first 4 moments of the gamma distribution with the a and b parameters.

```
double MathMomentsGamma(
    const double a, // the first parameter of the distribution (shape)
    const double b, // the second parameter of the distribution (scale)
    double& mean, // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code // variable for the error code
);
```

**Parameters**

- `a`  
  [in] The first parameter of the distribution (shape).

- `b`  
  [in] The second parameter of the distribution (scale).

- `mean`  
  [out] Variable to get the mean value.

- `variance`  
  [out] Variable to get the variance.

- `skewness`  
  [out] Variable to get the skewness.

- `kurtosis`  
  [out] Variable to get the kurtosis.

- `error_code`  
  [out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Chi-squared distribution

This section contains functions for working with chi-squared distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the corresponding law. The chi-squared distribution is defined by the following formula:

\[ f_{\text{Chi-Square}}(x | \nu) = \frac{(x/2)^{(\nu/2)-1} e^{-x/2}}{2^{\nu/2} \Gamma\left(\frac{\nu}{2}\right)} \]

where:
- \( x \) — value of the random variable
- \( \nu \) — number of degrees of freedom

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

}
MathProbabilityDensityChiSquare

Calculates the value of the probability density function of chi-squared distribution with the nu parameter for a random variable x. In case of error it returns NaN.

```c
double MathProbabilityDensityChiSquare(
    const double x,  // value of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code  // variable to store the error code
);
```

Calculates the value of the probability density function of chi-squared distribution with the nu parameter for an array of random variables x[]. In case of error it returns false. Analog of the `dchisq()` in R.

```c
bool MathProbabilityDensityChiSquare(
    const double x[],  // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double result[]    // array for values of the probability density function
);
```

Calculates the value of the probability density function of chi-squared distribution with the nu parameter for an array of random variables x[]. In case of error it returns false.

```c
bool MathProbabilityDensityChiSquare(
    const double x[],  // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    double result[]    // array for values of the probability density function
);
```

Parameters

- `x`
  - [in] Value of random variable.

- `x[]`
  - [in] Array with the values of random variable.

- `nu`
  - [in] Parameter of distribution (number of degrees of freedom)

- `log_mode`
[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

`error_code`

[out] Variable to store the error code.

`result[]`

[out] Array for values of the probability density function.
MathCumulativeDistributionChiSquare

Calculates the probability distribution function of chi-squared distribution with the \( \nu \) parameter for a random variable \( x \). In case of error it returns \( \text{NaN} \).

```cpp
double MathCumulativeDistributionChiSquare(
    const double x, // value of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of chi-squared distribution with the \( \nu \) parameter for a random variable \( x \). In case of error it returns \( \text{NaN} \).

```cpp
double MathCumulativeDistributionChiSquare(
    const double x, // value of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of chi-squared distribution with the \( \nu \) parameter for an array of random variables \( x[] \). In case of error it returns false. Analog of the \texttt{pchisq()} in R.

```cpp
bool MathCumulativeDistributionChiSquare(
    const double& x[], // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true
    double& result[] // array for values of the probability function
);
```

Calculates the probability distribution function of chi-squared distribution with the \( \nu \) parameter for an array of random variables \( x[] \). In case of error it returns false.

```cpp
bool MathCumulativeDistributionChiSquare(
    const double& x[], // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    double& result[] // array for values of the probability function
);
```

**Parameters**

\( x \)
- \([\text{in}]\) Value of random variable.

\( x[] \)
- \([\text{in}]\) Array with the values of random variable.

\( \nu \)
- \([\text{in}]\) Parameter of distribution (number of degrees of freedom).
**Standard Library**

`tail`

[in] Flag of calculation. If true, then the probability of random variable not exceeding x is calculated.

`log_mode`

[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability is calculated.

`error_code`

[out] Variable to store the error code.

`result[]`

[out] Array for values of the probability function.
**MathQuantileChiSquare**

```c
double MathQuantileChiSquare(
    const double  probability,  // probability value of random variable occurrence
    const double  nu,           // parameter of distribution (number of degrees of freedom)
    const bool    tail,         // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool    log_mode,     // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int&          error_code    // variable to store the error code
);  
```

For the specified *probability* array of probability values, the function calculates the value of inverse chi-squared distribution function. In case of error it returns false. Analog of the `qchisq()` in R.

```c
double MathQuantileChiSquare(
    const double& probability[],  // array with probability values of random variable occurrence
    const double  nu,              // parameter of distribution (number of degrees of freedom)
    const bool    tail,            // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool    log_mode,        // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double&       result[]         // array with values of quantiles
);  
```

For the specified *probability* array of probability values, the function calculates the value of inverse chi-squared distribution function. In case of error it returns false.

```c
bool MathQuantileChiSquare(
    const double& probability[],  // array with probability values of random variable occurrence
    const double  nu,              // parameter of distribution (number of degrees of freedom)
    double&       result[]         // array with values of quantiles
);  
```

**Parameters**

- `probability`
  - *in* Probability value of random variable.

- `probability[]`
  - *in* Array with probability values of random variable.

- `nu`
  - *in* Parameter of distribution (number of degrees of freedom).
tail
  [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
  [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

error_code
  [out] Variable to get the error code.

result[]
  [out] Array with values of quantiles.
**MathRandomChiSquare**

Generates a pseudorandom variable distributed according to the law of chi-squared distribution with the nu parameter. In case of error it returns `NaN`.

```c
double MathRandomChiSquare(
    const double nu, // parameter of distribution (number of degrees of freedom)
    int& error_code  // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of chi-squared distribution with the nu parameter. In case of error it returns false. Analog of the `rchisq()` in R.

```c
bool MathRandomChiSquare(
    const double nu, // parameter of distribution (number of degrees of freedom)
    const int data_count, // amount of required data
    double& result[]  // array with values of pseudorandom variables
);
```

**Parameters**

- **nu**
  - [in] Parameter of distribution (number of degrees of freedom).

- **error_code**
  - [out] Variable to store the error code.

- **data_count**
  - [out] Amount of required data.

- **result[]**
  - [out] Array to obtain the values of pseudorandom variables.
MathMomentsChiSquare

Calculates the theoretical numerical values of the first 4 moments of the chi-squared distribution with the nu parameter.

```c
double MathMomentsChiSquare(
    const double nu,       // parameter of distribution (number of degrees of freedom)
    double& mean,          // variable for the mean
    double& variance,      // variable for the variance
    double& skewness,      // variable for the skewness
    double& kurtosis,      // variable for the kurtosis
    int& error_code        // variable for the error code
);
```

Parameters

- `nu` [in] Parameter of distribution (number of degrees of freedom).
- `mean` [out] Variable to get the mean value.
- `variance` [out] Variable to get the variance.
- `skewness` [out] Variable to get the skewness.
- `kurtosis` [out] Variable to get the kurtosis.
- `error_code` [out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
Noncentral chi-squared distribution

This section contains functions for working with noncentral chi-squared distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the corresponding law. The noncentral chi-squared distribution is defined by the following formula:

$$f_{NoncentrChiSq}(x|\nu, \sigma) = \frac{1}{2^\frac{\nu}{2} \Gamma\left(\frac{\nu}{2}\right)} e^{-\frac{\sigma^2}{2}} \sum_{r=0}^{\infty} \frac{(\lambda \nu)^r}{(2r)!} \Gamma\left(\frac{\nu+2r}{2}\right)$$

where:

- $x$ — value of the random variable
- $\nu$ — number of degrees of freedom
- $\sigma$ — noncentrality parameter

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathMomentsNoncentralChiSquare

Calculates the theoretical numerical values of the first 4 moments of the noncentral chi-squared distribution

Example:

```c
#include <Graphics\Graphic.mqh>
#include <Math\Stat\NoncentralChiSquare.mqh>
#include <Math\Stat\Math.mqh>

//--- input parameters
input double nu_par=8;   // the number of degrees of freedom
input double si_par=1;   // noncentrality parameter

//--- script program start function
void OnStart()
{
    //--- hide the price chart
    ChartSetInteger(0,CHART_SHOW,false);
    //--- initialize the random number generator
    MathSrand(GetTickCount());
    //--- generate a sample of the random variable
    long chart=0;
    string name="GraphicNormal";
    int n=1000000;   // the number of values in the sample
    int ncells=51;   // the number of intervals in the histogram
    double x[];     // centers of the histogram intervals
    double y[];     // the number of values from the sample falling within the interval
    double data[];  // sample of random values
    double max,min; // the maximum and minimum values in the sample

    //--- obtain a sample from the noncentral chi-squared distribution
    MathRandomNoncentralChiSquare(nu_par,si_par,n,data);
    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data,x,y,max,min,ncells);
    //--- obtain the sequence boundaries and the step for plotting the theoretical curve
    double step;
    GetMaxMinStepValues(max,min,step);
    step=MathMin(step,(max-min)/ncells);
    //--- obtain the theoretically calculated data at the interval of [min,max]
    double x2[];
    double y2[];
    MathSequence(min,max,step,x2);
    MathProbabilityDensityNoncentralChiSquare(x2,nu_par,si_par,false,y2);
    //--- set the scale
    double theor_max=y2[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
```
double k=sample_max/theor_max;
for(int i=0; i<ncells; i++)
  y[i]/=k;

        stepv/=10.;
}
MathProbabilityDensityNoncentralChiSquare

Calculates the value of the probability density function of noncentral chi-squared distribution with the nu and sigma parameters for a random variable x. In case of error it returns NaN.

double MathProbabilityDensityNoncentralChiSquare(
    const double x, // value of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);

Calculates the value of the probability density function of noncentral chi-squared distribution with the nu and sigma parameters for an array of random variables x[]. In case of error it returns false. Analog of the dchisq() in R.

bool MathProbabilityDensityNoncentralChiSquare(
    const double x[], // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);

Calculates the value of the probability density function of noncentral chi-squared distribution with the nu parameter for an array of random variables x[]. In case of error it returns false.

bool MathProbabilityDensityNoncentralChiSquare(
    const double x[], // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    double& result[] // array for values of the probability density function
);

Parameters

x

x[]
Array with the values of random variable.

Parameter of distribution (number of degrees of freedom).

Noncentrality parameter.

Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

Variable to store the error code.

Array for values of the probability density function.
MathCumulativeDistributionNoncentralChiSquare

Calculates the probability distribution function of noncentral chi-squared distribution with the nu and sigma parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionNoncentralChiSquare(
    const double x,       // value of random variable
    const double nu,      // parameter of distribution (number of degrees of freedom)
    const double sigma,   // noncentrality parameter
    const bool tail,      // flag of calculation, if lower_tail=true, then the probability of random variable not exceeding x is calculated
    const bool log_mode,  // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is returned
    int& error_code       // variable to store the error code
);
```

Calculates the probability distribution function of noncentral chi-squared distribution with the nu and sigma parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionNoncentralChiSquare(
    const double x,       // value of random variable
    const double nu,      // parameter of distribution (number of degrees of freedom)
    const double sigma,   // noncentrality parameter
    int& error_code       // variable to store the error code
);
```

Calculates the probability distribution function of noncentral chi-squared distribution with the nu and sigma parameters for an array of random variables x[]. In case of error it returns false. Analog of the `pchisq()` in R.

```cpp
bool MathCumulativeDistributionNoncentralChiSquare(
    const double x[],     // array with the values of random variable
    const double nu,      // parameter of distribution (number of degrees of freedom)
    const double sigma,   // noncentrality parameter
    const bool tail,      // flag of calculation, if lower_tail=true, then the probability of random variable not exceeding x is calculated
    const bool log_mode,  // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[]     // array for values of the probability function
);
```

Calculates the probability distribution function of noncentral chi-squared distribution with the nu and sigma parameters for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathCumulativeDistributionNoncentralChiSquare(
    const double x[],     // array with the values of random variable
    const double nu,      // parameter of distribution (number of degrees of freedom)
    const double sigma,   // noncentrality parameter
    double& result[]     // array for values of the probability function
);
```

Parameters

`x`

$x[]$
  [in]  Array with the values of random variable.

$nu$
  [in]  Parameter of distribution (number of degrees of freedom).

$sigma$
  [in]  Noncentrality parameter.

$tail$
  [in]  Flag of calculation. If true, then the probability of random variable not exceeding $x$ is calculated.

$log\_mode$
  [in]  Flag to calculate the logarithm of the value. If $log\_mode=\text{true}$, then the natural logarithm of the probability is calculated.

$error\_code$
  [out]  Variable to store the error code.

$result[]$
  [out]  Array for values of the probability function.
MathQuantileNoncentralChiSquare

For the specified `probability`, the function calculates the value of inverse noncentral chi-squared distribution function with the nu and sigma parameters. In case of error it returns NaN.

```c
double MathQuantileNoncentralChiSquare(
    const double probability, // probability value of random variable occurrence
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code // variable to store the error code
);
```

For the specified `probability` array of probability values, the function calculates the value of inverse noncentral chi-squared distribution function with the nu and sigma parameters. In case of error it returns false. Analog of the `qchisq()` in R.

```c
double MathQuantileNoncentralChiSquare(
    const double& probability[], // array with probability values of random variable occurrence
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[] // array with values of quantiles
);
```

For the specified `probability[]` array of probability values, the function calculates the value of inverse noncentral chi-squared distribution function. In case of error it returns false.

```c
bool MathQuantileNoncentralChiSquare(
    const double& probability[], // array with probability values of random variable occurrence
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    double& result[] // array with values of quantiles
);
```

Parameters

- `probability`:
  - [in] Probability value of random variable.
probability[
  [in] Array with probability values of random variable.
]

nu
  [in] Parameter of distribution (number of degrees of freedom).

sigma
  [in] Noncentrality parameter.

tail
  [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
  [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

error_code
  [out] Variable to get the error code.

result[]
  [out] Array with values of quantiles.
MathRandomNoncentralChiSquare

Generates a pseudorandom variable distributed according to the law of noncentral chi-squared distribution with the nu and sigma parameters. In case of error it returns NaN.

double MathRandomNoncentralChiSquare{
    const double nu,                  // parameter of distribution (number of degrees of freedom)
    const double sigma,               // noncentrality parameter
    int& error_code                   // variable to store the error code
};

Generates pseudorandom variables distributed according to the law of noncentral chi-squared distribution with the nu and sigma parameters. In case of error it returns false. Analog of the \texttt{rchisq()} in R.

bool MathRandomNoncentralChiSquare{
    const double nu,                  // parameter of distribution (number of degrees of freedom)
    const double sigma,               // noncentrality parameter
    const int data_count,             // amount of required data
    double& result[]                  // array with values of pseudorandom variables
};

Parameters

\textit{nu} \\
[in] Parameter of distribution (number of degrees of freedom).

\textit{sigma} \\
[in] Noncentrality parameter.

\textit{error\_code} \\
[out] Variable to store the error code.

\textit{data\_count} \\
[out] Amount of required data.

\textit{result[]} \\
[out] Array to obtain the values of pseudorandom variables.
**MathMomentsNoncentralChiSquare**

Calculates the theoretical numerical values of the first 4 moments of the noncentral chi-squared distribution with the nu and sigma parameters.

```cpp
double MathMomentsNoncentralChiSquare(
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    double& mean, // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code // variable for the error code
);
```

**Parameters**

`nu`
- [in] Parameter of distribution (number of degrees of freedom).

`sigma`
- [in] Noncentrality parameter.

`mean`
- [out] Variable to get the mean value.

`variance`
- [out] Variable to get the variance.

`skewness`
- [out] Variable to get the skewness.

`kurtosis`
- [out] Variable to get the kurtosis.

`error_code`
- [out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Exponential

This section contains functions for working with exponential distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the law of exponential distribution. The exponential distribution is defined by the following formula:

\[ f_{\text{Exponential}}(x \mid \mu) = \frac{1}{\mu} e^{-\frac{x}{\mu}} \]

where:
- \( x \) — value of the random variable
- \( \mu \) — expected value

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

    stepv=NormalizeDouble(MathPow(10,-degree),degree);
    if((maxv-minv)/stepv>10)
        stepv/=10.;
}
MathProbabilityDensityExponential

Calculates the value of the probability density function of exponential distribution with the mu parameter for a random variable x. In case of error it returns NaN.

```cpp
double MathProbabilityDensityExponential(
    const double x,      // value of random variable
    const double mu,     // parameter of the distribution (expected value)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code       // variable to store the error code
);
```

Calculates the value of the probability density function of exponential distribution with the mu parameter for an array of random variables x[]. In case of error it returns false. Analog of the `dexp()` in R.

```cpp
bool MathProbabilityDensityExponential(
    const double x[],   // array with the values of random variable
    const double mu,    // parameter of the distribution (expected value)
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[]    // array for values of the probability density function
);
```

Calculates the value of the probability density function of exponential distribution with the mu parameter for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathProbabilityDensityExponential(
    const double x[],   // array with the values of random variable
    const double mu,    // parameter of the distribution (expected value)
    double& result[]    // array for values of the probability density function
);
```

Parameters

- `x`
  - `[in]` Value of random variable.

- `x[]`
  - `[in]` Array with the values of random variable.

- `mu`
  - `[in]` Parameter of the distribution (expected value)

- `log_mode`
[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

`error_code`

[out] Variable to store the error code.

`result[]`

[out] Array for values of the probability density function.
MathCumulativeDistributionExponential

Calculates the exponential distribution function of probabilities with the mu parameter for a random variable x. In case of error it returns NaN.

double  MathCumulativeDistributionExponential(
    const double  x,  // value of random variable
    const double  mu,  // parameter of the distribution (expected value)
    const bool    tail,  // flag of calculation, if true, then the probability
    const bool    log_mode,  // calculate the logarithm of the value, if log_mode=true
    int&            error_code  // variable to store the error code
);

Calculates the exponential distribution function of probabilities with the mu parameter for a random variable x. In case of error it returns NaN.

double  MathCumulativeDistributionExponential(
    const double  x,  // value of random variable
    const double  mu,  // parameter of the distribution (expected value)
    int&            error_code  // variable to store the error code
);

Calculates the exponential distribution function of probabilities with the mu parameter for an array of random variables x[]. In case of error it returns false. Analog of the pexp() in R.

bool   MathCumulativeDistributionExponential(
    const double& x[],  // array with the values of random variable
    const double  mu,  // parameter of the distribution (expected value)
    const bool    tail,  // flag of calculation, if true, then the probability
    const bool    log_mode,  // flag to calculate the logarithm of the value, if log_mode=true
    double&       result[]  // array for values of the probability function
);

bool   MathCumulativeDistributionExponential(
    const double& x[],  // array with the values of random variable
    const double  mu,  // parameter of the distribution (expected value)
    double&       result[]  // array for values of the probability function
);

Parameters

x    [in]  Value of random variable.

x[]    [in]  Array with the values of random variable.

mu    [in]  Parameter of the distribution (expected value).
**tail**

[in] Flag of calculation. If true, then the probability of random variable not exceeding \( x \) is calculated.

**log_mode**

[in] Flag to calculate the logarithm of the value. If \( \text{log\_mode} = \text{true} \), then the natural logarithm of the probability is calculated.

**error_code**

[out] Variable to store the error code.

**result[]**

[out] Array for values of the probability function.
**MathQuantileExponential**

For the specified `probability`, the function calculates the value of inverse exponential distribution function with the `mu` parameter. In case of error it returns `NaN`.

```cpp
double MathQuantileExponential(
    const double probability, // probability value of random variable occurrence
    const double mu, // parameter of the distribution (expected value)
    const bool tail, // flag of calculation, if false, then calculation is
    const bool log_mode, // flag of calculation, if log_mode=true, calculation
    int& error_code // variable to store the error code
);
```

For the specified `probability` array of probability values, the function calculates the value of inverse exponential distribution function with the `mu` parameter. In case of error it returns false. Analog of the `qexp()` in R.

```cpp
double MathQuantileExponential(
    const double& probability[], // array with probability values of random variable occurrence
    const double mu, // parameter of the distribution (expected value)
    const bool tail, // flag of calculation, if false, then calculation is
    const bool log_mode, // flag of calculation, if log_mode=true, calculation
    double& result[] // array with values of quantiles
);
```

Parameters

- `probability`
  - `[in]` Probability value of random variable.

- `probability[]`
  - `[in]` Array with probability values of random variable.

- `mu`
[in]  Parameter of the distribution (expected value).

`tail`
[in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

`log_mode`
[in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

`error_code`
[out] Variable to get the error code.

`result[]`
[out] Array with values of quantiles.
MathRandomExponential

Generates a pseudorandom variable distributed according to the law of exponential distribution with the mu parameter. In case of error it returns NaN.

```cpp
double MathRandomExponential(
    const double mu, // parameter of the distribution (expected value)
    int& error_code // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of exponential distribution with the mu parameter. In case of error it returns false. Analog of the `rexp()` in R.

```cpp
bool MathRandomExponential(
    const double mu, // parameter of the distribution (expected value)
    const int data_count, // amount of required data
    double& result[] // array with values of pseudorandom variables
);
```

Parameters

mu

[in] Parameter of the distribution (expected value).

error_code

[out] Variable to store the error code.

data_count

[out] Amount of required data.

result[]

[out] Array to obtain the values of pseudorandom variables.
MathMomentsExponential

Calculates the theoretical numerical values of the first 4 moments of the exponential distribution with the mu parameter.

```cpp
double MathMomentsExponential(
    const double mu, // parameter of the distribution (expected value)
    double& mean, // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code // variable for the error code
);
```

Parameters

- `mu` [in] Parameter of the distribution (expected value).
- `mean` [out] Variable to get the mean value.
- `variance` [out] Variable to get the variance.
- `skewness` [out] Variable to get the skewness.
- `kurtosis` [out] Variable to get the kurtosis.
- `error_code` [out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
F-distribution

This section contains functions for working with F-distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the law of Fisher’s F-distribution. The F-distribution is defined by the following formula:

\[
 f_F(x | \nu_1, \nu_2) = \frac{\Gamma\left(\frac{\nu_1 + \nu_2}{2}\right)}{\Gamma\left(\frac{\nu_1}{2}\right)\Gamma\left(\frac{\nu_2}{2}\right)} \left(\frac{\nu_2}{\nu_1}\right)^{\frac{\nu_1}{2}} \frac{x^{\frac{\nu_1}{2}-1}}{\left(1 + \frac{\nu_1}{\nu_2}x\right)^{\frac{\nu_1 + \nu_2}{2}}}
\]

where:

- \(x\) — value of the random variable
- \(\nu_1\) — the first parameter of distribution (number of degrees of freedom)
- \(\nu_2\) — the second parameter of distribution (number of degrees of freedom)

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

    stepv=NormalizeDouble(MathPow(10,-degree),degree);
    if((maxv-minv)/stepv<10) stepv/=10.;
}

return (true);
}
MathProbabilityDensityF

Calculates the value of the probability density function of Fisher’s F-distribution with the nu1 and nu2 parameters for a random variable x. In case of error it returns NaN.

double MathProbabilityDensityF(
    const double x, // value of random variable
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    int& error_code // variable to store the error code
);
[in] Array with the values of random variable.

nu1 [in] The first parameter of distribution (number of degrees of freedom).

nu2 [in] The second parameter of distribution (number of degrees of freedom).

log_mode [in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

error_code [out] Variable to store the error code.

result[] [out] Array for values of the probability density function.
MathCumulativeDistributionF

Calculates the value of the probability distribution function of Fisher’s F-distribution with the nu1 and nu2 parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionF(
    const double x,          // value of random variable
    const double nu1,        // the first parameter of distribution (number of degrees of freedom)
    const double nu2,        // the second parameter of distribution (number of degrees of freedom)
    const bool tail,         // flag of calculation, if true, then the probability
    const bool log_mode,     // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    int& error_code          // variable to store the error code
);

Calculates the value of the probability distribution function of Fisher’s F-distribution with the nu1 and nu2 parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionF(
    const double x,          // value of random variable
    const double nu1,        // the first parameter of distribution (number of degrees of freedom)
    const double nu2,        // the second parameter of distribution (number of degrees of freedom)
    const bool tail,         // flag of calculation, if true, then the probability
    const bool log_mode,     // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    int& error_code          // variable to store the error code
);

Calculates the value of the probability distribution function of Fisher’s F-distribution with the nu1 and nu2 parameters for an array of random variables x[]. In case of error it returns false. Analog of the pf() in R.

bool MathCumulativeDistributionF(
    const double& x[],       // array with the values of random variable
    const double nu1,        // the first parameter of distribution (number of degrees of freedom)
    const double nu2,        // the second parameter of distribution (number of degrees of freedom)
    const bool tail,         // flag of calculation, if true, then the probability
    const bool log_mode,     // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    double& result[]         // array for values of the probability function
);

Calculates the value of the probability distribution function of Fisher’s F-distribution with the nu1 and nu2 parameters for an array of random variables x[]. In case of error it returns false.

bool MathCumulativeDistributionF(
    const double& x[],       // array with the values of random variable
    const double nu1,        // the first parameter of distribution (number of degrees of freedom)
    const double nu2,        // the second parameter of distribution (number of degrees of freedom)
    double& result[]         // array for values of the probability function
);

Parameters

x
x[]
  [in] Array with the values of random variable.

nu1
  [in] The first parameter of distribution (number of degrees of freedom).

nu2
  [in] The second parameter of distribution (number of degrees of freedom).

tail
  [in] Flag of calculation. If true, then the probability of random variable not exceeding x is calculated.

log_mode
  [in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability is calculated.

tail
  [in] Flag of calculation. If true, then the probability of random variable not exceeding x is calculated.

error_code
  [out] Variable to store the error code.

result[]
  [out] Array for values of the probability function.
### MathQuantileF

For the specified `probability`, the function calculates the value of inverse Fisher's F-distribution function with the `nu1` and `nu2` parameters. In case of error it returns `NaN`.

```cpp
double MathQuantileF(
    const double probability, // probability value of random variable occurrence
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code // variable to store the error code
);
```

For the specified `probability[]` array of probability values, the function calculates the value of inverse Fisher's F-distribution function with the `nu1` and `nu2` parameters. In case of error it returns false. Analog of the `qf()` in R.

```cpp
double MathQuantileF(
    const double& probability[], // array with probability values of random variable occurrence
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[] // array with values of quantiles
);
```

Parameters

- **probability**
  - `[in]` Probability value of random variable.
**probability[]**
[in] Array with probability values of random variable.

**nu1**
[in] The first parameter of distribution (number of degrees of freedom).

**nu2**
[in] The second parameter of distribution (number of degrees of freedom).

**tail**
[in] Flag of calculation, if lower_tail=false, then calculation is performed for 1.0-probability.

**log_mode**
[in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

**error_code**
[out] Variable to get the error code.

**result[]**
[out] Array with values of quantiles.
MathRandomF

Generates a pseudorandom variable distributed according to the law of Fisher's F-distribution with the nu1 and nu2 parameters. In case of error it returns NaN.

double MathRandomF(
    const double nu1,            // the first parameter of distribution (number of degrees of freedom)
    const double nu2,            // the second parameter of distribution (number of degrees of freedom)
    int& error_code              // variable to store the error code
);

Generates pseudorandom variables distributed according to the law of Fisher's F-distribution with the nu1 and nu2 parameters. In case of error it returns false. Analog of the rf() in R.

bool MathRandomF(
    const double nu1,            // the first parameter of distribution (number of degrees of freedom)
    const double nu2,            // the second parameter of distribution (number of degrees of freedom)
    const int data_count,        // amount of required data
    double& result[]             // array with values of pseudorandom variables
);

Parameters

nu1
    [in] The first parameter of distribution (number of degrees of freedom).

nu2
    [in] The second parameter of distribution (number of degrees of freedom).

error_code
    [out] Variable to store the error code.

data_count
    [out] Amount of required data.

result[]
    [out] Array to obtain the values of pseudorandom variables.
MathMomentsF

Calculates the theoretical numerical values of the first 4 moments of the Fisher's F-distribution with the \( \nu_1 \) and \( \nu_2 \) parameters.

```cpp
double MathMomentsF(
    const double \( \nu_1 \),               // the first parameter of distribution (number of degrees of freedom)
    const double \( \nu_2 \),               // the second parameter of distribution (number of degrees of freedom)
    double& \( \text{mean} \),             // variable for the mean
    double& \( \text{variance} \),         // variable for the variance
    double& \( \text{skewness} \),         // variable for the skewness
    double& \( \text{kurtosis} \),         // variable for the kurtosis
    int& \( \text{error\_code} \)          // variable for the error code
);
```

**Parameters**

- \( \nu_1 \)  
  - [in] The first parameter of distribution (number of degrees of freedom).
- \( \nu_2 \)  
  - [in] The second parameter of distribution (number of degrees of freedom).
- \( \text{mean} \)  
  - [out] Variable to get the mean value.
- \( \text{variance} \)  
  - [out] Variable to get the variance.
- \( \text{skewness} \)  
  - [out] Variable to get the skewness.
- \( \text{kurtosis} \)  
  - [out] Variable to get the kurtosis.
- \( \text{error\_code} \)  
  - [out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Noncentral F-distribution

This section contains functions for working with noncentral F-distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the law of noncentral Fisher’s F-distribution. The noncentral F-distribution is defined by the following formula:

\[ f_{\text{NoncentralF}}(x|\nu_1, \nu_2, \sigma) = e^{-\frac{x}{2}} \sum_{r=0}^{\infty} \frac{1}{r!} \left( \frac{\sigma}{2} \right)^r \frac{\Gamma \left( \frac{\nu_1 + \nu_2}{2} + r \right)}{\Gamma \left( \frac{\nu_2}{2} + r \right) \Gamma \left( \frac{\nu_1}{2} \right)} \left( \frac{\nu_1}{\nu_2} x^{\frac{\nu_2}{2}} \right)^{-\frac{\nu_1 + \nu_2}{2} - r} x^{\nu_2 - 1 - r} \]

where:
- \( x \) — value of the random variable
- \( \nu_1 \) — the first parameter of distribution (number of degrees of freedom)
- \( \nu_2 \) — the second parameter of distribution (number of degrees of freedom)
- \( \sigma \) — noncentrality parameter

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathProbabilityDensityNoncentralF

Calculates the value of the probability density function of noncentral Fisher’s F-distribution with the nu1, nu2 and sigma parameters for a random variable x. In case of error it returns NaN.

double MathProbabilityDensityNoncentralF(
    const double x,    // value of random variable
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code    // variable to store the error code
);

Calculates the value of the probability density function of noncentral Fisher’s F-distribution with the nu1, nu2 and sigma parameters for an array of random variables x[]. In case of error it returns false. Analog of the df() in R.

bool MathProbabilityDensityNoncentralF(
    const double x[], // array with the values of random variable
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[]   // array for values of the probability density function
);

Calculates the value of the probability density function of noncentral Fisher’s F-distribution with the nu1, nu2 and sigma parameters for an array of random variables x[]. In case of error it returns false.

bool MathProbabilityDensityNoncentralF(
    const double x[], // array with the values of random variable
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    double& result[]   // array for values of the probability density function
);

Parameters
Standard Library

\( x \)

\( x[] \)

[in] Array with the values of random variable.

\( nu1 \)

[in] The first parameter of distribution (number of degrees of freedom).

\( nu2 \)

[in] The second parameter of distribution (number of degrees of freedom).

\( sigma \)

[in] Noncentrality parameter.

\( log\_mode \)

[in] Flag to calculate the logarithm of the value. If \( log\_mode=\text{true} \), then the natural logarithm of the probability density is returned.

\( error\_code \)

[\text{out}] Variable to store the error code.

\( result[] \)

[\text{out}] Array for values of the probability density function.
MathCumulativeDistributionNoncentralF

Calculates the value of the probability distribution function of noncentral Fisher’s F-distribution with the nu1, nu2 and sigma parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionNoncentralF(
    const double x,  // value of random variable
    const double nu1,  // the first parameter of distribution (number of degrees of freedom)
    const double nu2,  // the second parameter of distribution (number of degrees of freedom)
    const double sigma,  // noncentrality parameter
    const bool tail,  // flag of calculation, if true, then the probability of random variable not exceeding x is calculated
    const bool log_mode,  // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    int& error_code  // variable to store the error code
);

Calculates the value of the probability distribution function of noncentral Fisher’s F-distribution with the nu1, nu2 and sigma parameters for an array of random variables x[]. In case of error it returns false. Analog of the `pf()` in R.

bool MathCumulativeDistributionNoncentralF(
    const double x[],  // array with the values of random variable
    const double nu1,  // the first parameter of distribution (number of degrees of freedom)
    const double nu2,  // the second parameter of distribution (number of degrees of freedom)
    const double sigma,  // noncentrality parameter
    const bool tail,  // flag of calculation, if true, then the probability
    const bool log_mode,  // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    double& result[]  // array for values of the probability function
);
Parameters

\( x \)

\( x[] \)
  [in] Array with the values of random variable.

\( nu1 \)
  [in] The first parameter of distribution (number of degrees of freedom).

\( nu2 \)
  [in] The second parameter of distribution (number of degrees of freedom).

\( sigma \)
  [in] Noncentrality parameter.

\( tail \)
  [in] Flag of calculation. If true, then the probability of random variable not exceeding \( x \) is calculated.

\( log\_mode \)
  [in] Flag to calculate the logarithm of the value. If \( log\_mode=true \), then the natural logarithm of the probability is calculated.

\( error\_code \)
  [out] Variable to store the error code.

\( result[] \)
  [out] Array for values of the probability function.
MathQuantileF

For the specified probability, the function calculates the value of inverse noncentral Fisher's F-distribution function with the nu1, nu2 and sigma parameters. In case of error it returns NaN.

double MathQuantileF(
    const double probability, // probability value of random variable occurrence
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code // variable to store the error code
);

For the specified probability array of probability values, the function calculates the value of inverse noncentral Fisher's F-distribution function with the nu1, nu2 and sigma parameters. In case of error it returns false. Analog of the qf() in R.

double MathQuantileF(
    const double& probability[], // array with probability values of random variable occurrence
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[] // array with values of quantiles
);

For the specified probability[] array of probability values, the function calculates the value of inverse noncentral Fisher's F-distribution function with the nu1, nu2 and sigma parameters. In case of error it returns false.

bool MathQuantileF(
    const double& probability[], // array with probability values of random variable occurrence
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    double& result[] // array with values of quantiles
);
Parameters

**probability**
- [in] Probability value of random variable.

**probability[]**
- [in] Array with probability values of random variable.

**nu1**
- [in] The first parameter of distribution (number of degrees of freedom).

**nu2**
- [in] The second parameter of distribution (number of degrees of freedom).

**sigma**
- [in] Noncentrality parameter.

**tail**
- [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

**log_mode**
- [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

**error_code**
- [out] Variable to get the error code.

**result[]**
- [out] Array with values of quantiles.
MathRandomNoncentralF

Generates a pseudorandom variable distributed according to the law of noncentral Fisher's F-distribution with the nu1, nu2 and sigma parameters. In case of error it returns NaN.

double MathRandomNoncentralF(
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    int& error_code // variable to store the error code
);

Generates pseudorandom variables distributed according to the law of noncentral Fisher's F-distribution with the nu1, nu2 and sigma parameters. In case of error it returns false. Analog of the rf() in R.

bool MathRandomNoncentralF(
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    const int data_count, // amount of required data
    double& result[] // array with values of pseudorandom variables
);

Parameters

nu1
    [in] The first parameter of distribution (number of degrees of freedom).

nu2
    [in] The second parameter of distribution (number of degrees of freedom).

sigma
    [in] Noncentrality parameter.

error_code
    [out] Variable to store the error code.

data_count
    [out] Amount of required data.

result[]
    [out] Array to obtain the values of pseudorandom variables.
MathMomentsNoncentralF

Calculates the theoretical numerical values of the first 4 moments of the noncentral Fisher's F-distribution with the nu1, nu2 and sigma parameters.

```cpp
double MathMomentsNoncentralF(
    const double nu1, // the first parameter of distribution (number of degrees of freedom)
    const double nu2, // the second parameter of distribution (number of degrees of freedom)
    const double sigma, // noncentrality parameter
    double& mean, // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code // variable for the error code
);
```

Parameters

- **nu1**
  [in] The first parameter of distribution (number of degrees of freedom).

- **nu2**
  [in] The second parameter of distribution (number of degrees of freedom).

- **sigma**
  [in] Noncentrality parameter.

- **mean**
  [out] Variable to get the mean value.

- **variance**
  [out] Variable to get the variance.

- **skewness**
  [out] Variable to get the skewness.

- **kurtosis**
  [out] Variable to get the kurtosis.

- **error_code**
  [out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
t-distribution

This section contains functions for working with Student's t-distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the Student's law. The t-distribution is defined by the following formula:

\[
f_T(x | \nu) = \frac{\Gamma\left(\frac{\nu+1}{2}\right)}{\sqrt{\pi \nu} \Gamma\left(\frac{\nu}{2}\right)} \frac{1}{\left(1 + \frac{x^2}{\nu}\right)^{\frac{\nu+1}{2}}}
\]

where:
- \(x\) — value of the random variable
- \(\nu\) — parameter of distribution (number of degrees of freedom)

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

}
MathProbabilityDensityT

Calculates the value of the probability density function of Student’s t-distribution with the nu parameter for a random variable x. In case of error it returns NaN.

double MathProbabilityDensityT(
    const double x, // value of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

error_code

[out] Variable to store the error code.

result[]

[out] Array for values of the probability density function.
MathCumulativeDistributionT

Calculates the value of the Student’s t-distribution function with the nu parameter for a random variable x. In case of error it returns NaN.

```c
double MathCumulativeDistributionT(
    const double x,      // value of random variable
    const double nu,     // parameter of distribution (number of degrees of freedom)
    const bool tail,     // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    int& error_code      // variable to store the error code
);```

Calculates the value of the Student’s t-distribution function with the nu parameter for an array of random variables x[]. In case of error it returns false. Analog of the pt() in R.

```c
bool MathCumulativeDistributionT(
    const double& x[],  // array with the values of random variable
    const double nu,     // parameter of distribution (number of degrees of freedom)
    const bool tail,     // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[]    // array for values of the probability function
);```

Parameters

x

x[]

[in] Array with the values of random variable.

nu

[in] Parameter of distribution (number of degrees of freedom).
Standard Library

`tail`

[in] Flag of calculation. If true, then the probability of random variable not exceeding `x` is calculated.

`log_mode`

[in] Flag to calculate the logarithm of the value. If `log_mode=true`, then the natural logarithm of the probability is calculated.

`error_code`

[out] Variable to store the error code.

`result[]`

[out] Array for values of the probability function.
MathQuantileT

For the specified probability, the function calculates the value of inverse Student's t-distribution function with the nu parameter. In case of error it returns NaN.

```c
double MathQuantileT(
    const double probability,  // probability value of random variable occurrence
    const double nu,           // parameter of distribution (number of degrees of freedom)
    const bool tail,            // flag of calculation, if false, then calculation is
    const bool log_mode,        // flag of calculation, if log_mode=true, calculation
    int& error_code             // variable to store the error code
);
```

For the specified probability array of probability values, the function calculates the value of inverse Student's t-distribution function with the nu parameter. In case of error it returns false. Analog of the qt() in R.

```c
double MathQuantileT(
    const double& probability[],  // array with probability values of random variable
    const double nu,               // parameter of distribution (number of degrees of freedom)
    const bool tail,               // flag of calculation, if false, then calculation is
    const bool log_mode,           // flag of calculation, if log_mode=true, calculation
    double& result[]              // array with values of quantiles
);
```

Parameters

- `probability` [in] Probability value of random variable.
- `probability[]` [in] Array with probability values of random variable.
- `nu`
Parameter of distribution (number of degrees of freedom).

\[ tail \]
[in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

\[ log\_mode \]
[in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

\[ error\_code \]
[out] Variable to get the error code.

\[ result[] \]
[out] Array with values of quantiles.
MathRandomT

Generates a pseudorandom variable distributed according to the law of Student's t-distribution with the nu parameter. In case of error it returns NaN.

```
double MathRandomT(
    const double nu, // parameter of distribution (number of degrees of freedom)
    int& error_code  // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of Student's t-distribution with the nu parameter. In case of error it returns false. Analog of the rt() in R.

```
bool MathRandomT(
    const double nu, // parameter of distribution (number of degrees of freedom)
    const int data_count, // amount of required data
    double& result[] // array with values of pseudorandom variables
);
```

Parameters

**nu**

[in] Parameter of distribution (number of degrees of freedom).

**error_code**

[out] Variable to store the error code.

**data_count**

[out] Amount of required data.

**result[]**

[out] Array to obtain the values of pseudorandom variables.
**MathMomentsT**

Calculates the theoretical numerical values of the first 4 moments of the Student's t-distribution with the nu parameter.

```c
double MathMomentsT(
    const double nu,          // parameter of distribution (number of degrees of freedom)
    double& mean,             // variable for the mean
    double& variance,         // variable for the variance
    double& skewness,         // variable for the skewness
    double& kurtosis,         // variable for the kurtosis
    int& error_code           // variable for the error code
);
```

**Parameters**

- **nu**
  - [in] Parameter of distribution (number of degrees of freedom).

- **mean**
  - [out] Variable to get the mean value.

- **variance**
  - [out] Variable to get the variance.

- **skewness**
  - [out] Variable to get the skewness.

- **kurtosis**
  - [out] Variable to get the kurtosis.

- **error_code**
  - [out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
t-distribution

This section contains functions for working with noncentral Student's t-distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the law of noncentral t-distribution. The noncentral t-distribution is defined by the following formula:

\[
 f_{\text{NoncentralT}}(x | ν, δ) = \frac{ν^\frac{ν}{2} e^{-\frac{δ^2}{2ν}}}{\sqrt{π} \left( v + x^2 \right)^{\frac{ν}{2}} \frac{\Gamma\left( \frac{v+1}{2} \right)}{\Gamma\left( \frac{v}{2} \right)}} \sum_{r=0}^{\infty} \frac{(νδ)^r}{r!} \left( \frac{2}{v + x^2} \right)^r
\]

where:

- \( x \) — value of the random variable
- \( ν \) — parameter of distribution (number of degrees of freedom)
- \( δ \) — noncentrality parameter

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

### MathMomentsNoncentralT

Calculates the theoretical numerical values of the first 4 moments of the noncentral Student's t-distribution.

**Example:**

```csharp
#include <Graphics\Graphic.mqh>
#include <Math\Stat\NoncentralT.mqh>
#include <Math\Stat\Math.mqh>

#property script_show_inputs

//--- input parameters
input double nu_par=30; // the number of degrees of freedom
input double delta_par=5; // noncentrality parameter

//--- script program start function
void OnStart()
{
    //--- hide the price chart
    ChartSetInteger(0,CHART_SHOW,false);
    //--- initialize the random number generator
    MathSrand(GetTickCount());
    //--- generate a sample of the random variable
    long chart=0;
    string name="GraphicNormal";
    int n=1000000; // the number of values in the sample
    int ncells=51; // the number of intervals in the histogram
    double x[]; // centers of the histogram intervals
    double y[]; // the number of values from the sample falling within the int
    double data[]; // sample of random values
    double max,min; // the maximum and minimum values in the sample
    //--- obtain a sample from the noncentral Student's t-distribution
    MathRandomNoncentralT(nu_par,delta_par,n,data);
    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data,x,y,max,min,ncells);
    //--- obtain the sequence boundaries and the step for plotting the theoretical curve
    double step;
    GetMaxMinStepValues(max,min,step);
    step=MathMin(step,(max-min)/ncells);
    //--- obtain the theoretically calculated data at the interval of [min,max]
    double x2[];
    double y2[];
    MathSequence(min,max,step,x2);
    MathProbabilityDensityNoncentralT(x2,nu_par,delta_par,false,y2);
    //--- set the scale
    double theor_max=y2[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
```
double k = sample_max / theor_max;
for (int i = 0; i < cells; i++)
    y[i] /= k;

  stepv=NormalizeDouble(MathPow(10,-degree),degree);
  if((maxv-minv)/stepv<10)
  stepv/=10.;
}
MathProbabilityDensityNoncentralT

Calculates the value of the probability density function of noncentral Student’s t-distribution with the nu and delta parameters for a random variable x. In case of error it returns NaN.

double MathProbabilityDensityNoncentralT(
    const double x, // value of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double delta, // noncentrality parameter
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable for the error code
);

Calculates the value of the probability density function of noncentral Student’s t-distribution with the nu and delta parameters for an array of random variables x[]. In case of error it returns false. Analog of the dt() in R.

bool MathProbabilityDensityNoncentralT(
    const double x[], // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double delta, // noncentrality parameter
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);

Calculates the value of the probability density function of noncentral Student’s t-distribution with the nu and delta parameters for an array of random variables x[]. In case of error it returns false.

bool MathProbabilityDensityNoncentralT(
    const double x[], // array with the values of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double delta, // noncentrality parameter
    double& result[] // array for values of the probability density function
);

Parameters

x

x[]
Array with the values of random variable.

nu
[in] Parameter of distribution (number of degrees of freedom).

delta
[in] Noncentrality parameter.

log_mode
[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

error_code
[ out ] Variable to store the error code.

result[]
[ out ] Array for values of the probability density function.
MathCumulativeDistributionNoncentralT

Calculates the probability distribution function of noncentral Student's t-distribution with the nu and delta parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionNoncentralT(
    const double x, // value of random variable
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double delta, // noncentrality parameter
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    int& error_code // variable to store the error code
);
$x[]$  
[in] Array with the values of random variable.

$nu$  
[in] Parameter of distribution (number of degrees of freedom).

delta  
[in] Noncentrality parameter.

tail  
[in] Flag of calculation. If true, then the probability of random variable not exceeding $x$ is calculated.

log_mode  
[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability is calculated.

error_code  
[out] Variable to store the error code.

result[]  
[out] Array for values of the probability function.
MathQuantileNoncentralT

For the specified probability, the function calculates the value of inverse noncentral Student's t-distribution function with the nu and delta parameters. In case of error it returns NaN.

double MathQuantileNoncentralT(
    const double probability, // probability value of random variable occurrence
    const double nu,          // parameter of distribution (number of degrees of freedom)
    const double delta,        // noncentrality parameter
    const bool tail,           // flag of calculation, if lower_tail=false, then calculation is performed for 1.0-probability
    const bool log_mode,       // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code            // variable to store the error code
);

For the specified probability, the function calculates the value of inverse noncentral Student's t-distribution function with the nu and delta parameters. In case of error it returns NaN.

double MathQuantileNoncentralT(
    const double probability, // probability value of random variable occurrence
    const double nu,          // parameter of distribution (number of degrees of freedom)
    const double delta,        // noncentrality parameter
    int& error_code            // variable to store the error code
);

For the specified probability[] array of probability values, the function calculates the value of inverse noncentral Student's t-distribution function with the nu and delta parameters. In case of error it returns false. Analog of the qt() in R.

double MathQuantileNoncentralT(
    const double& probability[], // array with probability values of random variable occurrence
    const double nu,               // parameter of distribution (number of degrees of freedom)
    const double delta,            // noncentrality parameter
    const bool tail,               // flag of calculation, if lower_tail=false, then calculation is performed for 1.0-probability
    const bool log_mode,           // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[]              // array with values of quantiles
);

For the specified probability[] array of probability values, the function calculates the value of inverse noncentral Student's t-distribution function with the nu and delta parameters. In case of error it returns false.

bool MathQuantileNoncentralT(
    const double& probability[], // array with probability values of random variable occurrence
    const double nu,               // parameter of distribution (number of degrees of freedom)
    const double delta,            // noncentrality parameter
    double& result[]               // array with values of quantiles
);

Parameters

probability
[in] Probability value of random variable.

`probability[]`

[in] Array with probability values of random variable.

`nu`

[in] Parameter of distribution (number of degrees of freedom).

`delta`

[in] Noncentrality parameter.

`tail`

[in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

`log_mode`

[in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

`error_code`

[out] Variable to get the error code.

`result[]`

[out] Array with values of quantiles.
MathRandomNoncentralT

Generates a pseudorandom variable distributed according to the law of noncentral Student's t-distribution with the nu and delta parameters. In case of error it returns NaN.

double MathRandomNoncentralT(
    const double nu,       // parameter of distribution (number of degrees of freedom)
    const double delta,    // noncentrality parameter
    int& error_code        // variable to store the error code
);

Generates pseudorandom variables distributed according to the law of noncentral Student's t-distribution with the nu and delta parameters. In case of error it returns false. Analog of the rt() in R.

bool MathRandomNoncentralT(
    const double nu,       // parameter of distribution (number of degrees of freedom)
    const double delta,    // noncentrality parameter
    const int data_count,  // amount of required data
    double& result[]       // array with values of pseudorandom variables
);

Parameters

nu
    [in] Parameter of distribution (number of degrees of freedom).

delta
    [in] Noncentrality parameter.

error_code
    [out] Variable to store the error code.

data_count
    [out] Amount of required data.

result[]
    [out] Array to obtain the values of pseudorandom variables.
MathMomentsNoncentralT

Calculates the theoretical numerical values of the first 4 moments of the noncentral Student's t-distribution with the nu and delta parameters.

```c
double MathMomentsNoncentralT(
    const double nu, // parameter of distribution (number of degrees of freedom)
    const double delta, // noncentrality parameter
    double& mean, // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code // variable for the error code
);
```

Parameters

- **nu**
  - [in] Parameter of distribution (number of degrees of freedom).

- **delta**
  - [in] Noncentrality parameter.

- **mean**
  - [out] Variable to get the mean value.

- **variance**
  - [out] Variable to get the variance.

- **skewness**
  - [out] Variable to get the skewness.

- **kurtosis**
  - [out] Variable to get the kurtosis.

- **error_code**
  - [out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
Logistic distribution

This section contains functions for working with logistic distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the logistic law. The logistic distribution is defined by the following formula:

\[
    f_{\text{Logistic}}(x | \mu, \sigma) = \frac{e^{\frac{x-\mu}{\sigma}}}{\sigma \left(1 + e^{\frac{x-\mu}{\sigma}}\right)^2}
\]

where:
- \( x \) — value of the random variable
- \( \mu \) — mean parameter of the distribution
- \( \sigma \) — scale parameter of the distribution

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

//--- sequence generation step is also set based on the specified precision
    stepv=NormalizeDouble(MathPow(10,-degree),degree);
    if((maxv-minv)/stepv<10)
        stepv/=10.;
}
MathProbabilityDensityLogistic

Calculates the value of the probability density function of logistic distribution with the mu and sigma parameters for a random variable \( x \). In case of error it returns NaN.

```cpp
double MathProbabilityDensityLogistic(
    const double x, // value of random variable
    const double mu, // mean parameter of the distribution
    const double sigma, // scale parameter of the distribution
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability density function of logistic distribution with the mu and sigma parameters for an array of random variables \( x[] \). In case of error it returns false. Analog of the \texttt{dlogis()} in R.

```cpp
bool MathProbabilityDensityLogistic(
    const double& x[], // array with the values of random variable
    const double mu, // mean parameter of the distribution
    const double sigma, // scale parameter of the distribution
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);
```

Calculates the value of the probability density function of logistic distribution with the mu and sigma parameters for an array of random variables \( x[] \). In case of error it returns false.

```cpp
bool MathProbabilityDensityLogistic(
    const double& x[], // array with the values of random variable
    const double mu, // mean parameter of the distribution
    const double sigma, // scale parameter of the distribution
    double& result[] // array for values of the probability density function
);
```

**Parameters**

- \( x \)
  - [in] Value of random variable.

- \( x[] \)
Standard Library

- **[in]** Array with the values of random variable.
- **mu**
  - [in] mean parameter of the distribution.
- **sigma**
  - [in] scale parameter of the distribution.
- **log_mode**
  - [in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.
- **error_code**
  - [out] Variable to store the error code.
- **result[]**
  - [out] Array for values of the probability density function.
MathCumulativeDistributionLogistic

Calculates the logistic distribution function of probabilities with the mu and sigma parameters for a random variable \( x \). In case of error it returns \( \text{NaN} \).

```c
double MathCumulativeDistributionLogistic(
    const double x, // value of random variable
    const double mu, // mean parameter of the distribution
    const double sigma, // scale parameter of the distribution
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    int& error_code // variable to store the error code
);
```

Calculates the logistic distribution function of probabilities with the mu and sigma parameters for a random variable \( x \). In case of error it returns \( \text{NaN} \).

```c
double MathCumulativeDistributionLogistic(
    const double x, // value of random variable
    const double mu, // mean parameter of the distribution
    const double sigma, // scale parameter of the distribution
    int& error_code // variable to store the error code
);
```

Calculates the logistic distribution function of probabilities with the mu and sigma parameters for an array of random variables \( x[] \). In case of error it returns false.

```c
bool MathCumulativeDistributionLogistic(
    const double x[], // array with the values of random variable
    const double mu, // mean parameter of the distribution
    const double sigma, // scale parameter of the distribution
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[] // array for values of the probability function
);
```

Calculates the logistic distribution function of probabilities with the mu and sigma parameters for an array of random variables \( x[] \). In case of error it returns false. Analog of the \texttt{plogis()} in R.

```c
bool MathCumulativeDistributionLogistic(
    const double x[], // array with the values of random variable
    const double mu, // mean parameter of the distribution
    const double sigma, // scale parameter of the distribution
    double& result[] // array for values of the probability function
);
```

**Parameters**

\( x \)

\( x[] \)
Standard Library

[in] Array with the values of random variable.

\( \mu \)
[in] mean parameter of the distribution.

\( \sigma \)
[in] scale parameter of the distribution.

tail
[in] Flag of calculation. If true, then the probability of random variable not exceeding \( x \) is calculated.

log_mode
[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability is calculated.

error_code
[out] Variable to store the error code.

result[]
[out] Array for values of the probability function.
MathQuantileLogistic

For the specified probability, the function calculates the value of inverse logistic distribution function with the mu and sigma parameters. In case of error it returns NaN.

double MathQuantileLogistic(
    const double probability, // probability value of random variable occurrence
    const double mu,          // mean parameter of the distribution
    const double sigma,       // scale parameter of the distribution
    const bool tail,          // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,      // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code           // variable to store the error code
);
probability[]
  [in] Array with probability values of random variable.

mu
  [in] mean parameter of the distribution.

sigma
  [in] scale parameter of the distribution.

tail
  [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
  [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

error_code
  [out] Variable to get the error code.

result[]
  [out] Array with values of quantiles.
**MathRandomLogistic**

Generates a pseudorandom variable distributed according to the law of logistic distribution with the mu and sigma parameters. In case of error it returns NaN.

```cpp
double MathRandomLogistic(
    const double mu,  // mean parameter of the distribution
    const double sigma,  // scale parameter of the distribution
    int& error_code   // variable to store the error code
);```

Generates pseudorandom variables distributed according to the law of logistic distribution with the mu and sigma parameters. In case of error it returns false. Analog of the `rlogis()` in R.

```cpp
bool MathRandomLogistic(
    const double mu,  // mean parameter of the distribution
    const double sigma,  // scale parameter of the distribution
    const int data_count,  // amount of required data
    double& result[]  // array with values of pseudorandom variables
);```

**Parameters**

- **mu**
  - [in] mean parameter of the distribution.

- **sigma**
  - [in] scale parameter of the distribution.

- **error_code**
  - [out] Variable to store the error code.

- **data_count**
  - [out] Amount of required data.

- **result[]**
  - [out] Array to obtain the values of pseudorandom variables.
MathMomentsLogistic

Calculates the theoretical numerical values of the first 4 moments of the logistic distribution with the mu and sigma parameters.

```cpp
double MathMomentsLogistic(
    const double  mu,  // mean parameter of the distribution
    const double  sigma,  // scale parameter of the distribution
    double& mean,  // variable for the mean
    double& variance,  // variable for the variance
    double& skewness,  // variable for the skewness
    double& kurtosis,  // variable for the kurtosis
    int& error_code  // variable for the error code
);
```

**Parameters**

- **mu**
  - [in] mean parameter of the distribution.

- **sigma**
  - [in] scale parameter of the distribution.

- **mean**
  - [out] Variable to get the mean value.

- **variance**
  - [out] Variable to get the variance.

- **skewness**
  - [out] Variable to get the skewness.

- **kurtosis**
  - [out] Variable to get the kurtosis.

- **error_code**
  - [out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Cauchy distribution

This section contains functions for working with Cauchy distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the Cauchy law. The Cauchy distribution is defined by the following formula:

\[ f_{\text{Cauchy}}(x | a, b) = \frac{b}{\pi \left( b^2 + (x - a)^2 \right)} \]

where:
- \( x \) — value of the random variable
- \( a \) — mean parameter of the distribution
- \( b \) — scale parameter of the distribution

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

**MathMomentsCauchy**

Calculates the theoretical numerical values of the first 4 moments of the Cauchy distribution.

Example:

```c++
#include <Graphics\Graphics.mqh>
#include <Math\Stat\Cauchy.mqh>
#include <Math\Stat\Math.mqh>

#property script_show_inputs

//--- input parameters
input double a_par=-2;     // mean parameter of the distribution
input double b_par=1;      // scale parameter of the distribution

//--- script program start function
void OnStart()
{
    //--- hide the price chart
    ChartSetInteger(0, CHART_SHOW, false);
    //--- initialize the random number generator
    MathSrand(GetTickCount());
    //--- generate a sample of the random variable
    long chart=0;
    string name="GraphicNormal";
    int n=1000000;           // the number of values in the sample
    int ncells=51;           // the number of intervals in the histogram
    double x[];             // centers of the histogram intervals
    double y[];             // the number of values from the sample falling within the intervals
    double data[];          // sample of random values
    double max, min;        // the maximum and minimum values in the sample
    //--- obtain a sample from the Cauchy distribution
    MathRandomCauchy(a_par, b_par, n, data);
    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data, x, y, min, max, ncells);
    //--- obtain the sequence boundaries and the step for plotting the theoretical curve
    double step;
    GetMaxMinStepValues(max, min, step);
    step=MathMin(step, (max-min)/ncells);
    //--- obtain the theoretically calculated data at the interval of [min, max]
    double x2[];
    double y2[];
    MathSequence(min, max, step, x2);
    MathProbabilityDensityCauchy(x2, a_par, b_par, false, y2);
    //--- set the scale
    double theor_max=y2[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
    double k=sample_max/theor_max;
    for(int i=0; i<ncells; i++)
    {
        //---
    }
}
```

    //--- sequence generation step is also set based on the specified precision
    stepv = NormalizeDouble(MathPow(10, -degree), degree);
    if ((maxv - minv) / stepv < 10)
        stepv /= 10.;
}
```
MathProbabilityDensityCauchy

Calculates the value of the probability density function of Cauchy distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```c
double MathProbabilityDensityCauchy(
    const double x,       // value of random variable
    const double a,       // mean parameter of the distribution
    const double b,       // scale parameter of the distribution
    const double log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code       // variable to store the error code
);
```

Calculates the value of the probability density function of Cauchy distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```c
double MathProbabilityDensityCauchy(
    const double x,       // value of random variable
    const double a,       // mean parameter of the distribution
    const double b,       // scale parameter of the distribution
    int& error_code       // variable to store the error code
);
```

Calculates the value of the probability density function of Cauchy distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false. Analog of the dcauchy() in R.

```c
bool MathProbabilityDensityCauchy(
    const double x[],     // array with the values of random variable
    const double a,       // mean parameter of the distribution
    const double b,       // scale parameter of the distribution
    const double log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[]      // array for values of the probability density function
);
```

Calculates the value of the probability density function of Cauchy distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false.

```c
bool MathProbabilityDensityCauchy(
    const double x[],     // array with the values of random variable
    const double a,       // mean parameter of the distribution
    const double b,       // scale parameter of the distribution
    double& result[]      // array for values of the probability density function
);
```

Parameters

x

x[]
[in] Array with the values of random variable.

\( a \)

[in] mean parameter of the distribution.

\( b \)

[in] scale parameter of the distribution.

\( \text{log}_\text{mode} \)

[in] Flag to calculate the logarithm of the value. If \( \text{log}_\text{mode}=\text{true} \), then the natural logarithm of the probability density is returned.

\( \text{error}_\text{code} \)

[out] Variable to store the error code.

\( \text{result}[\cdot] \)

[out] Array for values of the probability density function.
MathCumulativeDistributionCauchy

Calculates the probability distribution function of Cauchy distribution with the \(a\) and \(b\) parameters for a random variable \(x\). In case of error it returns \(\text{NaN}\).

```cpp
double MathCumulativeDistributionCauchy(
    const double x, // value of random variable
    const double a, // mean parameter of the distribution
    const double b, // scale parameter of the distribution
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of Cauchy distribution with the \(a\) and \(b\) parameters for a random variable \(x\). In case of error it returns \(\text{NaN}\).

```cpp
double MathCumulativeDistributionCauchy(
    const double x, // value of random variable
    const double a, // mean parameter of the distribution
    const double b, // scale parameter of the distribution
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of Cauchy distribution with the \(a\) and \(b\) parameters for an array of random variables \(x[]\). In case of error it returns false.

```cpp
bool MathCumulativeDistributionCauchy(
    const double& x[], // array with the values of random variable
    const double a, // mean parameter of the distribution
    const double b, // scale parameter of the distribution
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    double& result[] // array for values of the probability function
);
```

Calculates the probability distribution function of Cauchy distribution with the \(a\) and \(b\) parameters for an array of random variables \(x[]\). In case of error it returns false. Analog of the \(\text{plogis}()\) in R.

```cpp
bool MathCumulativeDistributionCauchy(
    const double& x[], // array with the values of random variable
    const double a, // mean parameter of the distribution
    const double b, // scale parameter of the distribution
    double& result[] // array for values of the probability function
);
```

**Parameters**

- \(x\)
  - [in] Value of random variable.

- \(x[]\)
Standard Library

[in] Array with the values of random variable.

\(a\)

[in] mean parameter of the distribution.

\(b\)

[in] scale parameter of the distribution.

\(\text{tail}\)

[in] Flag of calculation. If true, then the probability of random variable not exceeding \(x\) is calculated.

\(\text{log\_mode}\)

[in] Flag to calculate the logarithm of the value. If \(\text{log\_mode}=\text{true}\), then the natural logarithm of the probability is calculated.

\(\text{error\_code}\)

[out] Variable to store the error code.

\(\text{result[]}\)

[out] Array for values of the probability function.
MathQuantileCauchy

For the specified probability, the function calculates the value of inverse Cauchy distribution function with the a and b parameters. In case of error it returns NaN.

```cpp
double MathQuantileCauchy(
    const double probability,  // probability value of random variable occurrence
    const double a,            // mean parameter of the distribution
    const double b,            // scale parameter of the distribution
    const bool tail,            // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,        // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code             // variable to store the error code
);
```

For the specified probability array of probability values, the function calculates the value of inverse Cauchy distribution function with the a and b parameters. In case of error it returns false. Analog of the qcauchy() in R.

```cpp
double MathQuantileCauchy(
    const double& probability[],   // array with probability values of random variable occurrence
    const double a,                 // mean parameter of the distribution
    const double b,                 // scale parameter of the distribution
    const bool tail,                 // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,             // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[]                // array with values of quantiles
);
```

Parameters

- **probability**
  - [in] Probability value of random variable.
probability[]
   [in] Array with probability values of random variable.

a
   [in] mean parameter of the distribution.

b
   [in] scale parameter of the distribution.

tail
   [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
   [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

tail
   [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

error_code
   [out] Variable to get the error code.

result[]
   [out] Array with values of quantiles.
MathRandomCauchy

Generates a pseudorandom variable distributed according to the law of Cauchy distribution with the a and b parameters. In case of error it returns NaN.

```cpp
double MathRandomCauchy(
    const double a,           // mean parameter of the distribution
    const double b,           // scale parameter of the distribution
    int& error_code           // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of Cauchy distribution with the a and b parameters. In case of error it returns false. Analog of the rcauchy() in R.

```cpp
bool MathRandomCauchy(
    const double a,           // mean parameter of the distribution
    const double b,           // scale parameter of the distribution
    const int data_count,     // amount of required data
    double& result[]          // array with values of pseudorandom variables
);
```

Parameters

a
- [in] mean parameter of the distribution.

b
- [in] scale parameter of the distribution.

error_code
- [out] Variable to store the error code.

data_count
- [out] Amount of required data.

result[]
- [out] Array to obtain the values of pseudorandom variables.
MathMomentsCauchy

Calculates the theoretical numerical values of the first 4 moments of the Cauchy distribution with the a and b parameters.

```cpp
double MathMomentsCauchy(
    const double a,    // mean parameter of the distribution
    const double b,    // scale parameter of the distribution
    double& mean,      // variable for the mean
    double& variance,  // variable for the variance
    double& skewness,  // variable for the skewness
    double& kurtosis,  // variable for the kurtosis
    int& error_code);  // variable for the error code
```

**Parameters**

- **a**  
  [in] mean parameter of the distribution.

- **b**  
  [in] scale parameter of the distribution.

- **mean**  
  [out] Variable to get the mean value.

- **variance**  
  [out] Variable to get the variance.

- **skewness**  
  [out] Variable to get the skewness.

- **kurtosis**  
  [out] Variable to get the kurtosis.

- **error_code**  
  [out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Uniform distribution

This section contains functions for working with uniform distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the uniform law. The uniform distribution is defined by the following formula:

\[ f_{\text{Uniform}}(x | a, b) = \frac{1}{b - a} \]

where:
- \( x \) — value of the random variable
- \( a \) — parameter of the distribution (lower bound)
- \( b \) — parameter of the distribution (upper bound)

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathProbabilityDensityUniform

Calculates the value of the probability density function of uniform distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathProbabilityDensityUniform(
    const double x,    // value of random variable
    const double a,    // distribution parameter a (lower bound)
    const double b,    // distribution parameter b (upper bound)
    const bool log_mode,  // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code     // variable to store the error code
);```

Calculates the value of the probability density function of uniform distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathProbabilityDensityUniform(
    const double x,    // value of random variable
    const double a,    // distribution parameter a (lower bound)
    const double b,    // distribution parameter b (upper bound)
    const bool log_mode,  // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code     // variable to store the error code
);```

Calculates the value of the probability density function of uniform distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false. Analog of the dunif() in R.

```cpp
bool MathProbabilityDensityUniform(
    const double& x[],    // array with the values of random variable
    const double a,    // distribution parameter a (lower bound)
    const double b,    // distribution parameter b (upper bound)
    const bool log_mode,  // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[]    // array for values of the probability density function
);```

Calculates the value of the probability density function of uniform distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathProbabilityDensityUniform(
    const double& x[],    // array with the values of random variable
    const double a,    // distribution parameter a (lower bound)
    const double b,    // distribution parameter b (upper bound)
    double& result[]    // array for values of the probability density function
);```

Parameters

- **x**
  - [in] Value of random variable.
  - x[]

© 2000-2019, MetaQuotes Software Corp.
Array with the values of random variable.

\( a \) [in] Distribution parameter \( a \) (lower bound).

\( b \) [in] Distribution parameter \( b \) (upper bound).

\( \log\_mode \) [in] Flag to calculate the logarithm of the value. If \( \log\_mode=\text{true} \), then the natural logarithm of the probability density is returned.

\( \text{error\_code} \) [out] Variable to store the error code.

\( \text{result[]} \) [out] Array for values of the probability density function.
MathCumulativeDistributionUniform

Calculates the probability distribution function of uniform distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionUniform(
    const double x, // value of random variable
    const double a, // distribution parameter a (lower bound)
    const double b, // distribution parameter b (upper bound)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of uniform distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionUniform(
    const double x, // value of random variable
    const double a, // distribution parameter a (lower bound)
    const double b, // distribution parameter b (upper bound)
    int& error_code // variable to store the error code
);
```

Calculates the probability distribution function of uniform distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathCumulativeDistributionUniform(
    const double& x[], // array with the values of random variable
    const double a, // distribution parameter a (lower bound)
    const double b, // distribution parameter b (upper bound)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[] // array for values of the probability function
);
```

Calculates the probability distribution function of uniform distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false. Analog of the `punif()` in R.

```cpp
bool MathCumulativeDistributionUniform(
    const double& x[], // array with the values of random variable
    const double a, // distribution parameter a (lower bound)
    const double b, // distribution parameter b (upper bound)
    double& result[] // array for values of the probability function
);
```

### Parameters

- **x**
  - [in] Value of random variable.
- **x[]**
Array with the values of random variable.

\( a \)

Distribution parameter \( a \) (lower bound).

\( b \)

Distribution parameter \( b \) (upper bound).

\( \text{tail} \)

Flag of calculation. If true, then the probability of random variable not exceeding \( x \) is calculated.

\( \text{log\_mode} \)

Flag to calculate the logarithm of the value. If \( \text{log\_mode}=\text{true} \), then the natural logarithm of the probability is calculated.

\( \text{error\_code} \)

Variable to store the error code.

\( \text{result[]} \)

Array for values of the probability function.
MathQuantileUniform

For the specified probability, the function calculates the value of inverse uniform distribution function with the a and b parameters. In case of error it returns NaN.

```cpp
double MathQuantileUniform(
    const double probability,  // probability value of random variable occurrence
    const double a,            // distribution parameter a (lower bound)
    const double b,            // distribution parameter b (upper bound)
    const bool tail,           // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,       // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code            // variable to store the error code
);```

For the specified probability, the function calculates the value of inverse uniform distribution function with the a and b parameters. In case of error it returns NaN.

```cpp
double MathQuantileUniform(
    const double probability,  // probability value of random variable occurrence
    const double a,            // distribution parameter a (lower bound)
    const double b,            // distribution parameter b (upper bound)
    int& error_code            // variable to store the error code
);```

For the specified probability array of probability values, the function calculates the value of inverse uniform distribution function with the a and b parameters. In case of error it returns false. Analog of the `qcausichy()` in R.

```cpp
double MathQuantileUniform(
    const double& probability[], // array with probability values of random variable occurrence
    const double a,               // distribution parameter a (lower bound)
    const double b,               // distribution parameter b (upper bound)
    const bool tail,              // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,          // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[]             // array with values of quantiles
);```

For the specified probability array of probability values, the function calculates the value of inverse uniform distribution function with the a and b parameters. In case of error it returns false.

```cpp
bool MathQuantileUniform(
    const double& probability[], // array with probability values of random variable occurrence
    const double a,               // distribution parameter a (lower bound)
    const double b,               // distribution parameter b (upper bound)
    double& result[]              // array with values of quantiles
);```

**Parameters**

probability
  
  [in] Probability value of random variable.
probability[]
[in] Array with probability values of random variable.

a
[in] Distribution parameter a (lower bound).

b
[in] Distribution parameter b (upper bound).

tail
[in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
[in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

tail
[out] Variable to get the error code.

result[]
[out] Array with values of quantiles.
MathRandomUniform

Generates a pseudorandom variable distributed according to the law of uniform distribution with the a and b parameters. In case of error it returns NaN.

```cpp
double MathRandomUniform(
    const double a,  // distribution parameter a (lower bound)
    const double b,  // distribution parameter b (upper bound)
    int& error_code   // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of uniform distribution with the a and b parameters. In case of error it returns false. Analog of the runif() in R.

```cpp
bool MathRandomUniform(
    const double a,  // distribution parameter a (lower bound)
    const double b,  // distribution parameter b (upper bound)
    const int data_count,  // amount of required data
    double& result[]    // array with values of pseudorandom variables
);
```

**Parameters**

- **a**
  - [in] Distribution parameter a (lower bound).

- **b**
  - [in] Distribution parameter b (upper bound).

- **error_code**
  - [out] Variable to store the error code.

- **data_count**
  - [out] Amount of required data.

- **result[]**
  - [out] Array to obtain the values of pseudorandom variables.
MathMomentsUniform

Calculates the theoretical numerical values of the first 4 moments of the uniform distribution with the a and b parameters.

```cpp
double MathMomentsUniform(
    const double a,  // distribution parameter a (lower bound)
    const double b,  // distribution parameter b (upper bound)
    double& mean,    // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code   // variable for the error code
);
```

**Parameters**

- **a**
  - [in] Distribution parameter a (lower bound).

- **b**
  - [in] Distribution parameter b (upper bound).

- **mean**
  - [out] Variable to get the mean value.

- **variance**
  - [out] Variable to get the variance.

- **skewness**
  - [out] Variable to get the skewness.

- **kurtosis**
  - [out] Variable to get the kurtosis.

- **error_code**
  - [out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Weibull distribution

This section contains functions for working with Weibull distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the Weibull law. The Weibull distribution is defined by the following formula:

$$f_{\text{Weibull}}(x|a, b) = \frac{a}{b} \left( \frac{x}{b} \right)^{a-1} e^{-\left( \frac{x}{b} \right)^a}$$

where:

- $x$ — value of the random variable
- $a$ — parameter of the distribution (shape)
- $b$ — parameter of the distribution (scale)

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathMomentsWeibull

Calculates the theoretical numerical values of the first 4 moments of the Weibull distribution

Example:

```csharp
#include <Graphics\Graphics.mqh>
#include <Math\Stat\Weibull.mqh>
#include <Math\Stat\Math.mqh>

#property script_show_inputs

//--- input parameters
input double a_par=1;      // parameter of the distribution (shape)
input double b_par=5;       // parameter of the distribution (scale)

//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{
    // hide the price chart
    ChartSetInteger(0, CHART_SHOW, false);

    //--- initialize the random number generator
    MathSrand(GetTickCount());

    //--- generate a sample of the random variable
    long chart=0;
    string name="GraphicNormal";
    int n=1000000;          // the number of values in the sample
    int ncells=51;          // the number of intervals in the histogram
    double x[];            // centers of the histogram intervals
    double y[];            // the number of values from the sample falling within the interval
    double data[];         // sample of random values
    double max, min;       // the maximum and minimum values in the sample

    //--- obtain a sample from the Weibull distribution
    MathRandomWeibull(a_par,b_par,n,data);

    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data,x,y,max,min,ncells);

    //--- obtain the sequence boundaries and the step for plotting the theoretical curve
    double step;
    GetMaxMinStepValues(max,min,step);
    step=MathMin(step,(max-min)/ncells);

    //--- obtain the theoretically calculated data at the interval of [min,max]
    double x2[];
    double y2[];
    MathSequence(min,max,step,x2);
    MathProbabilityDensityWeibull(x2,a_par,b_par,false,y2);

    //--- set the scale
    double theor_max=y2[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
    double k=sample_max/theor_max;
    for(int i=0; i<ncells; i++)
```
y[i]/=k;

//--- output charts
CGraphic graphic;
if (ObjectFind(chart, name)<0)
    graphic.Create(chart, name, 0, 0, 0, 780, 380);
else
    graphic.Attach(chart, name);
graphic.BackgroundMain(StringFormat("Weibull distribution a=%G b=%G", a_par, b_par));
graphic.BackgroundMainSize(16);
//--- disable automatic scaling of the X axis
graphic.XAxis().AutoScale(false);
graphic.XAxis().Max(max);

    //--- normalize the maximum and minimum values to the specified precision
    maxv=NormalizeDouble(maxv,degree);
    minv=NormalizeDouble(minv,degree);
    //--- sequence generation step is also set based on the specified precision
    stepv=NormalizeDouble(MathPow(10,-degree),degree);
    if{(maxv-minv)/stepv<10}
        stepv/=10.;
}
```
MathProbabilityDensityWeibull

Calculates the value of the probability density function of Weibull distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

double MathProbabilityDensityWeibull{
    const double x,       // value of random variable
    const double a,       // parameter of the distribution (shape)
    const double b,       // parameter of the distribution (scale)
    const bool log_mode,  // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code       // variable to store the error code
};

Calculates the value of the probability density function of Weibull distribution with the a and b parameters for a random variable x. In case of error it returns NaN.

double MathProbabilityDensityWeibull{
    const double x,       // value of random variable
    const double a,       // parameter of the distribution (shape)
    const double b,       // parameter of the distribution (scale)
    const bool log_mode,  // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code       // variable to store the error code
};

Calculates the value of the probability density function of Weibull distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false. Analog of the dweibull() in R.

bool MathProbabilityDensityWeibull{
    const double& x[],    // array with the values of random variable
    const double a,       // parameter of the distribution (shape)
    const double b,       // parameter of the distribution (scale)
    const bool log_mode,  // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[]      // array for values of the probability density function
};

Calculates the value of the probability density function of Weibull distribution with the a and b parameters for an array of random variables x[]. In case of error it returns false.

bool MathProbabilityDensityWeibull{
    const double& x[],    // array with the values of random variable
    const double a,       // parameter of the distribution (shape)
    const double b,       // parameter of the distribution (scale)
    double& result[]      // array for values of the probability density function
};

Parameters

x

x[]
Array with the values of random variable.

Parameter of the distribution (scale).

Parameter of the distribution (shape).

Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

Variable to store the error code.

Array for values of the probability density function.
MathCumulativeDistributionWeibull

Calculates the value of the Weibull distribution function with the a and b parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionWeibull(
    const double x, // value of random variable
    const double a, // parameter of the distribution (shape)
    const double b, // parameter of the distribution (scale)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if
    int& error_code // variable to store the error code
);

Calculates the value of the Weibull distribution function with the a and b parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionWeibull(
    const double x, // value of random variable
    const double a, // parameter of the distribution (shape)
    const double b, // parameter of the distribution (scale)
    int& error_code // variable to store the error code
);

Calculates the value of the Weibull distribution function with the a and b parameters for an array of random variables x[]. In case of error it returns false. Analog of the pweibull() in R.

bool MathCumulativeDistributionWeibull(
    const double x[], // array with the values of random variable
    const double a, // parameter of the distribution (shape)
    const double b, // parameter of the distribution (scale)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if
    double& result[] // array for values of the probability function
);

Calculates the value of the Weibull distribution function with the a and b parameters for an array of random variables x[]. In case of error it returns false.

bool MathCumulativeDistributionWeibull(
    const double x[], // array with the values of random variable
    const double a, // parameter of the distribution (shape)
    const double b, // parameter of the distribution (scale)
    double& result[] // array for values of the probability function
);

Parameters

x

x[]
Standard Library

- **a**
  - [in] Parameter of the distribution (scale).

- **b**
  - [in] Parameter of the distribution (shape).

- **tail**
  - [in] Flag of calculation. If true, then the probability of random variable not exceeding x is calculated.

- **log_mode**
  - [in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability is calculated.

- **error_code**
  - [out] Variable to store the error code.

- **result[]**
  - [out] Array for values of the probability function.
MathQuantileWeibull

For the specified probability, the function calculates the value of inverse Weibull distribution function with the a and b parameters. In case of error it returns NaN.

\[
\text{double MathQuantileWeibull}(
    \text{const double} \quad \text{probability}, \quad \text{// probability value of random variable occurrence}
    \text{const double} \quad a, \quad \text{// parameter of the distribution (shape)}
    \text{const double} \quad b, \quad \text{// parameter of the distribution (scale)}
    \text{const bool} \quad \text{tail}, \quad \text{// flag of calculation, if false, then calculation is}
    \text{const bool} \quad \text{log_mode,} \quad \text{// flag of calculation, if log_mode=true, calculation}
    \text{int} & \quad \text{error_code} \quad \text{// variable to store the error code}
);\]

For the specified probability array of probability values, the function calculates the value of inverse Weibull distribution function with the a and b parameters. In case of error it returns false. Analog of the qweibull() in R.

\[
\text{double MathQuantileWeibull}(
    \text{const double} & \quad \text{probability[]}, \quad \text{// array with probability values of random variable occurrence}
    \text{const double} \quad a, \quad \text{// parameter of the distribution (shape)}
    \text{const double} \quad b, \quad \text{// parameter of the distribution (scale)}
    \text{const bool} \quad \text{tail}, \quad \text{// flag of calculation, if false, then calculation is}
    \text{const bool} \quad \text{log_mode,} \quad \text{// flag of calculation, if log_mode=true, calculation}
    \text{double} & \quad \text{result[]} \quad \text{// array with values of quantiles}
);\]

For the specified probability array of probability values, the function calculates the value of inverse Weibull distribution function with the a and b parameters. In case of error it returns false.

\[
\text{bool MathQuantileWeibull}(
    \text{const double} & \quad \text{probability[]}, \quad \text{// array with probability values of random variable occurrence}
    \text{const double} \quad a, \quad \text{// parameter of the distribution (shape)}
    \text{const double} \quad b, \quad \text{// parameter of the distribution (scale)}
    \text{double} & \quad \text{result[]} \quad \text{// array with values of quantiles}
);\]

Parameters

probability

[in] Probability value of random variable.
probability[]
    [in] Array with probability values of random variable.

a
    [in] Parameter of the distribution (scale).

b
    [in] Parameter of the distribution (shape).

tail
    [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
    [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

error_code
    [out] Variable to get the error code.

result[]
    [out] Array with values of quantiles.
MathRandomWeibull

Generates a pseudorandom variable distributed according to the law of Weibull distribution with the \(a\) and \(b\) parameters. In case of error it returns NaN.

```c
double MathRandomWeibull(
    const double a,  // parameter of the distribution (shape)
    const double b,  // parameter of the distribution (scale)
    int& error_code  // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of Weibull distribution with the \(a\) and \(b\) parameters. In case of error it returns false. Analog of the \texttt{weibull()} in R.

```c
bool MathRandomWeibull(
    const double a,  // parameter of the distribution (shape)
    const double b,  // parameter of the distribution (scale)
    const int data_count,  // amount of required data
    double* result[]  // array with values of pseudorandom variables
);
```

**Parameters**

- \(a\)
  - [in] Parameter of the distribution (scale).

- \(b\)
  - [in] Parameter of the distribution (shape).

- \(error\_code\)
  - [out] Variable to store the error code.

- \(data\_count\)
  - [out] Amount of required data.

- \(result[]\)
  - [out] Array to obtain the values of pseudorandom variables.
MathMomentsWeibull

Calculates the theoretical numerical values of the first 4 moments of the Weibull distribution with the a and b parameters.

```cpp
double MathMomentsWeibull(
    const double a,       // parameter of the distribution (shape)
    const double b,       // parameter of the distribution (scale)
    double& mean,         // variable for the mean
    double& variance,     // variable for the variance
    double& skewness,     // variable for the skewness
    double& kurtosis,     // variable for the kurtosis
    int& error_code       // variable for the error code
);
```

**Parameters**

a

[in] Parameter of the distribution (scale).

b

[in] Parameter of the distribution (shape).

mean

[out] Variable to get the mean value.

variance

[out] Variable to get the variance.

skewness

[out] Variable to get the skewness.

kurtosis

[out] Variable to get the kurtosis.

error_code

[out] Variable to get the error code.

**Return Value**

Returns true if calculation of the moments has been successful, otherwise false.
Binomial distribution

This section contains functions for working with binomial distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the binomial law. The binomial distribution is defined by the following formula:

\[ f_{\text{Binomial}}(x|n,p) = \binom{n}{x} p^x (1-p)^{n-x} \]

where:
- \( x \) — value of the random variable
- \( n \) — number of tests
- \( p \) — probability of success for each test

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathMomentsBinomial calculates the theoretical numerical values of the first 4 moments of the binomial distribution.

**Example:**

```c
#include <Graphics\Graphic.mqh>
#include <Math\Stat\Binomial.mqh>
#include <Math\Stat\Math.mqh>

//--- input parameters
input double n_par=40; // the number of tests
input double p_par=0.75; // probability of success for each test

void OnStart()
{
    //--- hide the price chart
    ChartSetInteger(0, CHART_SHOW, false);

    //--- initialize the random number generator
    MathSrand(GetTickCount());

    //--- generate a sample of the random variable
    long chart=0;
    string name="GraphicNormal";
    int n=1000000; // the number of values in the sample
    int ncells=20; // the number of intervals in the histogram
    double x[]; // centers of the histogram intervals
    double y[]; // the number of values from the sample falling within the interval
    double data[]; // sample of random values
    double max,min;

    //--- obtain a sample from the binomial distribution
    MathRandomBinomial(n_par, p_par, n, data);

    //--- calculate the data to plot the histogram
    CalculateHistogramArray(data, x, y, min, max, ncells);

    //--- obtain the theoretically calculated data at the interval of [min, max]
    double x2[];
    double y2[];
    MathSequence(0, n_par, 1, x2);
    MathProbabilityDensityBinomial(x2, n_par, p_par, false, y2);

    //--- set the scale
    double theor_max=y2[ArrayMaximum(y2)];
    double sample_max=y[ArrayMaximum(y)];
    double k=sample_max/theor_max;
    for(int i=0; i<ncells; i++)
    y[i]/=k;

    //--- output charts
    CGraphic graphic;
    if(ObjectFind(chart, name)<0)
```
graphic.Create(chart, name, 0, 0, 0, 780, 380);
else
    graphic.Attach(chart, name);
graphic.BackgroundColor(StringFormat("Binomial distribution\n n=%d p=%d", n_par, p_par));
graphic.BackgroundColorMainSize(16);
    //--- plot all curves
    graphic.CurveAdd(x, y, CURVE_HISTOGRAM, "Sample").HistogramWidth(6);
    //--- and now plot the theoretical curve of the distribution density
    graphic.CurveAdd(x2, y2, CURVE_LINES, "Theory").LinesSmooth(true);
    //--- plot all curves
    graphic.Update();
}

// Calculate frequencies for data set
bool CalculateHistogramArray(const double &data[], double &intervals[], double &frequency[],
    double &maxv, double &minv, const int cells=10)
{
    if (cells<=1) return (false);
    int size=ArraySize(data);
    if (size<=cells*10) return (false);
    minv=data[ArrayMinimum(data)];
    maxv=data[ArrayMaximum(data)];
    double range=maxv-minv;
    double width=range/cells;
    if (width==0) return false;
    ArrayResize(intervals, cells);
    ArrayResize(frequency, cells);
    //--- define the interval centers
    for (int i=0; i<cells; i++)
        {intervals[i]=minv+(i+0.5)*width;
        frequency[i]=0;
        }
    //--- fill the frequencies of falling within the interval
    for (int i=0; i<size; i++)
    {int ind=int((data[i]-minv)/width);
        if (ind>=cells) ind=cells-1;
        frequency[ind]++;
    }
    return (true);
}
MathProbabilityDensityBinomial

Calculates the value of the probability mass function of binomial distribution with the n and p parameters for a random variable x. In case of error it returns NaN.

```c
double MathProbabilityDensityBinomial(
    const double x,          // value of random variable
    const double n,          // parameter of the distribution (number of tests)
    const double p,          // parameter of the distribution (probability of event occurrence in one test)
    const bool log_mode,     // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code          // variable to store the error code
);
```

Calculates the value of the probability mass function of binomial distribution with the n and p parameters for an array of random variables x[]. In case of error it returns false. Analog of the `dbinom()` in R.

```c
bool MathProbabilityDensityBinomial(
    const double& x[],       // array with the values of random variable
    const double n,          // parameter of the distribution (number of tests)
    const double p,          // parameter of the distribution (probability of event occurrence in one test)
    const bool log_mode,     // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[]         // array for values of the probability density function
);
```

Parameters

- x
  - [in] Value of random variable.
- x[]
**Standard Library**

- **Array with the values of random variable.**
- **Parameter of the distribution (number of tests).**
- **Parameter of the distribution (probability of event occurrence in one test).**
- **Flag to calculate the logarithm of the value.** If `log_mode=true`, then the natural logarithm of the probability density is returned.
- **Variable to store the error code.**
- **Array for values of the probability density function.**
MathCumulativeDistributionBinomial

Calculates the value of the probability distribution function for binomial law with the n and p parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathCumulativeDistributionBinomial(
    const double x,          // value of random variable
    const double n,          // parameter of the distribution (number of tests)
    const double p,          // parameter of the distribution (probability of event occurrence in one test)
    const bool tail,         // flag of calculation, if true, then the probability of random variable not exceeding x is calculated
    const bool log_mode,     // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    int& error_code          // variable to store the error code
);
```

Calculates the value of the probability distribution function for binomial law with the n and p parameters for an array of random variables x[]. In case of error it returns false. Analog of the pweibull() in R.

```cpp
bool MathCumulativeDistributionBinomial(
    const double& x[],         // array with the values of random variable
    const double n,            // parameter of the distribution (number of tests)
    const double p,            // parameter of the distribution (probability of event occurrence in one test)
    const bool tail,           // flag of calculation, if true, then the probability of random variable not exceeding x is calculated
    const bool log_mode,       // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[]          // array for values of the probability function
);
```

Parameters

x

Standard Library

\(x[]\)

[in] Array with the values of random variable.

\(n\)

[in] Parameter of the distribution (number of tests).

\(p\)

[in] Parameter of the distribution (probability of event occurrence in one test).

\(\text{tail}\)

[in] Flag of calculation. If true, then the probability of random variable not exceeding \(x\) is calculated.

\(\log\_mode\)

[in] Flag to calculate the logarithm of the value. If \(\log\_mode=\text{true}\), then the natural logarithm of the probability is calculated.

\(\text{error\_code}\)

[out] Variable to store the error code.

\(\text{result[]}\)

[out] Array for values of the probability function.
MathQuantileBinomial

For the specified probability, the function calculates the inverse value of distribution function for binomial law with the n and p parameters. In case of error it returns NaN.

double MathQuantileBinomial(
    const double probability, // probability value of random variable occurrence
    const double n, // parameter of the distribution (number of tests)
    const double p, // parameter of the distribution (probability of event occurrence in one test)
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code // variable to store the error code
);

For the specified probability[], array of probability values, the function calculates the inverse value of distribution function for binomial law with the n and p parameters. In case of error it returns false. Analog of the qbinom() in R.

double MathQuantileBinomial(
    const double& probability[], // array with probability values of random variable occurrence
    const double n, // parameter of the distribution (number of tests)
    const double p, // parameter of the distribution (probability of event occurrence in one test)
    const bool tail, // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode, // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[] // array with values of quantiles
);

For the specified probability[], array of probability values, the function calculates the inverse value of distribution function for binomial law with the n and p parameters. In case of error it returns false.

bool MathQuantileBinomial(
    const double& probability[], // array with probability values of random variable occurrence
    const double n, // parameter of the distribution (number of tests)
    const double p, // parameter of the distribution (probability of event occurrence in one test)
    double& result[] // array with values of quantiles
);

Parameters

probability

[in] Probability value of random variable.
probability[]
  [in] Array with probability values of random variable.

n
  [in] Parameter of the distribution (number of tests).

p
  [in] Parameter of the distribution (probability of event occurrence in one test).

tail
  [in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
  [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

error_code
  [out] Variable to get the error code.

result[]
  [out] Array with values of quantiles.
MathRandomBinomial

Generates a pseudorandom variable distributed according to the law of binomial distribution with the n and p parameters. In case of error it returns NaN.

```cpp
double MathRandomBinomial{
    const double n,       // parameter of the distribution (number of tests)
    const double p,       // parameter of the distribution (probability of event occurrence in one test)
    int& error_code       // variable to store the error code
};
```

Generates pseudorandom variables distributed according to the law of binomial distribution with the n and p parameters. In case of error it returns false. Analog of the `rweibull()` in R.

```cpp
bool MathRandomBinomial{
    const double n,       // parameter of the distribution (number of tests)
    const double p,       // parameter of the distribution (probability of event occurrence in one test)
    const int data_count, // amount of required data
    double& result[]      // array with values of pseudorandom variables
};
```

**Parameters**

- **n**
  - [in] Parameter of the distribution (number of tests).

- **p**
  - [in] Parameter of the distribution (probability of event occurrence in one test).

- **error_code**
  - [out] Variable to store the error code.

- **data_count**
  - [out] Amount of required data.

- **result[]**
  - [out] Array to obtain the values of pseudorandom variables.
MathMomentsBinomial

Calculates the theoretical numerical values of the first 4 moments of the binomial distribution with the n and p parameters.

```
double MathMomentsBinomial(
      const double n,  // parameter of the distribution (number of tests)
      const double p,  // parameter of the distribution (probability of event occurrence in one test)
      double& mean,    // variable for the mean
      double& variance, // variable for the variance
      double& skewness, // variable for the skewness
      double& kurtosis, // variable for the kurtosis
      int& error_code  // variable for the error code
    );
```

Parameters

- **n**
  
  [in] Parameter of the distribution (number of tests).

- **p**
  
  [in] Parameter of the distribution (probability of event occurrence in one test).

- **mean**
  
  [out] Variable to get the mean value.

- **variance**
  
  [out] Variable to get the variance.

- **skewness**
  
  [out] Variable to get the skewness.

- **kurtosis**
  
  [out] Variable to get the kurtosis.

- **error_code**
  
  [out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
Negative binomial distribution

This section contains functions for working with negative binomial distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the negative binomial law. The negative binomial distribution is defined by the following formula:

\[ f_{\text{NegativeBinomial}}(x | r, p) = \frac{\Gamma(r + x)}{\Gamma(r)\Gamma(x+1)} p^r (1-p)^x \]

where:
- \( x \) — value of the random variable
- \( r \) — number of successful tests
- \( p \) — probability of success

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

        if (ind>=cells) ind=cells-1;
        frequency[ind]++;
    }
    return (true);
}
MathProbabilityDensityNegativeBinomial

Calculates the value of the probability mass function of negative binomial distribution with the r and p parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathProbabilityDensityNegativeBinomial(
    const double x, // value of random variable (integer)
    const double r, // number of successful tests
    const double p, // probability of success
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability mass function of negative binomial distribution with the r and p parameters for a random variable x. In case of error it returns NaN.

```cpp
double MathProbabilityDensityNegativeBinomial(
    const double x, // value of random variable (integer)
    const double r, // number of successful tests
    const double p, // probability of success
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability mass function of negative binomial distribution with the r and p parameters for an array of random variables x[]. In case of error it returns false. Analog of the `dnbinom()` in R.

```cpp
bool MathProbabilityDensityNegativeBinomial(
    const double x[], // array with the values of random variable
    const double r, // number of successful tests
    const double p, // probability of success
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);
```

Calculates the value of the probability mass function of negative binomial distribution with the r and p parameters for an array of random variables x[]. In case of error it returns false.

```cpp
bool MathProbabilityDensityNegativeBinomial(
    const double x[], // array with the values of random variable
    const double r, // number of successful tests
    const double p, // probability of success
    double& result[] // array for values of the probability density function
);
```

Parameters

x

x[]
Standard Library

- \( r \) [in] Array with the values of random variable.
- \( p \) [in] Number of successful tests
- \( p \) [in] Probability of success.
- \( \text{log\_mode} \) [in] Flag to calculate the logarithm of the value. If \( \text{log\_mode}=\text{true} \), then the natural logarithm of the probability density is returned.
- \( \text{error\_code} \) [out] Variable to store the error code.
- \( \text{result}\[] \) [out] Array for values of the probability density function.
MathCumulativeDistributionNegativeBinomial

Calculates the value of the probability distribution function for negative binomial law with the \( r \) and \( p \) parameters for a random variable \( x \). In case of error it returns \texttt{NaN}.

```cpp
double MathCumulativeDistributionNegativeBinomial(  
    const double x,                        // value of random variable (integer)  
    const double r,                        // number of successful tests  
    const double p,                        // probability of success  
    const bool tail,                       // flag of calculation, if true, then the probability  
    const bool log_mode,                   // flag to calculate the logarithm of the value, if \texttt{true}  
    int& error_code                        // variable to store the error code  
);
```

Calculates the value of the probability distribution function for negative binomial law with the \( r \) and \( p \) parameters for a random variable \( x \). In case of error it returns \texttt{NaN}.

```cpp
double MathCumulativeDistributionNegativeBinomial(  
    const double x,                        // value of random variable (integer)  
    const double r,                        // number of successful tests  
    const double p,                        // probability of success  
    int& error_code                        // variable to store the error code  
);
```

Calculates the value of the probability distribution function for negative binomial law with the \( r \) and \( p \) parameters for an array of random variables \( x[] \). In case of error it returns \texttt{false}. Analog of the \texttt{pweibull()} in R.

```cpp
bool MathCumulativeDistributionNegativeBinomial(  
    const double x[],                     // array with the values of random variable  
    const double r,                       // number of successful tests  
    const double p,                       // probability of success  
    const bool tail,                      // flag of calculation, if true, then the probability  
    const bool log_mode,                  // flag to calculate the logarithm of the value, if \texttt{true}  
    double& result[]                     // array for values of the probability function  
);
```

Calculates the value of the probability distribution function for negative binomial law with the \( r \) and \( p \) parameters for an array of random variables \( x[] \). In case of error it returns \texttt{false}.

```cpp
bool MathCumulativeDistributionNegativeBinomial(  
    const double & x[],                   // array with the values of random variable  
    const double & r,                     // number of successful tests  
    const double & p,                     // probability of success  
    double & result[]                    // array for values of the probability function  
);
```

### Parameters

\( x \)

$x[]$
  [in] Array with the values of random variable.

$r$
  [in] Number of successful tests.

$p$

$tail$
  [in] Flag of calculation, if true, then the probability of random variable not exceeding $x$ is calculated.

$log\_mode$
  [in] Flag to calculate the logarithm of the value, if $log\_mode$=true, then the natural logarithm of the probability is calculated.

$error\_code$
  [out] Variable to store the error code.

$result[]$
  [out] Array for values of the probability function.
MathQuantileNegativeBinomial

For the specified probability, the function calculates the inverse value of distribution function for negative binomial law with the r and p parameters. In case of error it returns NaN.

```cpp
double MathQuantileNegativeBinomial(
    const double probability,  // probability value of random variable occurrence
    const double r,            // number of successful tests
    const double p,            // probability of success
    const bool tail,           // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,       // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code            // variable to store the error code
);
```

For the specified probability array of probability values, the function calculates the inverse value of distribution function for negative binomial law with the r and p parameters. In case of error it returns false. Analog of the qnbinom() in R.

```cpp
double MathQuantileNegativeBinomial(
    const double& probability[], // array with probability values of random variable occurrence
    const double r,               // number of successful tests
    const double p,               // probability of success
    const bool tail,              // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,          // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[]             // array with values of quantiles
);
```

Parameters

- **probability**
probability[]
[in] Array with probability values of random variable.

r
[in] Number of successful tests.

p

tail
[in] Flag of calculation, if false, then calculation is performed for 1.0-probability.

log_mode
[in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

tout[]
[out] Variable to get the error code.

result[]
[out] Array with values of quantiles.
MathRandomNegativeBinomial

Generates a pseudorandom variable distributed according to the law of negative binomial distribution with the $r$ and $p$ parameters. In case of error it returns NaN.

```c
double MathRandomNegativeBinomial(
    const double r,     // number of successful tests
    const double p,     // probability of success
    int& error_code     // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of negative binomial distribution with the $r$ and $p$ parameters. In case of error it returns false. Analog of the `rweibull()` in R.

```c
bool MathRandomNegativeBinomial(
    const double r,     // number of successful tests
    const double p,     // probability of success
    const int data_count,  // amount of required data
    double& result[]    // array with values of pseudorandom variables
);
```

### Parameters

- $r$  
  [in] Number of successful tests.

- $p$  

- `error_code`  
  [out] Variable to store the error code.

- `data_count`  
  [out] Amount of required data.

- `result[]`  
  [out] Array to obtain the values of pseudorandom variables.
MathMomentsNegativeBinomial

Calculates the theoretical numerical values of the first 4 moments of the negative binomial distribution with the r and p parameters.

```cpp
double MathMomentsNegativeBinomial(
    const double r, // number of successful tests
    const double p, // probability of success
    double& mean,   // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code // variable for the error code
);
```

Parameters

r

[in] Number of successful tests.

p

mean

[ out] Variable to get the mean value.

variance

[ out] Variable to get the variance.

skewness

[ out] Variable to get the skewness.

kurtosis

[ out] Variable to get the kurtosis.

error_code

[ out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
Geometric distribution

This section contains functions for working with geometric distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the geometric law. The geometric distribution is defined by the following formula:

\[ f_{\text{Geometric}}(x | p) = p(1 - p)^x \]

where:

- \( x \) — value of the random variable (integer)
- \( p \) — probability of event occurrence in one test

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

# MathProbabilityDensityGeometric

Calculates the value of the probability mass function of geometric distribution with the \( p \) parameter for a random variable \( x \). In case of error it returns \( NaN \).

```c
double MathProbabilityDensityGeometric(const double x, // value of random variable (integer)
                                        const double p, // parameter of the distribution (probability of event occurrence in one test)
                                        const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
                                        int& error_code // variable to store the error code
);```

Calculates the value of the probability mass function of geometric distribution with the \( p \) parameter for an array of random variables \( x[] \). In case of error it returns false. Analog of the \texttt{dgeom()} in R.

```c
bool MathProbabilityDensityGeometric(const double& x[], // array with the values of random variable
                                       const double p, // parameter of the distribution (probability of event occurrence in one test)
                                       const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
                                       double& result[] // array for values of the probability density function
);```

## Parameters

- **\( x \)**
  - [in] Value of random variable.

- **\( x[] \)**
  - [in] Array with the values of random variable.

- **\( p \)**
  - [in] Parameter of the distribution (probability of event occurrence in one test).

- **\( log\_mode \)**
  - [in] Flag to calculate the logarithm of the value, if \( log\_mode=true \), then the natural logarithm of the probability density is calculated.
[in] Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

`error_code`
[out] Variable to store the error code.

`result[]`
[out] Array for values of the probability density function.
# MathCumulativeDistributionGeometric

Calculates the value of the probability distribution function for geometric law with the \( p \) parameter for a random variable \( x \). In case of error it returns NaN.

```cpp
double MathCumulativeDistributionGeometric(
    const double x,         // value of random variable (integer)
    const double p,         // parameter of the distribution (probability of event
                            // occurrence in one test)
    const bool tail,        // flag of calculation, if true, then the probability
                            // of random variable not exceeding x is calculated
    const bool log_mode,    // flag to calculate the logarithm of the value, if
                            // log_mode=true, then the natural logarithm of the
                            // probability is calculated
    int& error_code         // variable to store the error code
);
```

Calculates the value of the probability distribution function for geometric law with the \( p \) parameter for a random variable \( x \). In case of error it returns NaN.

```cpp
bool MathCumulativeDistributionGeometric(
    const double\& x[],     // array with the values of random variable
    const double p,         // parameter of the distribution (probability of event
                            // occurrence in one test)
    const bool tail,        // flag of calculation, if true, then the probability
                            // of random variable not exceeding x is calculated
    const bool log_mode,    // flag to calculate the logarithm of the value, if
                            // log_mode=true, then the natural logarithm of the
                            // probability is calculated
    double\& result[]       // array for values of the probability function
);
```

## Parameters

- **\( x \)**
  - [in] Value of random variable.

- **\( x[] \)**
  - [in] Array with the values of random variable.

- **\( p \)**
  - [in] Parameter of the distribution (probability of event occurrence in one test).
**tail**

[in] Flag of calculation, if tail=true, then the probability of random variable not exceeding x is calculated.

**log_mode**

[in] Flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated.

**error_code**

[out] Variable to store the error code.

**result[]**

[out] Array for values of the probability function.
MathQuantileGeometric

For the specified probability, the function calculates the inverse value of distribution function for geometric law with the p parameter. In case of error it returns NaN.

```cpp
double MathQuantileGeometric(
    const double probability, // probability value of random variable occurrence
    const double p,           // parameter of the distribution (probability of ever
    const bool tail,          // flag of calculation, if false, then calculation is:
    const bool log_mode,      // flag of calculation, if log_mode=true, calculation
    int& error_code           // variable to store the error code
);
```

For the specified probability[], array of probability values, the function calculates the inverse value of distribution function for geometric law with the p parameter. In case of error it returns false. Analog of the qgeom() in R.

```cpp
double MathQuantileGeometric(
    const double& probability[], // array with probability values of random variable
    const double p,              // parameter of the distribution (probability of ever
    const bool tail,             // flag of calculation, if false, then calculation is:
    const bool log_mode,         // flag of calculation, if log_mode=true, calculation
    double& result[]            // array with values of quantiles
);
```

For the specified probability[], array of probability values, the function calculates the inverse value of distribution function for geometric law with the p parameter. In case of error it returns false.

```cpp
bool MathQuantileGeometric(
    const double& probability[], // array with probability values of random variable
    const double p,              // parameter of the distribution (probability of ever
    double& result[]            // array with values of quantiles
);
```

**Parameters**

**probability**

- [in] Probability value of random variable.

**probability[]**

- [in] Array with probability values of random variable.

**p**
Parameter of the distribution (probability of event occurrence in one test).

\[ \text{tail} \]
- \[ \text{in} \] Flag of calculation, if false, then calculation is performed for 1.0-probability.

\[ \text{log\_mode} \]
- \[ \text{in} \] Flag of calculation, if \text{log\_mode}=true, calculation is performed for \text{Exp}(\text{probability}).

\[ \text{error\_code} \]
- \[ \text{out} \] Variable to get the error code.

\[ \text{result[]} \]
- \[ \text{out} \] Array with values of quantiles.
MathRandomGeometric

Generates a pseudorandom variable distributed according to the law of geometric distribution with the p parameter. In case of error it returns NaN.

```cpp
double MathRandomGeometric(
    const double p,  // parameter of the distribution (probability of event occurrence in one test)
    int& error_code   // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of geometric distribution with the p parameter. In case of error it returns false. Analog of the `rgeom()` in R.

```cpp
bool MathRandomGeometric(
    const double p,  // parameter of the distribution (probability of event occurrence in one test)
    const int data_count,  // amount of required data
    double& result[]  // array with values of pseudorandom variables
);
```

**Parameters**

- **p**
  - `[in]` Parameter of the distribution (probability of event occurrence in one test).

- **error_code**
  - `[out]` Variable to store the error code.

- **data_count**
  - `[out]` Amount of required data.

- **result[]**
  - `[out]` Array to obtain the values of pseudorandom variables.
MathMomentsGeometric

Calculates the theoretical numerical values of the first 4 moments of the geometric distribution with
the p parameter.

double MathMomentsGeometric(
    const double p,       // parameter of the distribution (probability of ever
    double& mean,        // variable for the mean
    double& variance,    // variable for the variance
    double& skewness,    // variable for the skewness
    double& kurtosis,    // variable for the kurtosis
    int& error_code      // variable for the error code
);

Parameters

p
    [in] Parameter of the distribution (probability of event occurrence in one test).

mean
    [out] Variable to get the mean value.

variance
    [out] Variable to get the variance.

skewness
    [out] Variable to get the skewness.

kurtosis
    [out] Variable to get the kurtosis.

error_code
    [out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
Hypergeometric distribution

This section contains functions for working with hypergeometric distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the hypergeometric law. The hypergeometric distribution is defined by the following formula:

\[ f_{hypergeometric}(x \mid m, k, n) = \frac{\binom{k}{x} \binom{m-k}{n-x}}{\binom{m}{n}} \]

where:
- \( x \) — value of the random variable (integer)
- \( m \) — total number of objects
- \( k \) — number of objects with the desired characteristic
- \( n \) — number of object draws

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

MathProbabilityDensityHypergeometric

Calculates the value of the probability mass function of hypergeometric distribution with the m, k and n parameters for a random variable x. In case of error it returns NaN.

```c
double MathProbabilityDensityHypergeometric(
    const double x, // value of random variable (integer)
    const double m, // total number of objects (integer)
    const double k, // number of objects with the desired characteristic
    const double n, // number of object draws (integer)
    const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    int& error_code // variable to store the error code
);
```

Calculates the value of the probability mass function of hypergeometric distribution with the m, k and n parameters for an array of random variables x[]. In case of error it returns false. Analog of the dhyper() in R.

```c
bool MathProbabilityDensityHypergeometric(
    const double& x[], // array with the values of random variable
    const double m, // total number of objects (integer)
    const double k, // number of objects with the desired characteristic
    const double n, // number of object draws (integer)
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
    double& result[] // array for values of the probability density function
);
```

Calculates the value of the probability mass function of hypergeometric distribution with the m, k and n parameters for an array of random variables x[]. In case of error it returns false.

```c
bool MathProbabilityDensityHypergeometric(
    const double& x[], // array with the values of random variable
    const double m, // total number of objects (integer)
    const double k, // number of objects with the desired characteristic
    const double n, // number of object draws (integer)
    double& result[] // array for values of the probability density function
);
```

Parameters
$x$

$x[]$
[in] Array with the values of random variable.

$m$
[in] Total number of objects (integer).

$k$
[in] Number of objects with the desired characteristic (integer).

$n$
[in] Number of object draws (integer).

$log\_mode$
[in] Flag to calculate the logarithm of the value. If log\_mode=true, then the natural logarithm of the probability density is returned.

$error\_code$
[ out] Variable to store the error code.

$result[]$
[ out] Array for values of the probability density function.
MathCumulativeDistributionHypergeometric

Calculates the value of the probability distribution function for hypergeometric law with the m, k and n parameters for a random variable x. In case of error it returns NaN.

double MathCumulativeDistributionHypergeometric(
    const double x, // value of random variable (integer)
    const double m, // total number of objects (integer)
    const double k, // number of objects with the desired characteristic
    const double n, // number of object draws (integer)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    int& error_code // variable to store the error code
);

Calculates the value of the probability distribution function for hypergeometric law with the m, k and n parameters for an array of random variables x[]. In case of error it returns false. Analog of the dhyper() in R.

bool MathCumulativeDistributionHypergeometric(
    const double& x[], // array with the values of random variable
    const double m, // total number of objects (integer)
    const double k, // number of objects with the desired characteristic
    const double n, // number of object draws (integer)
    const bool tail, // flag of calculation, if true, then the probability
    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability
    double& result[] // array for values of the distribution function
);

Calculates the value of the probability distribution function for hypergeometric law with the m, k and n parameters for an array of random variables x[]. In case of error it returns false.

bool MathCumulativeDistributionHypergeometric(
    const double& x[], // array with the values of random variable
    const double m, // total number of objects (integer)
    const double k, // number of objects with the desired characteristic
    const double n, // number of object draws (integer)
    double& result[] // array for values of the distribution function
);
Parameters

\( x \)  

\( x[] \)  
[in] Array with the values of random variable.

\( m \)  
[in] Total number of objects (integer).

\( k \)  
[in] Number of objects with the desired characteristic (integer).

\( n \)  
[in] Number of object draws (integer).

\( \text{tail} \)  
[in] Flag of calculation, if true, then the probability of random variable not exceeding \( x \) is calculated.

\( \text{log\_mode} \)  
[in] Flag to calculate the logarithm of the value, if \( \text{log\_mode} = \text{true} \), then the natural logarithm of the probability is calculated.

\( \text{error\_code} \)  
[out] Variable to store the error code.

\( \text{result[]} \)  
[out] Array for values of the distribution function.
MathQuantileHypergeometric

For the specified probability, the function calculates the inverse value of distribution function for hypergeometric law with the m, k and n parameters. In case of error it returns NaN.

```cpp
double MathQuantileHypergeometric(
    const double probability, // probability value of random variable occurrence
    const double m,           // total number of objects (integer)
    const double k,           // number of objects with the desired characteristic
    const double n,           // number of object draws (integer)
    const bool tail,          // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,      // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    int& error_code           // variable to store the error code
);
```

For the specified probability array of probability values, the function calculates the inverse value of distribution function for hypergeometric law with the m, k and n parameters. In case of error it returns false. Analog of the `qhyper()` in R.

```cpp
double MathQuantileHypergeometric(
    const double& probability[], // array with probability values of random variable
    const double m,               // total number of objects (integer)
    const double k,               // number of objects with the desired characteristic
    const double n,               // number of object draws (integer)
    const bool tail,              // flag of calculation, if false, then calculation is performed for 1.0-probability
    const bool log_mode,          // flag of calculation, if log_mode=true, calculation is performed for Exp(probability)
    double& result[]             // array with values of quantiles
);
```

For the specified probability[] array of probability values, the function calculates the inverse value of distribution function for hypergeometric law with the m, k and n parameters. In case of error it returns false.

```cpp
bool MathQuantileHypergeometric(
    const double& probability[], // array with probability values of random variable
    const double m,               // total number of objects (integer)
    const double k,               // number of objects with the desired characteristic
    const double n,               // number of object draws (integer)
    double& result[]             // array with values of quantiles
);
Parameters

probability
  [in] Probability value of random variable.

probability[]
  [in] Array with probability values of random variable.

m
  [in] Total number of objects (integer).

k
  [in] Number of objects with the desired characteristic (integer).

n
  [in] Number of object draws (integer).

tail
  [in] Flag of calculation, if tail=false, then calculation is performed for 1.0-probability.

log_mode
  [in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

error_code
  [out] Variable to get the error code.

result[]
  [out] Array with values of quantiles.
MathRandomHypergeometric

Generates a pseudorandom variable distributed according to the law of hypergeometric distribution with the m, n and k parameters. In case of error it returns NaN.

```cpp
double MathRandomHypergeometric(
    const double m,  // total number of objects (integer)
    const double k,  // number of objects with the desired characteristic
    const double n,  // number of object draws (integer)
    int& error_code  // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of hypergeometric distribution with the m, n and k parameters. In case of error it returns false. Analog of the `rgeom()` in R.

```cpp
bool MathRandomHypergeometric(
    const double m,  // total number of objects (integer)
    const double k,  // number of objects with the desired characteristic
    const double n,  // number of object draws (integer)
    const int data_count,  // amount of required data
    double& result[]  // array with values of pseudorandom variables
);
```

Parameters

- **m**
  - [in] Total number of objects (integer).

- **k**
  - [in] Number of objects with the desired characteristic (integer).

- **n**
  - [in] Number of object draws (integer).

- **error_code**
  - [out] Variable to store the error code.

- **data_count**
  - [out] Amount of required data.

- **result[]**
  - [out] Array to obtain the values of pseudorandom variables.
MathMomentsHypergeometric

Calculates the theoretical numerical values of the first 4 moments of the hypergeometric distribution with the m, n and k parameters.

```cpp
double MathMomentsHypergeometric(
    const double m,   // total number of objects (integer)
    const double k,   // number of objects with the desired characteristic
    const double n,   // number of object draws (integer)
    double& mean,    // variable for the mean
    double& variance, // variable for the variance
    double& skewness, // variable for the skewness
    double& kurtosis, // variable for the kurtosis
    int& error_code   // variable for the error code
);
```

Parameters

m
- [in] Total number of objects (integer).

k
- [in] Number of objects with the desired characteristic (integer).

n
- [in] Number of object draws (integer).

mean
- [out] Variable to get the mean value.

variance
- [out] Variable to get the variance.

skewness
- [out] Variable to get the skewness.

kurtosis
- [out] Variable to get the kurtosis.

error_code
- [out] Variable to get the error code.

Return Value

Returns true if calculation of the moments has been successful, otherwise false.
Poisson distribution

This section contains functions for working with Poisson distribution. They allow to calculate density, probability, quantiles and to generate pseudo-random numbers distributed according to the Poisson law. The Poisson distribution is defined by the following formula:

\[ f_{\text{Poisson}}(x|\lambda) = \frac{\lambda^x}{x!} e^{-\lambda} \]

where:
- \( x \) — value of the random variable
- \( \lambda \) — parameter of the distribution (mean)

In addition to the calculation of the individual random variables, the library also implements the ability to work with arrays of random variables.

    stepv=NormalizeDouble(MathPow(10,-degree),degree);
    if((maxv-minv)/stepv<10)
        stepv/=10.;
}
```
MathProbabilityDensityPoisson

Calculates the value of the probability mass function of Poisson distribution with the lambda parameter for a random variable x. In case of error it returns \texttt{NaN}.

```cpp
double MathProbabilityDensityPoisson(const double x, // value of random variable (integer)
                                      const double lambda, // parameter of the distribution (mean)
                                      const bool log_mode, // calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
                                      int& error_code); // variable to store the error code
```

Calculates the value of the probability mass function of Poisson distribution with the lambda parameter for a random variable x. In case of error it returns \texttt{NaN}.

```cpp
double MathProbabilityDensityPoisson(const double x, // value of random variable (integer)
                                      const double lambda, // parameter of the distribution (mean)
                                      int& error_code); // variable to store the error code
```

Calculates the value of the probability mass function of Poisson distribution with the lambda parameter for an array of random variables \(x\). In case of error it returns false. Analog of the \texttt{dhyper()} in R.

```cpp
bool MathProbabilityDensityPoisson(const double x[], // array with the values of random variable
                                    const double lambda, // parameter of the distribution (mean)
                                    const bool log_mode, // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability density is calculated
                                    double& result[]); // array for values of the probability density function
```

Calculates the value of the probability mass function of Poisson distribution with the lambda parameter for an array of random variables \(x\). In case of error it returns false.

```cpp
bool MathProbabilityDensityPoisson(const double x[], // array with the values of random variable
                                    const double lambda, // parameter of the distribution (mean)
                                    double& result[]); // array for values of the probability density function
```

**Parameters**

- \(x\) [in] Value of random variable.
- \(x[]\) [in] Array with the values of random variable.
- lambda [in] Parameter of the distribution (mean).
- log_mode
Flag to calculate the logarithm of the value. If log_mode=true, then the natural logarithm of the probability density is returned.

`error_code`

Variable to store the error code.

`result[]`

Array for values of the probability density function.
MathCumulativeDistributionPoisson

Calculates the value of the Poisson distribution function with the lambda parameter for a random variable x. In case of error it returns NaN.

```c
double MathCumulativeDistributionPoisson(
    const double x,       // value of random variable (integer)
    const double lambda,  // parameter of the distribution (mean)
    const bool tail,      // flag of calculation, if true, then the probability
    const bool log_mode,  // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    int& error_code       // variable to store the error code
);
```

Calculates the value of the Poisson distribution function with the lambda parameter for a random variable x. In case of error it returns NaN.

```c
double MathCumulativeDistributionPoisson(
    const double x,       // value of random variable (integer)
    const double lambda,  // parameter of the distribution (mean)
    int& error_code       // variable to store the error code
);
```

Calculates the value of the Poisson distribution function with the lambda parameter for an array of random variables x[]. In case of error it returns false. Analog of the `dhyper()` in R.

```c
bool MathCumulativeDistributionPoisson(
    const double& x[],    // array with the values of random variable
    const double lambda,  // parameter of the distribution (mean)
    const bool tail,      // flag of calculation, if true, then the probability
    const bool log_mode,  // flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated
    double& result[]     // array for values of the distribution function
);
```

Calculates the value of the Poisson distribution function with the lambda parameter for an array of random variables x[]. In case of error it returns false.

```c
bool MathCumulativeDistributionPoisson(
    const double& x[],    // array with the values of random variable
    const double lambda,  // parameter of the distribution (mean)
    double& result[]     // array for values of the distribution function
);
```

**Parameters**

- **x**
  - [in] Value of random variable.

- **x[]**
  - [in] Array with the values of random variable.

- **lambda**
  - [in] Parameter of the distribution (mean).
tail
    [in] Flag of calculation, if true, then the probability of random variable not exceeding \( x \) is calculated.

log_mode
    [in] Flag to calculate the logarithm of the value, if log_mode=true, then the natural logarithm of the probability is calculated.

error_code
    [out] Variable to store the error code.

result[]
    [out] Array for values of the distribution function.
MathQuantilePoisson

For the specified probability, the function calculates the inverse value of Poisson distribution function with the lambda parameter. In case of error it returns NaN.

```c
double MathQuantilePoisson(
    const double probability,  // probability value of random variable occurrence
    const double lambda,       // parameter of the distribution (mean)
    const bool tail,           // flag of calculation, if false, then calculation is
    const bool log_mode,       // flag of calculation, if log_mode=true, calculation
    int& error_code            // variable to store the error code
);
```

For the specified probability[] array of probability values, the function calculates the inverse value of Poisson distribution function with the lambda parameter. In case of error it returns false. Analog of the qhyper() in R.

```c
double MathQuantilePoisson(
    const double& probability[],  // array with probability values of random variable occurrence
    const double lambda,           // parameter of the distribution (mean)
    const bool tail,               // flag of calculation, if false, then calculation is
    const bool log_mode,           // flag of calculation, if log_mode=true, calculation
    double& result[]              // array with values of quantiles
);
```

Parameters

- **probability**
  - [in] Probability value of random variable.

- **probability[]**
  - [in] Array with probability values of random variable.

- **lambda**
Standard Library

[in] Parameter of the distribution (mean).

tail
[in] Flag of calculation, if tail=false, then calculation is performed for 1.0-probability.

log_mode
[in] Flag of calculation, if log_mode=true, calculation is performed for Exp(probability).

error_code
[out] Variable to get the error code.

result[]
[out] Array with values of quantiles.
MathRandomPoisson

Generates a pseudorandom variable distributed according to the law of Poisson distribution with the lambda parameter. In case of error it returns NaN.

```c
double MathRandomPoisson(
    const double lambda,  // parameter of the distribution (mean)
    int& error_code       // variable to store the error code
);
```

Generates pseudorandom variables distributed according to the law of Poisson distribution with the lambda parameter. In case of error it returns false. Analog of the `rgeom()` in R.

```c
bool MathRandomPoisson(
    const double lambda,  // parameter of the distribution (mean)
    const int data_count, // amount of required data
    double& result[]      // array with values of pseudorandom variables
);
```

Parameters

- **lambda**
  - [in] Parameter of the distribution (mean).

- **error_code**
  - [out] Variable to store the error code.

- **data_count**
  - [out] Amount of required data.

- **result[]**
  - [out] Array to obtain the values of pseudorandom variables.
## MathMomentsPoisson

Calculates the theoretical numerical values of the first 4 moments of the Poisson distribution with the lambda parameter.

```cpp
double MathMomentsPoisson(
    const double lambda,  // parameter of the distribution (mean)
    double& mean,         // variable for the mean
    double& variance,     // variable for the variance
    double& skewness,     // variable for the skewness
    double& kurtosis,     // variable for the kurtosis
    int& error_code       // variable for the error code
);
```

### Parameters

- **lambda**
  - [in] Parameter of the distribution (mean).

- **mean**
  - [out] Variable to get the mean value.

- **variance**
  - [out] Variable to get the variance.

- **skewness**
  - [out] Variable to get the skewness.

- **kurtosis**
  - [out] Variable to get the kurtosis.

- **error_code**
  - [out] Variable to get the error code.

### Return Value

Returns true if calculation of the moments has been successful, otherwise false.
Subfunctions

Group of functions that perform basic mathematical operations: calculation of the gamma function, beta function, factorial, exponential, logarithms with different bases, square root, etc.

They provide the ability to process both individual numeric values (real and integer) and arrays of such values (with output of the results to a separate or the original array).

<tr>
<td>MathAbs</td>
<td>Calculates the absolute values of array elements.</td>
</tr>
<tr>
<td>MathCeil</td>
<td>Returns the nearest larger integers for array elements.</td>
</tr>
<tr>
<td>MathFloor</td>
<td>Returns the nearest smaller integers for array elements.</td>
</tr>
<tr>
<td>MathSqrt</td>
<td>Calculates the square roots of array elements.</td>
</tr>
<tr>
<td>MathExp</td>
<td>Calculates the values of the exp(x) function for array elements.</td>
</tr>
<tr>
<td>MathPow</td>
<td>Calculates the values of the pow(x, power) function for array elements.</td>
</tr>
<tr>
<td>MathLog</td>
<td>Calculates the values of the log(x) function for array elements.</td>
</tr>
<tr>
<td>MathLog2</td>
<td>Calculates the logarithm to the base 2 for the array elements.</td>
</tr>
<tr>
<td>MathLog10</td>
<td>Calculates the logarithm to the base 10 for the array elements.</td>
</tr>
<tr>
<td>MathDifference</td>
<td>Generates an array with element differences of y[i]=x[i+lag]-x[i].</td>
</tr>
<tr>
<td>MathSample</td>
<td>Generates a random sample from the array elements.</td>
</tr>
<tr>
<td>MathTukeySummary</td>
<td>Calculates the Tukey's five-number summary for the array elements.</td>

<tr>
<td><strong>MathMax</strong></td>
<td>Returns the maximum value of all array elements.</td>
</tr>
<tr>
<td><strong>MathSum</strong></td>
<td>Returns the sum of array elements.</td>
</tr>
<tr>
<td><strong>MathProduct</strong></td>
<td>Returns the product of array elements.</td>
</tr>
<tr>
<td><strong>MathStandardDeviation</strong></td>
<td>Calculates the standard deviation of arrayelements.</td>
</tr>
<tr>
<td><strong>MathAverageDeviation</strong></td>
<td>Calculates the average absolute deviation of array elements.</td>
</tr>
<tr>
<td><strong>MathMedian</strong></td>
<td>Calculates the median value of array elements.</td>
</tr>
<tr>
<td><strong>MathMean</strong></td>
<td>Calculates the mean values of array elements.</td>
</tr>
<tr>
<td><strong>MathVariance</strong></td>
<td>Calculates the variance of the array elements.</td>
</tr>
<tr>
<td><strong>MathSkewness</strong></td>
<td>Calculates the skewness of the array elements.</td>
</tr>
<tr>
<td><strong>MathKurtosis</strong></td>
<td>Calculates the kurtosis of the array elements.</td>
</tr>
<tr>
<td><strong>MathLog1p</strong></td>
<td>Calculates the values of the log(1+x) function for array elements.</td>
</tr>
<tr>
<td><strong>MathExpm1</strong></td>
<td>Calculates the values of the exp(x)-1 function for array elements.</td>
</tr>
<tr>
<td><strong>MathSinh</strong></td>
<td>Calculates the values of the sinh(x) function for array elements.</td>
</tr>
<tr>
<td><strong>MathCosh</strong></td>
<td>Calculates the values of the cosh(x) function for array elements.</td>
</tr>
<tr>
<td><strong>MathTanh</strong></td>
<td>Calculates the values of the tanh(x) function for array elements.</td>
</tr>
<tr>
<td><strong>MathArccosh</strong></td>
<td>Calculates the values of the arccosh(x) function for array elements.</td>
</tr>
<tr>
<td><strong>MathArctanh</strong></td>
<td>Calculates the values of the arctanh(x) function for array elements.</td>
</tr>
<tr>
<td><strong>MathSignif</strong></td>
<td>Rounds a value to the specified number of digits in the mantissa.</td>
</tr>
<tr>
<td><strong>MathRank</strong></td>
<td>Calculates the ranks of array elements.</td>
</tr>
<tr>
<td><strong>MathCorrelationPearson</strong></td>
<td>Calculates the Pearson's correlation coefficient.</td>
</tr>
<tr>
<td><strong>MathCorrelationSpearman</strong></td>
<td>Calculates the Spearman's correlation coefficient.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>MathCorrelationKendall</code></td>
<td>Calculates the Kendall's correlation coefficient.</td>
</tr>
<tr>
<td><code>MathQuantile</code></td>
<td>Calculates sample quantiles corresponding to the specified probabilities.</td>
</tr>
<tr>
<td><code>MathProbabilityDensityEmpirical</code></td>
<td>Calculates the empirical probability density function for random values.</td>
</tr>
<tr>
<td><code>MathCumulativeDistributionEmpirical</code></td>
<td>Calculates the empirical cumulative distribution function for random values.</td>
</tr>
</tbody>
</table>
MathRandomNonZero

Returns a random number with a floating point in the range from 0.0 to 1.0.

```cpp
double MathRandomNonZero()
```

Return Value

Random number with a floating point in the range from 0.0 to 1.0.
MathMoments

Calculates the first 4 moments of array elements: mean, variance, skewness, kurtosis.

bool MathMoments(
    const double& array[],  // array of values
    double& mean,           // variable for the mean
    double& variance,       // variable for the variance
    double& skewness,       // variable for the skewness
    double& kurtosis,       // variable for the kurtosis
    const int start=0,      // initial index
    const int count=WHOLE_ARRAY  // the number of elements
)

Parameters

array[]
    [in] Array of values.

mean
    [out] Variable for the mean (1st moment).

variance
    [out] Variable for the variance (2nd moment).

skewness
    [out] Variable for the skewness (3rd moment).

kurtosis
    [out] Variable for the kurtosis (4th moment).

start=0
    [in] Initial index for calculation.

count=WHOLE_ARRAY
    [in] The number of elements for calculation.

Return Value

Returns true if the moments have been calculated successfully, otherwise false.
MathPowInt

Raises a number to the specified integer power.

```cpp
double MathPowInt(
    const double x,  // value of the number
    const int power  // power to raise to
)
```

Parameters

- `x`
  - [in] Double-precision floating-point number to be raised to the power.

- `power`
  - [in] Integer specifying the power.

Return Value

The number `x`, raised to the specified power.
MathFactorial

Calculates the factorial of the specified integer.

```cpp
double MathFactorial(
    const int n  // value of the number
)
```

Parameters

- **n**
  - [in] Integer number, the factorial of which is to be calculated.

Return Value

- The factorial of the number.
MathTrunc

Calculates the integer part of the specified number or array elements.

Version for working with a double-precision floating-point number:

```cpp
double MathTrunc(
    const double x  // value of the number
)
```

Return Value

The integer part of the specified number.

Version for working with an array of double-precision floating-point numbers. The results are output to a new array:

```cpp
bool MathTrunc(
    const double& array[],   // array of values
double& result[]          // array of results
)
```

Return Value

Returns true if successful, otherwise false.

Version for working with an array of double-precision floating-point numbers. The results are output to the original array:

```cpp
bool MathTrunc(
    double& array[]          // array of values
)
```

Return Value

Returns true if successful, otherwise false.

Parameters

- `x`
  - [in] Double-precision floating-point number, the integer part of which is to be obtained.

- `array[]`
  - [in] Array of double-precision floating-point numbers, the integer parts of which are to be obtained.

- `array[]`
  - [out] Array of output values.

- `result[]`
  - [out] Array of output values.
MathRound

Rounds a double-precision floating-point number or an array of such numbers to the specified number of decimal places.

Version for rounding a double-precision floating-point number to the specified number of decimal places:

```cpp
double MathRound(
    const double x,  // value of the number
    const int digits // the number of decimal places
)
```

Return Value

A number nearest to the x parameter, with the number of decimal places equal to digits.

Version for rounding an array of double-precision floating-point numbers to the specified number of decimal places. The results are output to a new array.

```cpp
bool MathRound(
    const double& array[],  // array of values
    int digits,             // the number of decimal places
    double& result[]       // array of results
)
```

Return Value

Returns true if successful, otherwise false.

Version for rounding an array of double-precision floating-point numbers to the specified number of decimal places. The results are output to the original array.

```cpp
bool MathRound(
    double& array[], // array of values
    int digits       // the number of decimal places
)
```

Return Value

Returns true if successful, otherwise false.

Parameters

x

[in] Double-precision floating-point number to be rounded.

digits

[in] The number of decimal places in the returned value.

array[]

[in] Array of double-precision floating-point numbers to be rounded.

array[]
[out] Array of output values.

result[]

[out] Array of output values.
MathArctan2

Returns the arctangent of the quotient of two arguments (x, y).

Version for working with the ratio of the two specified numbers (x, y):

```cpp
double MathArctan2(
    const double y, // Y coordinate
    const double x // X coordinate
)
```

Return Value

Angle θ, measured in radians, so that -π ≤ θ ≤ π and tan (θ) = y or x, where (x, y) is a point in a Cartesian coordinate system.

Version for working with the ratio of the element pairs from the x and y arrays:

```cpp
bool MathArctan2(
    const double& x[], // array of x values
    const double& y[], // array of y values
donble& result[] // array of results
)
```

Return Value

Returns true if successful, otherwise false.

Parameters

y
[in] The Y coordinate of the point.

x
[in] The X coordinate of the point.

x[]
[in] Array of X coordinates of the points.

y[]
[in] Array of Y coordinates of the points.

result[]
[out] Array to output the results

Notes

Please note the following.

- For (x, y) in the quadrant 1, the return value will be: 0 < θ < π/2.
- For (x, y) in the quadrant 2, the return value will be: π/2 < θ ≤ π.
- For (x, y) in the quadrant 3, the return value will be: -π < θ < -π/2.
- For (x, y) in the quadrant 4, the return value will be: -π/2 < θ < 0.
The return value for the points outside these quadrants is indicated below.

- If \( y \) is 0 and \( x \) is not negative, then \( \theta = 0 \).
- If \( y \) is 0 and \( x \) is negative, then \( \theta = \pi \).
- If \( y \) is a positive number, and \( x \) is 0, then \( \theta = \pi/2 \).
- If \( y \) is negative and \( x \) is 0, then \( \theta = -\pi/2 \).
- If \( y \) is 0 and \( x \) is 0, then \( \theta = -\pi/2 \).

If the value of the \( x \) or \( y \) parameter is NaN, or if the values of the \( x \) and \( y \) parameters are equal to the value PositiveInfinity or NegativeInfinity, the method returns the NaN value.
MathGamma

Calculates the value of the gamma function for the real argument $x$.

```c
double MathGamma(
    const double x       // argument of the function
)
```

Parameters

$x$

[in] The real argument of the function.

Return Value

The value of the gamma function.
MathGammaLog

Calculates the logarithm of the gamma function for the real argument \( x \).

```cpp
double MathGammaLog(
    const double x // argument of the function
)
```

**Parameters**

\( x \)

[\textbf{in}] The real argument of the function.

**Return Value**

Logarithm of the function.
### MathBeta

Calculates the value of the beta function for the real arguments a and b.

```c
double MathBeta(
    const double a, // the first argument of the function
    const double b  // the second argument of the function
)
```

#### Parameters

- **a**
  - [in] The a argument of the function.

- **b**
  - [in] The b argument of the function.

#### Return Value

Value of the function.
MathBetaLog

Calculates the logarithm of the beta function for the real arguments a and b.

```c
double MathBetaLog(
    const double a,  // the first argument of the function
    const double b    // the second argument of the function
)
```

**Parameters**

a

[in] The a argument of the function.

b

[in] The b argument of the function.

**Return Value**

Logarithm of the function.
MathBetaIncomplete

Calculates the value of the incomplete beta function.

```cpp
double MathBetaIncomplete(
    const double x,  // argument of the function
    const double p,  // the first parameter of the function
    const double q   // the second parameter of the function
)
```

**Parameters**

- **x**
  
  [in] The argument of the function.

- **p**
  
  [in] The first parameter of the beta function, must be >0.0.

- **q**
  
  [in] The second parameter of the beta function, must be >0.0.

**Return Value**

Value of the function.
MathGammaIncomplete

Calculates the value of the incomplete gamma function.

```cpp
double MathGammaIncomplete(
    double x,   // argument of the function
    double alpha  // parameter of the function
)
```

Parameters

- **x**
  - [in] The argument of the function.

- **alpha**
  - [in] The parameter of the incomplete gamma function.

Return Value

- Value of the function.
MathBinomialCoefficient

Calculates the binomial coefficient: $C(n,k) = \frac{n!}{(k!)(n-k)!}$.

```cpp
long MathBinomialCoefficient(
    const int n,   // the total number of elements
    const int k    // the number of elements in combination
)
```

Parameters

- $n$
  - [in] The number of elements.
- $k$
  - [in] The number of elements for each combination.

Return Value

The number of combinations of $N$ choose $K$. 
MathBinomialCoefficientLog

Calculates the logarithm of the binomial coefficient: $\log(C(n,k)) = \log(n!/(k!*(n-k)!))$

Version for integer arguments:

```cpp
double MathBinomialCoefficientLog(
    const int n,  // the total number of elements
    const int k   // the number of elements in combination
)
```

Version for real arguments:

```cpp
double MathBinomialCoefficientLog(
    const double n,  // the total number of elements
    const double k   // the number of elements in combination
)
```

Parameters

$n$

[in] The number of elements.

$k$

[in] The number of elements for each combination.

Return Value

The logarithm of $C(n,k)$. 
MathHypergeometric2F2

Calculates the value of the Hypergeometric\_2F2 (a, b, c, d, z) function using the Taylor's method.

```cpp
double MathHypergeometric2F2(
    const double a,    // the first parameter of the function
    const double b,    // the second parameter of the function
    const double c,    // the third parameter of the function
    const double d,    // the fourth parameter of the function
    const double z     // the fifth parameter of the function
)
```

**Parameters**

- **a**
  - [in] The first parameter of the function.
- **b**
  - [in] The second parameter of the function.
- **c**
  - [in] The third parameter of the function.
- **d**
  - [in] The fourth parameter of the function.
- **z**
  - [in] The fifth parameter of the function.

**Return Value**

Value of the function.
MathSequence

Generates a sequence of values based on the following values: the first element, the last element, the step of the sequence.

Version for working with real values:

```cpp
bool MathSequence(
    const double from,       // initial value
    const double to,         // final value
    const double step,       // step
    double& result[]         // array of results
)
```

Version for working with integer values:

```cpp
bool MathSequence(
    const int from,          // initial value
    const int to,            // final value
    const int step,          // step
    int& result[]            // array of results
)
```

Parameters

- **from**
  - [in] The first value of the sequence

- **to**
  - [in] The last value of the sequence

- **step**
  - [in] The step of the sequence.

- **result[]**
  - [out] Array to output the sequence.

Return Value

Returns true if successful, otherwise false.
MathSequenceByCount

Generates a sequence of values based on the following values: the first element, the last element, the number of elements in the sequence.

Version for working with real values:

```cpp
bool MathSequenceByCount(
    const double from, // initial value
    const double to,   // final value
    const int count,   // count
    double& result[]   // array of results
)
```

Version for working with integer values:

```cpp
bool MathSequenceByCount(
    const int from,   // initial value
    const int to,     // final value
    const int count,  // count
    int& result[]     // array of results
)
```

Parameters

*from*
  
  [in] The first value of the sequence.

*to*
  
  [in] The last value of the sequence.

*count*
  
  [in] The number of elements in the sequence.

*result[]*
  
  [out] Array to output the sequence.

Return Value

Returns true if successful, otherwise false.
MathReplicate

Generates a repeating sequence of values.

Version for working with real values:

```cpp
bool MathReplicate(
    const double& array[],  // array of values
    const int count,        // number of repetitions
    double& result[]       // array of results
)
```

Version for working with integer values:

```cpp
bool MathReplicate(
    const int& array[],    // array of values
    const int count,       // number of repetitions
    int& result[]          // array of results
)
```

**Parameters**

`array[]`

[in] Array for generating a sequence.

`count`

[in] The number of the array repetitions in the sequence.

`result[]`

[out] Array to output the sequence.

**Return Value**

Returns true if successful, otherwise false.
## MathReverse

Generates an array of values with reverse order of elements.

### Version for working with real values and with output of the results to a new array:

```cpp
bool MathReverse(
    const double& array[],                      // array of values
    double& result[]                            // array of results
)
```

### Version for working with integer values and with output of the results to a new array:

```cpp
bool MathReverse(
    const int& array[],                        // array of values
    int& result[]                              // array of results
)
```

### Version for working with real values and with output of the results to the original array:

```cpp
bool MathReverse(
    double& array[]                           // array of values
)
```

### Version for working with integer values and with output of the results to the original array:

```cpp
bool MathReverse(
    int& array[]                               // array of values
)
```

### Parameters

- `array[]`
  - [in] Array of values.

- `array[]`
  - [out] Output array with the reverse order of values.

- `result[]`
  - [out] Output array with the reverse order of values.

### Return Value

Returns true if successful, otherwise false.
MathIdentical

Compares two arrays of values and returns true if all elements match.

Version for working with arrays of real values:

```c
bool MathIdentical{
    const double& array1[], // the first array of values
    const double& array2[]   // the second array of values
}
```

Version for working with arrays of integer values:

```c
bool MathIdentical{
    const int& array1[],   // the first array of values
    const int& array2[]    // the second array of values
}
```

Parameters

array1[]

[in] The first array to compare.

array2[]

[in] The second array to compare.

Return Value

Returns true if the arrays are equal, otherwise false.
### MathUnique

Generates an array with unique values only.

**Version for working with real values:**

```cpp
bool MathUnique(
    const double& array[],   // array of values
    double& result[]        // array of results
)
```

**Version for working with integer values:**

```cpp
bool MathUnique(
    const int& array[],    // array of values
    int& result[]          // array of results
)
```

**Parameters**

- `array[]` ([in]) The source array.
- `result[]` ([out]) Array to output the unique values.

**Return Value**

Returns true if successful, otherwise false.
MathQuickSortAscending

The function for the simultaneous ascending sorting of the array[] and indices[] arrays using the QuickSort algorithm.

```c
void MathQuickSortAscending(
    double& array[], // array of values
    int& indices[], // array of indexes
    int first, // initial value
    int last // final value
)
```

Parameters

array[]

[in][out] Array to be sorted.

indices[]

[in][out] Array to store the indexes of the original array.

first

[in] Index of the element to start sorting from.

last

[in] Index of the element to stop sorting at.
MathQuickSortDescending

The function for the simultaneous descending sorting of the array[] and indices[] arrays using the QuickSort algorithm.

```c
void MathQuickSortDescending(
    double & array[],       // array of values
    int & indices[],        // array of indexes
    int first,              // initial value
    int last                // final value
);
```

Parameters

array[]
[in][out] Array to be sorted.

indices[]
[in][out] Array to store the indexes of the original array.

first
[in] Index of the element to start sorting from.

last
[in] Index of the element to stop sorting at.
MathQuickSort

The function for the simultaneous sorting of the array[] and indices[] arrays using the QuickSort algorithm.

```cpp
void MathQuickSort(
    double& array[], // array of values
    int& indices[], // array of indexes
    int first, // initial value
    int last, // final value
    int mode // direction
)
```

Parameters

`array[]`

[in][out] Array to be sorted.

`indices[]`

[in][out] Array to store the indexes of the original array.

`first`

[in] Index of the element to start sorting from.

`last`

[in] Index of the element to stop sorting at.

`mode`

[in] Direction of sorting (>0 ascending; otherwise, descending).
MathOrder

Generates an integer array with permutation according to order of the array elements after sorting.

Version for working with an array of real values:

```cpp
bool MathOrder(
    const double& array[], // array of values
    int& result[]        // array of results
)
```

Version for working with an array of integer values:

```cpp
bool MathOrder(
    const int& array[], // array of values
    int& result[]        // array of results
)
```

Parameters

array()

[in] Array of values.

result[]

[out] Array to output the sorted indexes.

Return Value

Returns true if successful, otherwise false.
MathBitwiseNot

Calculates the result of bitwise NOT operation for array elements.

Version with output of the results to a new array:

```cpp
bool MathBitwiseNot(
    const int& array[],  // array of values
    int& result[]        // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathBitwiseNot(
    int& array[]          // array of values
)
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `array[]`  
  [out] Array of output values.

- `result[]`  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
# MathBitwiseAnd

Calculates the result of bitwise AND operation for specified arrays.

```cpp
bool MathBitwiseAnd(
    const int& array1[], // the first array of values
    const int& array2[], // the second array of values
    int& result[]        // array of results
)
```

## Parameters

- `array1[]`: [in] The first array of values.
- `array2[]`: [in] The second array of values.
- `result[]`: [out] Array to output the results.

## Return Value

Returns true if successful, otherwise false.
MathBitwiseOr

Calculates the result of bitwise OR operation for specified arrays.

```c++
bool MathBitwiseOr(
    const int& array1[], // the first array of values
    const int& array2[], // the second array of values
    int& result[]       // array of results
)
```

**Parameters**

- `array1[]`
  - [in] The first array of values.
- `array2[]`
  - [in] The second array of values.
- `result[]`
  - [out] Array to output the results.

**Return Value**

Returns true if successful, otherwise false.
MathBitwiseXor

Calculates the result of bitwise XOR operation for specified arrays.

```cpp
bool MathBitwiseXor(
    const int& array1[], // the first array of values
    const int& array2[], // the second array of values
    int& result[]       // array of results
)
```

**Parameters**

`array1[]`
- [in] The first array of values.

`array2[]`
- [in] The second array of values.

`result[]`
- [out] Array to output the results.

**Return Value**

Returns true if successful, otherwise false.
MathBitwiseShiftL

Calculates the result of bitwise SHL (bitwise shift left) operation for array elements.

Version with output of the results to a new array:

```c
bool MathBitwiseShiftL(
    const int& array[], // array of values
    const int n, // shift value
    int& result[] // array of results
)
```

Version with output of the results to the original array:

```c
bool MathBitwiseShiftL(
    int& array[], // array of values
    const int n // shift value
)
```

Parameters

array[]

[in] Array of values.

n

[in] The number of bits to shift.

array[]

[out] Array of output values.

result[]

[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathBitwiseShiftR

Calculates the result of bitwise SHR (bitwise shift right) operation for array elements.

Version with output of the results to a new array:

```c
bool MathBitwiseShiftR(
    const int& array[],  // array of values
    const int   n,       // shift value
    int&       result[]  // array of results
)
```

Version with output of the results to the original array:

```c
bool MathBitwiseShiftR(
    int&    array[],  // array of values
    const int   n       // shift value
)
```

**Parameters**

- `array[]`
  - [in] Array of values.

- `n`
  - [in] The number of bits to shift.

- `array[]`
  - [out] Array of output values.

- `result[]`
  - [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathCumulativeSum

Generates an array with the cumulative sums.

Version with output of the results to a new array:

```cpp
bool MathCumulativeSum(
    const double& array[],  // array of values
    double& result[]  // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCumulativeSum(
    double& array[]  // array of values
)
```

Parameters

`array[]`
[in] Array of values.

`array[]`
[out] Array of output values.

`result[]`
[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathCumulativeProduct

Generates an array with the cumulative products.

Version with output of the results to a new array:

```cpp
bool MathCumulativeProduct(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCumulativeProduct(
    double& array[]        // array of values
)
```

Parameters

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

- `array[]`  
  [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
**MathCumulativeMin**

Generates an array with the cumulative minima.

Version with output of the results to a new array:

```cpp
bool MathCumulativeMin(
    const double& array[],  // array of values
double& result[]  // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCumulativeMin(
    double& array[]  // array of values
)
```

**Parameters**

- `array[]`
  - [in] Array of values.

- `result[]`
  - [out] Array of output values.

- `array[]`
  - [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
**MathCumulativeMax**

Generates an array with the cumulative maxima.

Version with output of the results to a new array:

```cpp
bool MathCumulativeMax(
    const double& array[],  // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCumulativeMax(
    double& array[]         // array of values
)
```

**Parameters**

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
**MathSin**

Calculates the values of the \( \sin(x) \) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathSin(
    const double& array[], // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathSin(
    double& array[]         // array of values
)
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathCos

Calculates the values of the \( \cos(x) \) function for array elements.

Version with output of the results to a new array:

```c
bool MathCos的优点
        const double& array[], // array of values
        double& result[] // array of results
```

Version with output of the results to the original array:

```c
bool MathCos的优点
        double& array[] // array of values
```

Parameters

array[]  
  [in] Array of values.

result[]  
  [out] Array of output values.

array[]  
  [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathTan

Calculates the values of the tan(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathTan(
    const double& array[], // array of values
    double& result[]     // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathTan(
    double& array[]       // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
**MathArcsin**

Calculates the values of the arcsin(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArcsin(
    const double& array[], // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArcsin(
    double& array[]        // array of values
)
```

**Parameters**

`array[]`
- [in] Array of values.

`result[]`
- [out] Array of output values.

`array[]`
- [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathArccos

Calculates the values of the arccos(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArccos(
    const double& array[],      // array of values
    double& result[]            // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArccos(
    double& array[]              // array of values
)
```

Parameters

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

- `array[]`  
  [out] Array of output values.

Return Value

- Returns true if successful, otherwise false.
MathArctan

Calculates the values of the arctan(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArctan(
    const double&  array[],  // array of values
    double&        result[]   // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArctan(
    double&        array[]    // array of values
)
```

**Parameters**

- `array[]`
  - [in] Array of values.

- `result[]`
  - [out] Array of output values.

- `array[]`
  - [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathSinPi

Calculates the values of the sin(pi*x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathSinPi(
    const double& array[], // array of values
    double& result[] // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathSinPi(
    double& array[] // array of values
)
```

Parameters

`array[]`
[in] Array of values.

`result[]`
[out] Array of output values.

`array[]`
[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
**MathCosPi**

Calculates the values of the \( \cos(\pi x) \) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathCosPi(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCosPi(
    double& array[]        // array of values
)
```

**Parameters**

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathTanPi

Calculates the values of the tan(pi*x) function for array elements.

Version with output of the result to a new array:

```c
bool MathTanPi(
    const double& array[],   // array of values
    double& result[]        // array of results
);
```

Version with output of the result to the original array:

```c
bool MathTanPi(
    double& array[]          // array of values
);
```

Parameters

array[]
  [in] Array of values.

result[]
  [out] Array of output values.

array[]
  [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathAbs

Calculates the absolute values of array elements.

Version with output of the results to a new array:

```c
bool MathAbs(
    const double& array[], // array of values
    double& result[] // array of results
)
```

Version with output of the results to the original array:

```c
bool MathAbs(
    double& array[] // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathCeil

Returns the nearest larger integers for array elements.

Version with output of the results to a new array:

```cpp
bool MathCeil(
    const double& array[], // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCeil(
    double& array[]        // array of values
)
```

Parameters

- **array[]**  
  [in] Array of values.

- **result[]**  
  [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathFloor

Returns the nearest smaller integers for array elements.

Version with output of the results to a new array:

```cpp
bool MathFloor(
    const double& array[], // array of values
double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathFloor(
    double& array[]    // array of values
)
```

Parameters

array[]
    [in] Array of values.
result[]
    [out] Array of output values.
array[]
    [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathSqrt

Calculates the square roots of array elements.

Version with output of the results to a new array:

```cpp
bool MathSqrt(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathSqrt(
    double& array[]       // array of values
)
```

Parameters

- `array[]` 
  [in] Array of values.

- `result[]` 
  [out] Array of output values.

array[] 
[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
**MathExp**

Calculates the values of the exp(x) function for array elements.

Version with output of the results to a new array:

```c++
bool MathExp(
    const double& array[], // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```c++
bool MathExp(
    double& array[]     // array of values
)
```

**Parameters**

`array[]`

[in] Array of values.

`result[]`

[out] Array of output values.

`array[]`

[out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathPow

Calculates the values of the pow(x, power) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathPow(
    const double& array[], // array of values
    const double power,   // power
    double& result[]    // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathPow(
    double& array[],    // array of values
    const double power   // power
)
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

- `array[]`  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
**MathLog**

Calculates the values of the log(x) function for array elements.

Version for calculating the natural logarithm with output of the results to a new array.

```cpp
bool MathLog(
        const double& array[],   // array of values
        double& result[]         // array of results
    )
```

Version for calculating the natural logarithm with output of the results to the original array.

```cpp
bool MathLog(
        double& array[]           // array of values
    )
```

Version for calculating the logarithm to a specified base with output of the results to a new array.

```cpp
bool MathLog(
        const double& array[],   // array of values
        const double base,       // base of the logarithm
        double& result[]         // array of results
    )
```

Version for calculating the logarithm to a specified base with output of the results to the original array.

```cpp
bool MathLog(
        double& array[],          // array of values
        const double base         // base of the logarithm
    )
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `base`  
  [in] The base of the logarithm.

- `array[]`  
  [out] Array of output values.

- `result[]`  
  [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathLog2

Calculates the logarithm to the base 2 for the array elements.

Version with output of the results to a new array:

```cpp
bool MathLog2(
    const double& array[], // array of values
    double& result[]        // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathLog2(
    double& array[]         // array of values
)
```

Parameters

array[]
[in] Array of values.

result[]
[out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathLog10

Calculates the logarithm to the base 10 for the array elements.

Version with output of the results to a new array:

```cpp
bool MathLog10(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathLog10(
    double& array[]          // array of values
)
```

Parameters

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

- `array[]`  
  [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathLog1p

Calculates the values of the $\log(1+x)$ function for array elements.

Version with output of the results to a new array:

```cpp
bool MathLog1p(
   const double& array[], // array of values
   double& result[] // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathLog1p(
   double& array[] // array of values
)
```

Parameters

- `array[]`
  
  [in] Array of values.

- `result[]`
  
  [out] Array of output values.

- `array[]`
  
  [out] Array of output values.

Return Value

- Returns true if successful, otherwise false.
**MathDifference**

Generates an array with element differences of \( y[i] = x[i+\text{lag}] - x[i] \).

Version for a single generation of an array of real values:

```cpp
bool MathDifference(
    const double &array[], // array of values
    const int lag,         // lag
    double &result[]       // array of results
)
```

Version for a single generation of an array of integer values:

```cpp
bool MathDifference(
    const int &array[],     // array of values
    const int lag,          // lag
    int &result[]           // array of results
)
```

Version for iterated generation of an array of real values (the number of iterations is set in the input parameters):

```cpp
bool MathDifference(
    const double &array[], // array of values
    const int lag,         // lag
    const int differences, // number of iterations
    double &result[]       // array of results
)
```

Version for iterated generation of an array of integer values (the number of iterations is set in the input parameters):

```cpp
bool MathDifference(
    const int &array[],     // array of values
    const int lag,          // lag
    const int differences,  // number of iterations
    int &result[]           // array of results
)
```

**Parameters**

- `array[]`
  - [in] Array of values.
- `lag`
  - [in] Lag parameter.
- `differences`
  - [in] The number of iterations.
- `result[]`

© 2000-2019, MetaQuotes Software Corp.
[out] Array to output the results.

Return Value

Returns true if successful, otherwise false.
MathSample

Generates a random sample from the array elements.

Version for working with an array of real values:

```cpp
bool MathSample(
    const double& array[],  // array of values
    const int count,        // count
    double& result[]        // array of results
)
```

Version for working with an array of integer values:

```cpp
bool MathSample(
    const int& array[],      // array of values
    const int count,         // count
    int& result[]            // array of results
)
```

Version for working with an array of real values. It is possible to obtain a sample with replacement:

```cpp
bool MathSample(
    const double& array[],  // array of values
    const int count,        // count
    const bool replace,     // flag
    double& result[]        // array of results
)
```

Version for working with an array of integer values. It is possible to obtain a sample with replacement:

```cpp
bool MathSample(
    const int& array[],      // array of values
    const int count,         // count
    const bool replace,      // flag
    int& result[]            // array of results
)
```

Version for working with an array of real values, for which the probabilities of sampling are defined.

```cpp
bool MathSample(
    const double& array[],  // array of values
    double& probabilities[], // array of probabilities
    const int count,        // count
    double& result[]        // array of results
)
```

Version for working with an array of integer values, for which the probabilities of sampling are defined.
### bool MathSample(
    const int& array[],
    double& probabilities[],
    const int count,
    int& result[]
)

Version for working with an array of real values, for which the probabilities of sampling are defined. It is possible to obtain a sample with replacement:

```
bool MathSample(
    const double& array[],
    double& probabilities[],
    const int count,
    const bool replace,
    double& result[]
)
```

Version for working with an array of integer values, for which the probabilities of sampling are defined. It is possible to obtain a sample with replacement:

```
bool MathSample(
    const int& array[],
    double& probabilities[],
    const int count,
    const bool replace,
    int& result[]
)
```

### Parameters

- **array[]**: [in] Array of integer values.
- **probabilities[]**: [in] Array of probabilities for sampling the elements.
- **count**: [in] The number of elements.
- **replace**: [in] Parameter that allows sampling with replacement.
- **result[]**: [out] Array to output the results.

### Return Value

Returns true if successful, otherwise false.

### Note
The replace=true argument allows performing random sampling of the elements with replacement back to the original sequence.
MathTukeySummary

Calculates the Tukey's five-number summary (minimum, lower quartile, median, upper quartile, maximum) for the array elements.

```cpp
bool MathTukeySummary(
    const double& array[], // array of values
    const bool removeNAN, // flag
    double& minimum, // minimum value
    double& lower_hinge, // lower quartile
    double& median, // median value
    double& upper_hinge, // upper quartile
    double& maximum // maximum value
)
```

**Parameters**

- `removeNAN`: [in] Flag that indicates if non-numeric values are to be removed.
- `minimum`: [out] Variable to store the minimum value.
- `lower_hinge`: [out] Variable to store the lower quartile.
- `median`: [out] Variable to store the median value.
- `upper_hinge`: [out] Variable to store the upper quartile.
- `maximum`: [out] Variable to store the maximum value.

**Return Value**

Returns true if successful, otherwise false.
MathRange

Calculates the minima and maxima of array elements.

```cpp
bool MathRange(
    const double& array[], // array of values
    double& min,          // minimum value
    double& max           // maximum value
)
```

Parameters

array[]

[in] Array of values.

min

[out] Variable to store the minimum value.

max

[out] Variable to store the maximum value.

Return Value

Returns true if successful, otherwise false.
MathMin

Returns the minimum value of all array elements.

```c
double MathMin(
    const double& array[]  // array of values
)
```

Parameters

- `array[]`
  - [in] Array of values.

Return Value

- The minimum value.
MathMax

Returns the maximum value of all array elements.

```c
double MathMax(
    const double& array[]  // array of values
)
```

Parameters

array[]

[in] Array of values.

Return Value

The maximum value.
MathSum

Returns the sum of array elements.

```cpp
double MathSum(
    const double& array[]  // array of values
)
```

Parameters

`array[]`

[in] Array of values.

Return Value

The sum of the elements.
MathProduct

Returns the product of array elements.

```cpp
double MathProduct(
    const double& array[]  // array of values
)
```

Parameters

`array[]`

[in] Array of values.

Return Value

The product of the elements.
MathStandardDeviation

Calculates the standard deviation of array elements.

```c
double MathStandardDeviation(
    const double& array[]  // array of values
)
```

Parameters

`array[]`

[in] Array of values.

Return Value

Standard deviation.
MathAverageDeviation

The function calculates the average absolute deviation of array elements.

```c
double MathAverageDeviation(
    const double & array[]  // array of values
)
```

Parameters

`array[]`

[in] Array of values.

Return Value

The average absolute deviation of array elements.
MathMedian

Calculates the median value of array elements.

```cpp
double MathMedian(
    double& array[]  // array of values
);
```

Parameters

array[]

[in] Array of values.

Return Value

The median value.
MathMean

Calculates the mean values of array elements.

```cpp
double MathMean(
    const double& array[]  // array of values
)
```

Parameters

`array[]`

[in] Array of values.

Return Value

The mean value.
MathVariance

The function calculates the variance (second moment) of array elements.

```cpp
double MathVariance(
    const double& array[]  // array of values
)
```

Parameters

- `array[]`
  
  [in] Array of values.

Return Value

- Value of the variance.
MathSkewness

The function calculates the skewness (third moment) of array elements.

```cpp
double MathSkewness(
    const double& array[]  // array of values
)
```

Parameters

```cpp
array[]
```

[in] Array of values.

Return Value

Skewness.
MathKurtosis

The function calculates the kurtosis (fourth moment) of array elements.

```c
double MathKurtosis(
    const double& array[]  // array of values
)
```

**Parameters**

`array[]`

[in] Array of values.

**Return Value**

Kurtosis.
MathExpm1

Calculates the values of the exp(x)-1 function for array elements.

Version with output of the results to a new array:

```cpp
bool MathExpm1(
    const double& array[],  // array of values
    double& result[]   // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathExpm1(
    double& array[]   // array of values
)
```

**Parameters**

*array[]*    
[in] Array of values.

*result[]*    
[out] Array of output values.

*array[]*    
[out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathSinh

Calculates the values of the sinh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathSinh(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathSinh(
    double& array[]       // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathCosh

Calculates the values of the cosh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathCosh(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathCosh(
    double& array[]        // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathTanh

Calculates the values of the tanh(x) function for array elements.

Version with output of the results to a new array:

```c
bool MathTanh(
    const double& array[],  // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```c
bool MathTanh(
    double& array[]       // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]` [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
**MathArcsinh**

Calculates the values of the arcsinh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArcsinh(
    const double& array[],  // array of values
    double& result[]       // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArcsinh(
    double& array[]          // array of values
)
```

**Parameters**

- `result[]` — [out] Array of output values.
- `array[]` — [out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathArccosh

Calculates the values of the arccosh(x) function for array elements.

Version with output of the results to a new array:

```c
bool MathArccosh(
    const double& array[],  // array of values
    double& result[]       // array of results
);
```

Version with output of the results to the original array:

```c
bool MathArccosh(
    double& array[]         // array of values
);
```

**Parameters**

- `array[]`  
  [in] Array of values.

- `result[]`  
  [out] Array of output values.

**Array[]**  
[out] Array of output values.

**Return Value**

Returns true if successful, otherwise false.
MathArctanh

Calculates the values of the arctanh(x) function for array elements.

Version with output of the results to a new array:

```cpp
bool MathArctanh(
    const double& array[], // array of values
    double& result[]      // array of results
)
```

Version with output of the results to the original array:

```cpp
bool MathArctanh(
    double& array[]         // array of values
)
```

Parameters

- `result[]` [out] Array of output values.
- `array[]`  [out] Array of output values.

Return Value

Returns true if successful, otherwise false.
MathSignif

Rounds a value to the specified number of digits in the mantissa.

Version for working with a real value:

```cpp
double MathSignif(
    const double x, // value
    const int digits // number of decimal places
)
```

Return Value

The rounded value.

Version for working with an array of real values and with output of the results to a separate array:

```cpp
bool MathSignif(
    const double& array[], // array of values
    int digits, // number of decimal places
    double result[] // array of results
)
```

Return Value

Returns true if successful, otherwise false.

Version for working with an array of real values and with output of the results to the original array:

```cpp
bool MathSignif(
    double& array[], // array of values
    int digits // number of decimal places
)
```

Return Value

Returns true if successful, otherwise false.

Parameters

x

[in] Real value to be rounded.

digits

[in] Number of decimal places.

array[]

[in] Array of real values.

array[]

[out] Array of output values.

result[]

[out] Array of output values.
MathRank

Calculates the ranks of array elements.

Version for working with an array of real values:

```c
bool MathRank(
    const double& array[],    // array of values
double& rank[]               // array of ranks
)
```

Version for working with an array of integer values:

```c
bool MathRank(
    const int& array[],         // array of values
double& rank[]                // array of ranks
)
```

Parameters

array{}

[in] Array of values.

rank{}

[out] Array to output the ranks.

Return Value

Returns true if successful, otherwise false.
MathCorrelationPearson

Calculates the Pearson's correlation coefficient.

Version for working with arrays of real values:

```cpp
bool MathCorrelationPearson(  
    const double& array1[],  // the first array of values  
    const double& array2[],  // the second array of values  
    double& r                // correlation coefficient  
)
```

Version for working with arrays of integer values:

```cpp
bool MathCorrelationPearson(  
    const int& array1[],  // the first array of values  
    const int& array2[],  // the second array of values  
    double& r            // correlation coefficient  
)
```

Parameters

array1[]

[in] The first array of values.

array2[]

[in] The second array of values.

r

[out] Variable to store the correlation coefficient.

Return Value

Returns true if successful, otherwise false.
MathCorrelationSpearman

Calculates the Spearman's correlation coefficient.

Version for working with arrays of real values:

```cpp
bool MathCorrelationSpearman(
    const double& array1[], // the first array of values
    const double& array2[], // the second array of values
    double& r // correlation coefficient
)
```

Version for working with arrays of integer values:

```cpp
bool MathCorrelationSpearman(
    const int& array1[], // the first array of values
    const int& array2[], // the second array of values
    double& r // correlation coefficient
)
```

Parameters

array1[]
[in] The first array of values.

array2[]
[in] The second array of values.

r
[out] Variable to store the correlation coefficient.

Return Value

Returns true if successful, otherwise false.
MathCorrelationKendall

Calculates the Kendall's correlation coefficient.

Version for working with arrays of real values:

```cpp
bool MathCorrelationKendall(
    const double& array1[], // the first array of values
    const double& array2[], // the second array of values
    double& tau           // correlation coefficient
)
```

Version for working with arrays of integer values:

```cpp
bool MathCorrelationKendall(
    const int& array1[], // the first array of values
    const int& array2[], // the second array of values
    double& tau           // correlation coefficient
)
```

Parameters

array1[]
    [in] The first array of values.

array2[]
    [in] The second array of values.

tau
    [out] Variable to store the correlation coefficient.

Return Value

Returns true if successful, otherwise false.
MathQuantile

Calculates sample quantiles corresponding to the specified probabilities: 
\[ Q[i](p) = (1 - \gamma) \times x[j] + \gamma \times x[j+1] \]

```cpp
bool MathQuantile(
    const double& array[],   // array of values
    const double& probs[],   // array of probabilities
    double& quantile[]       // array to output the quantiles
)
```

Parameters

`array[]`
- [in] Array of values.

`probs[]`

`quantile[]`
- [out] Array to output the quantiles.

Return Value

Returns true if successful, otherwise false.
MathProbability Density Empirical

The function calculates the empirical probability density function (pdf) for random values from an array.

```cpp
bool MathProbabilityDensityEmpirical(
    const double& array[], // array of random values
    const int count, // the number of pairs
    double& x[], // array of x values
    double& pdf[] // array of pdf values
)
```

Parameters

- `array[]`  
  [in] Array of random values.

- `count`  
  [in] The number of (x, pdf(x)) pairs.

- `x[]`  
  [out] Array to output the x values.

- `pdf[]`  
  [out] Array to output the pdf(x) values.

Return Value

Returns true if successful, otherwise false.
MathCumulativeDistributionEmpirical

The function calculates the empirical cumulative distribution function (cdf) for random values from an array.

```cpp
bool MathCumulativeDistributionEmpirical(
    const double& array[],  // array of random values
    const int count,        // the number of pairs
    double& x[],            // array of x values
    double& cdf[]           // array of cdf values
)
```

Parameters

- `count` [in] The number of (x, cdf(x)) pairs.
- `x[]` [out] Array to output the x values.
- `cdf[]` [out] Array to output the cdf(x) values.

Return Value

Returns true if successful, otherwise false.
Fuzzy is a library for working with fuzzy logic

Fuzzy logic is a synthesis of the traditional Aristotelian logic when truth is marked as a linguistic variable. Fuzzy logic, equivalent to classical logic, has its own fuzzy logic operations on fuzzy sets defined. There are the same operations for fuzzy sets as well as for ordinary sets, only their calculation is by far more difficult. We should also note that the composition of fuzzy sets constitutes as a fuzzy set.

The main principles of fuzzy logic, setting it apart from classical logic, are the maximum proximity to the reflection of reality and a high level of subjectivity, which can lead to significant errors in calculations.

Fuzzy model (or system) is a mathematical model whose calculation is based on fuzzy logic. Construction of such models is applicable when the subject of study has a weak formalization and its exact mathematical description is too complex or unknown. The quality of these models’ output values (error model) directly depends only on the Expert Advisor, which set up this model. The best option to minimize errors is to draw the most complete and comprehensive model and subsequently adjust it with machine learning on a large training set.

The progress of a model construction can be divided into three main stages:
1. Definition of input and output characteristics of a model.
2. Building a knowledge base.
3. Selecting one of the methods of fuzzy inference (Mamdani or Sugeno).

The first stage directly effects the consequent two and determines the future operation of the model. A knowledge base or, as sometimes called, rule base is a set of fuzzy rules type: “if, then” that define the relationship between inputs and outputs of the examined object. The number of rules in the system is not limited and is also determined by the Expert Advisor. The generalized format of fuzzy rules is as follows:

If rule condition, then rule conclusion.

Rule condition describes the current state of the object, and rule conclusion — how this condition affects the object. General view of conditions and conclusions cannot be selected because they are determined by a fuzzy inference.

Each rule in the system has its weight — this characteristic defines the importance of a rule in the model. Weighting factors are assigned to a rule within range \([0, 1]\). In many examples with fuzzy models, which can be found in the relevant literature, weight data is not specified, but it does not mean that it is not present. In fact, in such case for each rule from the database, the weight is fixed and equals unity. There can be two types of terms and conclusions for each rule:
1. simple — includes one fuzzy variable;
2. complex — includes several fuzzy variables.

Depending on the created knowledge base, the system of fuzzy inference is determined for a model. Fuzzy logical inference is a receipt of conclusion in form of a fuzzy set corresponding to the current value of the inputs with use of knowledge base and fuzzy operations. The two main types of fuzzy inference are Mamdani and Sugeno.
Membership functions

A membership function is a function that allows to calculate the membership degree of a random element of the universal set to a fuzzy set. Consequently, the domain of a membership function should be within the range \([0, 1]\).

In most cases, the membership function is continuous and monotonic.

</table>
CConstantMembershipFunction

Class for implementing a membership function as a straight line in parallel with the coordinate axis.

Description

The function is described by the equation:

\[ y(x) = c \]

Therefore, the membership degree for the function is the same along the entire numerical axis and is equal to the parameter specified in the constructor.

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CConstantMembershipFunction : public IMembershipFunction
```

Title

```
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

CObject

IMembershipFunction

CConstantMembershipFunction

    graphic.YAxis().Min(0.0);
    graphic.YAxis().Max(1.1);
    graphic.YAxis().DefaultStep(0.2);
    //--- plot
```
GetValue

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const double x // membership function argument
)
```

**Parameters**

- `x`

**Return Value**

Membership function value.
CCompositeMembershipFunction

Class for implementing a composition of membership functions.

Description

Composition of membership functions is a combination of two or more membership functions using a specified operator.

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CCompositeMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

    graphic.CurveAdd(ProductTwoSigmoidalMembershipFunctions,0.0,10.0,0.1,CURVE_LINES,"Func2");
    graphic.CurveAdd(CompositeMembershipFunction,0.0,10.0,0.1,CURVE_LINES,"Func1 * Func2");
    //--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
    graphic.XAxis().Min(0.0);
    graphic.XAxis().Max(10.0);
    graphic.XAxis().DefaultStep(1.0);
    //--- sets the Y-axis properties
    graphic.YAxis().AutoScale(false);
    graphic.YAxis().Min(0.0);
    graphic.YAxis().Max(1.1);
    graphic.YAxis().DefaultStep(0.2);
    //--- plot
```
CompositionType

Sets the composition operator.

```cpp
void CompositionType(
    MfCompositionType value  // operator type
)
```

Parameters

- `value`  
  [in] Composition operator type.

Note

The following operator types are available:

- MinMF (minimum of functions)
- MaxMF (maximum of functions)
- ProdMF (product of functions)
- SumMF (sum of functions)

MembershipFunctions

Gets the list of membership functions included into a composition.

```cpp
CList* MembershipFunctions(
    void  // list of membership functions
)
```

Return Value

List of membership functions.

GetValue

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const x  // membership function argument
)
```

Parameters

- `x`  

Return Value
Membership function value.
CDifferencTwoSigmoidalMembershipFunction

Class for implementing the membership function in the form of a difference between two sigmoid functions with the A1, A2, C1 and C2 parameters.

Description

The function is based on a sigmoid curve. It allows creating membership functions with the values equal to 1 beginning with an argument value. Such functions are suitable if you need to set such linguistic terms as "short" or "long".

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CDifferencTwoSigmoidalMembershipFunction : public IMembershipFunction
```

Title

```
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

```cpp
CObject
IMembershipFunction
CDifferencTwoSigmoidalMembershipFunction
```

Example

```c
#include <Math\Fuzzy\membershipfunction.mqh>
#include <Graphics\Graphic.mqh>

//--- Create membership functions
CDifferenceTwoSigmoidalMembershipFunction func1(5,1,8,7);
CDifferenceTwoSigmoidalMembershipFunction func2(5,4,5,7);
CDifferenceTwoSigmoidalMembershipFunction func3(5,6,2,7);

//--- Create wrappers for membership functions
double DifferenceTwoSigmoidalMembershipFunction1(double x) { return (func1.GetValue(x)); }
double DifferenceTwoSigmoidalMembershipFunction2(double x) { return (func2.GetValue(x)); }
double DifferenceTwoSigmoidalMembershipFunction3(double x) { return (func3.GetValue(x)); }

//| Script program start function
void OnStart()
{
    //--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"DifferenceTwoSigmoidalMembershipFunction",0,30,30,780,380))
    {
        graphic.Attach(0,"DifferenceTwoSigmoidalMembershipFunction");
    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("DifferenceTwoSigmoidalMembershipFunction");
    graphic.BackgroundMainSize(16);
    //--- create curve
    graphic.CurveAdd(DifferenceTwoSigmoidalMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,
    graphic.CurveAdd(DifferenceTwoSigmoidalMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,
    graphic.CurveAdd(DifferenceTwoSigmoidalMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,
```

© 2000-2019, MetaQuotes Software Corp.
```cpp
//--- sets the X-axis properties
graphic.XAxis().AutoScale(false);
graphic.XAxis().Min(0.0);
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);
//--- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);
//--- plot
graphic.CurvePlotAll();
graphic.Update();
}

A1 (Get method)

Gets the first membership function slope ratio.

```cpp
double A1()
```

Return Value

Slope ratio value.

A1 (Set method)

Sets the first membership function slope ratio.

```cpp
void A1{
    const double a1 // slope ratio value
}
```

Parameters

a1

[in] Slope ratio value.

A2 (Get method)

Gets the second membership function slope ratio.

```cpp
double A2()
```

Return Value

Slope ratio value.

A2 (Set method)

Sets the second membership function slope ratio.

```cpp
void A2{
```
const double a2 // slope ratio value
)

Parameters
a2
    [in]  Slope ratio value.

**C1 (Get method)**

Gets the first membership function inflection coordinate parameter.

```c
double C1()
```

**Return Value**

Inflection coordinate value.

**C1 (Set method)**

Sets the first membership function inflection coordinate parameter.

```c
void C1(
    const double c1 // inflection coordinate value
)
```

Parameters
c1
    [in]  Inflection coordinate value.

**C2 (Get method)**

Gets the second membership function inflection coordinate parameter.

```c
double C2()
```

**Return Value**

Inflection coordinate value.

**C2 (Set method)**

Sets the second membership function inflection coordinate parameter.

```c
void C2(
    const double c2 // inflection coordinate value
)
```

Parameters
c2
[in] Inflection coordinate value.

**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const double x  // membership function argument
)
```

**Parameters**

`x`

**Return Value**

Membership function value.
CGeneralizedBellShapedMembershipFunction

Class for implementing a generalized bell-shaped membership function with A, B and C parameters.

Description

Generalized bell-shaped membership function shape is similar to Gaussian functions. The function is smooth and takes non-zero values along the entire definition area.

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CGeneralizedBellShapedMembershipFunction : public IMembershipFunction
```

Title

```
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

- CObject
  - IMembershipFunction
    - CGeneralizedBellShapedMembershipFunction

Class methods

<table>

<tr>
<th>Class method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Gets and sets the membership function concentration ratio.</td>
</tr>
<tr>
<td>B</td>
<td>Gets and sets the membership function slope ratio.</td>
</tr>
</tbody>
</table>
Gets and sets the membership function maximum coordinate.

Calculates the value of the membership function by a specified argument.

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Example

```
#include <Math\Fuzzy\membershipfunction.mgh>
#include <Graphics\Graphic.mgh>

--- Create membership functions
CGeneralizedBellShapedMembershipFunction func1(5, 1, 3);
CGeneralizedBellShapedMembershipFunction func2(5, 2, 3);
CGeneralizedBellShapedMembershipFunction func3(5, 3, 3);

--- Create wrappers for membership functions
double GeneralizedBellShapedMembershipFunction1(double x) { return (func1.GetValue(x)); }
double GeneralizedBellShapedMembershipFunction2(double x) { return (func2.GetValue(x)); }
double GeneralizedBellShapedMembershipFunction3(double x) { return (func3.GetValue(x)); }

--- Script program start function
void OnStart()
{
    //--- create graphic
    CGraphic graphic;
    if (!graphic.Create(0, "GeneralizedBellShapedMembershipFunction", 0, 30, 30, 780, 380))
    {
        graphic.Attach(0, "GeneralizedBellShapedMembershipFunction");
    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("GeneralizedBellShapedMembershipFunction");
    graphic.BackgroundMainSize(16);
    //--- create curve
    graphic.CurveAdd(GeneralizedBellShapedMembershipFunction1, 0.0, 10.0, 0.1, CURVE_LINES,
    graphic.CurveAdd(GeneralizedBellShapedMembershipFunction2, 0.0, 10.0, 0.1, CURVE_LINES,
    graphic.CurveAdd(GeneralizedBellShapedMembershipFunction3, 0.0, 10.0, 0.1, CURVE_LINES,
    //--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
    graphic.XAxis().Min(0.0);
    graphic.XAxis().Max(10.0);
    graphic.XAxis().DefaultStep(1.0);
```
A (Get method)

Gets the membership function concentration ratio.

```cpp
double A()
```

Return Value

Concentration ratio value.

A (Set method)

Sets the membership function concentration ratio.

```cpp
void A(
    const double a // concentration ratio value
)
```

Parameters

- `a`
  

B (Get method)

Gets the membership function slope ratio.

```cpp
double B()
```

Return Value

Slope ratio value.

B (Set method)

Sets the membership function slope ratio.

```cpp
void B(
    const double b // slope ratio value
)
```
Parameters

\( b \)

**C (Get method)**

Gets the membership function maximum coordinate.

```c
double C()
```

**Return Value**

Membership function maximum coordinate.

**C (Set method)**

Sets the membership function maximum coordinate.

```c
void C(
    const double c  // maximum coordinate value
)
```

Parameters

\( c \)

[in] Membership function maximum coordinate.

**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const x  // membership function argument
)
```

Parameters

\( x \)

**Return Value**

Membership function value.
CNormalCombinationMembershipFunction

Class for implementing a two-sided Gaussian membership function with the B1, B2, Sigma1 and Sigma2 parameters.

Description

The two-sided Gaussian membership function is formed using Gaussian distribution. It allows setting asymmetrical membership functions. The function is smooth and takes non-zero values along the entire definition area.

A sample code for plotting a chart is displayed below.

Declaration

class CNormalCombinationMembershipFunction : public IMembershipFunction

Title

#include <Math\Fuzzy\membershipfunction.mqh>

Inheritance hierarchy

graphic.XAxis().Min(0.0);
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);

//--- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);

//--- plot
graphic.CurvePlotAll();
graphic.Update();
}

B1 (Get method)

Gets the value of the first membership function center.

```cpp
double B1()
```

Return Value

Value of the first membership function center.

B1 (Set method)

Sets the value of the first membership function center.

```cpp
void B1{
    const double b1 // first center value
}
```

Parameters

`b`

[in] Value of the first membership function center.

B2 (Get method)

Gets the value of the second membership function center.

```cpp
double B2()
```

Return Value

The value of the second membership function center.

B2 (Set method)
Sets the value of the second membership function center.

```cpp
void B2{
    const double b2 // second center value
}
```

**Parameters**

`b2`

[in] Value of the second membership function center.

---

**Sigma1 (Get method)**

Gets the first parameter of the membership function curvature.

```cpp
double Sigma1()
```

**Return Value**

The value of the first parameter of the membership function curvature.

---

**Sigma1 (Set method)**

Sets the value of the first parameter of the membership function curvature.

```cpp
void Sigma1(
    const double sigma1 // first curvature parameter value
)
```

**Parameters**

`sigma1`

[in] The first parameter of the membership function curvature.

---

**Sigma2 (Get method)**

Gets the second parameter of the membership function curvature.

```cpp
double Sigma2()
```

**Return Value**

The value of the second parameter of the membership function curvature.

---

**Sigma2 (Set method)**

Sets the value of the second parameter of the membership function curvature.

```cpp
void Sigma2(
```
const double sigma2 // second curvature parameter value

Parameters

sigma2

[in] The second curvature parameter of the membership function.

**GetValue**

Calculates the value of the membership function by a specified argument.

double GetValue(
    const x // membership function argument
)

Parameters

x

Return Value

Membership function value.
CNormalMembershipFunction

Class for implementing a symmetrical Gaussian membership function with the B and Sigma parameters.

Description

The symmetrical Gaussian membership function is formed using Gaussian distribution. The function is smooth and takes non-zero values along the entire definition area.

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CNormalMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

- CObject
  - IMembershipFunction

graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);
//--- plot
  graphic.CurvePlotAll();
  graphic.Update();
}

## B (Get method)

**Gets** the membership function center.

```cpp
double B()
```

### Return Value

The value of the membership function center.

## B (Set method)

**Sets** the value of the membership function center.

```cpp
void B(const double b) // function center value
```

### Parameters

- **b**
  - [in] Value of the membership function center.

## Sigma (Get method)

**Gets** the parameter of the membership function curvature.

```cpp
double Sigma()
```

### Return Value

The value of the membership function curvature parameter.

## Sigma (Set method)

**Sets** the value of the membership function curvature parameter.

```cpp
void Sigma(const double sigma) // curvature parameter value
```

### Parameters

- **sigma**
**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const double x // argument.
)
```

**Parameters**

- `x`

**Return Value**

- Membership function value.
CP_ShapedMembershipFunction

Class for implementing a pi-shaped membership function with the A, B, C and D parameters.

Description

The pi-shaped membership function has the form of a curvilinear trapezoid. The function is used to set asymmetric membership functions with a smooth transition from pessimistic to optimistic fuzzy number assessment.

![P_ShapedMembershipFunction](image)

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CP_ShapedMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

- CObject
  - IMembershipFunction
    - CP_ShapedMembershipFunction

</tr>
<tr>
<td>B</td>
<td>Gets and sets the first parameter of the fuzzy set core.</td>
</tr>
</tbody>
</table>
C

Gets and sets the second parameter of the fuzzy set core.

D

Gets and sets the parameter of the fuzzy set end.

GetValue

Calculates the value of the membership function by a specified argument.

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Example

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
#include <Graphics\Graphic.mqh>

--- Create membership functions
CP_ShapedMembershipFunction func1(0,0.5,3,9);
CP_ShapedMembershipFunction func2(0,4,5.5,9);
CP_ShapedMembershipFunction func3(0,6,7,9);

--- Create wrappers for membership functions
double P_ShapedMembershipFunction1(double x) { return (func1.GetValue(x)); }
double P_ShapedMembershipFunction2(double x) { return (func2.GetValue(x)); }
double P_ShapedMembershipFunction3(double x) { return (func3.GetValue(x)); }

--- Script program start function
void OnStart()
{
    //--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"P_ShapedMembershipFunction",0,30,30,780,380))
    {
        graphic.Attach(0,"P_ShapedMembershipFunction");
    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("P_ShapedMembershipFunction");
    graphic.BackgroundMainSize(16);
    //--- create curve
    graphic.CurveAdd(P_ShapedMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,"
    graphic.CurveAdd(P_ShapedMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,"
    graphic.CurveAdd(P_ShapedMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,"
    //--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
```
graphic.XAxis().Min(0.0);
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);

//--- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);

//--- plot
graphic.CurvePlotAll();
graphic.Update();

A (Get method)

Gets the parameter of the fuzzy set beginning.

double A()

Return Value

Parameter of the fuzzy set beginning.

A (Set method)

Sets the parameter of the fuzzy set beginning.

void A(
    const double a // parameter of the fuzzy set beginning
)

Parameters

a

[in] Parameter of the fuzzy set beginning.

B (Get method)

Gets the first parameter of the fuzzy set core.

double B()

Return Value

The first parameter of the fuzzy set core.

B (Set method)

Sets the first parameter of the fuzzy set core.

void B(
    const double b // value of the fuzzy set core first parameter
)
Parameters

\( b \)

[in] The first parameter of the fuzzy set core.

**C (Get method)**

Gets the second parameter of the fuzzy set core.

```c
double C()
```

Return Value

The second parameter of the fuzzy set core.

**C (Set method)**

Sets the second parameter of the fuzzy set core.

```c
void C(
  const double c //= value of the fuzzy set core second parameter
)
```

Parameters

\( c \)

[in] The second parameter of the fuzzy set core.

**D (Get method)**

Gets the parameter of the fuzzy set end.

```c
double D()
```

Return Value

Value of the fuzzy set end parameter.

**D (Set method)**

Sets the parameter of the fuzzy set end.

```c
void D(
  const double d //= value of the fuzzy set end parameter
)
```

Parameters

\( d \)

[in] Value of the fuzzy set end parameter.

**GetValue**
Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const double x
)
```

**Parameters**

- `x`
  - [in] membership function argument

**Return Value**

- membership function value
CProductTwoSigmoidalMembershipFunction

Class for implementing the membership function in the form of a product of two sigmoid functions with the A1, A2, C1 and C2 parameters.

Description

A product of two sigmoid membership functions is applied for setting smooth asymmetric functions. It allows creating membership functions with the values equal to 1 beginning with an argument value. Such functions are suitable if you need to set such linguistic terms as "short" or "long".

A sample code for plotting a chart is displayed below.

Declaration

class CProductTwoSigmoidalMembershipFuncion : public IMembershipFunction

Title

#include <Math\Fuzzy\membershipfunction.mqh>

Inheritance hierarchy

CObject
   IMembershipFunction

graphic.CurvePlotAll();
graphic.Update();
}

A1 (Get method)

Gets the first membership function slope ratio.

```cpp
double A1()
```

Return Value

The first membership function slope ratio.

A1 (Set method)

Sets the first membership function slope ratio.

```cpp
void A1(
    const double a1 // the first membership function slope ratio
)
```

Parameters

a1

[in] The first membership function slope ratio.

A2 (Get method)

Gets the second membership function slope ratio.

```cpp
double A2()
```

Return Value

The second membership function slope ratio.

A2 (Set method)
Sets the second membership function slope ratio.

```cpp
void A2(
    const double a2 // the second membership function slope ratio
)
```

**Parameters**

`a2`

[in] The second membership function slope ratio.

---

**C1 (Get method)**

Gets the first membership function inflection coordinate parameter.

```cpp
double C1()
```

**Return Value**

The first membership function inflection coordinate.

---

**C1 (Set method)**

Sets the first membership function inflection coordinate.

```cpp
void C1(
    const double c1 // the first membership function inflection coordinate
)
```

**Parameters**

`c1`

[in] The first membership function inflection coordinate.

---

**C2 (Get method)**

Gets the second membership function inflection coordinate parameter.

```cpp
double C2()
```

**Return Value**

The second membership function inflection coordinate.

---

**C2 (Set method)**

Sets the second membership function inflection coordinate.

```cpp
void C2(
    const double c2 // the second membership function inflection coordinate
)
```

**Parameters**

`c2`
[in] The second membership function inflection coordinate.

**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const x // membership function argument
)
```

**Parameters**

- **x**

**Return Value**

- Membership function value.
CS_ShapedMembershipFunction

Class for implementing an S-like membership function with the A and B parameters.

Description

The function sets an S-like two-parameter membership function. This is a non-decreasing function that takes values from 0 to 1. The A and B parameters define the interval, within which the function increases in non-linear trajectory from 0 to 1.

The function represents fuzzy sets of "very high" type (i.e. non-decreasing membership functions with saturation are set).

![S_ShapedMembershipFunction](image)

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CS_ShapedMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

```
CObject
  IMembershipFunction
    CS_ShapedMembershipFunction
```

Class methods

<table>
<thead>
<tr>
<th>Class method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Gets and sets the parameter of the increasing interval start.</td>
</tr>
</tbody>
</table>
B

Gets and sets the first parameter of the fuzzy set core.

GetValue

Calculates the value of the membership function by a specified argument.

Methods inherited from class CObject

Prev, Prev, Next, Next, Save, Load, Type, Compare

Example

```csharp
#include <Math\Fuzzy\membershipfunction.mgh>
#include <Graphics\Graphic.mgh>

//--- Create membership functions
CS_ShapedMembershipFunction func1(2,1);
CS_ShapedMembershipFunction func2(2,4);
CS_ShapedMembershipFunction func3(2,7);

//--- Create wrappers for membership functions
double S_ShapedMembershipFunction1(double x) { return(func1.GetValue(x)); }
double S_ShapedMembershipFunction2(double x) { return(func2.GetValue(x)); }
double S_ShapedMembershipFunction3(double x) { return(func3.GetValue(x)); }

//+------------------------------------------------------------------+
//| Script program start function                                    |
//+------------------------------------------------------------------+
void OnStart()
{

//--- create graphic
CGraphic graphic;
if(!graphic.Create(0,"S_ShapedMembershipFunction",0,30,30,780,380))
{
   graphic.Attach(0,"S_ShapedMembershipFunction");
}

graphic.HistoryNameWidth(70);
graphic.BackgroundMain("S_ShapedMembershipFunction");
graphic.BackgroundMainSize(16);

//--- create curve
graphic.CurveAdd(S_ShapedMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,"[2, 1]");
graphic.CurveAdd(S_ShapedMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,"[2, 4]");
graphic.CurveAdd(S_ShapedMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,"[2, 7]");

//--- sets the X-axis properties
graphic.XAxis().AutoScale(false);
graphic.XAxis().Min(0.0);
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);
```
//--- sets the Y-axis properties
    graphic.YAxis().AutoScale(false);
    graphic.YAxis().Min(0.0);
    graphic.YAxis().Max(1.1);
    graphic.YAxis().DefaultStep(0.2);
    //--- plot
    graphic.CurvePlotAll();
    graphic.Update();
}

A (Get method)

Gets the parameter of the increasing interval start.

double A()

Return Value

Increasing interval start parameter.

A (Set method)

Sets the parameter of the increasing interval start.

void A(
    const double a // increasing interval start parameter
}

Parameters

a

[in] Increasing interval start parameter.

B (Get method)

Gets the first parameter of the fuzzy set core.

double B()

Return Value

The first parameter of the fuzzy set core.

B (Set method)

Sets the first parameter of the fuzzy set core.

void B(
    const double b // the first parameter of the fuzzy set core
}

Parameters

b
[in] The first parameter of the fuzzy set core.

**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const x // membership function argument
)
```

**Parameters**

- `x`

**Return Value**

- Membership function value.
**CSigmoidalMembershipFunction**

Class for implementing a sigmoid membership function with the A and C parameters.

**Description**

The sigmoid function is applied when setting monotonous membership functions. It allows creating membership functions with the values equal to 1 beginning with an argument value. Such functions are suitable if you need to set such linguistic terms as "short" or "long".

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CSigmoidalMembershipFunction : public IMembershipFunction
```

**Title**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

**Inheritance hierarchy**

- CObject
- IMembershipFunction
- CSigmoidalMembershipFunction

    //--- sets the Y-axis properties
    graphic.YAxis().AutoScale(false);
```

© 2000-2019, MetaQuotes Software Corp.
A (Get method)

Gets the membership function slope ratio.

```cpp
double A()
```

Return Value

The membership function slope ratio.

A (Set method)

Sets the membership function slope ratio.

```cpp
void A(
    const double a  // the first membership function slope ratio
)
```

Parameters

- `a`
  

C (Get method)

Gets the membership function inflection coordinate parameter.

```cpp
double C()
```

Return Value

Membership function inflection coordinate.

C (Set method)

Sets the membership function inflection coordinate.

```cpp
void C(
    const double c  // membership function inflection coordinate
)
```

Parameters

- `c`
  
  [in] The membership function inflection coordinate.
**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(const x // membership function argument)
```

**Parameters**

- `x`

**Return Value**

- Membership function value.
CTrapezoidMembershipFunction

Class for implementing a trapezoidal membership function with the X1, X2, X3 and X4 parameters.

Description

The function is formed using piecewise linear approximation. This is a generalization of the triangular function allowing you to assign a fuzzy set core as an interval. Such a membership function makes it possible to conveniently interpret optimistic/pessimistic assessments.

The function is used to set asymmetric membership functions of the variables with their most critical values defined within a certain interval.

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CTrapezoidMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

```
COobject
    IMembershipFunction
        CTrapezoidMembershipFunction
```

X1 (Get method)

Gets the value of the first point on the X axis.

```plaintext
double X1()
```

Return Value

The value of the first point on the X axis.

X1 (Set method)

Sets the value of the first point on the X axis.

```plaintext
void X1(
    const double x1   // value of the first point on the X axis
)
```

Parameters

x1

[in] The value of the first point on the X axis.

X2 (Get method)

Gets the value of the second point on the X axis.

```plaintext
double X2()
```

Return Value

The value of the second point on the X axis.

X2 (Set method)

Sets the value of the second point on the X axis.

```plaintext
void X2(
```
const double x2  // value of the second point on the X axis

Parameters
x2
   [in]  The value of the second point on the X axis.

X3 (Get method)

Gets the value of the third point on the X axis.

double X3()

Return Value
   The value of the third point on the X axis.

X3 (Set method)

Sets the value of the third point on the X axis.

void X3{
   const double x3  // value of the third point on the X axis
}

Parameters
x3
   [in]  The value of the third point on the X axis.

X4 (Get method)

Gets the value of the fourth point on the X axis.

double X4()

Return Value
   The value of the fourth point on the X axis.

X4 (Set method)

Sets the value of the fourth point on the X axis.

void X4{
   const double x4  // value of the fourth point on the X axis
}

Parameters
x4
   [in]  The value of the fourth point on the X axis.
GetValue

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const x    // membership function argument
)
```

Parameters

- `x` [in] Membership function argument.

Return Value

- Membership function value.
CTriangularMembershipFunction

Class for implementing a triangle membership function with the X1, X2 and X3 parameters.

Description

The function sets a membership function in the form of a triangle. This is a simple and most frequently applied membership function.

![Triangular Membership Function Graph](image)

A sample code for plotting a chart is displayed below.

Declaration

```cpp
class CTriangularMembershipFunction : public IMembershipFunction
```

Title

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

Inheritance hierarchy

CObject

IMembershipFunction

CTriangularMembershipFunction

ToNormalMF
Converts a triangle membership function into a Gaussian one.

GetValue
Calculates the value of the membership function by a specified argument.

Methods inherited from class CObject
Prev, Prev, Next, Next, Save, Load, Type, Compare

Example
```c
#include <Math\Fuzzy\membershipfunction.mgh>
#include <Graphics\Graphic.mgh>

//--- Create membership functions
CTriangularMembershipFunction func1(0,2,5);
CTriangularMembershipFunction func2(0,5,10);
CTriangularMembershipFunction func3(8,8,10);

//--- Create wrappers for membership functions
double TriangularMembershipFunction1(double x) { return(func1.GetValue(x)); } 
double TriangularMembershipFunction2(double x) { return(func2.GetValue(x)); } 
double TriangularMembershipFunction3(double x) { return(func3.GetValue(x)); } 

//--- create graphic
CGraphic graphic;
if(!graphic.Create(0,"TriangularMembershipFunction",0,30,30,780,380))
{
    graphic.Attach(0,"TriangularMembershipFunction");
}
graphic.XAxis().AutoScale(false);
```
graphic.XAxis().Min(0.0);
graphic.XAxis().Max(10.0);
graphic.XAxis().DefaultStep(1.0);

//--- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);

//--- plot
graphic.CurvePlotAll();
graphic.Update();
}

**X1 (Get method)**

Gets the value of the first point on the X axis.

```c++
double X1()
```

**Return Value**

The value of the first point on the X axis.

**X1 (Set method)**

Sets the value of the first point on the X axis.

```c++
void X1(
    const double x1 // value of the first point on the X axis
)
```

**Parameters**

x1

[in] The value of the first point on the X axis.

**X2 (Get method)**

Gets the value of the second point on the X axis.

```c++
double X2()
```

**Return Value**

The value of the second point on the X axis.

**X2 (Set method)**

Sets the value of the second point on the X axis.

```c++
void X2(
    const double x2 // value of the second point on the X axis
)
```
Parameters

\( x_2 \)

[in] The value of the second point on the X axis.

**X3 (Get method)**

Gets the value of the third point on the X axis.

```c
double X3()
```

**Return Value**

The value of the third point on the X axis.

**X3 (Set method)**

Sets the value of the third point on the X axis.

```c
void X3(
    const double x3  // value of the third point on the X axis
)
```

Parameters

\( x_3 \)

[in] The value of the third point on the X axis.

**ToNormalMF**

Converts a triangle membership function into a Gaussian one.

```c
CNormalMembershipFunction* ToNormalMF()
```

**Return Value**

The pointer to a Gaussian membership function.

**GetValue**

Calculates the value of the membership function by a specified argument.

```c
double GetValue(
    const x  // membership function argument
)
```

Parameters

\( x \)

Return Value

Membership function value.
**CZ_ShapedMembershipFunction**

Class for implementing a z-like membership function with the A and B parameters.

**Description**

The function sets a z-like two-parameter membership function. This is a non-increasing membership function that takes values from 1 to 0. The function parameters define an interval, within which the function decreases in non-linear trajectory from 1 to 0.

The function represents fuzzy sets of "very low" type. In other words, it sets non-increasing membership functions with saturation.

A sample code for plotting a chart is displayed below.

**Declaration**

```cpp
class CZ_ShapedMembershipFunction : public IMembershipFunction
```

**Title**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
```

**Inheritance hierarchy**

```
CObject
   IMembershipFunction
      CZ_ShapedMembershipFunction
```

**Class methods**

<table>
<thead>
<tr>
<th>Class method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Gets and sets the parameter of the decreasing interval start.</td>
</tr>
</tbody>
</table>
**B**

Gets and sets the parameter of the decreasing interval end.

**GetValue**

Calculates the value of the membership function by a specified argument.

**Methods inherited from class CObject**

Prev, Prev, Next, Next, Save, Load, Type, Compare

**Example**

```cpp
#include <Math\Fuzzy\membershipfunction.mqh>
#include <Graphics\Graphic.mqh>

//--- Create membership functions
CZ_ShapedMembershipFunction func1(2,1);
CZ_ShapedMembershipFunction func2(2,5);
CZ_ShapedMembershipFunction func3(2,9);

//--- Create wrappers for membership functions
double Z_ShapedMembershipFunction1(double x) { return(func1.GetValue(x)); }
double Z_ShapedMembershipFunction2(double x) { return(func2.GetValue(x)); }
double Z_ShapedMembershipFunction3(double x) { return(func3.GetValue(x)); }

//--- Script program start function
void OnStart()
{
    //--- create graphic
    CGraphic graphic;
    if(!graphic.Create(0,"Z_ShapedMembershipFunction",0,30,30,780,380))
    {
        graphic.Attach(0,"Z_ShapedMembershipFunction");
    }
    graphic.HistoryNameWidth(70);
    graphic.BackgroundMain("Z_ShapedMembershipFunction");
    graphic.BackgroundMainSize(16);
    //--- create curve
    graphic.CurveAdd(Z_ShapedMembershipFunction1,0.0,10.0,0.1,CURVE_LINES,"[2, 1]" );
    graphic.CurveAdd(Z_ShapedMembershipFunction2,0.0,10.0,0.1,CURVE_LINES,"[2, 5]" );
    graphic.CurveAdd(Z_ShapedMembershipFunction3,0.0,10.0,0.1,CURVE_LINES,"[2, 9]" );
    //--- sets the X-axis properties
    graphic.XAxis().AutoScale(false);
    graphic.XAxis().Min(0.0);
    graphic.XAxis().Max(10.0);
    graphic.XAxis().DefaultStep(1.0);
```
//--- sets the Y-axis properties
graphic.YAxis().AutoScale(false);
graphic.YAxis().Min(0.0);
graphic.YAxis().Max(1.1);
graphic.YAxis().DefaultStep(0.2);
//--- plot
graphic.CurvePlotAll();
graphic.Update();
}

A (Get method)

Gets the parameter of the decreasing interval start.

```cpp
double A() { return Decreasing interval start parameter; }
```

Return Value

Decreasing interval start parameter.

A (Set method)

Sets the parameter of the decreasing interval start.

```cpp
void A(
    const double a // decreasing interval start parameter
) {
}
```

Parameters

a

[in] Decreasing interval start parameter.

B (Get method)

Gets the parameter of the decreasing interval end.

```cpp
double B() { return Decreasing interval end parameter; }
```

Return Value

Decreasing interval end parameter.

B (Set method)

Sets the parameter of the decreasing interval end.

```cpp
void B(
    const double b // decreasing interval end parameter
) {
}
```

Parameters

b
[in] Decreasing interval end parameter.

**GetValue**

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const x // membership function argument
)
```

**Parameters**

- `x`
  

**Return Value**

- Membership function value.
IMembershipFunction

Basic class for all membership function classes.

Declaration

Calculates the value of the membership function by a specified argument.

```cpp
double GetValue(
    const x // membership function argument
)
```

Parameters

- x

Return Value

Membership function value.
Fuzzy systems rules

A fuzzy system (fuzzy logical inference system) is a receipt of conclusion in the form of a fuzzy set corresponding to the current values of the inputs with the use of a set of fuzzy rules and fuzzy operations.

The fuzzy rules determine the relationship between inputs and outputs of an examined object. Amount of rules in the system is unlimited. The generalized format of fuzzy rules is as follows:

\[
\text{if rule condition, then rule conclusion.}
\]

*Rule condition* describes the current state of the object. *Rule conclusion* describes how the condition affects the object.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
CMamdaniFuzzyRule

Mamdani-type fuzzy inference — one of the two basic types of fuzzy systems. Output variable values are set using fuzzy terms.

Description

Fuzzy logic rule for the Mamdani algorithm can be described as follows:

\[ if(X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n) \text{ then } (Y \text{ is } d)(W) \]

where:
- \(X = (X_1, X_2, X_3 \ldots X_n)\) — vector of input variables;
- \(Y\) — output variable;
- \(a = (a_1, a_2, a_3 \ldots a_n)\) — vector of input variable values;
- \(d\) — output variable value;
- \(W\) — rule weight.

Declaration

```cpp
class CMamdaniFuzzyRule : public CGenericFuzzyRule
```

Title

```cpp
CSingleCondition* Conclusion()
```

**Return Value**

Conclusion of a Mamdani fuzzy rule.

**Conclusion (Set method)**

Sets the Mamdani fuzzy rule conclusion.

```cpp
void Conclusion(
    CSingleCondition* value // conclusion of a Mamdani fuzzy rule
)
```

**Parameters**

`value`

[in] Conclusion of a Mamdani fuzzy rule.

**Weight (Get method)**

Gets the Mamdani fuzzy rule weight.

```cpp
double Weight()
```

**Return Value**

Mamdani fuzzy rule weight.

**Weight (Set method)**

Sets the Mamdani fuzzy rule weight.

```cpp
void Weight(
    const double value // weight of a Mamdani fuzzy rule
)
```

**Parameters**

`value`

[in] Weight of a Mamdani fuzzy rule.
CSugenoFuzzyRule

Sugeno-type fuzzy inference — one of the two basic types of fuzzy systems. Output variable values are set as a linear combination of input variables.

Description

Unlike the Mamdani rule, an input variable value is set by a linear function from input parameters rather than by a fuzzy term. Fuzzy logic rule for the Sugeno algorithm can be described as follows:

\[ if (X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n) \text{ then } Y = b_0 + b_1 \cdot X_1 + b_2 \cdot X_2 + \ldots + b_n \cdot X_n (W) \]

where:

- \( X = (X_1, X_2, X_3 \ldots X_n) \) — vector of input variables;
- \( Y \) — output variable;
- \( a = (a_1, a_2, a_3 \ldots a_n) \) — vector of input variable values;
- \( b = (b_1, b_2, b_3 \ldots b_n) \) — free term ratio in the linear function for an output value;
- \( W \) — rule weight.

Declaration

```cpp

class CSugenoFuzzyRule : public CGenericFuzzyRule
```

Title

```cpp
#include <Math\Fuzzy\fuzzyrule.mqh>
```

Inheritance hierarchy

- CObject
  - IParsableRule
    - CGenericFuzzyRule
      - CSugenoFuzzyRule

Conclusion (Get method)
Gets the Sugeno fuzzy rule conclusion.

| CSingleCondition* Conclusion() |

**Return Value**

Sugeno fuzzy rule conclusion.

**Conclusion (Set method)**

Sets the Sugeno fuzzy rule conclusion.

```cpp
void Conclusion(
    CSingleCondition* value  // conclusion of a Sugeno fuzzy rule
)
```

**Parameters**

`value`

[in] Conclusion of a Sugeno fuzzy rule.
**CSingleCondition**

The class sets a fuzzy condition expressed by "Fuzzy variable — Fuzzy term" pair.

**Description**

According to a fuzzy condition, one variable corresponds to one term. A fuzzy condition can be described by the following expression: \( X \text{ is } a \),

where:
- \( X \) is a fuzzy variable;
- \( a \) is a fuzzy variable value (fuzzy term).

**Declaration**

```cpp
class CSingleCondition : public ICondition
```

**Title**

```cpp
#include <Math\Fuzzy\fuzzyrule.mqh>
```

**Inheritance hierarchy**

</table>

Methods inherited from class CObject

- Prev, Prev, Next, Next, **Save**, **Load**, **Type**, **Compare**

**Not (Get method)**

Gets the flag indicating whether it is necessary to apply negation to this condition.

```cpp
bool Not()
```
Return Value

The flag value.

Not (Set method)

Sets the flag indicating whether it is necessary to apply negation to this condition.

```cpp
void Not(
    bool not  // flag value
);
```

Parameters

- `not`
  - [in] Flag value.

Term (Get method)

Gets a fuzzy term for the given condition.

```cpp
INamedValue* Term();
```

Return Value

A fuzzy term for the given condition.

Term (Set method)

Sets a fuzzy term for the given condition.

```cpp
void Term(
    INamedValue*& value  // fuzzy term for the given condition
);
```

Parameters

- `value`
  - [in] A fuzzy term for the given condition.

Var (Get method)

Gets a fuzzy variable for the given condition.

```cpp
INamedVariable* Var();
```

Return Value

A fuzzy variable for the given condition.

Var (Set method)

Sets a fuzzy variable for the given condition.
void Var(
    INamedVariable* value // a fuzzy variable for the given condition
)

Parameters

value

    [in] fuzzy variable.
CConditions

Class defines a set of fuzzy conditions connected to each other by an operator.

Description

A set of fuzzy conditions connected to each other by an operator may be described as follows:

\[(X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n)\]

where:

- \(X = (X_1, X_2, X_3 \ldots X_n)\) — vector of input variables;
- \(a = (a_1, a_2, a_3 \ldots a_n)\) — vector of input variable values.

In this example, the \text{and} operator is used. Besides, the \text{or} operator is available in this class.

Declaration

```
class CConditions : public ICondition
```

Title

```
#include <Math\Fuzzy\fuzzyrule.mqh>
```

Inheritance hierarchy

```
CObject
  ICondition
    CConditions

ConditionsList

Gets the list of all conditions.

```
CLlist* ConditionsList()
```
Return Value

List of all conditions.

**Not (Get method)**

Gets the flag indicating whether it is necessary to apply negation to these conditions.

```cpp
bool Not()
```

Return Value

The flag value.

**Not (Set method)**

Sets the flag indicating whether it is necessary to apply negation to these conditions

```cpp
void Not(
    bool not // flag value
)
```

Parameters

- `not`  
  [in] Flag value.

**Op (Get method)**

Gets a type of the conditions bundle operator. The and and or operators are available.

```cpp
OperatorType Op()
```

Return Value

Type of the conditions bundle operator.

**Op (Set method)**

Set the conditions bundle operator. The and and or operators are available.

```cpp
void Op(
    OperatorType op // type of the conditions bundle operator
)
```

Parameters

- `op`  
  [in] Type of the conditions bundle operator.
#### CGenericFuzzyRule

Base class for both types of fuzzy rules.

**Declaration**

```
class CGenericFuzzyRule : public IParsableRule
```

**Title**

```
#include <Math\Fuzzy\fuzzyrule.mqh>
```

**Inheritance hierarchy**

- CObject
  - IParsableRule
    - CGenericFuzzyRule

#### Conclusion (Get method)

Gets the conclusion of a fuzzy rule.

```
CSingleCondition* Conclusion()
```

**Return Value**

- Conclusion of a fuzzy rule.

#### Conclusion (Set method)

Sets the fuzzy rule conclusion.

```
virtual void Conclusion(CSingleCondition* value) // conclusion of a fuzzy rule
```
Parameters

value
  [in] Conclusion of a fuzzy rule.

**Condition (Get method)**

Gets the 'if' condition (set of conditions) for a fuzzy rule.

```csharp
CConditions* Condition()
```

**Return Value**

Fuzzy condition (set of conditions).

**Condition (Set method)**

Sets the 'if' condition (set of conditions) for a fuzzy rule.

```csharp
void Condition(
    CConditions* value // 'if' condition (set of conditions) for a fuzzy rule
)
```

Parameters

value
  [in] Fuzzy condition (set of conditions).

**CreateCondition**

Creates a condition for a fuzzy rule by specified parameters.

```csharp
CPuzzyCondition* CreateCondition(
    CFuzzyVariable* var,      // fuzzy variable
    CFuzzyTerm* term,         // fuzzy term
)
```

Parameters

var

term

**Return Value**

Fuzzy rule status.
Creates a condition for a fuzzy rule by specified parameters.

```cpp
CFuzzyCondition* CreateCondition(CFuzzyVariable* var, // fuzzy variable
                                 CFuzzyTerm* term,   // fuzzy term
                                 bool not,           // flag indicating whether it is necessary to apply negation to a condition
                                 HedgeType hedge)   // condition bundle type
```

Parameters

- `not` [in] Flag indicating whether it is necessary to apply negation to a condition.

Return Value

Fuzzy rule status.

CreateCondition

Creates a condition for a fuzzy rule by specified parameters.

```cpp
CFuzzyCondition* CreateCondition(CFuzzyVariable* var, // fuzzy variable
                                 CFuzzyTerm* term,   // fuzzy term
                                 bool not,           // flag indicating whether it is necessary to apply negation to a condition
                                 HedgeType hedge)   // condition bundle type
```

Parameters

- `not` [in] Flag indicating whether it is necessary to apply negation to a condition.

Return Value

Fuzzy rule status.
Fuzzy systems variables

Fuzzy (linguistic) variables are applied in fuzzy systems. These are the variables whose values are words or word combinations in a natural or artificial language.

Linguistic variables comprise fuzzy sets. The nature and number of fuzzy variables change for each certain task when defining fuzzy sets.

<table>

</table>
**CFuzzyVariable**

Class for creating general fuzzy variables.

**Description**

Here, a fuzzy variable is created with the following parameters:

- maximum variable value;
- minimum variable value;
- fuzzy variable name;
- term set (set of all possible values, which a linguistic variable is capable of receiving).

**Declaration**

```cpp
class CFuzzyVariable : public CNamedVariableImpl
```

**Title**

```cpp
#include <Math\Fuzzy\fuzzyvariable.mqh>
```

**Inheritance hierarchy**

Methods inherited from class CNamedVariableImpl

Name, Name

AddTerm

Adds a single fuzzy term to a fuzzy variable.

```cpp
void AddTerm(
    CFuzzyTerm* term // fuzzy term
)
```

Parameters

GetTermByName

Gets a fuzzy term by a specified name.

```cpp
CFuzzyTerm* GetTermByName(
    const string name // fuzzy term name
)
```

Parameters

- `name` [in] Fuzzy term name.

Return Value

- Fuzzy term with a specified name.

Max (Get method)

Gets the maximum value for a fuzzy variable.

```cpp
double Max()
```

Return Value

- Maximum value for a fuzzy variable.

Max (Set method)

Sets the maximum value for a fuzzy variable.

```cpp
void Max(
    const double max // maximum value for a fuzzy variable
)
```

Parameters
**max**

### Min (Get method)

Gets the minimum value for a fuzzy variable.

```c
double Min()
```

**Return Value**

Minimum value for a fuzzy variable.

### Max (Set method)

Sets the minimum value for a fuzzy variable.

```c
void Min(const double min)  // minimum value for a fuzzy variable
```

**Parameters**

`min`  

### Terms (Get method)

Gets a list of fuzzy terms for the given fuzzy variable.

```c
CList* Terms()
```

**Return Value**

List of fuzzy terms for the given fuzzy variable.

### Terms (Set method)

Sets a list of fuzzy terms for the given fuzzy variable.

```c
void Terms(CList* terms)  // list of fuzzy terms for the given variable
```

**Parameters**

`terms`  
[in] list of fuzzy terms for the given fuzzy variable.

### Values

Gets a list of fuzzy terms for the given fuzzy variable.
**List* Values()**

**Return Value**

List of fuzzy terms for the given variable.
CSugenoVariable

Class for creating fuzzy Sugeno-type variables.

Description

Fuzzy Sugeno-type variable is different from the general linguistic variable since it is not set by a term set but by a set of linear functions.

Declaration

```cpp
class CSugenoVariable : public CNamedVariableImpl
```

Title

```cpp
#include <Math\Fuzzy\sugenovariable.mqh>
```

Inheritance hierarchy

- CObject
  - INamedValue
    - INamedVariable
      - CNamedVariableImpl
        - CSugenoVariable

Class methods

<table>
<thead>
<tr>
<th>Class method</th>

Methods inherited from class CNamedVariableImpl

- Name, Name

Functions

Gets the list of linear functions of the fuzzy Sugeno variable.

```cpp
CLlist* Functions()
```

Return Value
List of linear functions.

**GetFuncByName**

Gets the linear function by a specified name.

```cpp
ISugenoFunction* GetFuncByName(
    const string name  // linear function name
)
```

**Parameters**

- `name`
  
  [in] Linear function name.

**Return Value**

- Linear function with a specified name.

**Values**

Gets the list of linear functions of the fuzzy Sugeno variable.

```cpp
CList* Values()
```

**Return Value**

- List of linear functions of the fuzzy Sugeno variable.
CFuzzyTerm (fuzzy terms)

Class for implementing fuzzy terms.

Description

A term is any element of a term set. A term is defined by two components:

- fuzzy term name;
- membership function.

Declaration

```cpp
class CFuzzyTerm : public CNamedValueImpl
```

Title

```cpp
#ifndef FUZZY_TERM_H
#define FUZZY_TERM_H

#include <Math/Fuzzy/fuzzyterm.h>

#include <Math/Fuzzy/fuzzyterm.h>
```

Inheritance hierarchy

**MembershipFunction**

Gets a membership function for the fuzzy term.

```c
IMembershipFunction* MembershipFunction()
```

**Return Value**

Membership function
Fuzzy systems

Fuzzy system (or fuzzy model) is a mathematical model whose calculation is based on fuzzy logic. Construction of such models is applicable when the subject of study has a weak formalization and its exact mathematical description is too complex or unknown.

The progress of a model construction can be divided into three main stages:

1. Definition of input and output characteristics of a model.
2. Building a knowledge base.
3. Selecting one of the methods of fuzzy inference (Mamdani and Sugeno).

The first stage directly effects the consequent two and determines the future operation of the model.

A knowledge base (rule base) is a set of fuzzy rules of “if, then” type that define the relationship between inputs and outputs of the examined object.

Rule condition describes the current state of the object, and rule conclusion — how this condition affects the object.

There can be two types of terms and conclusions for each rule:

1. simple (link to Csinglcond) — includes one fuzzy variable;
2. complex (link to Cconditions) — includes several fuzzy variables.

Each rule in the system has its weight — importance of a rule in the model. Weighting factors are assigned to a rule within range $[0, 1]$.

Depending on the created knowledge base, the system of fuzzy inference is determined for a model. Fuzzy logical inference is a receipt of conclusion in form of a fuzzy set corresponding to the current value of the inputs with use of knowledge base and fuzzy operations. The two main types of fuzzy inference are Mamdani and Sugeno.
Mamdani system

Output variable values in the Mamdani system are set using fuzzy terms.

Description

Fuzzy logic rule for the Mamdani algorithm can be described as follows:

\[ i f (X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n) \text{ then } (Y \text{ is } d)(W) \]

where:
- \(X = (X_1, X_2, X_3 \ldots X_n)\) — vector of input variables;
- \(Y\) — output variable;
- \(a = (a_1, a_2, a_3 \ldots an)\) — vector of input variable values;
- \(d\) — output variable value;
- \(W\) — rule weight.

Methods inherited from class CGenericFuzzySystem

- Input, AndMethod, AndMethod, OrMethod, OrMethod, InputByName, Fuzzify

AggregationMethod

Sets the type of conditions aggregation method.

```c
void AggregationMethod(AggregationMethod value) // aggregation method type
```
Parameters
value
[in] Type of conditions aggregation method.

**Calculate**
Calculates a fuzzy inference for the system

```cpp
CList* Calculate(
    CList* inputValues       // input data
)
```

Parameters
inputValues
[in] Input data for calculation.

Return Value
Calculation result.

**DefuzzificationMethod**
Sets defuzzification method type.

```cpp
void DefuzzificationMethod(
    DefuzzificationMethod value       // defuzzification method type.
)
```

Parameters
value

**EmptyRule**
Creates an empty fuzzy Mamdani rule based on the current system

```cpp
CMamdaniFuzzyRule* EmptyRule()  
```

Return Value
Fuzzy Mamdani rule.

**ImplicationMethod**
Sets a type of the conditions implication operator.

```cpp
void ImplicationMethod(
    ImplicationMethod value       // implication operator type
)  
```
Parameters

value
    [in] Type of the conditions implication operator.

Output

Gets the list of fuzzy Mamdani output variables.

CList* Output()

Return Value

List of fuzzy variables.

OutputByName

Gets a fuzzy Mamdani output variable by a specified name.

CFuzzyVariable* OutputByName{
    const string name // fuzzy variable name
}

Parameters

name
    [in] Fuzzy variable name.

Return Value

Fuzzy Mamdani variable with a specified name.

ParseRule

Creates a fuzzy Mamdani rule based on a specified line.

CMamdaniFuzzyRule* ParseRule{
    const string rule // string representation of a fuzzy rule
}

Parameters

rule
    [in] String representation of a fuzzy Mamdani rule.

Return Value

Fuzzy Mamdani rule.
Returns the list of fuzzy Mamdani rules.

\texttt{List* Rules()}

Return Value

List of fuzzy Mamdani rules.
**Sugeno system**

Sugeno fuzzy logic system is one of the two basic types of fuzzy systems. Output variable values are set as a linear combination of input variables.

**Description**

Unlike the Mamdani rule, an input variable value is set by a linear function from entries rather than by a fuzzy term. Fuzzy logic rule for the Sugeno algorithm can be described as follows:

\[ if(X_1 \text{ is } a_1) \land (X_2 \text{ is } a_2) \land \ldots \land (X_n \text{ is } a_n) \text{ then } (Y = b_0 + b_1 \cdot X_1 + b_2 \cdot X_2 + \ldots + b_n \cdot X_n)(W) \]

where:
- \( X = (X_1, X_2, X_3 \ldots X_n) \) — vector of input variables;
- \( Y \) — output variable;
- \( a = (a_1, a_2, a_3 \ldots an) \) — vector of input variable values;
- \( b = (b_1, b_2, b_3 \ldots bn) \) — free term ratio in the linear function for an output value
- \( W \) — rule weight.

**Class methods**

<table>
<thead>
<tr>

<td>Returns the list of fuzzy rules.</td>
</tr>
</tbody>
</table>

Methods inherited from class CGenericFuzzySystem

- Input, AndMethod, OrMethod, InputByName, Fuzzify

**Calculate**

Calculates a fuzzy inference for the system

```c
CList* Calculate(
    CList* & inputValues // input data
)```
Parameters

inputValues
  [in] Input data for calculation.

Return Value

Calculation result.

CreateSugenoFunction

Creates a linear Sugeno function for the system.

```
CLinearSugenoFunction* CreateSugenoFunction(
    const string name, // function name
    const double& coeffs[] // function ratios
)
```

Parameters

name
  [in] Function name.

coeffs[]

Return Value

Linear Sugeno function.

Note

The size of the ratio array may be equal to a number of inputs or exceed that number by one. In the first case, the free term of the Sugeno linear function is equal to zero, while in the second case, it is equal to the last ratio.

CreateSugenoFunction

Creates a linear Sugeno function for the system.

```
CLinearSugenoFunction* CreateSugenoFunction(
    const string name, // function name
    CList*& coeffs, // list of pairs fuzzy variable - its ratio
    const double constValue // function free term ratio
)
```

Parameters

name
  [in] Function name.

coeffs[]
Return Value

Linear Sugeno function.

**EmptyRule**

Creates an empty fuzzy Sugeno rule based on the current system.

```cpp
CSugenoFuzzyRule* EmptyRule()
```

Return Value

Fuzzy Sugeno rule.

**Output**

Gets the list of fuzzy Sugeno output variables.

```cpp
CList* Output()
```

Return Value

List of fuzzy variables.

**OutputByName**

Gets a fuzzy Sugeno output variable by a specified name.

```cpp
CSugenoVariable* OutputByName(
    const string name  // fuzzy variable name
)
```

Parameters

name

Fuzzy variable name.

Return Value

Fuzzy Sugeno variable with a specified name.

**ParseRule**

Creates a fuzzy Sugeno rule based on a specified line.

```cpp
CSugenoFuzzyRule* ParseRule(
    const string rule  // string representation of a fuzzy Sugeno rule
)
```

Parameters

rule

Return Value

Fuzzy Sugeno rule.

Rules

Returns the list of fuzzy rules.

```
CList* Rules()
```

Return Value

List of fuzzy rules.
Class for working with OpenCL programs

The COpenCL class is a wrapper to facilitate working with the OpenCL functions. In some cases, use of the GPU allows to substantially increase the speed of computations.

Examples of class use for calculations based on float and double values can be found in the corresponding subdirectories of the MQL5\Scripts\Examples\OpenCL folder. The source codes of the OpenCL programs are located in MQL5\Scripts\Examples\OpenCL\Double\Kernels and MQL5\Scripts\Examples\OpenCL\Float\Kernels subdirectories.

- MatrixMult.mq5 - example of matrix multiplication using global and local memory
- BitonicSort.mq5 - example of parallel sorting of array elements in GPU
- FFT.mq5 - example of fast Fourier transform calculation
- Wavelet.mq5 - example of wavelet transform of data using the Morlet wavelet.

It is recommended to write the source code for OpenCL in separate CL files, which can later be included in the MQL5 program using the resource variables.

Declaration

class COpenCL

</table>
BufferCreate

Creates an OpenCL buffer at the specified index.

```cpp
bool BufferCreate(
    const int buffer_index, // buffer index
    const uint size_in_bytes, // buffer size in bytes
    const uint flags // combination of flags that define the buffer properties
);
```

Parameters

- `buffer_index`
  - [in] Index buffer.
- `size_in_bytes`
  - [in] Buffer size in bytes.
- `flags`
  - [in] Buffer properties that are set using a combination of flags.

Return Value

In case of successful execution, returns true, otherwise - false.
### BufferFree

Deletes buffer at the specified index.

```cpp
bool BufferFree(
    const int buffer_index // buffer index
);
```

**Parameters**

`buffer_index`

- [in] Index buffer.

**Return Value**

In case of successful execution, returns true, otherwise - false.
BufferFromArray

Creates a buffer at the specified index from an array of values.

```cpp
template<typename T>
bool BufferFromArray(
    const int buffer_index,  // buffer index
    const T &data[],         // array of values
    const uint data_array_offset, // offset in the array of values, in bytes
    const uint data_array_count, // number of values from the array to write
    const uint flags // combination of flags that define the buffer
);
```

Parameters

- `buffer_index` [in] Index buffer.
- `data[]` [in] An array of values to be written into the OpenCL buffer.
- `data_array_offset` [in] Offset in the array of values in bytes, from which writing of values begins.
- `data_array_count` [in] The number of values to be written.
- `flags` [in] Buffer properties that are set using a combination of flags.

Return Value

In case of successful execution, returns true, otherwise - false.
BufferRead

Reads an OpenCL buffer at the specified index into an array.

```cpp
template<typename T>
bool BufferRead(
    const int buffer_index, // buffer index
    T &data[],             // array of values
    const uint cl_buffer_offset, // offset in the OpenCL buffer, in bytes
    const uint data_array_offset, // shift in the array elements
    const uint data_array_count // number of values from the buffer to read
);```

Parameters

- `buffer_index`  
  [in] Index buffer.
- `data[]`  
  [in] Array to obtain the values of the OpenCL buffer.
- `cl_buffer_offset`  
  [in] Offset in the OpenCL buffer in bytes, from which to start reading values.
- `data_array_offset`  
  [in] Index of the first element of the array to write values of the OpenCL buffer.
- `data_array_count`  
  [in] The number of values to be read.

Return Value

In case of successful execution, returns true, otherwise - false.
BufferWrite

Writes an array of values into buffer at the specified index.

```cpp
template<typename T>
bool BufferWrite(
    const int buffer_index, // buffer index
    T& data[], // array of values
    const uint cl_buffer_offset, // offset in the OpenCL buffer, in bytes
    const uint data_array_offset, // shift in the array elements
    const uint data_array_count // number of values from the array to write
);
```

Parameters

- **buffer_index**
  - [in] Index buffer.
  - ```cpp
data[]
```

- **data[]**
  - [in] An array of values to be written into the OpenCL buffer.

- **cl_buffer_offset**
  - [in] Offset in the OpenCL buffer in bytes, from which to start writing values.

- **data_array_offset**
  - [in] Index of the first element of the array, starting from which the array values are written to the OpenCL buffer.

- **data_array_count**
  - [in] The number of values to be written.

Return Value

In case of successful execution, returns true, otherwise - false.
Execute

Executes the OpenCL program at the specified index.

```cpp
bool Execute(
    const int kernel_index,  // index of the kernel
    const int work_dim,     // dimension of the tasks space
    const uint &work_offset[], // initial offset in the tasks space
    const uint &work_size[]  // total number of tasks
);
```

Executes the OpenCL kernel with the specified index and number of tasks in the local group.

```cpp
bool Execute(
    const int kernel_index,  // index of the kernel
    const int work_dim,     // dimension of the tasks space
    const uint &work_offset[], // initial offset in the tasks space
    const uint &work_size[], // total number of tasks
    const uint &local_work_size[]  // number of tasks in the local group
);
```

Parameters

- **kernel_index**
  - [in] Index of the kernel object.

- **work_dim**
  - [in] Dimension of the tasks space.

- **&work_offset[]**
  - [in][out] Initial offset in the tasks space. Passed by reference.

- **&work_size[]**

- **&local_work_size[]**
  - [in][out] The size of the local tasks subset in the group. Passed by reference.

Return Value

In case of successful execution, returns true, otherwise - false.
**GetContext**

Returns handle of the OpenCL context.

```c
int GetContext();
```

**Return Value**

Handle of the OpenCL context.
GetKernel

Returns handle of the kernel object at the specified index.

```cpp
int GetKernel(
    const int kernel_index  // index of the kernel
);
```

Parameters

**kernel_index**

[in] Index of the kernel object.

Return Value

Handle of the kernel object.
GetKernelName

Returns name of the kernel object at the specified index.

```c
string GetKernelName(
    const int kernel_index  // index of the kernel
);
```

Parameters

kernel_index

[in] Index of the kernel object.

Return Value

Name of the kernel object.
GetProgram

Returns handle of the OpenCL program.

```c
int GetProgram();
```

Return Value

Handle of the OpenCL program.
Initialize

Initializes the OpenCL program.

```cpp
bool Initialize(
    const string program,       // handle of the OpenCL program
    const bool show_log=true     // keep a log
);
```

Parameters

- **program**
  - [in] Handle of the OpenCL program.

- **show_log=true**
  - [in] Enable logging messages.

Return Value

Returns true, if the initialization succeeded. Otherwise, it returns false.
KernelCreate

Creates an entry point into the OpenCL program at the specified index.

```cpp
bool KernelCreate(
    const int kernel_index,  // index of the kernel
    const string kernel_name  // name of the kernel
);
```

**Parameters**

*kernel_index*

[in] Index of the kernel object.

*kernel_name*

[in] Name of the kernel object.

**Return Value**

In case of successful execution, returns true, otherwise - false.
KernelFree

Removes an OpenCL start function at the specified index.

```cpp
bool KernelFree(
    const int kernel_index // index of the kernel
);
```

Parameters

`kernel_index`

[in] Index of the kernel object.

Return Value

In case of successful execution, returns true, otherwise - false.
SetArgument

Sets a parameter for the OpenCL function at the specified index.

```cpp
template<typename T>
bool SetArgument(
    const int kernel_index,  // index of the kernel
    const int arg_index,    // index of the function argument
    T value                 // source code
);
```

**Parameters**

- `kernel_index`
  - [in] Index of the kernel object.

- `arg_index`
  - [in] Index of the function argument.

- `value`
  - [in] The value of the function argument.

**Return Value**

In case of successful execution, returns true, otherwise - false.
SetArgumentBuffer

Sets an OpenCL buffer as a parameter of the OpenCL function at the specified index.

```cpp
bool SetArgumentBuffer(
    const int kernel_index, // index of the kernel
    const int arg_index,    // index of the function argument
    const int buffer_index  // buffer index
);
```

**Parameters**

- **kernel_index**
  - [in] Index of the kernel object.

- **arg_index**
  - [in] Index of the function argument.

- **buffer_index**
  - [in] Index buffer.

**Return Value**

In case of successful execution, returns true, otherwise - false.
SetArgumentLocalMemory

Sets a parameter in local memory for the OpenCL function at the specified index.

```cpp
bool SetArgumentLocalMemory(
    const int kernel_index,  // index of the kernel
    const int arg_index,     // index of the function argument
    const int local_memory_size  // size of the local memory
);
```

Parameters

- **kernel_index**
  - [in] Index of the kernel object.

- **arg_index**
  - [in] Index of the function argument.

- **local_memory_size**
  - [in] Size of the local memory.

Return Value

In case of successful execution, returns true, otherwise - false.
SetBuffersCount

Sets the number of buffers.

```cpp
bool SetBuffersCount(const int total_buffers); // number of buffers
```

**Parameters**

`total_buffers`

[in] The total number of buffers.

**Return Value**

In case of successful execution, returns true, otherwise - false.
SetKernelsCount

Sets the number of kernel objects.

```c
bool SetKernelsCount(
    const int total_kernels  // number of kernels
);
```

Parameters

- `total_kernels` 
  - `[in]` The total number of kernels.

Return Value

In case of successful execution, returns true, otherwise - false.
Shutdown

Unloads the OpenCL program.

```c
void Shutdown();
```

Return Value

No return value.
SupportDouble

Checks if floating point data types are supported on the device.

```cpp
bool SupportDouble();
```

Return Value

Returns true, if the device supports floating point data types.
Basic Class CObject

Class CObject is the base class for constructing a MQL5 Standard Library.

Description

Class CObject allows all its descendants to be part of a linked list. Also, a number of virtual methods for further implementation in descendant classes are identified.

Declaration

```cpp
class CObject
```

Title

```cpp
#include <Object.mqh>
```

Inheritance hierarchy

CObject

Direct descendants

CAccountInfo, CArray, CChart, CChartObject, CCurve, CDealInfo, CDictionary_Obj_Double, CDictionary_Obj_Obj, CDictionary_String_Obj, CExpertBase, CFile, CHistoryOrderInfo, CList, COrderInfo, CPositionInfo, CString, CSymbolInfo, CTerminalInfo, CTrade, CTreeNode, CWnd, ICondition, IExpression, IMembershipFunction, INamedValue, IParsableRule

</tr>
</tbody>
</table>
**Prev**

Gets a pointer to the previous element in the list.

CObject* Prev()

**Return Value**

Pointer to the previous element in the list. If an item is listed first, then return NULL.

**Example:**

```cpp
//--- example for CObject::Prev()
#include <Object.mqh>
//---
void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
    object_second.Prev(object_first);
    //--- use prev object
    CObject *object=object_second.Prev();
    //--- delete objects
    delete object_first;
    delete object_second;
}
```
Sets the pointer to the previous element in the list.

```cpp
void Prev(
    CObject* object // Pointer to the previous element in the list
)
```

**Parameters**

- `object`
  
  [in] New value of the pointer to the previous element in the list.

**Example:**

```cpp
//--- example for CObject::Prev(CObject*)
#include <Object.mqh>
//---
void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
    object_second.Prev(object_first);
    //--- use objects
    //--- ...
    //--- delete objects
    delete object_first;
    delete object_second;
}
```
Next

Gets a pointer to the next element in the list.

CObject*   Next()

Return Value

Pointer to the next element in the list. If this is the last element in the list, return NULL.

Example:

```c
//--- example for CObject::Next()
#include <Object.mqh>
//---
void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
    object_second.Prev(object_first);
    //--- use next object
    CObject *object=object_first.Next();
    //--- delete objects
    delete object_first;
    delete object_second;
}
Next

Sets the pointer to the next element in the list.

```cpp
void Next(CObject* object) // Pointer to the next element in the list
```

**Parameters**

- `object`
  - [in] New value of the pointer to the next element in the list.

**Example:**

```cpp
//--- example for CObject::Next(CObject*)
#include <Object.mqh>
//--
void OnStart()
{
    CObject *object_first, *object_second;
    //--
    object_first = new CObject;
    if (object_first == NULL)
    {
        printf("Object create error");
        return;
    }
    object_second = new CObject;
    if (object_second == NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //-- set interconnect
    object_first.Next(object_second);
    object_second.Prev(object_first);
    //-- use objects
    //-- ...
    //-- delete objects
    delete object_first;
    delete object_second;
}
Compare

Compares the data on a list element with data on another list element.

```cpp
virtual int Compare(
    const CObject* node, // element
    const int mode=0      // variant
) const
```

Parameters

- **node**
  - [in] Pointer to a list element to compare
- **mode=0**
  - [in] Comparison variant

Return Value

- 0 - in case the list elements are equal, -1 - if the list element is less than the element used for comparison (node), 1 - if the list element is greater than the element used for comparison (node).

Note

Compare() method in CObject class always returns 0 and does not perform any action. If you want to compare data in derived class, the Compare(...) method should be implemented. The 'mode' parameter should be used when implementing multivariate comparison.

Example:

```cpp
//--- example for CObject::Compare(...) #include <Object.mqh> //---
void OnStart()
{
    CObject *object_first,*object_second;
    //---
    object_first=new CObject;
    if(object_first==NULL)
    {
        printf("Object create error");
        return;
    }
    object_second=new CObject;
    if(object_second==NULL)
    {
        printf("Object create error");
        delete object_first;
        return;
    }
    //--- set interconnect
    object_first.Next(object_second);
```
object_second.Prev(object_first);

//--- compare objects
int result = object_first.Compare(object_second);

//--- delete objects
delete object_first;
delete object_second;
}
Save

Saves list element data in a file.

```cpp
virtual bool Save(
    int file_handle     // File handle
)
```

**Parameters**

- `file_handle`
  - [in] Handle of the binary file opened earlier using the FileOpen() function

**Return Value**

- `true` - successfully completed, `false` - error.

**Note**

Save(int) method in CObject class always returns 'true' and does not perform any action. If you want to save the data of a derived class in a file, the Save(int) method should be implemented.

**Example:**

```cpp
//--- example for CObject::Save(int)
#include <Object.mqh>
//---
void OnStart()
{
    int file_handle;
    CObject *object=new CObject;
    //---
    if(object!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- set objects data
    //--- . . .
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!object.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete object;
            FileClose(file_handle);
            //---
            return;
        }
    }
}
```
```c
FileClose(file_handle);
}
delele object;
}```
Load

Loads list element data from a file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

**Parameters**

`file_handle`
- [in] Handle of the binary file opened earlier using the FileOpen() function.

**Return Value**

- `true` - successfully completed, `false` - error.

**Note**

Load(int) method in the CObject class always returns 'true' and does not perform any action. If you want to load the data of a derived class from a file, the Load(int) method should be implemented.

**Example:**

```cpp
//--- example for CObject::Load(int)
#include <Object.mqh>
//---
void OnStart()
{
    int file_handle;
    CObject *object=new CObject;
    //---
    if(object!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!object.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete object;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
}
```
//--- use object
//--- . . .
    delete object;
}
Type

Gets the type identifier.

```
virtual int Type() const
```

**Return Value**

Type identifier (for CObject - 0).

**Example:**

```
#include <Object.mqh>

void OnStart()
{
    CObject *object = new CObject;
    if (object == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get objects type
    int type = object->Type();
    //--- delete object
    delete object;
}
```
Data Structures

This section contains the technical details on working with various data structures (arrays, linked lists, etc.) and description of the relevant components of the MQL5 Standard Library.

Using classes of data structures will save time when creating custom data stores of various formats (including composite data structures).

MQL5 Standard Library (in terms of data sets) is placed in the working directory of the terminal in the Include\Arrays folder.

Data Arrays

Use of classes of dynamic data arrays will save time when creating a custom data stores of various formats (including multidimensional arrays).

MQL5 Standard Library (in terms of arrays of data) is located in the working directory of the terminal in the Include\Arrays folder.

</table>
CArray
class is the base class of a dynamic array of variables.

Description

Class CArray is intended to operate on dynamic arrays of variables: memory allocation, sorting, and working with files.

Declaration

```cpp
class CArray : public CObject
```

Title

```cpp
#include <Arrays\Array.mqh>
```

Inheritance hierarchy

```
CObject
    CArray
```

Direct descendants

```
CArrayChar, CArrayDouble, CArrayFloat, CArrayInt, CArrayLong, CArrayObj, CArrayShort, CArrayString
```

</tbody>
</table>

**Methods inherited from class CObject**
- Prev, Prev, Next, Next, Type, Compare
**Step**

Gets the increment size of the array.

```
int Step() const
```

**Return Value**

Increment size of the array.

**Example:**

```c
//--- example for CArray::Step()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array = new CArray;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get resize step
    int step = array.Step();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
**Step**

Sets the increment size of the array.

```cpp
bool Step(
    int step  // step
);
```

**Parameters**

*step*

- [in] The new value of the increment size of the array.

**Return Value**

- true - successful, false - there was an attempt to establish a step less than or equal to zero.

**Example:**

```cpp
//--- example for CArray::Step(int)
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- set resize step
    bool result=arrayStep(1024);
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Total

Gets the number of elements in the array.

```cpp
int Total() const;
```

Return Value

Number of elements in the array.

Example:

```cpp
#include "Arrays\Array.mqh"

void OnStart()
{
    CArray *array=new CArray;
    //---
    if (array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check total
    int total=array.Total();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Available

Gets the number of free elements of the array that are available without additional memory allocation.

```cpp
int Available() const
```

**Return Value**

Number of free elements of the array available without additional memory allocation.

**Example:**

```cpp
//--- example for CArray::Available()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if (array==NUL)
    {
        printf("Object create error");
        return;
    }
    //--- check available
    int available=array.Available();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Max

Gets the maximum possible size of the array without memory reallocation.

```c
int Max() const
```

Return Value

The maximum possible size of the array without memory reallocation.

Example:

```c
//--- example for CArray::Max()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check maximum size
    int max=array.Max();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
**IsSorted**

Gets the flag of array being sorted using the specified sorting mode.

```c
bool IsSorted(
    int mode=0  // sorting mode
) const
```

**Parameters**

- `mode=0`  
  [in] Tested sorting mode.

**Return Value**

Flag of the sorted list. If the list is sorted using the specified mode - true, otherwise - false.

**Note**

The sort flag cannot be changed directly. It is set by the Sort() method and reset by any add/insert method except for the InserSort(...).

**Example:**

```c
//--- example for CArray::IsSorted()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check sorted
    if(array.IsSorted())
    {
        //--- use methods for sorted array
        //--- ...
    }
    //--- delete array
    delete array;
}
```
SortMode

Gets the sorting mode for an array.

```cpp
int SortMode() const;
```

Return Value

- Sorting mode.

Example:

```cpp
//--- example for CArray::SortMode()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- check sort mode
    int sort_mode= array.SortMode();
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Clear

Deletes all of the array elements without memory release.

```cpp
void Clear()
```

Return Value

None.

Example:

```cpp
//--- example for CArray::Clear()
#include <Arrays\Array.mqh>
//---
void OnStart()
{
 CArray *array= new CArray;
 //---
 if(array==NULL)
 {
  printf("Object create error");
  return;
 }
 //--- use array
 //--- ... 
 //--- clear array
 array.Clear();
 //--- delete array
 delete array;
}
```
Sort

Sorts an array using the specified option.

```cpp
void Sort(
    int mode=0    // sorting mode
);  //--- example for CArray::Sort(int)
```

**Parameters**

- `mode=0`

**Return Value**

- No.

**Note**

Sorting an array is always ascending. For arrays of primitive data types (CArrayChar, CArrayShort, etc.), the 'mode' parameter is not used. For the CArrayObj array, multivariate sorting should be implemented in the `Sort(int)` method of derived classes.

**Example:**

```cpp
#include <Arrays\Array.mqh>
//---
void OnStart()
{
    CArray *array=new CArray;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- sorting by mode 0
    array.Sort(0);
    //--- use array
    //--- ...
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
class CArray {  
    virtual bool Save(  
        int file_handle  // file handle  
    )  
};
```

**Parameters**

- `file_handle`  
  
  [in] Handle of a binary file previously opened using the FileOpen(...) function.

**Return Value**

- true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArray::Save(int)
#include <Arrays\Array.mqh>
//---
void OnStart() {  
    int file_handle;  
    CArray *array=new CArray;  
    //---
    if(array!=NULL)  
    {  
        printf("Object create error");  
        return;  
    }  
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);  
    if(file_handle>=0)  
    {  
        if(!array.Save(file_handle))  
        {  
            //--- file save error
            printf("File save: Error %d!",GetLastError());  
            delete array;  
            FileClose(file_handle);  
            //---
            return;  
        }  
        FileClose(file_handle);  
    }  
    //--- delete array
    delete array;  
}
```
Load

Loads data array from a file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

**Parameters**

- *file_handle*
  - [in] Handle of a binary file previously opened using the FileOpen () function.

**Return Value**

- true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArray::Load(...)
#include <Arrays\Array.mqh>
//--
void OnStart()
{
    int file_handle;
    CArray *array=new CArray;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- delete array
    delete array;
}
```
**CArrayChar**

CArrayChar is a class of dynamic array of char or uchar variables.

**Description**

CArrayChar class provides the ability to work with a dynamic array of char or uchar variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

**Declaration**

```cpp
class CArrayChar : public CArray
```

**Title**

```cpp
#include <Arrays\ArrayChar.mqh>
```

**Inheritance hierarchy**

- CObject
  - CArray
    - CArrayChar

**Methods inherited from class CObject**

Prev, Prev, Next, Next, **Compare**

**Methods inherited from class CArray**

Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort
Reserve

Allocates memory to increase the size of the array.

```cpp
bool Reserve(
    int size  // number
);```

Parameters

size

[in] The number of additional elements of the array.

Return Value

ture - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is increased by the step previously determined by the Step(int) method or the default step of 16.

Example:

```cpp
//--- example for CArrayChar::Reserve(int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
**Resize**

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size    // size
)
```

**Parameters**

`size`

[in] New size of the array.

**Return Value**

- `true` - successful,
- `false` - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayChar::Resize(int)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array = new CArrayChar;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**Shutdown**

Clears the array with a full memory release.

```cpp
bool Shutdown()
```

**Return Value**

- true - successful, false - error.

**Example:**

```cpp
//--- example for CArrayChar::Shutdown()
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Add

Adds an element to the end of the array.

```
bool Add(
    char  element  // element to add
)
```

Parameters

- **element**
  - [in] Value of the element to add to the array.

Return Value

- true - successful, false - cannot add an element.

Example:

```
//--- example for CArrayChar::Add(char)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
        {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
            {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const char& src[]  // source array
)
```

**Parameters**

- `src[]`
  - [in] Reference to an array of source elements to add.

**Return Value**

- true - successful, false - cannot add items.

**Example:**

```cpp
//--- example for CArrayChar::AddArray(const char &[])
#include <Arrays\ArrayChar.mqh>
//---
char src[];
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayChar* src // pointer to the source
)
```

**Parameters**

*src*

[in] Pointer to an instance of CArrayChar class used as a source of elements to add.

**Return Value**

true - successful, false - cannot add items.

**Example:**

```cpp
//--- example for CArrayChar::AddArray(const CArrayChar*)
#include <Arrays/*ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayChar *src=new CArrayChar;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
    delete src;
}```
```cpp
//--- use array
//--- . . .
//--- delete array
delete array;
}
```
Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    char element,    // element to insert
    int pos          // position
)
```

**Parameters**

- `element`
  - [in] Value of the element to be inserted into the array

- `pos`
  - [in] Position in the array to insert

**Return Value**

true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayChar::Insert(char,int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```c
bool InsertArray(
    const char* src[],  // source array
    int pos             // position
)
```

Parameters

- `src[]`  
  [in] Reference to an array used as a source of elements to insert

- `pos`  
  [in] Position in the array to insert

Return Value

- `true` - successful, `false` - cannot insert items.

Example:

```c
//--- example for CArrayChar::InsertArray(const char &[],int)
#include <Arrays\ArrayChar.mqh>
//---
char src[];
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayChar* src, // pointer to the source
    int pos     // position
)
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayChar class used as a source of elements to insert.

*pos*

[in] Position in the array to insert

**Return Value**

true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayChar::InsertArray(const CArrayChar*, int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayChar *src=new CArrayChar;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src, 0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}  ```
    return;
}

//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const char & src[]     // source array
)
```

**Parameters**

*src[]*

[in] Reference to an array used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayChar::AssignArray(const char &[])
#include <Arrays\ArrayChar.mqh>
//--
char src[];
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayChar* src  // pointer to the source
)
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayChar class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```cpp
//--- example for CArrayChar::AssignArray(const CArrayChar*)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayChar *src =new CArrayChar;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays are identical
    //--- delete source array
```
```cpp
delete src;
//--- use array
//--- . .
//--- delete array
delete array;
```
**Update**

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,       // position
    char element   // value
);
```

**Parameters**

- **pos**
  - [in] Position of the element in the array to change

- **element**
  - [in] New value of the element

**Return Value**

- true - successful, false - cannot change the element.

**Example:**

```cpp
//--- example for CArrayChar::Update(int,char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,'A'))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```c
bool Shift(
    int pos,  // position
    int shift // value
)
```

**Parameters**

- `pos`
  - [in] Position of the moved element in the array

- `shift`
  - [in] The shift value (both positive and negative).

**Return Value**

- true - successful, false - cannot move the element.

**Example:**

```c
#include <Arrays\ArrayChar.mqh>

void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos  // position
)
```

**Parameters**

- `pos` [in] Position of the array element to be removed.

**Return Value**

- `true` - successful, `false` - cannot remove the element.

**Example:**

```cpp
//--- example for CArrayChar::Delete(int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
2660

Standard Library

DeleteRange
Deletes a group of elements from the specified array position.

bool DeleteRange(
int from,
// position of the first element
int to
// position of the last element
)

Parameters
from
[in]

Position of the first array element to be removed.

to
[in]

Position of the last array element to be removed.

Return Value
true - successful, false - cannot remove the elements.

Example:
//--- example for CArrayChar::DeleteRange(int,int)
#include <Arrays\ArrayChar.mqh>
//--void OnStart()
{
CArrayChar *array=new CArrayChar;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- delete elements
if(!array.DeleteRange(0,10))
{
printf("Delete error");
delete array;
return;
}
//--- delete array
delete array;
}

At

Gets the element from the specified array position.

```c
char At(
    int pos  // position
) const
```

**Parameters**

- **pos**
  
  [in] Position of the desired element in the array.

**Return Value**

The value of the element - success, CHAR_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, CHAR_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```c
//--- example for CArrayChar::At(int)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    for(int i=0;i<array.Total();i++)
    {
        char result=array.At(i);
        if(result==CHAR_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- error of reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //-- use element
        //-- . . .
    }
}
```
//--- delete array
delete array;
}
CompareArray

Compares the array with another one.

```cpp
bool CompareArray(  
    const char& src[]   // source array
) const
```

Parameters

- `src[]`
  - [in] Reference to an array used as a source of elements for comparison.

Return Value

- `true` - arrays are equal, `false` - arrays are not equal.

Example:

```cpp
//--- example for CArrayChar::CompareArray(const char &[])
#include <Arrays\ArrayChar.mqh>
//---
char src[];
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
CompareArray

Compares the array with another one.

```cpp
bool CompareArray(
    const CArrayChar* src // pointer to the source
) const
```

**Parameters**

`src`

> [in] Pointer to an instance of the CArrayChar class used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayChar::CompareArray(const CArrayChar*)
#include <Arrays/ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- create source array
    CArrayChar *src=new CArrayChar;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //-- add source arrays elements
    //-- . . .
    //-- compare with another array
    int result=array.CompareArray(src);
    //-- delete arrays
    delete src;
    delete array;
}
```
InsertSort

Inserts an element in a sorted array.

```c++
bool InsertSort(
    char element // element to insert
)
```

Parameters

`element`

[in] Value of the element to be inserted into a sorted array

Return Value

true - successful, false - cannot insert the element.

Example:

```c++
#include <Arrays\ArrayChar.mqh>

void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort('A'))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
2666

Standard Library

Search
Searches for an element equal to the sample in the sorted array.

int Search(
char element
) const

// sample

Parameters
element
[in]

The sample element to search in the array.

Return Value
The position of the found element - successful, -1 - the element not found.

Example:
//--- example for CArrayChar::Search(char)
#include <Arrays\ArrayChar.mqh>
//--void OnStart()
{
CArrayChar *array=new CArrayChar;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.Search('A')!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

© 2000-2019, MetaQuotes Software Corp.


**SearchGreat**

Searches for an element with a value exceeding the value of the sample in the sorted array.

```c
int SearchGreat(
    char element // sample
) const
```

**Parameters**

- `element`
  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element, if successful, -1 - the element not found.

**Example:**

```c
//-- example for CArrayChar::SearchGreat(char)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- sort array
    array.Sort();
    //-- search element
    if(array.SearchGreat('A')!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    char element // sample
) const
```

**Parameters**

- `element`:
  - [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayChar::SearchLess(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess('A')!==-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual(
    char element, // sample
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

- The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayChar::SearchGreatOrEqual(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLessOrEqual

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(const char element // sample)
```

**Parameters**

*element*  
[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
#include <Arrays\ArrayChar.mqh>

void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual(\'A\')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    char element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayChar::SearchFirst(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLast

Searches for the last element equal to the sample in the sorted array.

```c
int SearchLast(
    char element,   // sample
) const
```

Parameters

element
[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayChar::SearchLast(char)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast('A')!=-1) printf("Element found");
    else                     printf("Element not found");
    //--- delete array
    delete array;
```
SearchLinear

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    char element  // sample
) const
```

Parameters

`element`

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Note

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

Example:

```cpp
//--- example for CArrayChar::SearchLinear(char)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear('A')!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- **file_handle**
  - [in] Handle of the binary file previously opened using the `FileOpen(...)` function.

Return Value

- `true` - successfully completed, `false` - error.

Example:

```cpp
//--- example for CArrayChar::Save(int)
#include <Arrays\ArrayChar.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayChar *array = new CArrayChar;
    //---
    if(array != NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle = FileOpen("MyFile.bin", FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle >= 0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!", GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- delete array
    delete array;
}
```
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle  // file handle
)
```

Parameters

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayChar::Load(int)
#include <Arrays\ArrayChar.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayChar *array=new CArrayChar;
    //---
    if(!array!=NULL)
        {
            printf("Object create error");
            return;
        }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>-0)
        {
            if(!array.Load(file_handle))
                {
                    //--- file load error
                    printf("File load: Error %d!",GetLastError());
                    delete array;
                    FileClose(file_handle);
                    //---
                    return;
                }
            FileClose(file_handle);
        }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
        {
            printf("Element[%d] = '%c',i,array.At(i));
        }
```
}  
//--- delete array 
delete array;  
}
Type

Gets the array type identifier.

```cpp
virtual int Type() const
```

Return Value

Array type identifier (for CArrayChar - 77).

Example:

```cpp
//--- example for CArrayChar::Type()
#include "Arrays\ArrayChar.mqh"
//--
void OnStart()
{
    CArrayChar *array=new CArrayChar;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
CArrayShort

CArrayShort is a class of dynamic array of short or ushort variables.

Description

Class CArrayShort provides the ability to work with a dynamic array of short or ushort variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayShort : public CArray
```

Title

```cpp
#include <Arrays\ArrayShort.mqh>
```

Inheritance hierarchy

- CObject
- CArray
- CArrayShort

**Methods inherited from class CObject**

- Prev, Prev, Next, Next, `Compare`

**Methods inherited from class CArray**

- `Step`, `Step`, `Total`, `Available`, `Max`, `IsSorted`, `SortMode`, `Clear`, `Sort`
Reserve

Allocates memory to increase the size of the array.

```cpp
bool Reserve(
    int size   // number
)
```

Parameters

size

[in] The number of additional elements of the array.

Return Value

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

Note

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

Example:

```cpp
//-- example for CArrayShort::Reserve(int)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //-- use array
    //--- . . .
    //-- delete array
    delete array;
}
```
**Resize**

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size // size
)
```

**Parameters**

- **size**
  - [in] New size of the array.

**Return Value**

- `true` - successful, `false` - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayShort::Resize(int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //-- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**Shutdown**

Cleans the array with a full memory release.

```cpp
bool Shutdown()
```

**Return Value**

true - successful, false - error.

**Example:**

```cpp
//--- example for CArrayShort::Shutdown()
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Add

Adds an element to the end of the array.

```cpp
bool Add(
    short element // element to add
)
```

Parameters

element

[in] Value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Example:

```cpp
//--- example for CArrayShort::Add(short)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array = new CArrayShort;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0; i<100; i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```c
bool AddArray(
    const short & src[]   // source array
)
```

Parameters

`src[]`

[in] Reference to an array of source elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```c
#include <Arrays\ArrayShort.mqh>
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(const CArrayShort* src)  // pointer to the source
```

Parameters

src

[in] Pointer to an instance of CArrayShort class used as a source of elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayShort::AddArray(const CArrayShort*)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array = new CArrayShort;  //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src = new CArrayShort;
    if(src == NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
}
```
```cpp
//--- use array
//--- . . .
//--- delete array
delete array;

```
Insert

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    short element, // element to insert
    int pos        // position
)
```

**Parameters**

- `element`
  
  [in] Value of the element to be inserted into the array

- `pos`
  
  [in] Position in the array to insert

**Return Value**

- `true` - successful, `false` - cannot insert the element.

**Example:**

```cpp
#include <Arrays\ArrayShort.mqh>

void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```c
bool InsertArray(
    const short & src[], // source array
    int pos              // position
);
```

**Parameters**

- `src[]`
  - [in] Reference to an array used as a source of elements to insert

- `pos`
  - [in] Position in the array to insert

**Return Value**

- `true` - successful, `false` - cannot insert items.

**Example:**

```c
//--- example for CArrayShort::InsertArray(const short &[], int)
#include <Arrays\ArrayShort.mqh>
//---
short src[];
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayShort* src, // pointer to the source
    int pos    // position
)
```

**Parameters**

- **src**
  - [in] Pointer to an instance of the CArrayShort class used as a source of elements to insert.

- **pos**
  - [in] Position in the array to insert.

**Return Value**

- true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayShort::InsertArray(const CArrayShort*,int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src=new CArrayShort;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}
```
return;
}
//-- delete source array
delete src;
//-- use array
//-- . . .
//-- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const short & src[]       // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayShort::AssignArray(const short &[])
#include <Arrays\ArrayShort.mqh>
//--
short src[];
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
   //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //-- use array
    //--- . . .
    //-- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayShort* src  // pointer to the source
)
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayShort class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```cpp
//--- example for CArrayShort::AssignArray(const CArrayShort*)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src  =new CArrayShort;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
```
```cpp
    delete src;
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
```
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos, // position
    short element // value
)
```

Parameters

- `pos`
  - [in] Position of the element in the array to change

- `element`
  - [in] New value of the element

Return Value

- `true` - successful, `false` - cannot change the element.

Example:

```cpp
//--- example for CArrayShort::Update(int,short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,100))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,  // positions
    int shift  // shift
)
```

Parameters

- `pos`  
  [in] Position of the moved element in the array

- `shift`  
  [in] The shift value (both positive and negative).

Return Value

- true - successful, false - cannot move the element.

Example:

```cpp
//--- example for CArrayShort::Shift(int,int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos   // position
)
```

Parameters

- `pos`  
  - [in] Position of the array element to be removed.

Return Value

- true - successful, false - cannot remove the element.

Example:

```cpp
//--- example for CArrayShort::Delete(int)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from,  // position of the first element
    int to     // position of the last element
)
```

**Parameters**

- `from` [in] Position of the first array element to be removed.
- `to` [in] Position of the last array element to be removed.

**Return Value**

- `true` - successful, `false` - cannot remove the elements.

**Example:**

```cpp
//--- example for CArrayShort::DeleteRange(int,int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add array elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```cpp
short At(
    int pos // position
) const
```

**Parameters**

`pos`

[in] Position of the desired element in the array.

**Return Value**

The value of the element - success, SHORT_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, SHORT_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```cpp
//--- example for CArrayShort::At(int)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        short result=array.At(i);
        if(result==SHORT_MAX & GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- error of reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
}
```
```cpp
//--- delete array
delete array;
}
```
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const short & src[]  // source array
) const
```

**Parameters**

src[]

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
#include <Arrays\ArrayShort.mqh>

short src[];

void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
CompareArray

Compares the array with another one.

```cpp
bool CompareArray(
    const CArrayShort* src // pointer to the source
) const
```

Parameters

src

[in] Pointer to an instance of the CArrayShort class used as a source of elements for comparison.

Return Value

true - arrays are equal, false - arrays are not equal.

Example:

```cpp
//--- example for CArrayShort::CompareArray(const CArrayShort*)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayShort *src=new CArrayShort;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
InsertSort

Inserts an element in a sorted array.

```c
bool InsertSort(
    short element // element to insert
)
```

Parameters

`element`

[in] Value of the element to be inserted into a sorted array

Return Value

true - successful, false - cannot insert the element.

Example:

```c
//--- example for CArrayShort::InsertSort(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort(100))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```cpp
int Search(  
    short element // sample  
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```cpp
//--- example for CArrayShort::Search(short)
#include <Arrays\ArrayShort.mgh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //---
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```c
int SearchGreat(
    short element  // sample
) const
```

Parameters

`element`

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - element not found.

Example:

```c
//--- example for CArrayShort::SearchGreat(short)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . 
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    short element  // sample
) const
```

**Parameters**

- `element`
  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayShort::SearchLess(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array = new CArrayShort;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if (array.SearchLess(100) != -1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual()
    short element    // sample
) const
```

Parameters

element
    [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
#include <Arrays\ArrayShort.mqh>
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
**SearchLessOrEqual**

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(  
    short element    // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayShort::SearchLessOrEqual(short)  
#include <Arrays\ArrayShort.mqh>  
//--
void OnStart()
{
    CArrayShort *array=new CArrayShort;  
    //--
    if(array==NULL)
    {
        printf("Object create error");  
        return;
    }
    //--- add arrays elements  
    //--- . . .  
    //--- sort array  
    array.Sort();  
    //--- search element  
    if(array.SearchLessOrEqual(100)!=-1) printf("Element found");  
    else printf("Element not found");  
    //--- delete array  
    delete array;  
}
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    short element  // sample
) const
```

**Parameters**

*element*

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayShort::SearchFirst(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLast**

Searches for the last element equal to the sample in the sorted array.

```c
int SearchLast(
    short element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayShort::SearchLast(short)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    CArrayShort *array= new CArrayShort;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast(100)!=-1) printf("Element found");
    else printf("Element not found");
    //-- delete array
    delete array;
}
```
SearchLinear

Searches for the element equal to the sample in the array.

```c
int SearchLinear(
    short element    // sample
) const
```

Parameters

element

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Note

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

Example:

```c
//--- example for CArrayShort::SearchLinear(short)
#include <Arrays\ArrayShort.mqh>
//---
void OnStart()
{
    CArrayShort *array=new CArrayShort;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(100)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle  // file handle
)
```

Parameters

- **file_handle**
  - [in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayShort::Save(int)
#include <Arrays\ArrayShort.mqh>
//--
void OnStart()
{
    int file_handle;
    CArrayShort *array=new CArrayShort;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
    }
    FileClose(file_handle);
}```
```cpp
    }
    delete array;
    }
```
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

Parameters

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

true – successfully completed, false - error.

Example:

```cpp
//--- example for CArrayShort::Load(int)
#include <ArraysARRAY.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayShort *array=new CArrayShort;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %d",i,array.At(i));
    }
}
```
}  
    delete array;  
}
Type

Gets the array type identifier.

```cpp
virtual int Type() const
```

Return Value

Array type identifier (for CArrayShort - 82).

Example:

```cpp
//--- example for CArrayShort::Type()
#include "Arrays\ArrayShort.mqh"
//--
void OnStart()
{
  CArrayShort *array=new CArrayShort;
  //---
  if(array==NULL)
  {
    printf("Object create error");
    return;
  }
  //--- get array type
  int type=array.Type();
  //--- delete array
  delete array;
}
```
CArrayInt

CArrayInt is a class of dynamic array of int or uint variables.

Description

The class CArrayInt provides the ability to work with a dynamic array of int or uint variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayInt : public CArray
```

Title

```cpp
#include <Arrays\ArrayInt.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayInt

Direct descendants

- CSpreadBuffer

#### Input/output

- **virtual Save** Saves data array in the file
- **virtual Load** Loads data array from the file
- **virtual Type** Gets the type identifier of the array

**Methods inherited from class CObject**

- Prev, Prev, Next, Next, **Compare**

**Methods inherited from class CArray**

- **Step**, **Step**, **Total**, **Available**, **Max**, **IsSorted**, **SortMode**, **Clear**, **Sort**
Reserve

 Allocates memory to increase the size of the array.

```cpp
bool Reserve(
    int size  // number
);
```

**Parameters**

- `size`
  - [in] The number of additional elements of the array.

**Return Value**

- `true` - successful, `false` - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

**Note**

To reduce fragmentation of memory, the array size is changed using the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayInt::Reserve(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**Resize**

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size    // number
)
```

**Parameters**

**Return Value**

- `true` - successful, `false` - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayInt::Resize(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shutdown

Cleans the array with a full memory release.

```cpp
bool Shutdown()
```

**Return Value**

true - successful, false - error.

**Example:**

```cpp
#include <Arrays\ArrayInt.mqh>

void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //---...
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Add

Adds an element to the end of the array.

```cpp
bool Add(
    int element  // element to add
)
```

Parameters

`element`

[in] Value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Example:

```cpp
//--- example for CArrayInt::Add(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const int& src[] // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array of source elements to add.

**Return Value**

true - successful, false - cannot add items.

**Example:**

```cpp
#include "Arrays\ArrayInt.mqh"
//---
int src[];
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayInt* src  // pointer to the source
)
```

Parameters

- `src` [in] Pointer to an instance of CArrayInt class used as a source of elements to add.

Return Value

- true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayInt::AddArray(const CArrayInt*)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src=new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
```cpp
//--- use array
//--- ...
//--- delete array
delete array;
```

---

© 2000-2019, MetaQuotes Software Corp.
**Insert**

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    int element, // element to insert
    int pos     // position
)
```

**Parameters**

- `element`
  - `[in]` Value of the element to be inserted into the array

- `pos`
  - `[in]` Position in the array to insert

**Return Value**

- `true` - successful, `false` - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayInt::Insert(int,int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const int& src[], // source array
    int pos // position
)
```

**Parameters**

- **src[]**
  
  [in] Reference to an array used as a source of elements to insert

- **pos**
  
  [in] Position in the array to insert

**Return Value**

true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayInt::InsertArray(const int &, int)
#include <Arrays\ArrayInt.mqh>
//--
int src[];
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayInt* src, // pointer to the source
    int pos // position
)
```

Parameters

src

[in] Pointer to an instance of the CArrayInt class used as a source of elements to insert.

pos

[in] Position in the array to insert.

Return Value

true - successful, false - cannot insert items.

Example:

```cpp
//--- example for CArrayInt::InsertArray(const CArrayInt*,int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src=new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}
```
    return;
  }
  //--- delete source array
  delete src;
  //--- use array
  //--- . . .
  //--- delete array
  delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const int & src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the items.

Example:

```cpp
//--- example for CArrayInt::AssignArray(const int &[])
#include <Arrays\ArrayInt.mqh>
//--
int src[];
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //-- use array
    //--- . . .
    //-- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayInt* src  // pointer to the source
)
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayInt class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```cpp
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src =new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
}
```
//--- arrays is identical
//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
Update

Changes the element at the specified array position.

```c
bool Update(
    int pos,       // position
    int element    // value
)
```

Parameters

- **pos**
  - [in] Position of the element in the array to change.

- **element**
  - [in] New value of the element

Return Value

- `true` - successful, `false` - cannot change the element.

Example:

```c
//--- example for CArrayInt::Update(int,int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,10000))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**Shift**

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,  // position
    int shift  // shift
)
```

**Parameters**

*pos*

[in] Position of the moved element in the array

*shift*

[in] The shift value (both positive and negative).

**Return Value**

true - successful, false - cannot move the element.

**Example:**

```cpp
//--- example for CArrayInt::Shift(int,int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
**Delete**

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos     // position
)
```

**Parameters**

*pos*

[in] Position of the array element to be removed.

**Return Value**

true - successful, false - cannot remove the element.

**Example:**

```cpp
//--- example for CArrayInt::Delete(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add array elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
2737

Standard Library

DeleteRange
Deletes a group of elements from the specified array position.

bool DeleteRange(
int from,
// position of the first element
int to
// position of the last element
)

Parameters
from
[in]

Position of the first array element to be removed.

to
[in]

Position of the last array element to be removed.

Return Value
true - successful, false - cannot remove the elements.

Example:
//--- example for CArrayInt::DeleteRange(int,int)
#include <Arrays\ArrayInt.mqh>
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- delete elements
if(!array.DeleteRange(0,10))
{
printf("Delete error");
delete array;
return;
}
//--- delete array
delete array;
}

At

Gets the element from the specified array position.

```c
int At(
    int pos // position
) const
```

**Parameters**

`pos`  
[in] Position of the desired element in the array.

**Return Value**

The value of the element - success, INT_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, INT_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```c
#ifndef example for CArrayInt::At(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        int result=array.At(i);
        if(result==INT_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- error of reading from array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
}
```
//--- delete array
delete array;
}
2740

Standard Library

CompareArray
Compares the array with another one.

bool CompareArray(
const int& src[]
) const

// source array

Parameters
src[]
[in]

Reference to an array used as a source of elements for comparison.

Return Value
true - arrays are equal, false - arrays are not equal.

Example:
//--- example for CArrayInt::CompareArray(const int &[])
#include <Arrays\ArrayInt.mqh>
//--int src[];
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- compare with another array
int result=array.CompareArray(src);
//--- delete array
delete array;
}

© 2000-2019, MetaQuotes Software Corp.


CompareArray

Compares the array with another one.

```cpp
bool CompareArray(
    const CArrayInt* src // pointer to the source
) const
```

**Parameters**

`src`  
[in] Pointer to an instance of the CArrayInt class used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayInt::CompareArray(const CArrayInt*)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayInt *src=new CArrayInt;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}```
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    int element // element to insert
)
```

Parameters

- **element**
  
  [in] Value of the element to be inserted into a sorted array

Return Value

- true - successful, false - cannot insert the element.

Example:

```cpp
//--- example for CArrayInt::InsertSort(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort(10000))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```cpp
int Search(  
    int element  // sample
) const
```

**Parameters**

*element*

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayInt::Search(int)
#include <Arrays\ArrayInt.mqh>
//--
void OnStart()
{
    CArrayInt *array=new CArrayInt;  
    //---
    if(array==NULL)  
        {  
            printf("Object create error");
            return;
        }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();  
    //--- search element
    if(array.Search(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
2744

Standard Library

SearchGreat
Searches for an element with a value exceeding the value of the sample in the sorted array.

int SearchGreat(
int element
) const

// sample

Parameters
element
[in]

The sample element to search in the array.

Return Value
The position of the found element - successful, -1 - the element not found.

Example:
//--- example for CArrayInt::SearchGreat(int)
#include <Arrays\ArrayInt.mqh>
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchGreat(10000)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

2745

Standard Library

SearchLess
Searches for an element with a value less than the value of the sample in the sorted array.

int SearchLess(
int element
) const

// sample

Parameters
element
[in]

The sample element to search in the array.

Return Value
The position of the found element - successful, -1 - the element not found.

Example:
//--- example for CArrayInt::SearchLess(int)
#include <Arrays\ArrayInt.mqh>
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchLess(10000)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

© 2000-2019, MetaQuotes Software Corp.


SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual(int element);    // sample
```

**Parameters**

- `element`

  [in] The sample element to search in the array.

**Return Value**

- The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayInt::SearchGreatOrEqual(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
2747

Standard Library

SearchLessOrEqual
Searches for an element with a value less than or equal to the value of the sample in the sorted array.

int SearchLessOrEqual(
int element
// sample
) const

Parameters
element
[in]

The sample element to search in the array.

Return Value
The position of the found element - successful, -1 - the element not found.

Example:
//--- example for CArrayInt::SearchLessOrEqual(int)
#include <Arrays\ArrayInt.mqh>
//--void OnStart()
{
CArrayInt *array=new CArrayInt;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchLessOrEqual(10000)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

© 2000-2019, MetaQuotes Software Corp.


SearchFirst

Searches for the first element equal to the sample in the sorted array.

```cpp
int SearchFirst(
    int element // sample
) const
```

**Parameters**

- `element`  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayInt:: SearchFirst(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLast**

Searches for the last element equal to the sample in the sorted array.

```cpp
int SearchLast(
    int element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
///--- example for CArrayInt::SearchLast(int)
#include <Arrays\ArrayInt.mqh>
///---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLinear

Searches for the element equal to the sample in the array.

```c
int SearchLinear(
    int element // sample
) const
```

Parameters

**element**
- [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Note

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

Example:

```c
#include <Arrays
ArrayInt.mqh>

void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(10000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**Save**

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

**Parameters**

- **file_handle**
  - [in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

- true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayInt::Save(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayInt *array=new CArrayInt;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
    }
    FileClose(file_handle);
}
```
```cpp
}
delete array;
}
```
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle // file handle
)
```

Parameters

- **file_handle**
  
  [in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayInt::Load(int)
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayInt *array=new CArrayInt;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %d",i,array.At(i));
    }
}
```
}  
    delete array;  
}
Type

Gets the array type identifier.

```
virtual int Type() const
```

Return Value

Array type identifier (for CArrayInt - 82).

Example:

```c
//--- example for CArrayInt::Type()
#include <Arrays\ArrayInt.mqh>
//---
void OnStart()
{
    CArrayInt *array=new CArrayInt;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
CArrayLong

CArrayLong class is a class of dynamic array of long or ulong variables.

Description

The CArrayLong class provides the ability to work with a dynamic array of long or ulong variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayLong : public CArray
```

Title

`#include <Arrays\ArrayLong.mqh>`

Inheritance hierarchy

```cpp
CObject
class CArray
  CArrayLong
```

Direct descendants

```cpp
CRealVolumeBuffer, CTickVolumeBuffer, CTimeBuffer
```

</table>

**Input/output**

- **virtual Save** Saves data array in the file
- **virtual Load** Loads data array from the file
- **virtual Type** Gets the type identifier of the array

**Methods inherited from class CObject**

- Prev, Prev, Next, Next, **Compare**

**Methods inherited from class CArray**

- **Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort**
**Reserve**

Allocates memory to increase the size of the array.

```cpp
bool Reserve(
     int size     // number
)
```

**Parameters**

`size`

[in] The number of additional elements of the array.

**Return Value**

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

**Note**

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```cpp
#include <Arrays\ArrayLong.mqh>

void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    // --- . . .
    //--- delete array
    delete array;
}
```
**Resize**

Sets a new (smaller) size of the array.

```c
bool Resize(
    int size      // size
)
```

**Parameters**

- `size`
  - [in] New size of the array.

**Return Value**

- `true` - successful, `false` - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```c
//--- example for CArrayLong::Resize(int)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**Shutdown**

Cleans the array with a full memory release.

```cpp
bool Shutdown()
```

**Return Value**

true - successful, false - error.

**Example:**

```cpp
//--- example for CArrayLong::Shutdown()
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
Add

Adds an element to the end of the array.

```cpp
bool Add(
    long element // element to add
)
```

Parameters

`element`

[in] Value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Example:

```cpp
//--- example for CArrayLong::Add(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const long& src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array of source elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayLong::AddArray(const long &[]) #include <Arrays\ArrayLong.mqh>
//--- long src[];
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if (array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if (!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayLong* src  // pointer to the source
)
```

Parameters

- **src**
  - [in] Pointer to an instance of CArrayLong class used as a source of elements to add.

Return Value

- true - successful, false - cannot add items.

Example:

```cpp
///--- example for CArrayLong::AddArray(const CArrayLong*)
#include <Arrays\ArrayLong.mqh>
///---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayLong *src=new CArrayLong;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
```cpp
//--- use array
//--- . . .
//--- delete array
delete array;
```
**Insert**

Inserts an element to the specified position in the array.

```cpp
bool Insert(
    long element,   // element to insert
    int pos         // position
)
```

**Parameters**

- `element`  
  [in] Value of the element to be inserted into the array

- `pos`  
  [in] Position in the array to insert

**Return Value**

true - successful, false - cannot insert the element.

**Example:**

```cpp
#include <Arrays\ArrayLong.mqh>

void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //---- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```c
bool InsertArray(
    const long & src[], // source array
    int pos            // position
);
```

Parameters

src[]
[in] Reference to an array used as a source of elements to insert

pos
[in] Position in the array to insert

Return Value

true - successful, false - cannot insert items.

Example:

```c
//--- example for CArrayLong::InsertArray(const long &, int)
#include <Arrays\ArrayLong.mqh>
//--
long src[];
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayLong* src,    // pointer to the source
    int pos            // position
)
```

Parameters

- `src` [in] Pointer to an instance of the CArrayLong class used as a source of elements to insert.
- `pos` [in] Position in the array to insert

Return Value

- `true` - successful, `false` - cannot insert items.

Example:

```cpp
#include <Arrays\ArrayLong.mqh>

void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayLong *src=new CArrayLong;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- ...
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}
return;
}

//--- delete source array
delete src;
//--- use array
//--- . .
//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const long& src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the items.

Example:

```cpp
//--- example for CArrayLong::AssignArray(const long &[])
#include <Arrays\ArrayLong.h>
//--
long src[];
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //-- use array
    //-- . . .
    //-- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayLong* src // pointer to the source
)
```

Parameters

`src`

[in] Pointer to an instance of the CArrayLong class used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the elements.

Example:

```cpp
//--- example for CArrayLong::AssignArray(const CArrayLong*)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {  
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayLong *src =new CArrayLong;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
```
```
delete src;
//--- use array
//--- . .
//--- delete array
delete array;
```
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,       // position
    long element   // value
);
```

Parameters

- **pos**
  - [in] Position of the element in the array to change

- **element**
  - [in] New value of the element

Return Value

- true - successful, false - cannot change the element.

Example:

```cpp
//--- example for CArrayLong::Update(int,long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array = new CArrayLong;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if (!array.Update(0,1000000))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
**Shift**

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,   // position
    int shift  // shift
)
```

**Parameters**

- **pos**
  - [in] Position of the moved element in the array

- **shift**
  - [in] The shift value (both positive and negative).

**Return Value**

true - successful, false - cannot move the element.

**Example:**

```cpp
//--- example for CArrayLong::Shift(int,int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```c
bool Delete(
    int pos     // position
)
```

Parameters

`pos`

[in] Position of the array element to be removed.

Return Value

true - successful, false - cannot remove the element.

Example:

```c
//--- example for CArrayLong::Delete(int)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //-- delete array
    delete array;
}
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from,  // position of the first element
    int to     // position of the last element
)
```

**Parameters**

- `from`
  - [in] Position of the first array element to be removed.

- `to`
  - [in] Position of the last array element to be removed.

**Return Value**

- `true` - successful, `false` - cannot remove the elements.

**Example:**

```cpp
//--- example for CArrayLong::DeleteRange(int,int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```cpp
long At(
    int pos // position
) const
```

**Parameters**

`pos`

[in] Position of the desired element in the array.

**Return Value**

The value of the element - success, LONG_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, LONG_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```cpp
//--- example for CArrayLong::At(int)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    for(int i=0;i<array.Total();i++)
    {
        long result=array.At(i);
        if(result==LONG_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- Error reading from the array
            printf("Get element error");
            delete array;
            return;
        }
        //-- use element
        //-- . . .
    }
}
```
```c++
//--- delete array
delete array;
}```
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const long& src[] // source array
) const
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayLong::CompareArray(const long &[])
#include <Arrays\ArrayLong.h>
//---
long src[];
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
**CompareArrayconst**

Compares the array with another one.

```cpp
bool CompareArrayconst(
    const CArrayLong* src // pointer to the source
) const
```

**Parameters**

*src*

[in] Pointer to an instance of the CArrayLong class used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayLong::CompareArray(const CArrayLong*)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayLong *src=new CArrayLong;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
InsertSort

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    long element  // element to insert
)
```

**Parameters**

`element`

[in] Value of the element to be inserted into a sorted array

**Return Value**

`true` - successful, `false` - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayLong::InsertSort(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
        {
    printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort(1000000))
        {
    printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```c
int Search(
    long element // sample
) const
```

Parameters

- `element`
  - [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayLong::Search(long)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchGreat**

Searches for an element with a value exceeding the value of the sample in the sorted array.

```c
int SearchGreat(
    long element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayLong::SearchGreat(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
# SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    long element  // sample
) const
```

## Parameters

- `element`

  [in] The sample element to search in the array.

## Return Value

The position of the found element - successful, -1 - the element not found.

## Example:

```c
#include <Arrays\ArrayLong.mqh>

void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchGreatOrEqual**

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```cpp
int SearchGreatOrEqual(
    long element // sample
) const
```

**Parameters**

- `element`

  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayLong::SearchGreatOrEqual(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(1000000)!=-1) printf("Element found");
    else
        printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLessOrEqual

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(
    long element // sample
} const
```

**Parameters**

- `element`

  [in] The sample element to search in the array.

**Return Value**

- The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayLong::SearchLessOrEqual(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchFirst**

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    long element // sample
) const
```

**Parameters**

- **element**
  - [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayLong::SearchFirst(long)
#include <Arrays\ArrayLong.mqh>
//--
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
2788

Standard Library

SearchLast
Searches for the last element equal to the sample in the sorted array.

int SearchLast(
long element
) const

// sample

Parameters
element
[in]

The sample element to search in the array.

Return Value
The position of the found element - successful, -1 - the element not found.

Example:
//--- example for CArrayLong::SearchLast(long)
#include <Arrays\ArrayLong.mqh>
//--void OnStart()
{
CArrayLong *array=new CArrayLong;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- sort array
array.Sort();
//--- search element
if(array.SearchLast(1000000)!=-1) printf("Element found");
else
printf("Element not found");
//--- delete array
delete array;
}

© 2000-2019, MetaQuotes Software Corp.


SearchLinear

Searches for the element equal to the sample in the array.

```c
int SearchLinear(
    long element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```c
//--- example for CArrayLong::SearchLinear(long)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(1000000)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle  // file handle
)
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```cpp
#include <Arrays\ArrayLong.mqh>

void OnStart()
{
    int    file_handle;
    CArrayLong *array=new CArrayLong;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
    }
    FileClose(file_handle);
}
```

}
    delete array;
}
Load

Loads data array from the file.

```cpp
virtual bool Load(
    int file_handle  // file handle
);```

Parameters

- `file_handle`
  
  [in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayLong::Load(int)
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    int       file_handle;
    CArrayLong *array=new CArrayLong;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %ld",i,array.At(i));
    }
}
} delete array;
}
Type

Gets the array type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Array type identifier (for CArrayLong - 84).

**Example:**

```cpp
//--- example for CArrayLong::Type()
#include <Arrays\ArrayLong.mqh>
//---
void OnStart()
{
    CArrayLong *array=new CArrayLong;
    //---
    if (array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
CArrayFloat

CArrayFloat class is a class of dynamic array of float variables.

Description

The CArrayFloat class provides the ability to work with a dynamic array of float variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayFloat : public CArray
```

Title

```cpp
#include <Arrays\ArrayFloat.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayFloat

**Methods inherited from class CObject**

Prev, Prev, Next, Next, **Compare**

**Methods inherited from class CArray**

**Step, Step, Total, Available, Max, IsSorted, SortMode, Clear, Sort**
Delta

Sets the comparison tolerance.

```c
void Delta(
    float delta // tolerance
)
```

Parameters

delta

[in] The new value of the comparison tolerance.

Return Value

None

Note

Comparison tolerance is used in the search. Values are considered equal if their difference is less than or equal to tolerance. The default tolerance is 0.0.

Example:

```c
//--- example for CArrayFloat::Delta(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- set compare variation
    array.Delta(0.001);
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Reserve

Allocates memory to increase the size of the array.

```cpp
bool Reserve(
    int size    // number
)
```

**Parameters**

size

[in] The number of additional elements of the array.

**Return Value**

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

**Note**

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayFloat::Reserve(int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size  // size
)
```

**Parameters**

`size`

- [in] New size of the array.

**Return Value**

- `true`: successful
- `false`: there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayFloat::Resize(int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shutdown

Clears the array with a full memory release.

```cpp
bool Shutdown()
```

Return Value

true - successful, false - error.

Example:

```cpp
//--- example for CArrayFloat::Shutdown()
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add arrays elements
    //-- . . .
    //-- shutdown array
    if(!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //-- delete array
    delete array;
}```
Add
Add an element to the end of the array.

```cpp
bool Add(
    float element // element to add
)
```

**Parameters**

- `element`
  
  [in] Value of the element to add to the array.

**Return Value**

- `true` - successful, `false` - cannot add an element.

**Example:**

```cpp
//--- example for CArrayFloat::Add(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const float & src[] // source array
)
```

**Parameters**

`src[]`

[in] Reference to an array of source elements to add.

**Return Value**

true - successful, false - cannot add items.

**Example:**

```cpp
//--- example for CArrayFloat::AddArray(const float &[])
#include <Arrays\ArrayFloat.mqh>
//--
float src[];
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //-- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //-- use array
    //-- . . .
    //-- delete array
    delete array;
}
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const CArrayFloat* src // pointer to the source
)
```

Parameters

`src`

[in] Pointer to an instance of CArrayFloat class used as a source of elements to add.

Return Value

ture - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayFloat::AddArray(const CArrayFloat*)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src=new CArrayFloat;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
//--- use array
//--- . . .
//--- delete array
delete array;
}
## Insert

Inserts an element to the specified position in the array.

```c++
bool Insert(
    float element,  // element to insert
    int pos        // position
)
```

### Parameters

- `element`  
  
  [in] Value of the element to be inserted into an array

- `pos`  
  
  [in] Position in the array to insert

### Return Value

```
true - successful, false - cannot insert the element.
```

### Example:

```c++
#include <Arrays\ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Include CArrayFloat.h

```c
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayFloat* src, // pointer to the source
    int pos  // position
)
```

**Parameters**

* src  
  [in] Pointer to an instance of the CArrayFloat class used as a source of elements to insert.

* pos  
  [in] Position in the array to insert

**Return Value**

true - successful, false - cannot insert items.

**Example:**

```cpp
#include <Arrays\ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array = new CArrayFloat;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src = new CArrayFloat;
    if(src == NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- ...
    //--- insert another array
    if(!array.InsertArray(src, 0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
```

© 2000-2019, MetaQuotes Software Corp.
return;
}
//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```c
bool AssignArray(
    const float & src[] // source array
)
```

**Parameters**

*src[]*

[in] Reference to an array used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```c
//--- example for CArrayFloat::AssignArray(const float &[])
#include <Arrays\ArrayFloat.mqh>
//---
float src[];
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayFloat* src // pointer to the source
)
```

Parameters

src

[in] Pointer to an instance of the CArrayFloat class used as a source of elements to copy.

Return Value

true - successful, false - cannot copy the elements.

Example:

```cpp
//--- example for CArrayFloat::AssignArray(const CArrayFloat*)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src =new CArrayFloat;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
```
```cpp
delete src;
//--- use array
//--- ...
//--- delete array
delete array;
```

2813

Standard Library

Update
Changes the element at the specified array position.

bool Update(
int
pos,
float element
)

// position
// value

Parameters
pos
[in]

Position of the element in the array to change

element
[in]

New value of the element

Return Value
true - successful, false - cannot change the element.

Example:
//--- example for CArrayFloat::Update(int,float)
#include <Arrays\ArrayFloat.mqh>
//--void OnStart()
{
CArrayFloat *array=new CArrayFloat;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- update element
if(!array.Update(0,100.0))
{
printf("Update error");
delete array;
return;
}
//--- delete array
delete array;
}

© 2000-2019, MetaQuotes Software Corp.


Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,       // position
    int shift      // shift
)
```

Parameters

- **pos**
  - [in] Position of the moved element in the array

- **shift**
  - [in] The shift value (both positive and negative).

Return Value

- true - successful, false - cannot move the element.

Example:

```cpp
//--- example for CArrayFloat::Shift(int,int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- ...
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```c
bool Delete(
    int pos    // position
)
```

Parameters

`pos`

[in] Position of the array element to be removed.

Return Value

true - successful, false - cannot remove the element.

Example:

```c
//--- example for CArrayFloat::Delete(int)
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}```
DeleteRange

Deletes a group of elements from the specified array position.

```cpp
bool DeleteRange(
    int from, // position of the first element
    int to    // position of last element
)
```

Parameters

from

[in] Position of the first array element to be removed.

to

[in] Position of the last array element to be removed.

Return Value

true - successful, false - cannot remove the elements.

Example:

```cpp
//--- example for CArrayFloat::DeleteRange(int,int)
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete elements
    if(!array.DeleteRange(0,10))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
At

Gets the element from the specified array position.

```c
float At(
    int pos // position
) const
```

**Parameters**

`pos`

[in] Position of the desired element in the array.

**Return Value**

The value of the element - success, FLT_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, FLT_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```c
//--- example for CArrayFloat::At(int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
        {
            printf("Object create error");
            return;
        }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
        {
            float result=array.At(i);
            if(result==FLT_MAX && GetLastError()==ERR_OUT_OF RANGE)
                {
                    //--- error reading from array
                    printf("Get element error");
                    delete array;
                    return;
                }
            //--- use element
            //--- . . .
        }
```
//--- delete array
delete array;
}
### CompareArray

Compares the array with another one.

```cpp
bool CompareArray(
    const float & src[] // source array
) const
```

**Parameters**

- `src[]`  
  - [in] Reference to an array used as a source of elements for comparison.

**Return Value**

- `true` - arrays are equal, `false` - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayFloat::CompareArray(const float &[])
#include <Arrays\ArrayFloat.mqh>
//---
float src[];
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete array
    delete array;
}
```
AssignArrayConst

Compares the array with another one.

```cpp
bool AssignArrayConst(
    const CArrayFloat* src // pointer to the source
) const
```

**Parameters**

**src**

[in] Pointer to an instance of the CArrayFloat class used as a source of elements for comparison.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```cpp
//--- example for CArrayFloat::CompareArray(const CArrayFloat*)
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayFloat *src=new CArrayFloat;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
InsertSort

Inserts an element in a sorted array.

```c
bool InsertSort(
    float element // element to insert
)
```

Parameters

- `element`
  - [in] Value of the element to be inserted into a sorted array

Return Value

- true - successful, false - cannot insert the element.

Example:

```c
//--- example for CArrayFloat::InsertSort(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort(100.0))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
Search

Searches for an element equal to the sample in the sorted array.

```cpp
int Search(
    float element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayFloat::Search(float)
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    CArrayFloat *array = new CArrayFloat;
    //---
    if (array == NULL)
        {
            printf("Object create error");
            return;
        }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if (array.Search(100.0) != -1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```c
int SearchGreat(
    float element // sample
) const
```

Parameters

- **element**
  
  [in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
#include <Arrays/ArrayFloat.mqh>

void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    float element // sample
) const
```

**Parameters**

- `element`
  - [in] The sample element to search in the array.

**Return Value**

- The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayFloat::SearchLess(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```c
int SearchGreatOrEqual(  
    float element     // sample  
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayFloat::SearchGreatOrEqual(float)  
#include <Arrays\ArrayFloat.mqh>  
//---  
void OnStart()  
{  
    CArrayFloat *array=new CArrayFloat;  
    //---  
    if(array==NULL)  
    {  
        printf("Object create error");  
        return;  
    }  
    //--- add arrays elements  
    //--- . . .  
    //--- sort array  
    array.Sort();  
    //--- search element  
    if(array.SearchGreatOrEqual(100.0)!=-1) printf("Element found");  
    else printf("Element not found");  
    //--- delete array  
    delete array;  
}  
```
SearchLessOrEqual

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(
    float element    // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayFloat::SearchLessOrEqual(float)
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```c
int SearchFirst(
    float element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayFloat::SearchFirst(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
        {
            printf("Object create error");
            return;
        }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLast**

Searches for the last element equal to the sample in the sorted array.

```c
int SearchLast(
    float element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayFloat::SearchLast(float)
#include <ArraysArrayFloat.mqh>
//--
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLinear**

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    float element // sample
) const
```

**Parameters**

- `element`
  - [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayFloat::SearchLinear(float)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle  // file handle
)
```

Parameters

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayFloat::Save(int)
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{

    //---
    int file_handle;
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BINARY|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //---
            return;
        }
        FileClose(file_handle);
    }
}
}  
delete array;  
}
Load

Loads data array from the file.

```c
virtual bool Load(
    int file_handle   // file handle
)
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the FileOpen(...) function.

**Return Value**

true - successfully completed, false - error.

**Example:**

```c
//--- example for CArrayFloat::Load(int)
#include <Arrays\ArrayFloat.mqh>
//--
void OnStart()
{
    int          file_handle;
    CArrayFloat *array=new CArrayFloat;
    //--
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //-- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Load(file_handle))
        {
            //--- file load error
            printf("File load: Error %d!",GetLastError());
            delete array;
            FileClose(file_handle);
            //--
            return;
        }
        FileClose(file_handle);
    }
    //-- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %f",i,array.At(i));
    }
}
```
```cpp
}
delete array;
}
```
**Type**

Gets the array type identifier.

```cpp
virtual int Type() const
```

**Return Value**

Array type identifier (for CArrayFloat - 87).

**Example:**

```cpp
//--- example for CArrayFloat::Type()
#include <Arrays\ArrayFloat.mqh>
//---
void OnStart()
{
    CArrayFloat *array=new CArrayFloat;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //--- delete array
    delete array;
}
```
CArrayDouble

CArrayDouble class is a class of dynamic array of double variables.

Description

The CArrayDouble class provides the ability to work with a dynamic array of double variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

```cpp
class CArrayDouble : public CArray
```

Title

```
#include <Arrays\ArrayDouble.mqh>
```

Inheritance hierarchy

- CObject
  - CArray
    - CArrayDouble

Direct descendants

- CDoubleBuffer

### InsertArray
- Inserts to an array elements from another array from the specified position

### AssignArray
- Copies the elements of one array to another

### Update methods
- **Update**
  - Changes the element at the specified array position

### Shift
- Moves an element from a given position in the array to the specified offset

### Delete methods
- **Delete**
  - Removes the element from the specified array position

### DeleteRange
- Deletes a group of elements from the specified array position

### Access methods
- **At**
  - Gets the element from the specified array position

### Compare methods
- **CompareArray**
  - Compares the array with another one

### Search for min/max
- **Minimum**
  - Gets the lowest value index in the specified range

- **Maximum**
  - Gets the highest value index in the specified range

### Sorted array operations
- **InsertSort**
  - Inserts an element in a sorted array

- **Search**
  - Searches for an element equal to the sample in the sorted array

- **SearchGreat**
  - Searches for an element with a value exceeding the value of the sample in the sorted array

- **SearchLess**
  - Searches for an element with a value less than the value of the sample in the sorted array
<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SearchGreatOrEqual</code></td>
<td>Searches for an element with a value greater than or equal to the value of the sample in the sorted array</td>
</tr>
<tr>
<td><code>SearchLessOrEqual</code></td>
<td>Searches for an element with a value less than or equal to the value of the sample in the sorted array</td>
</tr>
<tr>
<td><code>SearchFirst</code></td>
<td>Searches for the first element equal to the sample in the sorted array</td>
</tr>
<tr>
<td><code>SearchLast</code></td>
<td>Searches for the last element equal to the sample in the sorted array</td>
</tr>
<tr>
<td><code>SearchLinear</code></td>
<td>Searches for the element equal to the sample in the array</td>
</tr>
</tbody>
</table>

**Input/output**

- `virtual Save` saves data array in the file
- `virtual Load` loads data array from the file
- `virtual Type` gets the type identifier of the array

**Methods inherited from class CObject**

- `Prev`, `Prev`, `Next`, `Next`, `Compare`

**Methods inherited from class CArray**

- `Step`, `Step`, `Total`, `Available`, `Max`, `IsSorted`, `SortMode`, `Clear`, `Sort`
## Delta

Sets the comparison tolerance.

```c
void Delta(
    double delta  // tolerance
)
```

**Parameters**

- `delta`
  - [in] The new value of the comparison tolerance.

**Return Value**

- No

**Note**

Comparison tolerance is used in the search. Values are considered equal if their difference is less than or equal to tolerance. The default tolerance is 0.0.

**Example:**

```c
//--- example for CArrayDouble::Delta(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;  //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- set compare variation
    array.Delta(0.001);  //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**Reserve**

Allocates memory to increase the size of the array.

```cpp
bool Reserve{
    int size    // number
}
```

**Parameters**

`size`

[in] The number of additional elements of the array.

**Return Value**

true - successful, false - there was an attempt to request for an amount less than or equal to zero, or failed to increase the array.

**Note**

To reduce fragmentation of memory, the array size is changed using the step previously determined by the Step(int) method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayDouble::Reserve(int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- reserve memory
    if(!array.Reserve(1024))
    {
        printf("Reserve error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
Resize

Sets a new (smaller) size of the array.

```cpp
bool Resize(
    int size    // size
}
```

**Parameters**

`size`
- `in` New size of the array.

**Return Value**

`true` - successful, `false` - there was an attempt to set the size less than zero.

**Note**

Changing the size of the array allows using the memory optimally. Excessive elements on the right are lost. To reduce fragmentation of memory, the array size is changed by the step previously determined by the `Step(int)` method or the default step of 16.

**Example:**

```cpp
//--- example for CArrayDouble::Resize(int)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . .
    //--- resize array
    if(!array.Resize(10))
    {
        printf("Resize error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
**Shutdown**

Clears the array with a full memory release.

```cpp
bool Shutdown()
```

**Return Value**

true - successful, false - error.

**Example:**

```cpp
//--- example for CArrayDouble::Shutdown()
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if (array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shutdown array
    if (!array.Shutdown())
    {
        printf("Shutdown error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Add

Adds an element to the end of the array.

```cpp
bool Add(
    double element  // element to add
)
```

Parameters

`element`

[in] Value of the element to add to the array.

Return Value

true - successful, false - cannot add an element.

Example:

```cpp
//--- example for CArrayDouble::Add(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    for(int i=0;i<100;i++)
    {
        if(!array.Add(i))
        {
            printf("Element addition error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```cpp
bool AddArray(
    const double& src[] // source array
)
```

Parameters

`src[]`

[in] Reference to an array of source elements to add.

Return Value

true - successful, false - cannot add items.

Example:

```cpp
//--- example for CArrayDouble::AddArray(const double &[])
#include <Arrays\ArrayDouble.mqh>
//--
double src[];
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AddArray

Adds elements of one array to the end of another.

```c
bool AddArray(
    const CArrayDouble* src // pointer to the source
)
```

Parameters

src

[in] Pointer to an instance of CArrayDouble class used as a source of elements to add.

Return Value

ture - successful, false - cannot add items.

Example:

```c
//--- example for CArrayDouble::AddArray(const CArrayDouble*)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array = new CArrayDouble;
    //---
    if(array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayDouble *src = new CArrayDouble;
    if(src == NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- add another array
    if(!array.AddArray(src))
    {
        printf("Array addition error");
        delete src;
        delete array;
        return;
    }
    //--- delete source array
    delete src;
```
```csharp
//--- use array
//--- . . .
//--- delete array
delete array;
}```
Insert

Inserts an element to the specified position in the array.

```c
bool Insert(
    double element, // element to insert
    int pos // position
)
```

Parameters

- **element**
  - [in] Value of the element to be inserted into an array

- **pos**
  - [in] Position in the array to insert

Return Value

- `true` - successful, `false` - cannot insert the element.

Example:

```c
//--- example for CArrayDouble::Insert(double,int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert elements
    for(int i=0;i<100;i++)
    {
        if(!array.Insert(i,0))
        {
            printf("Insert error");
            delete array;
            return;
        }
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
**InsertArray**

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    const double & src[], // source array
    int pos                // position
)
```

**Parameters**

- `src[]`
  - [in] Reference to an array used as a source of elements to insert
- `pos`
  - [in] Position in the array to insert

**Return Value**

- true - successful, false - cannot insert items.

**Example:**

```cpp
//--- example for CArrayDouble::InsertArray(const double &[],int)
#include <Arrays\ArrayDouble.mqh>
//---
double src[];
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
InsertArray

Inserts elements of one array from the specified position of another array.

```cpp
bool InsertArray(
    CArrayDouble* src, // pointer to the source
    int pos     // position
)
```

Parameters

- **src**
  - [in] Pointer to an instance of the CArrayDouble class used as a source of elements to insert.

- **pos**
  - [in] Position in the array to insert

Return Value

- true - successful, false - cannot insert items.

Example:

```cpp
#include <Arrays/ArrayDouble.mqh>

void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //----
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //---- create source array
    CArrayDouble *src=new CArrayDouble;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //---- add source arrays elements
    //---- . . .
    //---- insert another array
    if(!array.InsertArray(src,0))
    {
        printf("Array inserting error");
        delete src;
        delete array;
    }
}
```

© 2000-2019, MetaQuotes Software Corp.
return;
}

//--- delete source array
delete src;
//--- use array
//--- . . .
//--- delete array
delete array;
}
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const double& src[]  // source array
)
```

Parameters

- `src[]`
  - [in] Reference to an array used as a source of elements to copy.

Return Value

- true - successful, false - cannot copy the items.

Example:

```cpp
//--- example for CArrayDouble::AssignArray(const double &[])
#include <Arrays/ArrayDouble.mqh>
//---
double src[];
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- assign another array
    if(!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete array;
        return;
    }
    //--- use array
    //--- . . .
    //--- delete array
    delete array;
}
```
AssignArray

Copies the elements of one array to another.

```cpp
bool AssignArray(
    const CArrayDouble* src // pointer to the source
)
```

**Parameters**

`src`

[in] Pointer to an instance of the CArrayDouble class used as a source of elements to copy.

**Return Value**

true - successful, false - cannot copy the elements.

**Example:**

```cpp
void OnStart()
{
    CArrayDouble *array = new CArrayDouble;
    //---
    if (array == NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayDouble *src = new CArrayDouble;
    if (src == NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- ... 
    //--- assign another array
    if (!array.AssignArray(src))
    {
        printf("Array assigned error");
        delete src;
        delete array;
        return;
    }
    //--- arrays is identical
    //--- delete source array
```
```cpp
delete src;
//--- use array
//--- ...
//--- delete array
deleate array;
```
Update

Changes the element at the specified array position.

```cpp
bool Update(
    int pos,          // position
    double element    // value
)
```

Parameters

- **pos**
  - [in] Position of the element in the array to change

- **element**

Return Value

true - successful, false - cannot change the element.

Example:

```cpp
//--- example for CArrayDouble::Update(int,double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- update element
    if(!array.Update(0,100.0))
    {
        printf("Update error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Shift

Moves an item from a given position in the array to the specified offset.

```cpp
bool Shift(
    int pos,  // position
    int shift  // shift
)
```

Parameters

- **pos**
  - [in] Position of the moved element in the array

- **shift**
  - [in] The shift value (both positive and negative).

Return Value

- true - successful, false - cannot move the element.

Example:

```cpp
//--- example for CArrayDouble::Shift(int,int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- shift element
    if(!array.Shift(10,-5))
    {
        printf("Shift error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Delete

Removes the element from the specified array position.

```cpp
bool Delete(
    int pos // position
)
```

Parameters

`pos`

[in] Position of the array element to be removed.

Return Value

true - successful, false - cannot remove the element.

Example:

```cpp
//--- example for CArrayDouble::Delete(int)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- delete element
    if(!array.Delete(0))
    {
        printf("Delete error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
2856

Standard Library

DeleteRange
Deletes a group of elements from the specified array position.

bool DeleteRange(
int from,
// position of the first element
int to
// position of the last element
)

Parameters
from
[in]

Position of the first array element to be removed.

to
[in]

Position of the last array element to be removed.

Return Value
true - successful, false - cannot remove the elements.

Example:
//--- example for CArrayDouble::DeleteRange(int,int)
#include <Arrays\ArrayDouble.mqh>
//--void OnStart()
{
CArrayDouble *array=new CArrayDouble;
//--if(array==NULL)
{
printf("Object create error");
return;
}
//--- add arrays elements
//--- . . .
//--- delete elements
if(!array.DeleteRange(0,10))
{
printf("Delete error");
delete array;
return;
}
//--- delete array
delete array;
}

© 2000-2019, MetaQuotes Software Corp.


At

Gets the element from the specified array position.

```c
double At(
    int pos  // position
) const
```

**Parameters**

- `pos`
  - [in] Position of the desired element in the array.

**Return Value**

The value of the element - success, DBL_MAX - there was an attempt to get an element from a non-existing position (the last error code is ERR_OUT_OF_RANGE).

**Note**

Of course, DBL_MAX may be a valid value of an array element. Therefore, always check the last error code after receiving such a value.

**Example:**

```c
//--- example for CArrayDouble::At(int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    for(int i=0;i<array.Total();i++)
    {
        double result=array.At(i);
        if(result==DBL_MAX && GetLastError()==ERR_OUT_OF_RANGE)
        {
            //--- Error reading from the array
            printf("Get element error");
            delete array;
            return;
        }
        //--- use element
        //--- . . .
    }
}
```
//--- delete array
delete array;
}
**CompareArray**

Compares the array with another one.

```cpp
bool CompareArray(
    const double & src[] // source array
) const
```

**Parameters**

`src[]`

[in] Reference to an array used as a source of elements for comparison.

**Return Value**

true - arrays are equal, false - arrays are not equal.

**Example:**

```cpp
//--- example for CArrayDouble::CompareArray(const double &[])
#include <Arrays\ArrayDouble.mqh>
//---
double src[];
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- compare with another array
    int result=array->CompareArray(src);
    //--- delete array
    delete array;
}
```
**CompareArray**

Compares the array with another one.

```c++
bool CompareArray(
    const CArrayDouble* src   // pointer to the source
) const
```

**Parameters**

*src*  
[in] Pointer to an instance of the CArrayDouble class used as a source of elements for comparison.

**Return Value**

true - successful, false - cannot copy the items.

**Example:**

```c++
//--- example for CArrayDouble::CompareArray(const CArrayDouble*)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- create source array
    CArrayDouble *src=new CArrayDouble;
    if(src==NULL)
    {
        printf("Object create error");
        delete array;
        return;
    }
    //--- add source arrays elements
    //--- . . .
    //--- compare with another array
    int result=array.CompareArray(src);
    //--- delete arrays
    delete src;
    delete array;
}
```
Minimum

 Gets index of the lowest element of the array in the specified range.

```cpp
int Minimum(int start, // starting index
            int count, // number of elements
            const )
```

Parameters

- `start`  
  [in] Starting index of the search range.

- `count`  
  [in] Search range size (number of elements).

Return Value

Index of the lowest element in the specified range.
Maximum

Gets index of the highest element of the array in the specified range.

```cpp
int Maximum(
    int start,       // starting index
    int count        // number of elements
) const
```

Parameters

- **start**
  - [in] Starting index of the search range.

- **count**
  - [in] Search range size (number of elements).

Return Value

Index of the highest element in the specified range.
**InsertSort**

Inserts an element in a sorted array.

```cpp
bool InsertSort(
    double element;  // element to insert
)
```

**Parameters**

- `element`
  
  [in] Value of the element to be inserted into a sorted array

**Return Value**

- true - successful, false - cannot insert the element.

**Example:**

```cpp
//--- example for CArrayDouble::InsertSort(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- insert element
    if(!array.InsertSort(100.0))
    {
        printf("Insert error");
        delete array;
        return;
    }
    //--- delete array
    delete array;
}
```
Search

Searches for an element equal to the sample in the sorted array.

```c
int Search(
    double element // sample
) const
```

**Parameters**

- `element`
  
  [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
//--- example for CArrayDouble::Search(double)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.Search(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreat

Searches for an element with a value exceeding the value of the sample in the sorted array.

```cpp
int SearchGreat(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayDouble::SearchGreat(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreat(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLess

Searches for an element with a value less than the value of the sample in the sorted array.

```c
int SearchLess(
    double element // sample
) const
```

Parameters

element

[in] The sample element to search in the array.

Return Value

The position of the found element - successful, -1 - the element not found.

Example:

```c
//--- example for CArrayDouble::SearchLess(double)
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //-- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLess(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchGreatOrEqual

Searches for an element with a value greater than or equal to the value of the sample in the sorted array.

```cpp
int SearchGreatOrEqual(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayDouble::SearchGreatOrEqual(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchGreatOrEqual(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchLessOrEqual

Searches for an element with a value less than or equal to the value of the sample in the sorted array.

```c
int SearchLessOrEqual(
    double element  // sample
) const
```

**Parameters**

element

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```c
#include <Arrays\ArrayDouble.mqh>

void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLessOrEqual(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
SearchFirst

Searches for the first element equal to the sample in the sorted array.

```cpp
int SearchFirst(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayDouble::SearchFirst(double)
#include "Arrays\ArrayDouble.mqh"
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchFirst(100.0)!=-1) printf("Element found");
    else
        printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLast**

Searches for the last element equal to the sample in the sorted array.

```cpp
int SearchLast(  
    double element  // sample  
) const
```

**Parameters**

- **element**
  - [in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Example:**

```cpp
//--- example for CArrayDouble::SearchLast(double)
#include <Arrays\ArrayDouble.mqh>

void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- sort array
    array.Sort();
    //--- search element
    if(array.SearchLast(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
**SearchLinear**

Searches for the element equal to the sample in the array.

```cpp
int SearchLinear(
    double element // sample
) const
```

**Parameters**

`element`

[in] The sample element to search in the array.

**Return Value**

The position of the found element - successful, -1 - the element not found.

**Note**

The method uses the linear search (or sequential search) algorithm for unsorted arrays.

**Example:**

```cpp
//--- example for CArrayDouble::SearchLinear(double)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add arrays elements
    //--- . . .
    //--- search element
    if(array.SearchLinear(100.0)!=-1) printf("Element found");
    else printf("Element not found");
    //--- delete array
    delete array;
}
```
Save

Saves data array in the file.

```cpp
virtual bool Save(
    int file_handle // file handle
)
```

Parameters

- **file_handle**
  - [in] Handle of the binary file previously opened using the FileOpen(...) function.

Return Value

- true - successfully completed, false - error.

Example:

```cpp
//--- example for CArrayDouble::Save(int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- add 100 arrays elements
    for(int i=0;i<100;i++)
    {
        array.Add(i);
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_WRITE|FILE_BIN|FILE_ANSI);
    if(file_handle>=0)
    {
        if(!array.Save(file_handle))
        {
            //--- file save error
            printf("File save: Error %d!",GetLastError());
            delete array;
            FILEClose(file_handle);
            //---
            return;
        }
    }
    FILEClose(file_handle);
}
```
```cpp
//--- delete array
delete array;
```
Load

Loads data array from the file.

```cpp
virtual bool Load(int file_handle) // file handle
```

**Parameters**

`file_handle`

[in] Handle of the binary file previously opened using the `FileOpen(...)` function.

**Return Value**

- true - successfully completed, false - error.

**Example:**

```cpp
//--- example for CArrayDouble::Load(int)
#include <Arrays\ArrayDouble.mqh>
//---
void OnStart()
{
    int file_handle;
    CArrayDouble *array=new CArrayDouble;
    //---
    if(array!=NULL)
    {
        printf("Object create error");
        return;
    }
    //--- open file
    file_handle=FileOpen("MyFile.bin",FILE_READ|FILE_BIN|FILE_ANSI);
    if(file_handle>0)
    {
        //--- file load error
        printf("File load: Error %d!",GetLastError());
        delete array;
        FileClose(file_handle);
        //---
        return;
    }
    FileClose(file_handle);
    //--- use arrays elements
    for(int i=0;i<array.Total();i++)
    {
        printf("Element[%d] = %f",i,array.At(i));
    }
    delete array;
    FileClose(file_handle);
    return;
}
```
}  //--- delete array
delete array;
}
Type

Gets the array type identifier.

```
virtual int Type() const
```

Return Value

Array type identifier (for CArrayDouble - 87).

Example:

```c
//--- example for CArrayDouble::Type()
#include <Arrays\ArrayDouble.mqh>
//--
void OnStart()
{
    CArrayDouble *array=new CArrayDouble;
    //--
    if(array==NULL)
    {
        printf("Object create error");
        return;
    }
    //--- get array type
    int type=array.Type();
    //---- delete array
    delete array;
}
```
CArrayString

CArrayString class is a class of dynamic array of string variables.

Description

The CArrayString class provides the ability to work with a dynamic array of string variables. The class allows adding/inserting/deleting array elements, performing an array sorting, and searching in a sorted array. In addition, methods of working with files have been implemented.

Declaration

class CArrayString : public CArray

#include <Arrays\ArrayString.mqh>

Inheritance hierarchy

CObject
   CArray
      CArrayString
