[out] Vector of reciprocal condition numbers for each eigenvalue; it is computed if the 'sense' parameter is set to 'E' or 'B'.

rcondv

[out] Vector of reciprocal condition numbers for each eigenvector; it is computed if the 'sense' parameter is set to 'V' or 'B'.

Return Value

Return true if successful, otherwise false in case of an [error](#).

Note

Input matrix balancing depends on the value of the 'balance' parameter.

ENUM_EIG_BALANCE

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGBALANCE_N	Do not diagonally scale or permute
EIGBALANCE_P	Perform permutations to make the matrix more nearly upper triangular. Do not diagonally scale
EIGBALANCE_S	Diagonally scale the matrix. Do not permute
EIGBALANCE_B	Both diagonally scale and permute

ENUM_EIG_VECTORS

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVECTORS_N	Only eigenvalues are computed, without vectors.
EIGVECTORS_L	Only left eigenvectors are computed.
EIGVECTORS_R	Only right eigenvectors are computed.
EIGVECTORS_LR	Left and right eigenvectors are computed, eigenvalues are always computed.

ENUM_EIG_SENSE

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGSENSE_N	None of reciprocal condition numbers are computed
EIGSENSE_E	Computed for eigenvalues only
EIGSENSE_V	Computed for right eigenvectors only
EIGSENSE_B	Computed for eigenvalues and right eigenvectors

EigenSolverShur

Compute eigenvalues, upper triangular matrix in Schur form, and matrix of Schur vectors (lapack function [GEES](#)). See also [Schur decomposition](#).

Computing for type matrix<double>

```
bool matrix::EigenSolverShur(
    ENUM_EIG_VECTORS    jobvs,           // method to compute Schur vectors
    vector<double>&      eigen_values,     // vector of computed eigenvalues
    matrix<double>&      shur_matrix,      // matrix in Schur form
    matrix<double>&      shur_vectors     // matrix of Schur vectors
);
```

Computing for type matrix<float>

```
bool matrixf::EigenSolverShur(
    ENUM_EIG_VECTORS    jobvs,           // method to compute Schur vectors
    vector<float>&       eigen_values,    // vector of computed eigenvalues
    matrixf<float>&      shur_matrix,      // matrix in Schur form
    matrixf<float>&      shur_vectors     // matrix of Schur vectors
);
```

Computing for type matrix<complex>

```
bool matrixc::EigenSolverShur(
    ENUM_EIG_VECTORS    jobvs,           // method to compute Schur vectors
    vector<complex>&    eigen_values,    // vector of computed eigenvalues
    matrixc<complex>&   shur_matrix,      // matrix in Schur form
    matrixc<complex>&   shur_vectors     // matrix of Schur vectors
);
```

Computing for type matrix<complexf>

```
bool matrixcf::EigenSolverShur(
    ENUM_EIG_VECTORS    jobvs,           // method to compute Schur vectors
    vector<float>&       eigen_values,    // vector of computed eigenvalues
    matrixcf<float>&     shur_matrix,      // matrix in Schur form
    matrixcf<float>&     shur_vectors     // matrix of Schur vectors
);
```

Parameters

jobvs

[in] Value from the [ENUM_EIG_SHUR](#) enumeration, which defines the method for computing Schur vectors.

eigen_values

[out] Vector of eigenvalues.

shur_matrix

[out] Upper triangular Schur matrix (Schur form for the input matrix).

shur_vectors

[out] Matrix of Schur vectors; it is not computed if the *jobvs* parameter is set to N.

Return Value

Return true if successful, otherwise false in case of an [error](#).

Note

Computation depends on the *jobvs* parameter values.

Real (non-complex) matrices can have a complex solution. Therefore, the input vector of eigenvalues must be complex. In case of a complex solution, the error code is set to [4019 \(ERR_MATH_OVERFLOW\)](#). Otherwise, only the real parts of the complex values of the eigenvalue vector should be used.

EigenSolverSchur

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGSHUR_N	Schur vectors are not computed
EIGSHUR_V	Schur vectors are computed

EigenSolver2

Compute generalized eigenvalues and eigenvectors for a pair of ordinary square matrices (lapack function [GGEV](#)). Both matrices must be the same size.

Computing for type matrix<double>

```
bool matrix::EigenSolver2(
    matrix&          B,                // second matrix in the pair
    ENUM_EIG_VECTORS jobv,             // method to compute right and left
    vectorc&         alpha,            // vector of computed eigenvalues
    vectorc&         beta,             // vector of eigenvalue divisors
    matrix&          left_eigenvectors, // matrix of computed left vectors
    matrix&          right_eigenvectors // matrix of computed right vectors
);
```

Computing for type matrix<float>

```
bool matrixf::EigenSolver2(
    matrixf&          B,                // second matrix in the pair
    ENUM_EIG_VECTORS jobv,             // method to compute right and left
    vectorcf&         alpha,            // vector of computed eigenvalues
    vectorf&         beta,             // vector of eigenvalue divisors
    matrixf&          left_eigenvectors, // matrix of computed left vectors
    matrixf&          right_eigenvectors // matrix of computed right vectors
);
```

Computing for type matrix<complex>

```
bool matrixc::EigenSolver2(
    matrixc&          B,                // second matrix in the pair
    ENUM_EIG_VECTORS jobv,             // method to compute right and left
    vectorc&         alpha,            // vector of computed eigenvalues
    vectorc&         beta,             // vector of eigenvalue divisors
    matrixc&          left_eigenvectors, // matrix of computed left vectors
    matrixc&          right_eigenvectors // matrix of computed right vectors
);
```

Computing for type matrix<complexf>

```
bool matrixcf::EigenSolver2(
    matrixcf&          B,                // second matrix in the pair
    ENUM_EIG_VECTORS jobv,             // method to compute right and left
    vectorcf&         alpha,            // vector of computed eigenvalues
    vectorcf&         beta,             // vector of eigenvalue divisors
    matrixcf&          left_eigenvectors, // matrix of computed left vectors
    matrixcf&          right_eigenvectors // matrix of computed right vectors
);
```

Parameters

B

[in] The second matrix in the pair.

jobv

[in] [ENUM_EIG_VECTORS](#) enumeration value which determines the method for computing left and right eigenvectors.

alpha

[out] Vector of eigenvalues.

beta

[out] Vector of eigen value divisors.

left_eigenvectors

[out] Matrix of left eigenvectors.

right_eigenvectors

[out] Matrix of right eigenvectors.

Return Value

Return true if successful, otherwise false in case of an [error](#).

Note

Computation depends on the value of the jobv parameter.

ENUM_EIG_VECTORS

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVECTORS_N	Only eigenvalues are computed, without vectors.
EIGVECTORS_L	Only left eigenvectors are computed.
EIGVECTORS_R	Only right eigenvectors are computed.
EIGVECTORS_LR	Left and right eigenvectors are computed, eigenvalues are always computed.

A generalized eigenvalue for a pair of matrices (A,B) is a scalar lambda or a ratio alpha/beta = lambda, such that A - lambda*B is singular. It is usually represented as the pair (alpha,beta), as there is a reasonable interpretation for beta=0, and even for both being zero.

The right eigenvector v(j) corresponding to the eigenvalue lambda(j) of (A,B) satisfies

$$A * v(j) = lambda(j) * B * v(j).$$

The left eigenvector u(j) corresponding to the eigenvalue lambda(j) of (A,B) satisfies

$$u(j)**H * A = lambda(j) * u(j)**H * B.$$

where $u(j)^H$ is the conjugate-transpose of $u(j)$.

Real (non-complex) matrices can have a complex solution. Therefore, the input vector of eigenvalues must be complex. In case of a complex solution, the error code is set to [4019 \(ERR_MATH_OVERFLOW\)](#). Otherwise, only the real parts of the complex values of the eigenvalue vector should be used.

EigenSolver2X

Compute generalized eigenvalues and eigenvectors for a pair of regular square matrices in Expert mode, i.e. with the ability to influence the computation algorithm and the ability to obtain accompanying computation data (lapack function [GGEVX](#)). Both matrices must be the same size.

Optionally, it also computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors (ILO, IHI, LSCALE, RSCALE, ABNRM, and BBNRM), reciprocal condition numbers for the eigenvalues (RCONDE), and reciprocal condition numbers for the right eigenvectors (RCONDV).

Computing for type matrix<double>

```
bool matrix::EigenSolver2X(
    matrix&          B,                // second matrix in the pair
    ENUM_EIG_BALANCE balance,          // input matrix balancing method
    ENUM_EIG_VECTORS  jobv,            // determines computation of right eigenvectors
    ENUM_EIG_SENSE    sense,          // determines computation of reciprocal condition numbers
    vectorc&          alpha,           // vector of computed eigenvalues
    vector&           beta,            // vector of eigenvalue divisors
    matrix&           left_eigenvectors, // matrix of computed left eigenvectors
    matrix&           right_eigenvectors, // matrix of computed right eigenvectors
    matrix&           shur_matrix1,     // the first part of the real Schur decomposition
    matrix&           shur_matrix2,     // the second part of the real Schur decomposition
    long&             ilo,              // subscript of balanced matrix
    long&             ihi,              // superscript of balanced matrix
    vector&           lscale,           // details of the permutations and scaling
    vector&           rscale,           // details of the permutations and scaling
    double&           ab_norm,         // one-norm of balanced input matrix
    double&           bb_norm,         // one-norm of balanced second matrix
    vector&           rconde,          // vector of reciprocal condition numbers
    vector&           rcondv          // vector of reciprocal condition numbers for right eigenvectors
);
```

Computing for type matrix<complex>

```
bool matrixc::EigenSolver2X(
    matrixc&          B,                // second matrix in the pair
    ENUM_EIG_BALANCE balance,          // input matrix balancing method
    ENUM_EIG_VECTORS  jobv,            // determines computation of right eigenvectors
    ENUM_EIG_SENSE    sense,          // determines computation of reciprocal condition numbers
    vectorc&          alpha,           // vector of computed eigenvalues
    vectorc&          beta,            // vector of eigenvalue divisors
    matrixc&          left_eigenvectors, // matrix of computed left eigenvectors
    matrixc&          right_eigenvectors, // matrix of computed right eigenvectors
    matrixc&          shur_matrix1,     // the first part of the real Schur decomposition
    matrixc&          shur_matrix2,     // the second part of the real Schur decomposition
    long&             ilo,              // subscript of balanced matrix
    long&             ihi,              // superscript of balanced matrix
    vectorc&          lscale,           // details of the permutations and scaling
    vectorc&          rscale,           // details of the permutations and scaling
    double&           ab_norm,         // one-norm of balanced input matrix
    double&           bb_norm,         // one-norm of balanced second matrix
    vectorc&          rconde,          // vector of reciprocal condition numbers
    vectorc&          rcondv          // vector of reciprocal condition numbers for right eigenvectors
);
```

```

vector&          rscale,          // details of the permutations and s
double&          ab_norm,         // one-norm of balanced input matrix
double&          bb_norm,         // one-norm of balanced second matrix
vector&          rconde,          // vector of reciprocal condition numbers
vector&          rcondv           // vector of reciprocal condition numbers
);

```

Parameters

B

[in] The second matrix in the pair.

balance

[in] Value from the [ENUM_EIG_BALANCE](#) enumeration which determines the need and method for balancing the input matrix; it is used to improve the conditioning of the eigenvalues and eigenvectors.

jobv

[in] Value from the [ENUM_EIG_VECTORS](#) enumeration which determines the method for computing left and right eigenvectors.

sense

[in] Value from the [ENUM_EIG_SENSE](#) enumeration which determines the need to compute reciprocal condition numbers.

eigen_values

[out] Vector of eigenvalues.

left_eigenvectors

[out] Matrix of left eigenvectors.

right_eigenvectors

[out] Matrix of right eigenvectors.

shur_matrix1, shur_matrix2

[out] 2 parts of balanced matrix in Schur form; the matrix is not filled if neither left nor right eigenvectors are computed.

ilo

[out] Subscript of the balanced matrix; the matrix is not filled if no balancing is applied.

ihi

[out] Superscript of the balanced matrix; the matrix is not filled if no balancing is applied.

lscale

[out] Vector contains details of the permutations and scaling factors applied to the left side of A and B.

If PL(j) is the index of the row interchanged with row j, and DL(j) is the scaling factor applied to row j, then

lscale(j) = PL(j), for j = 1,..., ilo-1

= DL(j), for j = ilo,...,ihi

= PL(j) for j = ihi+1,..., n.

The order in which the interchanges are made is n to ihi+1, then 1 to ilo-1.

rscale

[out] Vector contains details of the permutations and scaling factors applied to the right side of A and B.

If PR(j) is the index of the column interchanged with column j, and DR(j) is the scaling factor applied to column j, then

rscale(j) = PR(j), for j = 1,..., ilo-1

= DR(j), for j = ilo,...,ihi

= PR(j) for j = ihi+1,..., n.

The order in which the interchanges are made is n to ihi+1, then 1 to ilo-1.

ab_norm

[out] One-norm of the balanced input matrix (the maximum of the sum of absolute values of elements in any of the matrix columns).

bb_norm

[out] One-norm of balanced second matrix B.

rconde

[out] Vector of reciprocal condition numbers for each eigenvalue; it is computed if the 'sense' parameter is set to 'E' or 'B'.

rcondv

[out] Vector of reciprocal condition numbers for each eigenvector; it is computed if the 'sense' parameter is set to 'V' or 'B'.

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

Input matrices balancing depends on the value of the *balance* parameter.

ENUM_EIG_BALANCE

An enumeration that specifies whether the matrices should be balanced.

ID	Description
EIGBALANCE_N	Do not diagonally scale or permute.
EIGBALANCE_P	Perform permutations to make the matrix more nearly upper triangular. Do not diagonally scale.
EIGBALANCE_S	Diagonally scale the matrix. Do not permute.
EIGBALANCE_B	Both diagonally scale and permute.

ENUM_EIG_VECTORS

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVECTORS_N	Only eigenvalues are computed, without vectors.
EIGVECTORS_L	Only left eigenvectors are computed.
EIGVECTORS_R	Only right eigenvectors are computed.
EIGVECTORS_LR	Left and right eigenvectors are computed, eigenvalues are always computed.

ENUM_EIG_SENSE

An enumeration determining the need to compute reciprocal condition numbers.

ID	Description
EIGSENSE_N	None of reciprocal condition numbers are computed.
EIGSENSE_E	Computed for eigenvalues only.
EIGSENSE_V	Computed for right eigenvectors only.
EIGSENSE_B	Computed for eigenvalues and right eigenvectors.

EigenSolver2Shur

Compute a pair of ordinary square matrices of generalized eigenvalues, generalized eigenvectors, generalized Schur forms, as well as left and right Schur vectors (lapack function [GGES](#)).

Computes the generalized eigenvalues, the generalized real/complex Schur form (S,T), optionally, the left and/or right matrices of Schur vectors (vsl and vsr) for a pair of n-by-n real/complex nonsymmetric matrices (A,B). This gives the generalized Schur factorization:

$$(A,B) = (vsl^* S \cdot vsr^H, vsl^* T \cdot vsr^H)$$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix S and the upper triangular matrix T. The leading columns of vsl and vsr then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

Computing for type matrix<double>

```
bool matrix::EigenSolver2Shur(
    matrix&          B,           // second matrix in the pair
    ENUM_EIG_VECTORS jobvs,       // method to compute left and right vectors
    vector&          alpha,       // vector of computed eigenvalues
    vector&          beta,        // vector of eigenvalue divisors
    matrix&          shur_s,      // matrix S in Schur form
    matrix&          shur_t,      // matrix T in Schur form
    matrix&          vsl,         // matrix of left Schur vectors vsl
    matrix&          vsr         // matrix of right Schur vectors vsr
);
```

Computing for type matrix<complex>

```
bool matrix::EigenSolver2Shur(
    matrixc&          B,           // second matrix in the pair
    ENUM_EIG_VECTORS jobvs,       // method to compute left and right vectors
    vectorc&          alpha,       // vector of computed eigenvalues
    vectorc&          beta,        // vector of eigenvalue divisors
    matrixc&          shur_s,      // matrix S in Schur form
    matrixc&          shur_t,      // matrix T in Schur form
    matrixc&          vsl,         // matrix of left Schur vectors vsl
    matrixc&          vsr         // matrix of right Schur vectors vsr
);
```

Parameters

B

[out] The second matrix in the pair.

jobvs

[in] [ENUM_EIG_VECTORS](#) enumeration value which determines the method for computing left and right eigenvectors.

alpha

[out] Vector of eigenvalues.

beta

[out] Vector of eigenvalue divisors.

shur_s

[out] Matrix S, block upper triangular Schur matrix (Schur form for the input matrix).

shur_t

[out] Matrix T, block upper triangular Schur matrix (Schur form for the second matrix in the pair).

vsl

[out] Matrix of left Schur vectors.

vsr

[out] Matrix of right Schur vectors.

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

Computation depends on the *jobvs* parameter values.

The second matrix in the pair must be the same size as the first (input) one.

Real (non-complex) matrices can have a complex solution. Therefore, the vector of eigenvalues must be complex. In case of a complex solution, the error code is set to [4019 \(ERR_MATH_OVERFLOW\)](#). Otherwise, only the real parts of the complex values of the eigenvalue vector should be used.

EigenSolverShur

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVECTORS_N	Only eigenvalues are computed, without vectors.
EIGVECTORS_L	Only left eigenvectors are computed.
EIGVECTORS_R	Only right eigenvectors are computed.
EIGVECTORS_LR	Left and right eigenvectors are computed, eigenvalues are always computed.

EigenSolver2Blocked

Compute generalized eigenvalues and eigenvectors for a pair of regular square matrices using a block algorithm (lapack function [GGEV3](#)). Both matrices must be the same size. The method parameters are exactly the same as [EigenSolver2](#).

Computing for type matrix<double>

```
bool matrix::EigenSolver2Blocked(
    matrix&                B,                // second matrix in the pair
    ENUM_EIG_VECTORS        jobv,            // method to compute right and left
    vectorc&                alpha,           // vector of computed eigenvalues
    vector&                 beta,            // vector of eigenvalue divisors
    matrix&                 left_eigenvectors, // matrix of computed left vectors
    matrix&                 right_eigenvectors // matrix of computed right vectors
);
```

Computing for type matrix<float>

```
bool matrixf::EigenSolver2Blocked(
    matrix&                B,                // second matrix in the pair
    ENUM_EIG_VECTORS        jobv,            // method to compute right and left
    vectorcf&               alpha,           // vector of computed eigenvalues
    vectorf&                beta,            // vector of eigenvalue divisors
    matrixf&                left_eigenvectors, // matrix of computed left vectors
    matrixf&                right_eigenvectors // matrix of computed right vectors
);
```

Computing for type matrix<complex>

```
bool matrix::EigenSolver2Blocked(
    matrixc&                B,                // second matrix in the pair
    ENUM_EIG_VECTORS        jobv,            // method to compute right and left
    vectorc&                alpha,           // vector of computed eigenvalues
    vectorc&                beta,            // vector of eigenvalue divisors
    matrixc&                left_eigenvectors, // matrix of computed left vectors
    matrixc&                right_eigenvectors // matrix of computed right vectors
);
```

Computing for type matrix<complexf>

```
bool matrixcf::EigenSolver2(
    matrixcf&                B,                // second matrix in the pair
    ENUM_EIG_VECTORS        jobv,            // method to compute right and left
    vectorcf&               alpha,           // vector of computed eigenvalues
    vectorcf&                beta,            // vector of eigenvalue divisors
    matrixcf&                left_eigenvectors, // matrix of computed left vectors
    matrixcf&                right_eigenvectors // matrix of computed right vectors
);
```

Parameters

B

[out] The second matrix in the pair.

jobv

[in] [ENUM_EIG_VECTORS](#) enumeration value which determines the method for computing left and right eigenvectors.

alpha

[out] Vector of eigenvalues.

beta

[out] Vector of eigenvalue divisors.

left_eigenvectors

[out] Matrix of left eigenvectors.

right_eigenvectors

[out] Matrix of right eigenvectors.

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

Computation depends on the value of the *jobv* parameter.

A generalized eigenvalue for a pair of matrices (A,B) is a scalar λ or a ratio $\alpha/\beta = \lambda$, such that $A - \lambda B$ is singular. It is usually represented as the pair (α,β), as there is a reasonable interpretation for $\beta=0$, and even for both being zero.

The right eigenvector $v(j)$ corresponding to the eigenvalue $\lambda(j)$ of (A,B) satisfies:

$$A * v(j) = \lambda(j) * B * v(j).$$

The left eigenvector $u(j)$ corresponding to the eigenvalue $\lambda(j)$ of (A,B) satisfies:

$$u(j)^H * A = \lambda(j) * u(j)^H * B.$$

where $u(j)^H$ is the conjugate-transpose of $u(j)$.

Real (non-complex) matrices can have a complex solution. Therefore, the input vector of eigenvalues must be complex. In case of a complex solution, the error code is set to [4019 \(ERR_MATH_OVERFLOW\)](#). Otherwise, only the real parts of the complex values of the eigenvalue vector should be used.

ENUM_EIG_VECTORS

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVECTORS_N	Only eigenvalues are computed, without vectors.

ID	Description
EIGVECTORS_L	Only left eigenvectors are computed.
EIGVECTORS_R	Only right eigenvectors are computed.
EIGVECTORS_LR	Left and right eigenvectors are computed, eigenvalues are always computed.

EigenSolver2ShurBlocked

Compute a pair of regular square matrices of generalized eigenvalues, generalized eigenvectors, generalized Schur forms, as well as left and right Schur vectors (lapack function [GGES3](#)).

Computes the generalized eigenvalues, the generalized real/complex Schur form (S,T), optionally, the left and/or right matrices of Schur vectors (VSL and VSR) for a pair of n-by-n real/complex nonsymmetric matrices (A,B). This gives the generalized Schur factorization:

$$(A,B) = (vsl^* S * vsrH, vsl^* T * vsrH)$$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix S and the upper triangular matrix T. The leading columns of vsl and vsr then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

Computing for type matrix<double>

```
bool matrix::EigenSolver2ShurBlocked(
    matrix&          B,          // second matrix in the pair
    ENUM_EIG_VECTORS jobvs,      // method to compute left and right vectors
    vectorc&         alpha,      // vector of computed eigenvalues
    vector&          beta,       // vector of eigenvalue divisors
    matrix&          shur_s,     // matrix S in Schur form
    matrix&          shur_t,     // matrix T in Schur form
    matrix&          vsl,        // matrix of left Schur vectors VSL
    matrix&          vsr        // matrix of right Schur vectors VSR
);
```

Computing for type matrix<float>

```
bool matrix::EigenSolver2ShurBlocked(
    matrixf&          B,          // second matrix in the pair
    ENUM_EIG_VECTORS jobvs,      // method to compute left and right vectors
    vectorcf&         alpha,      // vector of computed eigenvalues
    vectorf&          beta,       // vector of eigenvalue divisors
    matrixf&          shur_s,     // matrix S in Schur form
    matrixf&          shur_t,     // matrix T in Schur form
    matrixf&          vsl,        // matrix of left Schur vectors VSL
    matrixf&          vsr        // matrix of right Schur vectors VSR
);
```

Computing for type matrix<complex>

```
bool matrix::EigenSolver2ShurBlocked(
    matrixc&          B,          // second matrix in the pair
    ENUM_EIG_VECTORS jobvs,      // method to compute left and right vectors
    vectorc&         alpha,      // vector of computed eigenvalues
    vectorc&          beta,       // vector of eigenvalue divisors
    matrixc&          shur_s,     // matrix S in Schur form
    matrixc&          shur_t,     // matrix T in Schur form
);
```

```

matrixcf&          vsl,      // matrix of left Schur vectors VSL
matrixcf&          vsr      // matrix of right Schur vectors VSR
);

```

Computing for type matrix<complexf>

```

bool matrix::EigenSolver2ShurBlocked(
    matrixcf&        B,      // second matrix in the pair
    ENUM_EIG_VECTORS jobvs,  // method to compute left and right vectors
    vectorcf&        alpha,  // vector of computed eigenvalues
    vectorcf&        beta,   // vector of eigenvalue divisors
    matrixcf&        shur_s, // matrix S in Schur form
    matrixcf&        shur_t, // matrix T in Schur form
    matrixcf&        vsl,    // matrix of left Schur vectors VSL
    matrixcf&        vsr     // matrix of right Schur vectors VSR
);

```

Parameters

B

[in] The second matrix in the pair.

jobvs

[in] [ENUM_EIG_VECTORS](#) enumeration value which determines the method for computing left and right eigenvectors.

alpha

[out] Vector of eigenvalues.

beta

[out] Vector of eigenvalue divisors.

shur_s

[out] Matrix S, block upper triangular Schur matrix (Schur form for the input matrix).

shur_t

[out] Matrix T, block upper triangular Schur matrix (Schur form for the second matrix in the pair).

vsl

[out] Matrix of left Schur vectors VSL.

vsr

[out] Matrix of right Schur vectors VSR.

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

Computation depends on the *jobvs* parameter values.

The second matrix in the pair must be the same size as the first (input) one.

Real (non-complex) matrices can have a complex solution. Therefore, the vector of eigenvalues must be complex. In case of a complex solution, the error code is set to [4019 \(ERR_MATH_OVERFLOW\)](#). Otherwise, only the real parts of the complex values of the eigenvalue vector should be used.

EigenSolverShur

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVECTORS_N	Only eigenvalues are computed, without vectors.
EIGVECTORS_L	Only left eigenvectors are computed.
EIGVECTORS_R	Only right eigenvectors are computed.
EIGVECTORS_LR	Left and right eigenvectors are computed, eigenvalues are always computed.

Symmetric Matrices

Functions for computing eigenvalues and eigenvectors of symmetric or Hermitian matrices using the divide and conquer algorithm, making the process efficient and fast. These methods can be applied to matrices of different data types, including real and complex numbers.

Function	Action
EigenSymmetricDC	Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugate) matrix using the divide-and-conquer algorithm (lapack functions SYEVD, HEEVD).
EigenSymmetricQR	Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugate) matrix using the QR algorithm (lapack functions SYEV, HEEV).
EigenSymmetricRobust	Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugate) matrix using the Multiple Relatively Robust Representations, MRRR algorithm (lapack functions SYEVR, HEEVR).
EigenSymmetricBisect	Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugate) matrix using the bisection algorithm (lapack functions SYEVX, HEEVX).

EigenSymmetricDC

Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugated) matrix using the divide-and-conquer algorithm (lapack functions [SYEVD](#), [HEEVD](#)).

Computing for type matrix<double>

```
bool matrix::EigenSymmetricDC(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vector&               eigen_values,   // vector of computed eigenvalues  
    matrix&               eigen_vectors   // matrix of computed eigenvectors  
) ;
```

Computing for type matrix<float>

```
bool matrixf::EigenSymmetricDC(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vectorf&             eigen_values,   // vector of computed eigenvalues  
    matrixf&             eigen_vectors   // matrix of computed eigenvectors  
) ;
```

Computing for type matrix<complex>

```
bool matrixc::EigenSymmetricDC(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vector&               eigen_values,   // vector of computed eigenvalues  
    matrixc&             eigen_vectors   // matrix of computed eigenvectors  
) ;
```

Computing for type matrix<complexf>

```
bool matrixcf::EigenSymmetricDC(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vectorf&             eigen_values,   // vector of computed eigenvalues  
    matrixcf&            eigen_vectors   // matrix of computed eigenvectors  
) ;
```

Parameters

jobv

[in] ENUM_EIG_VALUES enumeration value which determines the method for computing eigenvectors.

eigen_values

[out] Vector of eigenvalues.

eigen_vectors

[out] Matrix of eigenvectors.

Return Value

Return true if successful, otherwise false in case of an [error](#).

Note

Computation depends on the value of the jobv parameter.

When jobv = EIGVALUES_V, eigenvectors and eigenvalues are calculated.

If EIGVALUES_N is set, eigenvectors are not calculated. Only eigenvalues are computed.

The input can be a symmetric (Hermitian), [upper triangular](#) or [lower triangular](#) matrix. Triangular matrices are assumed to be symmetric (Hermitian conjugated).

ENUM_EIG_VALUES

An enumeration that specifies whether to calculate eigenvectors.

ID	Description
EIGVALUES_V	Eigenvectors and eigenvalues are calculated.
EIGVALUES_N	Only eigenvalues are calculated, without vectors.

EigenSymmetricQR

Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugated) matrix using the QR algorithm (lapack functions [SYEV](#), [HEEV](#)).

Computing for type matrix<double>

```
bool matrix::EigenSymmetricQR(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vector&               eigen_values,   // vector of computed eigenvalues  
    matrix&               eigen_vectors  // matrix of computed eigenvectors  
);
```

Computing for type matrix<float>

```
bool matrixf::EigenSymmetricQR(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vectorf&             eigen_values,   // vector of computed eigenvalues  
    matrixf&             eigen_vectors  // matrix of computed eigenvectors  
);
```

Computing for type matrix<complex>

```
bool matrixc::EigenSymmetricQR(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vector&               eigen_values,   // vector of computed eigenvalues  
    matrixc&             eigen_vectors  // matrix of computed eigenvectors  
);
```

Computing for type matrix<complexf>

```
bool matrixcf::EigenSymmetricQR(  
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not  
    vectorf&             eigen_values,   // vector of computed eigenvalues  
    matrixcf&            eigen_vectors  // matrix of computed eigenvectors  
);
```

Parameters

jobv

[in] [ENUM_EIG_VALUES](#) enumeration value which determines the method for computing eigenvectors.

eigen_values

[out] Vector of eigenvalues.

eigen_vectors

[out] Matrix of eigenvectors.

Return Value

Return true if successful, otherwise false in case of an [error](#).

Note

Computation depends on the value of the `jobv` parameter.

When `jobv = EIGVALUES_V`, eigenvectors and eigenvalues are calculated.

If `EIGVALUES_N` is set, eigenvectors are not calculated. Only eigenvalues are computed.

The input can be a symmetric (Hermitian), [upper triangular](#) or [lower triangular](#) matrix. Triangular matrices are assumed to be symmetric (Hermitian conjugated).

ENUM_EIG_VALUES

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVALUES_V	Eigenvectors and eigenvalues are calculated.
EIGVALUES_N	Only eigenvalues are computed, without vectors.

EigenSymmetricRobust

Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugated) matrix using the Multiple Relatively Robust Representations, MRRR algorithm (lapack functions [SYEVR](#), [HEEVR](#)).

Computing for type matrix<double>

```
bool matrix::EigenSymmetricRobust(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BIAS_RANGE      range,          // subset of eigenvalues to compute
    double               lower,          // lower bound of the subset
    double               upper,          // Upper bound of the subset
    double               abstol,         // absolute error tolerance
    vector&              eigen_values,   // vector of computed eigenvectors
    matrix&              eigen_vectors  // matrix of computed eigenvectors
);
```

Computing for type matrix<float>

```
bool matrixf::EigenSymmetricRobust(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BIAS_RANGE      range,          // subset of eigenvalues to compute
    float                lower,          // lower bound of the subset
    float                upper,          // upper bound of the subset
    float                abstol,         // absolute error tolerance
    vectorf&             eigen_values,   // vector of computed eigenvectors
    matrixf&             eigen_vectors  // matrix of computed eigenvectors
);
```

Computing for type matrix<complex>

```
bool matrixc::EigenSymmetricRobust(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BIAS_RANGE      range,          // subset of eigenvalues to compute
    double               lower,          // lower bound of the subset
    double               upper,          // Upper bound of the subset
    double               abstol,         // absolute error tolerance
    vector&              eigen_values,   // vector of computed eigenvectors
    matrixc&             eigen_vectors  // matrix of computed eigenvectors
);
```

Computing for type matrix<complexf>

```
bool matrixcf::EigenSymmetricRobust(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BIAS_RANGE      range,          // subset of eigenvalues to compute
    float                lower,          // lower bound of the subset
    float                upper,          // Upper bound of the subset
    float                abstol,         // absolute error tolerance
```

```
vectorf&          eigen_values,          // vector of computed eigenvectors
matrixcf&         eigen_vectors         // matrix of computed eigenvectors
);
```

Parameters

jobv

[in] [ENUM_EIG_VALUES](#) enumeration value which determines the method for computing eigenvectors.

range

[in] [ENUM_BLAS_RANGE](#) enumeration value that defines a subset of computable eigenvalues and vectors.

lower

[in] The lower bound of eigenvalues subset; it is specified depending on the value of the 'range' parameter.

upper

[in] The upper bound of eigenvalues subset; it is specified depending on the value of the 'range' parameter.

abstol

[in] Absolute error tolerance.

The absolute error tolerance to which each eigenvalue/eigenvector is required.

If *jobv* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*.

If $abstol < n * \epsilon * |T|$, then $n * \epsilon * |T|$ is used instead, where ϵ is the machine precision, and $|T|$ is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of $\epsilon * |T|$ irrespective of *abstol*.

If high relative precision is important, 'abstol' should be set to a safe minimum value *X* such that $1.0/X$ does not overflow.

eigen_values

[out] Vector of eigenvalues.

eigen_vectors

[out] Matrix of eigenvectors.

Return Value

Return true if successful, otherwise false in case of an [error](#).

Note

Computation depends on the values of the *jobv* and *range* parameters.

When `BLASRANGE_A` is set, all eigenvalues are computed, and the lower and upper parameters are ignored.

With the `BLASRANGE_V` value, only those eigenvalues (and their vectors) are computed, which fall within the range of real values specified by the 'lower' and 'upper' parameters.

With the BLASRANGE_I value, only those eigenvalues (and their vectors) are computed, which fall within the range of integer indices specified by the 'lower' and 'upper' parameters. For example, with lower=0 and upper=2, only the first three eigenvalues are computed.

The input can be a symmetric (Hermitian), [upper triangular](#) or [lower triangular](#) matrix. Triangular matrices are assumed to be symmetric (Hermitian conjugated).

ENUM_EIG_VALUES

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVALUES_V	Eigenvectors and eigenvalues are calculated.
EIGVALUES_N	Only eigenvalues are computed, without vectors.

ENUM_BLAS_RANGE

An enumeration defining how right singular vectors should be computed.

ID	Description
BLASRANGE_A	All singular or eigenvalues will be found.
BLASRANGE_V	All singular or eigenvalues in the half-open interval (VL,VU] will be found.
BLASRANGE_I	The IL-th through IU-th singular or eigenvalues will be found.

EigenSymmetricBisect

Compute eigenvalues and eigenvectors of a symmetric or Hermitian (complex conjugated) matrix using the bisection algorithm (lapack functions [SYEVX](#), [HEEVX](#)).

Computing for type matrix<double>

```
bool matrix::EigenSymmetricBisect(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BLAS_RANGE      range,          // subset of eigenvalues to compute
    double               lower,          // lower bound of the subset
    double               upper,          // Upper bound of the subset
    double               abstol,         // absolute error tolerance
    vector&              eigen_values,   // vector of computed eigenvectors
    matrix&              eigen_vectors  // matrix of computed eigenvectors
);
```

Computing for type matrix<float>

```
bool matrixf::EigenSymmetricBisect(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BLAS_RANGE      range,          // subset of eigenvalues to compute
    float                lower,          // lower bound of the subset
    float                upper,          // upper bound of the subset
    float                abstol,         // absolute error tolerance
    vectorf&             eigen_values,   // vector of computed eigenvectors
    matrixf&             eigen_vectors  // matrix of computed eigenvectors
);
```

Computing for type matrix<complex>

```
bool matrixc::EigenSymmetricBisect(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BLAS_RANGE      range,          // subset of eigenvalues to compute
    double               lower,          // lower bound of the subset
    double               upper,          // Upper bound of the subset
    double               abstol,         // absolute error tolerance
    vector&              eigen_values,   // vector of computed eigenvectors
    matrixc&             eigen_vectors  // matrix of computed eigenvectors
);
```

Computing for type matrix<complexf>

```
bool matrixcf::EigenSymmetricBisect(
    ENUM_EIG_VALUES      jobv,           // compute eigenvectors or not
    ENUM_BLAS_RANGE      range,          // subset of eigenvalues to compute
    float                lower,          // lower bound of the subset
    float                upper,          // Upper bound of the subset
    float                abstol,         // absolute error tolerance
    vectorf&             eigen_values,   // vector of computed eigenvectors
    matrixcf&            eigen_vectors  // matrix of computed eigenvectors
);
```

```
matrixcf&          eigen_vectors    // matrix of computed eigenvectors
);
```

Parameters

jobv

[in] [ENUM_EIG_VALUES](#) enumeration value which determines the method for computing eigenvectors.

range

[in] [ENUM_BLAS_RANGE](#) enumeration value that defines a subset of computable eigenvalues and vectors.

lower

[in] The lower bound of eigenvalues subset; it is specified depending on the value of the '*range*' parameter.

upper

[in] The upper bound of eigenvalues subset; it is specified depending on the value of the '*range*' parameter.

abstol

[in] Absolute error tolerance.

The absolute error tolerance to which each eigenvalue/eigenvector is required.

If *jobv* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*.

If $\text{abstol} < n \cdot \text{eps} \cdot |T|$, then $n \cdot \text{eps} \cdot |T|$ is used instead, where *eps* is the machine precision, and $|T|$ is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of $\text{eps} \cdot |T|$ irrespective of *abstol*.

If high relative precision is important, '*abstol*' should be set to a safe minimum value *X* such that $1.0/X$ does not overflow.

eigen_values

[out] Vector of eigenvalues.

V

[out] Matrix of eigenvectors.

Return Value

Return true if successful, otherwise false in case of an [error](#).

Note

Computation depends on the values of the *jobv* and *range* parameters.

When BLASRANGE_A is set, all eigenvalues are computed, and the lower and upper parameters are ignored.

With the BLASRANGE_V value, only those eigenvalues (and their vectors) are computed, which fall within the range of real values specified by the '*lower*' and '*upper*' parameters.

With the BLASRANGE_I value, only those eigenvalues (and their vectors) are computed, which fall within the range of integer indices specified by the 'lower' and 'upper' parameters. For example, with lower=0 and upper=2, only the first three eigenvalues are computed.

The input can be a symmetric (Hermitian), [upper triangular](#) or [lower triangular](#) matrix. Triangular matrices are assumed to be symmetric (Hermitian conjugated).

ENUM_EIG_VALUES

An enumeration defining the need to compute eigenvectors.

ID	Description
EIGVALUES_V	Eigenvectors and eigenvalues are calculated.
EIGVALUES_N	Only eigenvalues are computed, without vectors.

ENUM_BLAS_RANGE

An enumeration defining how right singular vectors should be computed.

ID	Description
BLASRANGE_A	All singular or eigenvalues will be found.
BLASRANGE_V	All singular or eigenvalues in the half-open interval (VL,VU] will be found.
BLASRANGE_I	The IL-th through IU-th singular or eigenvalues will be found.

Singular Spectrum Analysis

The section contains functions for decomposing a matrix into three components: orthogonal matrices and a diagonal matrix of singular values. SVD is applied to solve various linear algebra problems such as data dimensionality reduction, image compression, solving systems of equations, as well as data analysis and optimization. The main functions allow calculating singular values and vectors, reconstruct matrices, as well as approximate them with reduced rank accuracy.

Function	Action
<u>SingularSpectrumAnalysisSpectrum</u>	A method function for calculating the relative contributions of spectral components based on their eigenvalues.
<u>SingularSpectrumAnalysisForecast</u>	A method function for calculating reconstructed and predicted data using spectral components of the input time series.
<u>SingularSpectrumAnalysisReconstructComponents</u>	A method function for calculating reconstructed components of the input time series and their contributions.
<u>SingularSpectrumAnalysisReconstructSeries</u>	A method function for calculating the reconstructed time series using the first component_count components.

SingularSpectrumAnalysisSpectrum

A method function for calculating the relative contributions of spectral components based on their eigenvalues.

Calculations for vector<double> type

```
bool vector::SingularSpectrumAnalysisSpectrum(  
    ulong    window_length,      // window size for constructing the trajectory matrix  
    vector& spectrum             // vector of component contributions to the input series  
);
```

Calculations for vector<complex> type

```
bool vector::SingularSpectrumAnalysisSpectrum(  
    ulong    window_length,      // window size for constructing the trajectory matrix  
    vectorc& spectrum           // vector of component contributions to the input series  
);
```

Parameters

window_length

[in] Window size for constructing the trajectory matrix, the number of components the input time series should be decomposed into.

spectrum

[out] Vector of component contributions to the input series - eigenvalues of the covariance matrix of the input time series.

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

The *window_length* parameter value should be less than the size of the input time series. To construct a full-fledged trajectory matrix, the optimal size is considered to be approximately equal to half the size of the input time series.

SingularSpectrumAnalysisForecast

A method function for calculating reconstructed and predicted data using spectral components of the input time series.

Calculations for vector<double> type

```
bool vector::SingularSpectrumAnalysisForecast(  
    ulong    window_length,           // window size for constructing the trajectory matrix  
    ulong    component_count,         // number of components used for forecasting  
    ulong    forecast_horizon,        // number of points to forecast  
    vector& forecast                  // vector consisting of reconstructed and predicted data  
);
```

Calculations for vector<complex> type

```
bool vector::SingularSpectrumAnalysisForecast(  
    ulong    window_length,           // window size for constructing the trajectory matrix  
    ulong    component_count,         // number of components used for forecasting  
    ulong    forecast_horizon,        // number of points to forecast  
    vectorc& forecast                 // vector consisting of reconstructed and predicted data  
);
```

Parameters

window_length

[in] Window size for constructing the trajectory matrix, the number of components the input time series should be decomposed into.

component_count

[in] Number of components used for forecasting.

forecast_horizon

[in] Number of points to forecast.

forecast

[out] Combining points reconstructed by *component_count* plus *forecast_horizon* points predicted using the first *component_count* components. Thus, the *forecast* vector has the size of (T+forecast_horizon), where T is the input series length.

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

The *window_length* parameter value should be less than the size of the input time series. To construct a full-fledged trajectory matrix, the optimal size is considered to be approximately equal to half the size of the input time series.

SingularSpectrumAnalysisReconstructComponents

A method function for calculating reconstructed components of the input time series and their contributions.

Calculations for vector<double> and matrix<double> types

```
bool vector::SingularSpectrumAnalysisReconstructComponents(
    ulong    window_length,      // window size for constructing the trajectory matrix
    matrix& components,          // matrix of reconstructed components
    vector& contributions        // vector of component contributions to the input series
);
```

Calculations for vector<complex> and matrix<complex> types

```
bool vector::SingularSpectrumAnalysisReconstructComponents(
    ulong    window_length,      // window size for constructing the trajectory matrix
    matrixc& components,          // matrix of reconstructed components
    vectorc& contributions        // vector of component contributions to the input series
);
```

Parameters

window_length

[in] Window size for constructing the trajectory matrix, the number of components the input time series should be decomposed into.

components

[out] A matrix of reconstructed components, where each column describes a separate component.

contributions

[out] Vector of component contributions to the input series (eigenvalues of the covariance matrix of the input time series).

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

The *window_length* parameter value should be less than the size of the input time series. To construct a full-fledged trajectory matrix, the optimal size is considered to be approximately equal to half the size of the input time series.

SingularSpectrumAnalysisReconstructSeries

A method function for calculating the reconstructed time series using the first *component_count* components.

Calculations for vector<double> type

```
bool vector::SingularSpectrumAnalysisReconstructSeries(  
    ulong    window_length,        // window size for constructing the trajectory matrix  
    ulong    component_count,      // number of components used for reconstruction  
    vector& reconstructed          // reconstructed time series  
);
```

Calculations for vector<complex> type

```
bool vector::SingularSpectrumAnalysisReconstructSeries(  
    ulong    window_length,        // window size for constructing the trajectory matrix  
    ulong    component_count,      // number of components used for reconstruction  
    vectorc& reconstructed         // reconstructed time series  
);
```

Parameters

window_length

[in] Window size for constructing the trajectory matrix, the number of components the input time series should be decomposed into.

component_count

[out] Number of components used for time series reconstruction.

reconstructed

[out] Vector containing the reconstructed output series.

Return Value

The function returns 'true' on success or 'false' if an [error](#) occurs.

Note

The *window_length* parameter value should be less than the size of the input time series. To construct a full-fledged trajectory matrix, the optimal size is considered to be approximately equal to half the size of the input time series.

Conversion Functions

This is a group of functions that provide conversion of data from one format into another.

The [NormalizeDouble\(\)](#) function must be specially noted as it provides the necessary accuracy of the price presentation. In trading operations, no unnormalized prices may be used if their accuracy even a digit exceeds that required by the trade server.

Function	Action
CharToString	Converting a symbol code into a one-character string
DoubleToString	Converting a numeric value to a text line with a specified accuracy
EnumToString	Converting an enumeration value of any type to string
NormalizeDouble	Rounding of a floating point number to a specified accuracy
StringToDouble	Converting a string containing a symbol representation of number into number of double type
StringToInteger	Converting a string containing a symbol representation of number into number of long type
StringToTime	Converting a string containing time or date in "yyyymm.dd [hh:mi]" format into datetime type
TimeToString	Converting a value containing time in seconds elapsed since 01.01.1970 into a string of "yyyymm.dd hh:mi" format
IntegerToString	Converting int into a string of preset length
ShortToString	Converting symbol code (unicode) into one-symbol string
ShortArrayToString	Copying array part into a string
StringToShortArray	Symbol-wise copying a string to a selected part of array of ushort type
CharArrayToString	Converting symbol code (ansi) into one-symbol array
StringToCharArray	Symbol-wise copying a string converted from Unicode to ANSI, to a selected place of array of uchar type
CharArrayToStruct	Copy uchar type array to POD structure
StructToCharArray	Copy POD structure to uchar type array
ColorToARGB	Converting color type to uint type to receive ARGB representation of the color.
ColorToString	Converting color value into string as "R,G,B"
StringToColor	Converting "R,G,B" string or string with color name into color type value
StringFormat	Converting number into string according to preset format

[Use of a Codepage](#)

CharToString

Converting a symbol code into a one-character string.

```
string CharToString(
    uchar char_code    // numeric code of symbol
);
```

Parameters

char_code

[in] Code of ANSI symbol.

Return Value

String with a ANSI symbol.

Example:

```
string ExtStrArray[224];

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- in the loop from the symbol code 32 (space) to 255(CHAR_MAX),
    //--- fill the array with symbol codes converted to a string in accordance with the c
    for(int i=32; i<=CHAR_MAX; i++)
        ExtStrArray[i-32]=CharToString((uchar)i);

    //--- print the header and the symbol table in the journal
    Print("Table of symbols:");
    ArrayPrint(ExtStrArray,_Digits," | ");
    /*
    result:
    Table of symbols:
    [ 0] " " | "!" | "\"" | "#" | "$" | "%" | "&" | "'" | "(" | ")" | "*" | "+" | ","
    [25] "9" | ":" | ";" | "<" | "=" | ">" | "?" | "@" | "A" | "B" | "C" | "D" | "E"
    [50] "R" | "S" | "T" | "U" | "V" | "W" | "X" | "Y" | "Z" | "[" | "\" | "]" | "^"
    [75] "k" | "l" | "m" | "n" | "o" | "p" | "q" | "r" | "s" | "t" | "u" | "v" | "w"
    [100] "„" | "..." | "+" | "÷" | "€" | "‰" | "ℒ" | "◁" | "ℹ" | "Ƒ" | "℔" | "℥"
    [125] "₰" | "℥" | "℥" | " " | "Ÿ" | "Ÿ" | "J" | "a" | "I" | "I" | "S" | "E" | "©"
    [150] "q" | "·" | "ë" | "№" | "e" | "»" | "j" | "S" | "s" | "i" | "A" | "B" | "B"
    [175] "П" | "P" | "C" | "T" | "y" | "Ф" | "X" | "Ц" | "Ч" | "Ш" | "Щ" | "Ъ" | "Ы"
    [200] "и" | "й" | "к" | "л" | "м" | "н" | "о" | "п" | "р" | "с" | "т" | "у" | "ф"
    */
}
```

See also

[StringToCharArray](#), [ShortToString](#), [StringGetCharacter](#)

CharArrayToString

It copies and converts part of array of uchar type into a returned string.

```
string CharArrayToString(
    uchar array[],           // array
    int start=0,             // starting position in the array
    int count=-1             // number of symbols
    uint codepage=CP_ACP     // code page
);
```

Parameters

array[]

[in] Array of uchar type.

start=0

[in] Position from which copying starts. by default 0 is used.

count=-1

[in] Number of array elements for copying. Defines the length of a resulting string. Default value is -1, which means copying up to the array end, or till terminal 0.

codepage=CP_ACP

[in] The value of the code page. There is a number of built-in constants for the most used [code pages](#).

Return Value

String.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- create an array with symbol codes
    uchar array[] = { 84, 104, 105, 115, 32, 105, 115, 32, 97, 32,
                     116, 101, 115, 116, 32, 111, 102, 32, 116, 104,
                     101, 32, 67, 104, 97, 114, 65, 114, 114, 97,
                     121, 84, 111, 83, 116, 114, 105, 110, 103, 40,
                     41, 32, 102, 117, 110, 99, 116, 105, 111, 110
                     };
    //--- print an array of codes converted into a string in the journal
    Print(CharArrayToString(array));

    //--- create an array with symbol codes and terminal zero
    uchar array_z[] = { 84, 104, 105, 115, 32, 105, 115, 32, 97, 32,
```

```
        116, 101, 115, 116, 0, 32, 111, 102, 32, 116,  
        104, 101, 32, 67, 104, 97, 114, 65, 114, 114,  
        97, 121, 84, 111, 83, 116, 114, 105, 110, 103,  
        40, 41, 32, 102, 117, 110, 99, 116, 105, 111, 110  
    };  
  
    //--- print the second array of codes with terminal zero in the journal  
    PrintFormat("%s ...", CharArrayToString(array_z));  
  
    /*  
    result:  
    This is a test of the CharArrayToString() function  
    This is a test ...  
    */  
}
```

See also

[StringToCharArray](#), [ShortArrayToString](#), [Use of a Codepage](#)

CharArrayToStruct

Copy uchar type array to [POD structure](#).

```
bool CharArrayToStruct(
    void&          struct_object,    // structure
    const uchar&   char_array[],    // array
    uint           start_pos=0       // starting position in the array
);
```

Parameters

struct_object

[in] Reference to any type of [POD structure](#) (containing only simple data types).

char_array[]

[in] [uchar](#) type array.

start_pos=0

[in] Position in the array, data copying starts from.

Return Value

Returns true if successful, otherwise false.

Example:

```
#define DATA_TOTAL 4

MqlRates ExtDataRates[DATA_TOTAL];
uchar     ExtCharArray[];

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- copy the data of the last four bars into the uchar array
    ResetLastError();
    for(int i=0; i<DATA_TOTAL; i++)
    {
        if(!CopyRatesToCharArray(i, ExtCharArray))
            return;
    }

    //--- copy all available data into the MqlRates structure array in a loop by the amount
    for(int i=0; i<DATA_TOTAL; i++)
    {
        ResetLastError();
        if(!CharArrayToStruct(ExtDataRates[i], ExtCharArray, sizeof(MqlRates)*i))
```

```

    {
        Print("CharArrayToStruct() failed. Error code: ", GetLastError());
        return;
    }

    //--- upon successful copying of data from the uchar array to the MqlRates struct
    //--- print the data, copied into the structure, to the journal
    MqlRatesPrint(ExtDataRates[i]);
}

/*
result:

        rates.spread,
        rates.real_volume);
    //--- print the header and the output string in the journal

```

```
Print("MqlRates data:\n", text, "\n");  
}
```

See also

[StringToCharArray](#), [ShortArrayToString](#), [StructToCharArray](#), [Use of a Codepage](#), [FileReadStruct](#),
[Unions \(union\)](#), [MathSwap](#)

StructToCharArray

Copy [POD structure](#) to uchar type array.

```
bool StructToCharArray(
    const void& struct_object,    // structure
    uchar&      char_array[],    // array
    uint        start_pos=0      // starting position in the array
);
```

Parameters

struct_object

[in] Reference to any type of [POD structure](#) (containing only simple data types).

char_array[]

[in] [uchar](#) type array.

start_pos=0

[in] Position in the array, starting from which the copied data are added.

Return Value

Returns true if successful, otherwise false.

Note

When copying, the dynamic array automatically expands ([ArrayResize](#)) if there is not enough space. If the array cannot be expanded up to the required value, the function returns an error.

Example:

```
uchar      ExtCharArray[];
MqlRates ExtRates[1];

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- copy the data of one current bar into the MqlRates structure
    if(CopyRates(Symbol(), PERIOD_CURRENT, 0, 1, ExtRates)!=1)
    {
        Print("CopyRates() failed. Error code: ", GetLastError());
        return;
    }

    //--- print the data received in the MqlRates structure in the journal
    Print("Data in the structure immediately after receiving it:");
    MqlRatesPrint(ExtRates[0]);
```

```

//--- copy the structure to the uchar type array
ResetLastError();
if(!StructToCharArray(ExtRates[0], ExtCharArray))
{
    Print("StructToCharArray() failed. Error code: ", GetLastError());
    return;
}

//--- clear the structure
ZeroMemory(ExtRates[0]);
//--- print the data in the structure after clearing
Print("\nData in the structure after ZeroMemory():" );
MqlRatesPrint(ExtRates[0]);

//--- now copy the data from the uchar array to the MqlRates structure
if(!CharArrayToStruct(ExtRates[0], ExtCharArray))
{
    Print("CharArrayToStruct() failed. Error code: ", GetLastError());
    return;
}
//--- print the data in the MqlRates structure after copying it from the uchar array
Print("\nData in the MqlRates structure after copying it from a uchar array:" );
MqlRatesPrint(ExtRates[0]);

/*
result:

ColorToARGB

The function converts [color](#) type into [uint](#) type to get ARGB representation of the color. ARGB color format is used to generate a [graphical resource](#), [text display](#), as well as for CCanvas standard library class.

```
uint ColorToARGB (
    color clr,           // converted color in color format
    uchar alpha=255     // alpha channel managing color transparency
);
```

Parameters

clr

[in] Color value in color type variable.

alpha

[in] The value of the alpha channel used to receive the color in [ARGB](#) format. The value may be set from 0 (a color of a foreground pixel does not change the display of an underlying one) up to 255 (a color of an underlying pixel is completely replaced by the foreground pixel's one). Color transparency in percentage terms is calculated as $(1 - \alpha/255) \times 100\%$. In other words, the lesser value of the alpha channel leads to more transparent color.

Return Value

Presenting the color in ARGB format where Alfa, Red, Green, Blue (alpha channel, red, green, blue) values are set in series in four uint type bytes.

Note

RGB is a basic and commonly used format for pixel color description on a screen in computer graphics. Names of basic colors are used to set red, green and blue color components. Each component is described by one byte specifying the color saturation in the range of 0 to 255 (0x00 to 0xFF in hexadecimal format). Since the white color contains all colors, it is described as 0xFFFFFF, that is, each one of three components is presented by the maximum value of 0xFF.

However, some tasks require to specify the color transparency to describe the look of an image in case it is covered by the color with some degree of transparency. The concept of alpha channel is introduced for such cases. It is implemented as an additional component of RGB format. ARGB format structure is shown below.

8								8								8								8							
Alpha								Red								Green								Blue							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ARGB values are typically expressed using hexadecimal format with each pair of digits representing the values of Alpha, Red, Green and Blue channels, respectively. For example, 80FFFF00 color represents 50.2% opaque yellow. Initially, 0x80 sets 50.2% alpha value, as it is 50.2% of 0xFF value. Then, the first FF pair defines the highest value of the red component; the next FF pair is like the previous but for the green component; the final 00 pair represents the lowest value the blue component can have (absence of blue). Combination of green and red colors yields yellow one. If the

alpha channel is not used, the entry can be reduced down to 6 RRGGBB digits, this is why the alpha channel values are stored in the top bits of uint integer type.

Depending on the context, hexadecimal digits can be written with '0x' or '#' prefix, for example, 80FFFF00, 0x80FFFF00 or #80FFFF00.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- set transparency
uchar alpha=0x55; // 0x55 means 55/255=21.6 % of transparency
//--- derive conversion to ARGB for clrBlue color
PrintFormat("0x%.8X - clrBlue",clrBlue);
PrintFormat("0x%.8X - clrBlue ARGB with alpha=0x55 (transparency 21.6%)",ColorToARGB(clrBlue,alpha));
//--- derive conversion to ARGB for clrGreen color
PrintFormat("0x%.8X - clrGreen",clrGreen);
PrintFormat("0x%.8X - clrGreen ARGB with alpha=0x55 (transparency 21.6%)",ColorToARGB(clrGreen,alpha));
//--- derive conversion to ARGB for clrRed color
PrintFormat("0x%.8X - clrRed",clrRed);
PrintFormat("0x%.8X - clrRed ARGB with alpha=0x55 (transparency 21.6%)",ColorToARGB(clrRed,alpha));
}
```

ColorToString

It converts color value into string of "R,G,B" form.

```
string ColorToString(  
    color  color_value,      // color value  
    bool   color_name       // show color name or not  
);
```

Parameters

color_value

[in] Color value in color type variable.

color_name

[in] Return color name if it is identical to one of predefined [color constants](#).

Return Value

String presentation of color as "R,G,B", where R, G and B are decimal constants from 0 to 255 converted into a string. If the color_name=true parameter is set, it will try to convert color value into color name.

Example:

```
string clr=ColorToString(C'0,255,0'); // green color  
Print(clr);  
  
clr=ColorToString(C'0,255,0',true);   // get color constant  
Print(clr);
```

See also

[StringToColor](#), [ColorToARGB](#)

DoubleToString

Converting numeric value into text string.

```
string DoubleToString(  
    double value,      // number  
    int digits=8       // number of digits after decimal point  
);
```

Parameters

value

[in] Value with a floating point.

digits

[in] Accuracy format. If the *digits* value is in the range between 0 and 16, a string presentation of a number with the specified number of digits after the point will be obtained. If the *digits* value is in the range between -1 and -16, a string representation of a number in the scientific format with the specified number of digits after the decimal point will be obtained. In all other cases the string value will contain 8 digits after the decimal point.

Return Value

String containing a symbol representation of a number with the specified accuracy.

Example:

```
Print("DoubleToString(120.0 + M_PI) : ",DoubleToString(120.0+M_PI));  
Print("DoubleToString(120.0 + M_PI,16) : ",DoubleToString(120.0+M_PI,16));  
Print("DoubleToString(120.0 + M_PI,-16) : ",DoubleToString(120.0+M_PI,-16));  
Print("DoubleToString(120.0 + M_PI,-1) : ",DoubleToString(120.0+M_PI,-1));  
Print("DoubleToString(120.0 + M_PI,-20) : ",DoubleToString(120.0+M_PI,-20));
```

[NormalizeDouble](#), [StringToDouble](#)

EnumToString

Converting an enumeration value of any type to a text form.

```
string EnumToString(  
    any_enum value    // any type enumeration value  
);
```

Parameters

value

[in] Any type enumeration value.

Return Value

A string with a text representation of the enumeration. To get the error message call the [GetLastError\(\)](#) function.

Note

The function can set the following error values in the [_LastError](#) variable:

- ERR_INTERNAL_ERROR - error of the execution environment
- ERR_NOT_ENOUGH_MEMORY - not enough memory to complete the operation
- ERR_INVALID_PARAMETER - can't allow the name of the enumeration value

Example:

```
enum interval // enumeration of named constants  
{  
    month=1,      // one-month interval  
    two_months,  // two months  
    quarter,     // three months - a quarter  
    halfyear=6,  // half a year  
    year=12,     // a year - 12 months  
};  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- set the time interval equal to one month  
    interval period=month;  
    Print(EnumToString(period)+"="+IntegerToString(period));  
  
    //--- set the time interval equal to a quarter (three months)  
    period=quarter;  
    Print(EnumToString(period)+"="+IntegerToString(period));  
  
    //--- set the time interval equal to one year (12 months)  
    period=year;
```

```
Print(EnumToString(period)+"="+IntegerToString(period));

//--- check how the order type is shown
ENUM_ORDER_TYPE type=ORDER_TYPE_BUY;
Print(EnumToString(type)+"="+IntegerToString(type));

//--- check how incorrect values are shown
type=WRONG_VALUE;
Print(EnumToString(type)+"="+IntegerToString(type));

// Result:
// month=1
// quarter=3
// year=12
// ORDER_TYPE_BUY=0
// ENUM_ORDER_TYPE::-1=-1
}
```

[Enumerations](#), [Input variables](#)

IntegerToString

This function converts value of integer type into a string of a specified length and returns the obtained string.

```
string IntegerToString(
    long    number,           // number
    int     str_len=0,       // length of result string
    ushort  fill_symbol=' ', // filler
);
```

Parameters

number

[in] Number for conversion.

str_len=0

[in] String length. If the resulting string length is larger than the specified one, the string is not cut off. If it is smaller, filler symbols will be added to the left.

fill_symbol=' '

[in] Filler symbol. By default it is a space.

Return Value

String.

Example:

```
#define DATA_TOTAL 1001

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- display rows with the index multiple of 100 in the loop by DATA_TOTAL
    //--- the string displays the index value in the four-character format
    //--- if the string length is less than 4 characters, then the value of the loop index
    //--- in the string is preceded by leading zeros
    for(int i=0; i<DATA_TOTAL; i++)
    {
        if(i%100==0)
            Print("Converted index value: ",IntegerToString(i,4,'0'));
    }
    /*
    result:
    Converted index value: 0000
    Converted index value: 0100
    Converted index value: 0200
    */
}
```

```
Converted index value: 0300
Converted index value: 0400
Converted index value: 0500
Converted index value: 0600
Converted index value: 0700
Converted index value: 0800
Converted index value: 0900
Converted index value: 1000
*/
}
```

See also[StringToInteger](#)

ShortToString

It converts the symbol code (unicode) into one-symbol string and returns resulting string.

```
string ShortToString(
    ushort symbol_code    // symbol
);
```

Parameters

symbol_code

[in] Symbol code. Instead of a symbol code you can use literal string containing a symbol or a literal string with 2-byte hexadecimal code corresponding to the symbol from the Unicode table.

Return Value

String.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- print 18 characters in a loop, starting with the character with the Unicode number U+23E9
    for(int i=0; i<18; i++)
    {
        ushort code=0x23E9+(ushort)i;
        PrintFormat("Unicode number U+%hX: %s",code,ShortToString(code));
    }
    /*
    result:
    Unicode number U+23E9: ▶
    Unicode number U+23EA: ◀
    Unicode number U+23EB: ⬆
    Unicode number U+23EC: ⬇
    Unicode number U+23ED: ▶▶
    Unicode number U+23EE: ◀◀
    Unicode number U+23EF: ▶|
    Unicode number U+23F0: ☒
    Unicode number U+23F1: ⌚
    Unicode number U+23F2: 🕒
    Unicode number U+23F3: ⌚
    Unicode number U+23F4: □
    Unicode number U+23F5: □
    Unicode number U+23F6: □
    Unicode number U+23F7: □
    Unicode number U+23F8: ||
```

Unicode number U+23F9: 

Unicode number U+23FA: 

`*/`

`}`

[StringToCharArray](#), [CharToString](#), [StringGetCharacter](#)

ShortArrayToString

It copies part of array into a returned string.

```
string ShortArrayToString(
    ushort array[],      // array
    int start=0,         // starting position in the array
    int count=-1         // number of symbols
);
```

Parameters

array[]

[in] Array of ushort type (analog of wchar_t type).

start=0

[in] Position, from which copying starts, Default - 0.

count=-1

[in] Number of array elements to copy. Defines the length of a resulting string. Default value is - 1, which means copying up to the array end, or till terminal 0.

Return Value

String.

Example:

```
#define ROW_SIZE 16

ushort ExtShortArray[]={0x2190,0x2191,0x2192,0x2193,0x2194,0x2195,0x2196,0x2197,0x2198,
                        0x21A0,0x21A1,0x21A2,0x21A3,0x21A4,0x21A5,0x21A6,0x21A7,0x21A8,
                        0x21B0,0x21B1,0x21B2,0x21B3,0x21B4,0x21B5,0x21B6,0x21B7,0x21B8,
                        0x21C0,0x21C1,0x21C2,0x21C3,0x21C4,0x21C5,0x21C6,0x21C7,0x21C8,
                        0x21D0,0x21D1,0x21D2,0x21D3,0x21D4,0x21D5,0x21D6,0x21D7,0x21D8,
                        0x21E0,0x21E1,0x21E2,0x21E3,0x21E4,0x21E5,0x21E6,0x21E7,0x21E8,
                        0x21F0,0x21F1,0x21F2,0x21F3,0x21F4,0x21F5,0x21F6,0x21F7,0x21F8};

//+-----+
//| Script program start function |
//+-----+

void OnStart()
{
    //--- calculate the number of strings in the symbol table of 7x16
    int total=(int)ExtShortArray.Size()/ROW_SIZE;
    //--- in a loop by the table rows, display 7 sets of arrows, 16 pieces in each row in
    for(int i=0; i<total; i++)
    {
        int row=i*ROW_SIZE;
        PrintFormat("Arrow set %u: %s",i+1,ShortArrayToString(ExtShortArray,row,ROW_SIZE));
    }
}
```

```

    }
    /*
    result:

TimeToString

Converting a value containing time in seconds elapsed since 01.01.1970 into a string of "yyyy.mm.dd hh:mi" format.

```
string TimeToString(
    datetime value,                // number
    int mode=TIME_DATE|TIME_MINUTES // output format
);
```

Parameters

value

[in] Time in seconds from 00:00 1970/01/01.

mode=TIME_DATE|TIME_MINUTES

[in] Additional data input mode. Can be one or combined flag:

TIME_DATE gets result as "yyyy.mm.dd",

TIME_MINUTES gets result as "hh:mi",

TIME_SECONDS gets results as "hh:mi:ss".

Return Value

String.

Example:

```
datetime ExtBarTimeOpen;

//+-----+
//| Custom indicator initialization function |
//+-----+
int OnInit()
{
    //--- set the timer to one second
    EventSetTimer(1);
    //---
    return(INIT_SUCCEEDED);
}

//+-----+
//| Custom indicator deinitialization function |
//+-----+
void OnDeinit(const int reason)
{
    Comment("");
}

//+-----+
//| Custom indicator iteration function |
//+-----+
int OnCalculate(const int rates_total,
```

```

        const int prev_calculated,
        const datetime &time[],
        const double &open[],
        const double &high[],
        const double &low[],
        const double &close[],
        const long &tick_volume[],
        const long &volume[],
        const int &spread[])

    {
//--- get the current bar opening time
        ExtBarTimeOpen=time[rates_total-1];
//--- return value of prev_calculated for next call
        return(rates_total);
    }
//+-----+
//| Timer function                                     |
//+-----+
void OnTimer()
{
//--- set the previous bar opening time
    static datetime bar_open_time=ExtBarTimeOpen;
//--- count the number of seconds passed since the bar opened
    static int seconds=int(TimeCurrent()-ExtBarTimeOpen);
//--- if the previous opening time is not equal to the current one, then this is a new bar
//--- write the new opening time as the previous one and set the seconds to zero
    if(bar_open_time!=ExtBarTimeOpen)
    {
        bar_open_time=ExtBarTimeOpen;
        seconds=0;
    }
//--- increase and adjust the number of seconds passed since the bar opened
    seconds++;
    if(seconds>PeriodSeconds(PERIOD_CURRENT))
        seconds=0;
//--- bar opening time as yyyy.mm.dd hh:mi
    string bar_time_open=TimeToString(ExtBarTimeOpen);
//--- current time as yyyy.mm.dd hh:mi:ss
    string time_current=TimeToString(TimeCurrent(),TIME_DATE|TIME_MINUTES|TIME_SECONDS);
//--- number of seconds left until a new bar opens
    int sec_left=PeriodSeconds(PERIOD_CURRENT)-seconds;
//--- amount of time remaining until the current bar closes as hh:mm:ss
    string time_left=TimeToString(sec_left,TIME_MINUTES|TIME_SECONDS);
//--- create the output string
    string txt=StringFormat("Opening time of the current bar: %s\n"+
        "Time Current: %s\n"+
        "Seconds have passed since the bar opened: %d\n"+
        "Approximately seconds left before bar closes: %d\n"+
        "Time remaining until bar closes: %s",bar_time_open,time_c

```

```
//--- display the bar open time and the current time,  
//--- the number of seconds passed since the current bar opened and remaining until it closes  
//--- the time remaining until the current bar closes in the comment  
Comment(txt);

NormalizeDouble

Rounding floating point number to a specified accuracy.

```
double NormalizeDouble(
    double value,      // normalized number
    int     digits     // number of digits after decimal point
);
```

Parameters

value

[in] Value with a floating point.

digits

[in] Accuracy format, number of digits after point (0-8).

Return Value

Value of double type with preset accuracy.

Note

Calculated values of StopLoss, TakeProfit, and values of open prices for pending orders must be normalized with the accuracy, the value of which can be obtained by [Digits\(\)](#).

Please note that when output to Journal using the Print() function, a normalized number may contain a greater number of decimal places than you expect. For example, for:

```
double a=76.671;           // A normalized number with three decimal places
Print("Print(76.671)=",a); // Output as is
Print("DoubleToString(a,8)=",DoubleToString(a,8)); // Output with a preset accuracy
```

you will have the following in the terminal:

```
DoubleToString(a,8)=76.67100000
```

```
Print(76.671)=76.671000000000001
```

Example:

```
double pi=M_PI;
Print("pi = ",DoubleToString(pi,16));

double pi_3=NormalizeDouble(M_PI,3);
Print("NormalizeDouble(pi,3) = ",DoubleToString(pi_3,16))
;
double pi_8=NormalizeDouble(M_PI,8);
Print("NormalizeDouble(pi,8) = ",DoubleToString(pi_8,16));

double pi_0=NormalizeDouble(M_PI,0);
Print("NormalizeDouble(pi,0) = ",DoubleToString(pi_0,16));
```

```
/*  
    Result:  
    pi= 3.1415926535897931  
    NormalizeDouble(pi,3)= 3.1419999999999999  
    NormalizeDouble(pi,8)= 3.1415926499999998  
    NormalizeDouble(pi,0)= 3.0000000000000000  
*/
```

[DoubleToString](#), [Real types \(double, float\)](#), [Typecasting](#)

StringToCharArray

Symbol-wise copies a string converted from Unicode to ANSI, to a selected place of array of uchar type. It returns the number of copied elements.

```
int StringToCharArray(
    string  text_string,      // source string
    uchar&  array[],          // array
    int     start=0,          // starting position in the array
    int     count=-1          // number of symbols
    uint    codepage=CP_ACP   // code page
);
```

Parameters

text_string

[in] String to copy.

array[]

[out] Array of uchar type.

start=0

[in] Position from which copying starts. Default - 0.

count=-1

[in] Number of array elements to copy. Defines length of a resulting string. Default value is -1, which means copying up to the array end, or till terminal 0. Terminal 0 will also be copied to the recipient array, in this case the size of a dynamic array can be increased if necessary to the size of the string. If the size of the dynamic array exceeds the length of the string, the size of the array will not be reduced.

codepage=CP_ACP

[in] The value of the code page. For the most-used [code pages](#) provide appropriate constants.

Return Value

Number of copied elements.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- string to convert
    string text = "This is a test of the StringToCharArray() function";

    //--- convert the input string into a uchar array in accordance with the set code page
    uchar char_array[];
```

```

int    copied=StringToCharArray(text, char_array);
PrintFormat("String length: %u\nNumber of characters copied (with terminal 0): %d\n",
            StringLen(text), copied, text);
//--- print the resulting array to the journal
ArrayPrint(char_array, 0, " | ");
/*
result:
String length: 50
Number of characters copied (with terminal 0): 51
Array of characters for the string 'This is a test of the StringToCharArray() funct
[ 0]  84 | 104 | 105 | 115 |  32 | 105 | 115 |  32 |  97 |  32 | 116 | 101 | 115 |
[17]  32 | 116 | 104 | 101 |  32 |  83 | 116 | 114 | 105 | 110 | 103 |  84 | 111 |
[34]  65 | 114 | 114 |  97 | 121 |  40 |  41 |  32 | 102 | 117 | 110 |  99 | 116 |
*/
}

```

StringToColor

Converting "R,G,B" string or string with color name into color type value.

```
color StringToColor(  
    string color_string    // string representation of color  
);
```

Parameters

color_string

[in] String representation of a color of "R,G,B" type or name of one of predefined [Web-colors](#).

Return Value

Color value.

Example:

```
color str_color=StringToColor("0,127,0");  
Print(str_color);  
Print((string)str_color);  
//--- change color a little  
str_color=StringToColor("0,128,0");  
Print(str_color);  
Print((string)str_color);
```

See also

[ColorToString](#), [ColorToARGB](#)

StringToDouble

The function converts string containing a symbol representation of number into number of double type.

```
double StringToDouble(  
    string value    // string  
);
```

Parameters

value

[in] String containing a symbol representation of a number.

Return Value

Value of double type.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- string to convert  
    string str = "12345.54321";  
    //--- convert the input string as a real number into a double type variable  
    double converted=StringToDouble(str);  
    //--- display the resulting number accurate to 8 decimal places in the journal  
    PrintFormat("The string '%s' is converted to the real number %.8f", str, converted)  
    /*  
    result:  
    The string '12345.54321' is converted to the real number 12345.54321000  
    */  
}
```

See also

[NormalizeDouble](#), [Real types \(double, float\)](#), [Typecasting](#)

StringToInteger

The function converts string containing a symbol representation of number into number of long (integer) type.

```
long StringToInteger(  
    string value    // string  
);
```

Parameters

value

[in] String containing a number.

Return Value

Value of long type.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- string to convert  
    string str = "12345.54321";  
    //--- convert the input string as a number into a long type variable  
    long converted=StringToInteger(str);  
    //--- display the obtained number in the journal with the fractional part cut off  
    PrintFormat("The string '%s' is converted to the integer number %I64d", str, converted);  
    /*  
    result:  
    The string '12345.54321' is converted to the integer number 12345  
    */  
}
```

See also

[IntegerToString](#), [Real types \(double, float\)](#), [Typecasting](#)

StringToShortArray

The function `symbol-wise` copies a string into a specified place of an array of `ushort` type. It returns the number of copied elements.

```
int StringToShortArray(  
    string  text_string,      // source string  
    ushort& array[],         // array  
    int     start=0,         // starting position in the array  
    int     count=-1         // number of symbols  
);
```

Parameters

```
text_string
```

[in] String to copy

array[]

[out] Array of ushort type (analog of wchar_t type).

```
start=0
```

[in] Position, from which copying starts. Default - 0.

```
count=-1
```

[in] Number of array elements to copy. Defines length of a resulting string. Default value is -1, which means copying up to the array end, or till terminal 0. Terminal 0 will also be copied to the recipient array, in this case the size of a dynamic array can be increased if necessary to the size of the string. If the size of the dynamic array exceeds the length of the string, the size of the array will not be reduced.

Return Value

Number of copied elements.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
  
void OnStart()  
{  
  
    //--- string with chars to convert  
    string text = "Chars: ♥♫☎🌀⚡⚙️✉️☆☪️♣️♦️♠️ ";  
    ushort short_array[];  
  
    //--- find the position of the ":" character in the input string and extract the substr  
    int pos=StringFind(text, ":");  
    string str=(pos<0 ? text : StringSubstr(text, pos+1));  
  
    //--- remove spaces, carriage movement and tabulation characters from the left and right  
    StringTrimLeft(str);  
    StringTrimRight(str);

[ShortArrayToString](#), [StringToCharArray](#), [Use of a Codepage](#)

StringToTime

Transforms the string containing time and/or date in the "yyyy.mm.dd [hh:mi]" format into the datetime type number.

```
datetime StringToTime(
    const string time_string // date string
);
```

Parameters

time_string

[in] String in one of the specified formats:

- "yyyy.mm.dd [hh:mi]"
- "yyyy.mm.dd [hh:mi:ss]"
- "yyyymmdd [hh:mi:ss]"
- "yyyymmdd [hhmiss]"
- "yyyy/mm/dd [hh:mi:ss]"
- "yyyy-mm-dd [hh:mi:ss]"

Return Value

[datetime](#) type value containing the number of seconds elapsed since 01.01.1970.

Note

Any sequence of space and tabulation characters between date and time is considered to be a single space to avoid additional processing of the *time_string* before calling StringToTime().

Example:

```
//--- input parameters
input group    "The date can be entered in any of the formats:"
input group    "yyyy.mm.dd [hh:mi], yyyy.mm.dd [hh:mi:ss]"
input group    "yyyymmdd [hh:mi:ss], yyyymmdd [hhmiss]"
input group    "yyyy/mm/dd [hh:mi:ss], yyyy-mm-dd [hh:mi:ss]"
input string   InpDateStr;    // Please enter the date here as a string

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- convert the time entered in the inputs as a string into a datetime value
    datetime time=StringToTime(InpDateStr);
    //--- display the entered string and the obtained time in the journal
    PrintFormat("Date entered as a string in the form '%s' is converted to datetime in
```

```

        InpDateStr, TimeToString(time, TIME_DATE|TIME_MINUTES|TIME_SECONDS));
//--- create a vertical line on the received date-time and shift the chart to this loc
    if(CreateVLine(time))
        ChartNavigateToTime(time);
    /*
    result:
    Date entered as a string in the form '' is converted to datetime in the form '1970.
    Date entered as a string in the form '2024' is converted to datetime in the form '2

StringFormat

The function formats obtained parameters and returns a string.

```
string StringFormat(  
    string  format,      // string with format description  
    ...     ...         // parameters  
);
```

Parameters

format

[in] String containing method of formatting. Formatting rules are the same as for the [PrintFormat](#) function.

...

[in] Parameters, separated by a comma.

Return Value

String.

Example:

```

void OnStart()
{
//--- string variables
    string output_string;
    string temp_string;
    string format_string;
//--- prepare the specification header
    temp_string=StringFormat("Contract specification for %s:\n",_Symbol);

Mathematical Functions

A set of mathematical and trigonometric functions.

Math functions were originally designed to perform relevant operations on scalar values. From this build on, most of the functions can be applied to [matrices and vectors](#). These include MathAbs, MathArccos, MathArcsin, MathArctan, MathCeil, MathCos, MathExp, MathFloor, MathLog, MathLog10, MathMod, MathPow, MathRound, MathSin, MathSqrt, MathTan, MathExp1, MathLog1p, MathArccosh, MathArcsinh, MathArctanh, MathCosh, MathSinh, and MathTanh. Such operations imply element-wise handling of matrices or vectors. Example:

```
//---
matrix a= {{1, 4}, {9, 16}};
Print("matrix a=\n",a);
a=MathSqrt(a);
Print("MatrSqrt(a)=\n",a);
/*
matrix a=
[[1,4]
 [9,16]]
MatrSqrt(a)=
[[1,2]
 [3,4]]
*/
```

For [MathMod](#) and [MathPow](#), the second element can be either a scalar or a matrix/vector of the appropriate size.

Function	Action
MathAbs	Returns absolute value (modulus) of the specified numeric value
MathArccos	Returns the arc cosine of x in radians
MathArcsin	Returns the arc sine of x in radians
MathArctan	Returns the arc tangent of x in radians
MathArctan2	Return the angle (in radians) whose tangent is the quotient of two specified numbers
MathClassify	Returns the type of a real number
MathCeil	Returns integer numeric value closest from above
MathCos	Returns the cosine of a number
MathExp	Returns exponent of a number
MathFloor	Returns integer numeric value closest from below
MathLog	Returns natural logarithm
MathLog10	Returns the logarithm of a number by base 10

Function	Action
<u>MathMax</u>	Returns the maximal value of the two numeric values
<u>MathMin</u>	Returns the minimal value of the two numeric values
<u>MathMod</u>	Returns the real remainder after the division of two numbers
<u>MathPow</u>	Raises the base to the specified power
<u>MathRand</u>	Returns a pseudorandom value within the range of 0 to 32767
<u>MathRound</u>	Rounds of a value to the nearest integer
<u>MathSin</u>	Returns the sine of a number
<u>MathSqrt</u>	Returns a square root
<u>MathSrand</u>	Sets the starting point for generating a series of pseudorandom integers
<u>MathTan</u>	Returns the tangent of a number
<u>MathIsValidNumber</u>	Checks the correctness of a real number
<u>MathExpM1</u>	Returns the value of the expression $\text{MathExp}(x)-1$
<u>MathLog1p</u>	Returns the value of the expression $\text{MathLog}(1+x)$
<u>MathArccosh</u>	Returns the hyperbolic arccosine
<u>MathArcsinh</u>	Returns the hyperbolic arcsine
<u>MathArctanh</u>	Returns the hyperbolic arctangent
<u>MathCosh</u>	Returns the hyperbolic cosine
<u>MathSinh</u>	Returns the hyperbolic sine
<u>MathTanh</u>	Returns the hyperbolic tangent
<u>MathSwap</u>	Change the order of bytes in the <u>ushort</u> / <u>uint</u> / <u>ushort</u> types value

MathAbs

The function returns the absolute value (modulus) of the specified numeric value.

```
double MathAbs(  
    double value    // numeric value  
);
```

Parameters

value

[in] Numeric value.

Return Value

Value of double type more than or equal to zero.

Note

Instead the MathAbs() function you can use [fabs\(\)](#).

Example:

```
//--- input parameters  
input int      InpValue = -10;    // Enter any value here  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the absolute value of the number entered in the inputs  
    uint abs_value=MathAbs(InpValue);  
    //--- print the values in the journal  
    PrintFormat("The entered value %d received the value %u after using the MathAbs() f  
}
```

MathArccos

The function returns the arccosine of x within the range 0 to π in radians.

```
double MathArccos(  
    double val    // -1<val<1  
);
```

Parameters

val

[in] The val value between -1 and 1, the arc cosine of which is to be calculated.

Return Value

Arc cosine of a number in radians. If val is less than -1 or more than 1, the function returns NaN (indeterminate value).

Note

Instead of the MathArccos() function you can use [acos\(\)](#).

Example:

```
#define GRAPH_WIDTH 750  
#define GRAPH_HEIGHT 350  
  
#include <Graphics\Graphic.mqh>  
  
CGraphic ExtGraph;  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    vector delta=vector::Full(101,2*M_PI/1000);  
    delta[0]=-1;  
    //--- get 101 values from -1 to 2 pi with delta step  
    vector X=delta.CumSum();  
    //--- calculate the arc cosine value for each value of the X vector  
    vector Y=MathArccos(X);  
  
    //--- transfer the calculated values from vectors to arrays  
    double x_array[],y_array[];  
    X.Swap(x_array);  
    Y.Swap(y_array);  
  
    //--- draw a graph of the calculated vector values  
    CurvePlot(x_array,y_array,clrDodgerBlue);
```

```

//--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE) != 0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN) != 0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);
    ExtGraph.CurveAdd(x_array, y_array, ColorToARGB(colour), CURVE_LINES);
    ExtGraph.IndentUp(30);
    ExtGraph.CurvePlotAll();
    string text1="Press ESC to delete the graph and stop the script, or";
    string text2="Press PgDn to create a screen, delete the graph and stop the script";
    ExtGraph.TextAdd(54, 9, text1, ColorToARGB clrBlack));
    ExtGraph.TextAdd(54,21, text2, ColorToARGB clrBlack));
    ExtGraph.Update();
}

//+-----+
//| Take a screenshot and saves the image to a file |
//+-----+
bool MakeAndSaveScreenshot(const string file_name)
{
    string file_names[];
    ResetLastError();

```

```

int selected=FileSelectDialog("Save Picture", NULL, "All files (*.*)|*.*", FSD_WRI
if(selected<1)
{
    if(selected<0)
        PrintFormat("%s: FileSelectDialog() function returned error %d", __FUNCTION__
    return false;
}

bool res=false;
if(CharSetInteger(0,CHART_SHOW,false))
    res=ChartScreenShot(0, file_names[0], GRAPH_WIDTH, GRAPH_HEIGHT);
CharSetInteger(0,CHART_SHOW,true);
return(res);
}

```

Result:**See also**

[Real types \(double, float\)](#), [Statistics](#), [Scientific Charts](#), [Client Terminal Properties](#)

MathArcsin

The function returns the arc sine of x within the range of $-\pi/2$ to $\pi/2$ radians.

```
double MathArcsin(
    double val      // -1<value<1
);
```

Parameters

val

[in] The val value between -1 and 1, the arc sine of which is to be calculated.

Return Value

Arc sine of the val number in radians within the range of $-\pi/2$ to $\pi/2$ radians. If val is less than -1 or more than 1, the function returns NaN (indeterminate value).

Note

Instead of the MathArcsin() function you can use [asin\(\)](#).

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+

void OnStart()
{
    vector delta=vector::Full(101,2*M_PI/1000);
    delta[0]=-1;
    //-- get 101 values from -1 to 2 pi with delta step
    vector X=delta.CumSum();
    //-- calculate the sine value for each value of the X vector
    vector Y=MathArcsin(X);

    //-- transfer the calculated values from vectors to arrays
    double x_array[],y_array[];
    X.Swap(x_array);
    Y.Swap(y_array);

    //-- draw a graph of the calculated vector values
    CurvePlot(x_array,y_array,clrDodgerBlue);
```

```

//--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE)!=0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN)!=0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);

MathArctan

The function returns the arc tangent of x. If x is equal to 0, the function returns 0.

```
double MathArctan(
    double value    // tangent
);
```

Parameters

value

[in] A number representing a tangent.

Return Value

MathArctan returns a value within the range of $-\pi/2$ to $\pi/2$ radians.

Note

Instead of the MathArctan() function you can use [atan\(\)](#).

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    vector delta=vector::Full(101,2*M_PI/100);
    delta[0]=0;
    //--- get 101 values from 0 to 2 pi with delta step
    vector X=delta.CumSum();
    //--- calculate the arc tangent value for each value of the X vector
    vector Y=MathArctan(X);

    //--- transfer the calculated values from vectors to arrays
    double x_array[],y_array[];
    X.Swap(x_array);
    Y.Swap(y_array);

    //--- draw a graph of the calculated vector values
    CurvePlot(x_array,y_array,clrDodgerBlue);

    //--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
```

```

while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE) != 0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN) != 0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);
    ExtGraph.CurveAdd(x_array, y_array, ColorToARGB(colour), CURVE_LINES);
    ExtGraph.IndentUp(30);
    ExtGraph.CurvePlotAll();
    string text1="Press ESC to delete the graph and stop the script, or";
    string text2="Press PgDn to create a screen, delete the graph and stop the script";
    ExtGraph.TextAdd(54, 9, text1, ColorToARGB clrBlack));
    ExtGraph.TextAdd(54,21, text2, ColorToARGB clrBlack));
    ExtGraph.Update();
}

//+-----+
//| Take a screenshot and save the image to a file |
//+-----+
bool MakeAndSaveScreenshot(const string file_name)
{
    string file_names[];
    ResetLastError();
    int selected=FileSelectDialog("Save Picture", NULL, "All files (*.*)|*.*", FSD_WRITE);

```

```

if(selected<1)
{
    if(selected<0)
        PrintFormat("%s: FileSelectDialog() function returned error %d", __FUNCTION__
        return false;
    }

    bool res=false;
    if(CharSetInteger(0,CHART_SHOW,false))
        res=ChartScreenShot(0, file_names[0], GRAPH_WIDTH, GRAPH_HEIGHT);

    return(res);
}

```

Result:**See also**

[Real types \(double, float\)](#), [Statistics](#), [Scientific Charts](#), [Client Terminal Properties](#)

MathArctan2

Return the angle (in radians) whose tangent is the quotient of two specified numbers.

```
double MathArctan2(
    double y      // The y coordinate of a point
    double x      // The x coordinate of a point
);
```

Parameters

y

[in] Y coordinate value.

x

[in] X coordinate value.

Return Value

MathArctan2 returns an angle, θ , within the range from $-\pi$ to π radians, so that $\text{MathTan}(\theta)=y/x$.

Please note as follows:

- For (x, y) in quadrant 1, $0 < \theta < \pi/2$
- For (x, y) in quadrant 2, $\pi/2 < \theta \leq \pi$
- For (x, y) in quadrant 3, $-\pi < \theta < -\pi/2$
- For (x, y) in quadrant 4, $-\pi/2 < \theta < 0$

For points on the boundaries of the quadrants, the return value is the following:

- If y is 0 and x is not negative, $\theta = 0$.
- If y is 0 and x is negative, $\theta = \pi$.
- If y is positive and x is 0, $\theta = \pi/2$.
- If y is negative and x is 0, $\theta = -\pi/2$.
- If y is 0 and x is 0, $\theta = 0$.

Note

Instead of the MathArctan2() function, you can use the [atan2\(\)](#) function.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
```

```

{
    vector delta=vector::Full(10,10);
    delta[0]=0;
    ///--- get 101 values from 0 to 2 pi with delta step
    vector X=delta.CumSum();
    ///--- calculate the arc tangent value for each value of the X vector
    vector Y=delta.CumSum();

    Print("vector delta = \n",delta);
    Print("vector X = \n",X);
    Print("vector Y = \n",Y);

    ///--- transfer the calculated values from vectors to arrays
    double x_array[];
    double y_array[];
    X.Swap(x_array);
    Y.Swap(y_array);

    double array[10];
    for(int i=0; i<10; i++)
    {
        array[i]=MathArctan2(y_array[i],x_array[i]);
    }

    ///--- draw a graph of the calculated vector values
    CurvePlot(x_array,y_array,clrDodgerBlue);

    ///--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
    while(!IsStopped())
    {
        if(StopKeyPressed())
            break;
        Sleep(16);
    }

    ///--- clean up
    ExtGraph.Destroy();
}

//+-----+
//| When pressing ESC, return 'true' |

MathClassify

Determines the type of a real number and returns a result as a value from the [ENUM_FP_CLASS](#) enumeration

```
ENUM_FP_CLASS MathClassify(  
    double value    // real number  
);
```

Parameters

value
[in] The real number to be checked

Return Value

A value from the ENUM_FP_CLASS enumeration

ENUM_FP_CLASS

ID	Description
FP_SUBNORMAL	A subnormal number which is closer to zero than the smallest representable normal number DBL_MIN (2.2250738585072014e-308)
FP_NORMAL	A normal number in the range between 2.2250738585072014e-308 and 1.7976931348623158e+308
FP_ZERO	A positive or a negative zero
FP_INFINITE	A number which cannot be represented by the appropriate type, positive or negative infinity
FP_NAN	Not a number.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- test NaN  
    double nan=double("nan");  
    PrintFormat("Test NaN: %G is %s, MathIsValidNumber(NaN)=%s",  
        nan,  
        EnumToString(MathClassify(nan)),  
        (string)MathIsValidNumber(nan));  
    //--- test infinity  
    double inf=double("inf");  
    PrintFormat("Test Inf: %G is %s, MathIsValidNumber(inf)=%s",
```

```

        inf,
        EnumToString(MathClassify(inf)),
        (string)MathIsValidNumber(inf));
//--- test normal value
double normal=1.2345e6;
PrintFormat("Test Normal: %G is %s, MathIsValidNumber(normal)=%s",
            normal,
            EnumToString(MathClassify(normal)),
            (string)MathIsValidNumber(normal));
//--- test subnormal value
double sub_normal=DBL_MIN/2.0;
PrintFormat("Test Subnormal: %G is %s, MathIsValidNumber(sub_normal)=%s",
            sub_normal,
            EnumToString(MathClassify(sub_normal)),
            (string)MathIsValidNumber(sub_normal));
//--- test zero value
double zero=0.0/(-1);
PrintFormat("Test Zero: %G is %s, MathIsValidNumber(zero)=%s",
            zero,
            EnumToString(MathClassify(zero)),
            (string)MathIsValidNumber(zero));
}
/*
Result:
    Test NaN: NaN is FP_NAN, MathIsValidNumber(NaN)=false
    Test Inf: INF is FP_INFINITE, MathIsValidNumber(inf)=false
    Test Normal: 1.2345E+06 is FP_NORMAL, MathIsValidNumber(normal)=true
    Test Subnormal: 1.11254E-308 is FP_SUBNORMAL, MathIsValidNumber(sub_normal)=true
    Test Zero: -0 is FP_ZERO, MathIsValidNumber(zero)=true
*/

MathCeil

The function returns integer numeric value closest from above.

```
double MathCeil(  
    double val      // number  
);
```

Parameters

val

[in] Numeric value.

Return Value

Numeric value representing the smallest integer that exceeds or equals to val.

Note

Instead of the MathCeil() function you can use [ceil\(\)](#).

Example:

```
#define VALUES_TOTAL 31  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- declare variables for conversion  
    double value=0;           // real number for MathCeil conversion  
    int    ceil_value=0;      // get the result here  
    //--- in a loop by the number of decimal increments of a real number  
    for(int i=0; i<VALUES_TOTAL; i++)  
    {  
        //--- increase the number value,  
        //--- get the nearest integer value from above  
        //--- and display control values in the journal  
        value+=0.1;  
        ceil_value=(int)MathCeil(NormalizeDouble(value,1));  
        PrintFormat("value: %.1f, ceil value: %d",value,ceil_value);  
        /*  
        result:  
        value: 0.1, ceil value: 1  
        value: 0.2, ceil value: 1  
        value: 0.3, ceil value: 1  
        value: 0.4, ceil value: 1  
        value: 0.5, ceil value: 1  
        value: 0.6, ceil value: 1  
        */  
    }  
}
```

```
value: 0.7, ceil value: 1
value: 0.8, ceil value: 1
value: 0.9, ceil value: 1
value: 1.0, ceil value: 1
value: 1.1, ceil value: 2
value: 1.2, ceil value: 2
value: 1.3, ceil value: 2
value: 1.4, ceil value: 2
value: 1.5, ceil value: 2
value: 1.6, ceil value: 2
value: 1.7, ceil value: 2
value: 1.8, ceil value: 2

value: 2.2, ceil value: 3
value: 2.3, ceil value: 3
value: 2.4, ceil value: 3
value: 2.5, ceil value: 3
value: 2.6, ceil value: 3
value: 2.7, ceil value: 3
value: 2.8, ceil value: 3
value: 2.9, ceil value: 3
value: 3.0, ceil value: 3
value: 3.1, ceil value: 4
*/
}
}
```

MathCos

The function returns the cosine of an angle.

```
double MathCos(  
    double value    // number  
);
```

Parameters

value

[in] Angle in radians.

Return Value

Value of double type within the range of -1 to 1.

Note

Instead of MathCos() you can use [cos\(\)](#).

Example:

```
#define GRAPH_WIDTH 750  
#define GRAPH_HEIGHT 350  
  
#include <Graphics\Graphic.mqh>  
  
CGraphic ExtGraph;  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    vector delta=vector::Full(101,2*M_PI/100);  
    delta[0]=0;  
    //--- get 101 values from 0 to 2 pi with delta step  
    vector X=delta.CumSum();  
    //--- calculate the cosine value for each value of the X vector  
    vector Y=MathCos(X);  
  
    //--- transfer the calculated values from vectors to arrays  
    double x_array[],y_array[];  
    X.Swap(x_array);  
    Y.Swap(y_array);  
  
    //--- draw a graph of the calculated vector values  
    CurvePlot(x_array,y_array,clrDodgerBlue);  
  
    //--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
```

```

while(!IsStopped())

MathExp

The function returns the value of e raised to the power of d.

```
double MathExp(  
    double value    // power for the number e  
);
```

Parameters

value

[in] A number specifying the power.

Return Value

A number of double type. In case of overflow the function returns INF (infinity), in case of underflow MathExp returns 0.

Note

Instead of MathExp() you can use [exp\(\)](#).

Example:

```
#define GRAPH_WIDTH 750  
#define GRAPH_HEIGHT 350  
  
#include <Graphics\Graphic.mqh>

MathFloor

The function returns integer numeric value closest from below.

```
double MathFloor(  
    double val    // number  
);
```

Parameters

val

[in] Numeric value.

Return Value

A numeric value representing the largest integer that is less than or equal to val.

Note

Instead of MathFloor() you can use [floor\(\)](#).

Example:

```
#define VALUES_TOTAL 31  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- declare variables for conversion  
    double value=0;           // real number for MathFloor conversion  
    int    floor_value=0;      // get the result here  
    //--- in a loop by the number of decimal increments of a real number  
    for(int i=0; i<VALUES_TOTAL; i++)  
    {  
        //--- increase the number value,  
        //--- get the nearest integer value from below  
        //--- and display control values in the journal  
        value+=0.1;  
        floor_value=(int)MathFloor(NormalizeDouble(value,1));  
        PrintFormat("value: %.1f, floor value: %d",value,floor_value);  
        /*  
        result:  
        value: 0.1, floor value: 0  
        value: 0.2, floor value: 0  
        value: 0.3, floor value: 0  
        value: 0.4, floor value: 0  
        value: 0.5, floor value: 0  
        value: 0.6, floor value: 0
```

```
value: 0.7, floor value: 0
value: 0.8, floor value: 0
value: 0.9, floor value: 0
value: 1.0, floor value: 1
value: 1.1, floor value: 1
value: 1.2, floor value: 1
value: 1.3, floor value: 1
value: 1.4, floor value: 1
value: 1.5, floor value: 1
value: 1.6, floor value: 1
value: 1.7, floor value: 1
value: 1.8, floor value: 1
value: 1.9, floor value: 1
value: 2.0, floor value: 2
value: 2.1, floor value: 2
value: 2.2, floor value: 2
value: 2.3, floor value: 2
value: 2.4, floor value: 2
value: 2.5, floor value: 2
value: 2.6, floor value: 2
value: 2.7, floor value: 2
value: 2.8, floor value: 2
value: 2.9, floor value: 2
value: 3.0, floor value: 3
value: 3.1, floor value: 3
*/
}
```

MathLog

The function returns a natural logarithm.

```
double MathLog(
    double val      // value to take the logarithm
);
```

Parameters

val

[in] Value logarithm of which is to be found.

Return Value

The natural logarithm of *val* in case of success. If *val* is negative, the function returns NaN (undetermined value). If *val* is equal to 0, the function returns INF (infinity).

Note

Instead of `MathLog()` you can use `log()`.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get 9 values from 0 to 8 with step 1
    vector X(9,VectorArange);
    Print("vector X = \n",X);
    //--- calculate the logarithm for each value of the X vector
    X=MathLog(X);
    Print("MathLog(X) = \n",X);

    //--- transfer the calculated values from the vector to the array
    double y_array[];
    X.Swap(y_array);

    //--- draw a graph of the calculated vector values
    CurvePlot(y_array,clrDodgerBlue);

    //--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
```

```

while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
/*
result:
vector X =
[0,1,2,3,4,5,6,7,8]
MathLog(X) =
[-inf,0,0.6931471805599453,1.09861228866811,1.386294361119891,1.6094379124341,1.791759469228055,1.945910149055313,2.079441541679836]
*/
}

//+-----+
//| Fill a vector with 'value' in 'step' increments |
//+-----+
template<typename T>
void VectorArange(vector<T> &vec,T value=0.0,T step=1.0)
{
    for(ulong i=0; i<vec.Size(); i++,value+=step)
        vec[i]=value;
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE)!=0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN)!=0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);
    ExtGraph.CurveAdd(x_array, y_array, ColorToARGB(colour), CURVE_LINES);
}

```

```

ExtGraph.IndentUp(30);
ExtGraph.CurvePlotAll();
string text1="Press ESC to delete the graph and stop the script, or";
string text2="Press PgDn to create a screen, delete the graph and stop the script";
ExtGraph.TextAdd(54, 9, text1, ColorToARGB(clrBlack));
ExtGraph.TextAdd(54,21, text2, ColorToARGB(clrBlack));
ExtGraph.Update();
}
//+-----+
//| Take a screenshot and save the image to a file |
//+-----+
bool MakeAndSaveScreenshot(const string file_name)
{
    string file_names[];
    ResetLastError();
    int selected=FileSelectDialog("Save Picture", NULL, "All files (*.*)|*.*", FSD_WRITE);
    if(selected<1)
    {
        if(selected<0)
            PrintFormat("%s: FileSelectDialog() function returned error %d", __FUNCTION__, GetLastError());
        return false;
    }

    bool res=false;
    if(CharSetInteger(0,CHART_SHOW,false))
        res=ChartScreenShot(0, file_names[0], GRAPH_WIDTH, GRAPH_HEIGHT);
    CharSetInteger(0,CHART_SHOW,true);
    return(res);
}

```

MathLog

Returns the logarithm of a number by base 10.

```
double MathLog10(
    double val      // number to take logarithm
);
```

Parameters

val

[in] Numeric value the common logarithm of which is to be calculated.

Return Value

The common logarithm in case of success. If *val* is negative, the function returns NaN (undetermined value). If *val* is equal to 0, the function returns INF (infinity).

Note

Instead of `MathLog10()` you can use `log10()`.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get 9 values from 0 to 8 with step 1
    vector X(9,VectorArange);
    Print("vector X = \n",X);
    //--- calculate the decimal logarithm for each value of the X vector
    X=MathLog10(X);
    Print("MathLog10(X) = \n",X);

    //--- transfer the calculated values from the vector to the array
    double y_array[];
    X.Swap(y_array);

    //--- draw a graph of the calculated vector values
    CurvePlot(y_array,clrDodgerBlue);

    //--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
```

```

while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
/*

MathMax

The function returns the maximal value of two values.

```
double MathMax(
    double value1,    // first value
    double value2     // second value
);
```

Parameters

value1

[in] First numeric value.

value2

[in] Second numeric value.

Return Value

The largest of the two values.

Note

Instead of `MathMax()` you can use `fmax()`. Functions `fmax()`, `fmin()`, `MathMax()`, `MathMin()` can work with integer types without typecasting them to the type of `double`.

If parameters of different types are passed into a function, the parameter of the smaller type is automatically cast to the larger type. The type of the return value corresponds to the larger type.

If data of the same type are passed, no casting is performed.

Example:

```
//--- input parameters
input int      InpPeriod = 10;           // Moving average calculation pe
input ENUM_MA_METHOD InpMethod = MODE_SMA; // Moving average calculation me
input ENUM_APPLIED_PRICE InpPrice = PRICE_CLOSE; // Moving average calculation p

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- if the moving average period is set to a value less than 1, then the default va
    int period=(InpPeriod<1 ? 10 : InpPeriod);
    //--- create the Moving Average indicator handle
    int handle=iMA(Symbol(),Period(),period,0,InpMethod,InpPrice);
    if(handle==INVALID_HANDLE)
    {
        Print("Failed to create the Moving Average indicator handle. Error ",GetLastError
        return;
    }
}
```

```

    }
//--- get the current Bid price
double bid=0;
ResetLastError();
if(!SymbolInfoDouble(Symbol(),SYMBOL_BID,bid))
{
    Print("Failed to get Bid price. Error ",GetLastError());
    return;
}
//--- get the moving average value on the current bar
double array[1];
int    copied=CopyBuffer(handle,0,0,1,array);
if(copied!=1)
{
    Print("Failed to get Moving Average data. Error ",GetLastError());
    return;
}
//--- get the highest price of the two (Bid price and Moving Average value) and display
double max_price=MathMax(bid,array[0]);
PrintFormat("Bid: %.2f, Moving Average: %.2f, highest price of the two: %.2f",_Digits,
PrintFormat("Bid price %s moving average", (bid>array[0] ? "higher" : bid<array[0] ? "lower" : "equal"));
}

```

MathMin

The function returns the minimal value of two values.

```
double MathMin(
    double value1,    // first value
    double value2     // second value
);
```

Parameters

value1

[in] First numeric value.

value2

[in] Second numeric value.

Return Value

The smallest of the two values.

Note

Instead of `MathMin()` you can use `fmin()`. Functions `fmax()`, `fmin()`, `MathMax()`, `MathMin()` can work with integer types without typecasting them to the type of double.

If parameters of different types are passed into a function, the parameter of the smaller type is automatically cast to the larger type. The type of the return value corresponds to the larger type.

If data of the same type are passed, no casting is performed.

Example:

```
//--- input parameters
input uint InpBars = 100000; // Desired number of bars

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the number of available bars on the server
    uint bars_total = Bars(Symbol(),Period());
    if(bars_total==0)
    {
        PrintFormat("Data for timeseries %s %s not yet generated in the terminal. Please
        return;
    }

    //--- get the minimum number of bars from two values - from those available on the server
    int bars = (int)MathMin(bars_total,InpBars);

    //--- if more bars are requested than are available on the server, report this in the
```

```
if(bars_total<InpBars)
    PrintFormat("Number of bars on the server (%u) is less than requested (%u)",bars
//--- display the number of bars available for work in the journal
Print("Bars available for work: ",bars);
}
```

MathMod

The function returns the real remainder of division of two numbers.

```
double MathMod(  
    double value,      // dividend value  
    double value2      // divisor value  
);
```

Parameters

value

[in] Dividend value.

value2

[in] Divisor value.

Return Value

The MathMod function calculates the real remainder f from expression val/y so that $val = i * y + f$, where i is an integer, f has the same sign as val , and the absolute value of f is less than the absolute value of y .

Note

Instead of MathMod() you can use [fmod\(\)](#).

Example:

```
#property script_show_inputs  
  
//--- input parameters  
input double   InpDividentValue = 10;   // Dividend value  
input double   InpDivisorValue  = 3;    // Divisor value  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the real remainder of the division of the numbers entered in the inputs  
    double res=MathMod(InpDividentValue,InpDivisorValue);  
    //--- print the result in the journal  
    PrintFormat("Real remainder when dividing %.2f by %.2f = %.2f",InpDividentValue,InpDivisorValue,res);  
}
```

MathPow

The function raises a base to a specified power.

```
double MathPow(
    double base,           // base
    double exponent        // exponent value
);
```

Parameters

base

[in] Base.

exponent

[in] Exponent value.

Return Value

Value of base raised to the specified power.

Note

Instead of MathPow() you can use [pow\(\)](#).

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#property script_show_inputs

#include <Graphics\Graphic.mqh>

//--- input parameters
input double InpExponentValue = 2; // exponent value

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get 11 values from 0 to 10 with step 1
    vector X(11, VectorArange);
    Print("vector X = \n", X);
    //--- calculate each value of the X vector raised to the InpExponentValue power
    X=MathPow(X, InpExponentValue);
    Print("MathPow(X, ", (string) InpExponentValue, ") = \n", X);
}
```

```

//--- transfer the calculated values from the vector to the array
double y_array[];
X.Swap(y_array);

//--- draw a graph of the calculated vector values
CurvePlot(y_array,clrDodgerBlue);

//--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
/*
result:
vector X =
[0,1,2,3,4,5,6,7,8,9,10]
MathPow(X,2.0) =
[0,1,4,9,16,25,36,49,64,81,100]
*/
}

//+-----+
//| Fill a vector with 'value' in 'step' increments |
//+-----+
template<typename T>
void VectorArange(vector<T> &vec,T value=0.0,T step=1.0)
{
    for(ulong i=0; i<vec.Size(); i++,value+=step)
        vec[i]=value;
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE)!=0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN)!=0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

```

```

    }
//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);
    ExtGraph.CurveAdd(x_array, y_array, ColorToARGB(colour), CURVE_LINES);
    ExtGraph.IndentUp(30);
    ExtGraph.CurvePlotAll();
    string text1="Press ESC to delete the graph and stop the script, or";
    string text2="Press PgDn to create a screen, delete the graph and stop the script";
    ExtGraph.TextAdd(54, 9, text1, ColorToARGB clrBlack));
    ExtGraph.TextAdd(54,21, text2, ColorToARGB clrBlack));
    ExtGraph.Update();
}
//+-----+
//| Take a screenshot and save the image to a file |
//+-----+
bool MakeAndSaveScreenshot(const string file_name)
{
    string file_names[];
    ResetLastError();
    int selected=FileSelectDialog("Save Picture", NULL, "All files (*.*)|*.*", FSD_WRITE);
    if(selected<1)
    {
        if(selected<0)
            PrintFormat("%s: FileSelectDialog() function returned error %d", __FUNCTION__, GetLastError());
        return false;
    }

    bool res=false;
    if(ChartSetInteger(0,CHART_SHOW,false))
        res=ChartScreenShot(0, file_names[0], GRAPH_WIDTH, GRAPH_HEIGHT);
    ChartSetInteger(0,CHART_SHOW,true);
    return(res);
}

```

Result:

[Real types \(double, float\)](#), [Statistics](#), [Scientific Charts](#), [Client Terminal Properties](#)

MathRand

Returns a pseudorandom integer within the range of 0 to 32767.

```
int MathRand();
```

Return Value

Integer value within the range of 0 to 32767.

Note

Before the first call of the function, it's necessary to call [MathSrand](#) to set the generator of pseudorandom numbers to the initial state.

Note

Instead of MathRand() you can use [rand\(\)](#).

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- set a new initial state to generate a series of pseudo-random integers at each
    MathSrand(GetTickCount());
    //--- in a loop, display 10 generated pseudo-random integers in the journal
    for(int i=0; i<10; i++)
    {
        int rand_value=MathRand();
        PrintFormat("Pseudorandom integer №%d: %u",i+1,rand_value);
    }
}
```

MathRound

The function returns a value rounded off to the nearest integer of the specified numeric value.

```
double MathRound(  
    double value    // value to be rounded  
);
```

Parameters

value

[in] Numeric value before rounding.

Return Value

Value rounded till to the nearest integer.

Note

Instead of MathRound() you can use [round\(\)](#).

Example:

```
#define VALUES_TOTAL 31  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- declare variables for conversion  
    double value=0;           // real number for MathRound conversion  
    int    round_value=0;     // get the result here  
    //--- in a loop by the number of decimal increments of a real number  
    for(int i=0; i<VALUES_TOTAL; i++)  
    {  
        //--- increase the real number value,  
        //--- get a numeric value rounded to the nearest integer  
        //--- and display control values in the journal  
        value+=0.1;  
        round_value=(int)MathRound(NormalizeDouble(value,1));  
        PrintFormat("value: %.1f, round value: %d",value,round_value);  
        /*  
        result:  
        value: 0.1, round value: 0  
        value: 0.2, round value: 0  
        value: 0.3, round value: 0  
        value: 0.4, round value: 0  
        value: 0.5, round value: 1  
        value: 0.6, round value: 1  
        */  
    }
```

```

```

MathSin

Returns the sine of a specified angle.

```
double MathSin(  
    double value    // argument in radians  
);
```

Parameters

value

[in] Angle in radians.

Return Value

Sine of an angle measured in radians. Returns value within the range of -1 to 1.

Note

Instead of MathSin() you can use [sin\(\)](#).

Example:

```
#define GRAPH_WIDTH 750  
#define GRAPH_HEIGHT 350  
  
#include <Graphics\Graphic.mqh>  
  
CGraphic ExtGraph;  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    vector delta=vector::Full(101,2*M_PI/100);  
    delta[0]=0;  
    //--- get 101 values from 0 to 2 pi with delta step  
    vector X=delta.CumSum();  
    //--- calculate the sine value for each value of the X vector  
    vector Y=MathSin(X);  
  
    //--- transfer the calculated values from vectors to arrays  
    double x_array[],y_array[];  
    X.Swap(x_array);  
    Y.Swap(y_array);  
  
    //--- draw a graph of the calculated vector values  
    CurvePlot(x_array,y_array,clrDodgerBlue);  
  
    //--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
```

```

while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'

MathSqrt

Returns the square root of a number.

```
double MathSqrt(  
    double value    // positive number  
);
```

Parameters

value

[in] Positive numeric value.

Return Value

Square root of value. If value is negative, MathSqrt returns NaN (indeterminate value).

Note

Instead of MathSqrt() you can use [sqrt\(\)](#).

Example:

```
#define GRAPH_WIDTH 750  
#define GRAPH_HEIGHT 350  
  
#include <Graphics\Graphic.mqh>  
  
CGraphic ExtGraph;  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()

MathSrand

Sets the starting point for generating a series of pseudorandom integers.

```
void MathSrand(
    int seed      // initializing number
);
```

Parameters

seed

[in] Starting number for the sequence of random numbers.

Return Value

No return value.

Note

The [MathRand\(\)](#) function is used for generating a sequence of pseudorandom numbers. Call of MathSrand() with a certain initializing number allows to always produces the same sequence of pseudorandom numbers.

To ensure receipt of non-recurring sequence, use the call of MathSrand(GetTickCount()), since the value of [GetTickCount\(\)](#) increases from the moment of the start of the operating system and is not repeated within 49 days, until the built-in counter of milliseconds overflows. Use of MathSrand(TimeCurrent()) is not suitable, because the [TimeCurrent\(\)](#) function returns the time of the last tick, which can be unchanged for a long time, for example at the weekend.

Initialization of the random number generator using MathSrand() for indicators and Expert Advisors is better performed in the OnInit() handler; it saves you from the following multiple restarts of the generator in OnTick() and OnCalculate().

Instead of the MathSrand() function you can use the [srand\(\)](#) function.

Example:

```
#property description "The indicator shows the central limit theorem, which states:"
#property description "The sum of a sufficiently large number of weakly dependent random numbers,
#property description "having approximately equal magnitude (none of the summands dominates),
#property description "or makes a determining contribution to the sum), has a distribution close to normal."

#property indicator_separate_window
#property indicator_buffers 1
#property indicator_plots 1
//--- Properties of the graphical construction
#property indicator_label1 "Label"
#property indicator_type1 DRAW_HISTOGRAM
#property indicator_color1 clrRoyalBlue
#property indicator_style1 STYLE_SOLID
#property indicator_width1 5
//--- An input variable
input int sample_number=10;
//--- An indicator buffer to for drawing the distribution
```

```

double          LabelBuffer[];
//--- A counter of ticks
double          ticks_counter;
//+-----+
//| Custom indicator initialization function |
//+-----+
void OnInit()
{
//--- Binding an array and an indicator buffer
    SetIndexBuffer(0,LabelBuffer,INDICATOR_DATA);
//--- turn the indicator buffer around from the present to the past
    ArraySetAsSeries(LabelBuffer,true);
//--- Initialize the generator of random numbers
    MathSrand(GetTickCount());
//--- Initialize the counter of ticks
    ticks_counter=0;
}
//+-----+
//| Custom indicator iteration function |
//+-----+
int OnCalculate(const int rates_total,
               const int prev_calculated,
               const datetime &time[],
               const double &open[],
               const double &high[],
               const double &low[],
               const double &close[],
               const long &tick_volume[],
               const long &volume[],
               const int &spread[])
{
//--- For a zero counter reset the indicator buffer
    if(ticks_counter==0) ArrayInitialize(LabelBuffer,0);
//--- Increase the counter
    ticks_counter++;
//--- We should periodically reset the counter ticks, to revive the distribution
    if(ticks_counter>100)
    {
        Print("We've reset the indicator values, let's start filling the cells once again");
        ticks_counter=0;
    }
//--- Get a sample of random values as the sum of three numbers from 0 to 7
    for(int i=0;i<sample_number;i++)
    {

        int rand_index=0;
        //--- Get three random numbers from 0 to 7
        for(int k=0;k<3;k++)
        {

```

```
    //--- A remainder in the division by 7 will return a value from 0 to 6
    rand_index+=MathRand()%7;
}
//--- Increase the value in the cell number rand_index by 1
LabelBuffer[rand_index]++;
}
//--- Exit the OnCalculate() handler
return(rates_total);
}
```

MathTan

The function returns a tangent of a number.

```
double MathTan(  
    double rad      // argument in radians  
);
```

Parameters

rad

[in] Angle in radians.

Return Value

Tangent of rad. If rad is greater than or equal to 263, or less than or equal to -263, a loss of significance in the result occurs, in which case the function returns an indefinite number.

Note

Instead of MathTan() you can use [tan\(\)](#).

Example:

```
#define GRAPH_WIDTH  750  
#define GRAPH_HEIGHT 350  
  
#include <Graphics\Graphic.mqh>  
  
CGraphic ExtGraph;  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    vector delta=vector::Full(101,2*M_PI/100);  
    delta[0]=-263;  
    //--- get 101 values from -263 to 2 pi with delta step  
    vector X=delta.CumSum();  
    //--- calculate the tangent value for each value of the X vector  
    vector Y=MathTan(X);  
  
    //--- transfer the calculated values from vectors to arrays  
    double x_array[],y_array[];  
    X.Swap(x_array);  
    Y.Swap(y_array);  
  
    //--- draw a graph of the calculated vector values  
    CurvePlot(x_array,y_array,clrDodgerBlue);
```

```

//--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE) != 0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN) != 0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);
    ExtGraph.CurveAdd(x_array, y_array, ColorToARGB(colour), CURVE_LINES);
    ExtGraph.IndentUp(30);
    ExtGraph.CurvePlotAll();
    string text1="Press ESC to delete the graph and stop the script, or";
    string text2="Press PgDn to create a screen, delete the graph and stop the script";
    ExtGraph.TextAdd(54, 9, text1, ColorToARGB clrBlack));
    ExtGraph.TextAdd(54,21, text2, ColorToARGB clrBlack));
    ExtGraph.Update();
}

//+-----+
//| Take a screenshot and save the image to a file |
//+-----+
bool MakeAndSaveScreenshot(const string file_name)
{
    string file_names[];
    ResetLastError();

```

```

int selected=FileSelectDialog("Save Picture", NULL, "All files (*.*)|*.*", FSD_WRITE);
if(selected<1)
{
    if(selected<0)
        PrintFormat("%s: FileSelectDialog() function returned error %d", __FUNCTION__, selected);
    return false;
}

bool res=false;
if(CharSetInteger(0, CHART_SHOW, false))
    res=ChartScreenShot(0, file_names[0], GRAPH_WIDTH, GRAPH_HEIGHT);
CharSetInteger(0, CHART_SHOW, true);
return(res);
}

```

MathIsValidNumber

It checks the correctness of a real number.

```
bool MathIsValidNumber(  
    double number    // number to check  
);
```

Parameters

number

[in] Checked numeric value.

Return Value

It returns true, if the checked value is an acceptable real number. If the checked value is a plus or minus infinity, or "not a number" (NaN), the function returns false.

Example:

```
double abnormal=MathArcsin(2.0);  
if(!MathIsValidNumber(abnormal)) Print("Attention! MathArcsin(2.0) = ",abnormal);
```

See also

[Real types \(double, float\)](#)

MathExpm1

Returns the value of the expression $\text{MathExp}(x)-1$.

```
double MathExpm1(
    double value    // power for the number e
);
```

Parameters

value

[in] The number specifying the power.

Return Value

A value of the double type. In case of overflow the function returns INF (infinity), in case of underflow MathExpm1 returns 0.

Note

At values of x close to 0, the MathExpm1(x) function generates much more accurate values than the $\text{MathExp}(x)-1$ function.

Instead of the MathExpm1() function you can use the [expm1\(\)](#) function.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+

{
    //--- get 9 values from 0 to 8 with step 1
    vector X(9,VectorArange);
    Print("vector X = \n",X);
    //--- calculate the ("e"(Euler number) to the power of each X vector value) - 1
    X=MathExpm1(X);
    Print("MathExpm1(X) = \n",X);

    //--- transfer the calculated values from the vector to the array
    double y_array[];
    X.Swap(y_array);

    //--- draw a graph of the calculated vector values
```

```

CurvePlot(y_array,clrDodgerBlue);

//--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
}

//+-----+
//| Fill a vector with 'value' in 'step' increments |
//+-----+
template<typename T>
void VectorArange(vector<T> &vec,T value=0.0,T step=1.0)
{
    for(ulong i=0; i<vec.Size(); i++,value+=step)
        vec[i]=value;
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE)!=0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN)!=0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);
    ExtGraph.CurveAdd(x_array, y_array, ColorToARGB(colour), CURVE_LINES);
    ExtGraph.IndentUp(30);
    ExtGraph.CurvePlotAll();
    string text1="Press ESC to delete the graph and stop the script, or";
    string text2="Press PgDn to create a screen, delete the graph and stop the script";
}

```

```

ExtGraph.TextAdd(54, 9, text1, ColorToARGB(clrBlack));
ExtGraph.TextAdd(54,21, text2, ColorToARGB(clrBlack));
ExtGraph.Update();
}
//+-----+
//| Take a screenshot and save the image to a file |
//+-----+
bool MakeAndSaveScreenshot(const string file_name)
{
    string file_names[];
    ResetLastError();
    int selected=FileSelectDialog("Save Picture", NULL, "All files (*.*)|*.*", FSD_WRITE);
    if(selected<1)
    {
        if(selected<0)
            PrintFormat("%s: FileSelectDialog() function returned error %d", __FUNCTION__, GetLastError());
        return false;
    }

    bool res=false;
    if(CharSetInteger(0, CHART_SHOW, false))
        res=ChartScreenShot(0, file_names[0], GRAPH_WIDTH, GRAPH_HEIGHT);
    CharSetInteger(0, CHART_SHOW, true);
    return(res);
}

```

Result:**See also**

MathLog1p

Returns the value of the expression $\text{MathLog}(1+x)$.

```
double MathLog1p(
    double value    // value to take the logarithm
);
```

Parameters

value

[in] The value, the logarithm of which is to be calculated.

Return Value

The natural logarithm of the value (value + 1) if successful. If value is < -1, the function returns NaN (undefined value). If value is equal to -1, the function returns INF (infinity).

Note

At values of x close to 0, the MathLog1p(x) function generates much more accurate values than the MathLog(1+x) function.

Instead of the MathLog1p() function you can use the [log1p\(\)](#) function.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get 9 values from 0 to 8 with step 1
    vector X(9,VectorArange);
    Print("vector X = \n",X);
    //--- for each vector value, calculate the logarithm for the expression (1 + X vector
    X=MathLog1p(X);
    Print("MathLog1p(X) = \n",X);

    //--- transfer the calculated values from the vector to the array
    double y_array[];
    X.Swap(y_array);

    //--- draw a graph of the calculated vector values
```

```

CurvePlot(y_array,clrDodgerBlue);

//--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

MathArccosh

Returns the hyperbolic arccosine.

```
double MathArccosh(
    double value    // 1 <= value < ∞
);
```

Parameters

value

[in] The value, the hyperbolic arccosine of which is to be calculated.

Return Value

The hyperbolic arccosine of the number. If value is less than +1, the function returns NaN (undefined value).

Note

Instead of the MathArccosh() function you can use the [acosh\(\)](#) function.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    vector delta=vector::Full(101,2*M_PI/10);
    delta[0]=1;
    //--- get 101 values from 1 to 2 pi with delta step
    vector X=delta.CumSum();
    //--- calculate the hyperbolic arc cosine value for each value of the X vector
    vector Y=MathArccosh(X);

    //--- transfer the calculated values from vectors to arrays
    double x_array[],y_array[];
    X.Swap(x_array);
    Y.Swap(y_array);

    //--- draw a graph of the calculated vector values
    CurvePlot(x_array,y_array,clrDodgerBlue);
```

```

//--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
while(!IsStopped())
{
    if(StopKeyPressed())
        break;
    Sleep(16);
}

//--- clean up
ExtGraph.Destroy();
}

//+-----+
//| When pressing ESC, return 'true' |
//| When pressing PgDn, take a graph screenshot and return 'true' |
//| Otherwise, return 'false' |
//+-----+
bool StopKeyPressed()
{
    //--- if ESC is pressed, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_ESCAPE) != 0)
        return(true);
    //--- if PgDn is pressed and a graph screenshot is successfully taken, return 'true'
    if(TerminalInfoInteger(TERMINAL_KEYSTATE_PAGEDOWN) != 0 && MakeAndSaveScreenshot(MQL5))
        return(true);
    //--- return 'false'
    return(false);
}

//+-----+
//| Create a graph object and draw a curve |
//+-----+
void CurvePlot(double &x_array[], double &y_array[], const color colour)
{
    ExtGraph.Create(ChartID(), "Graphic", 0, 0, 0, GRAPH_WIDTH, GRAPH_HEIGHT);
    ExtGraph.CurveAdd(x_array, y_array, ColorToARGB(colour), CURVE_LINES);
    ExtGraph.IndentUp(30);
    ExtGraph.CurvePlotAll();
    string text1="Press ESC to delete the graph and stop the script, or";
    string text2="Press PgDn to create a screen, delete the graph and stop the script";
    ExtGraph.TextAdd(54, 9, text1, ColorToARGB clrBlack));
    ExtGraph.TextAdd(54, 21, text2, ColorToARGB clrBlack));
    ExtGraph.Update();
}

//+-----+
//| Take a screenshot and saves the image to a file |
//+-----+
bool MakeAndSaveScreenshot(const string file_name)
{
    string file_names[];
    ResetLastError();

```

```

int selected=FileSelectDialog("Save Picture", NULL, "All files (*.*)|*.*", FSD_WRITE);
if(selected<1)
{
    if(selected<0)
        PrintFormat("%s: FileSelectDialog() function returned error %d", __FUNCTION__, selected);
    return false;
}

MathArcsinh

Returns the hyperbolic arcsine.

```
double MathArcsinh(
    double value      //  $-\infty < \text{value} < +\infty$ 
);
```

Parameters

val

[in] The value, the hyperbolic arcsine of which is to be calculated.

Return Value

The hyperbolic arcsine of the number.

Note

Instead of the MathArcsinh() function you can use the [asinh\(\)](#) function.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    vector delta=vector::Full(101,2*M_PI/10);
    delta[0]=-31;
    //--- get 101 values from -31 to 2 pi with delta step
    vector X=delta.CumSum();
    //--- calculate the hyperbolic arc sine value for each value of the X vector
    vector Y=MathArcsinh(X);

    //--- transfer the calculated values from vectors to arrays
    double x_array[],y_array[];
    X.Swap(x_array);
    Y.Swap(y_array);

    //--- draw a graph of the calculated vector values
    CurvePlot(x_array,y_array,clrDodgerBlue);

    //--- wait for pressing the Escape or PgDn keys to delete the graph (take a screenshot)
```

```

MathArctanh

Returns the hyperbolic arctangent.

```
double MathArctanh(
    double value    // value in the range of -1 < value < 1
);
```

Parameters

value

[in] Number within the range of $-1 < \text{value} < 1$, which represents the tangent.

Return Value

The hyperbolic arctangent of the number.

Note

Instead of the MathArctanh() function you can use the [atanh\(\)](#) function.

Example:

```
#define GRAPH_WIDTH 750
#define GRAPH_HEIGHT 350

#include <Graphics\Graphic.mqh>

CGraphic ExtGraph;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    vector delta=vector::Full(34,2*M_PI/100);
    delta[0]=-1;
    //--- get 34 values from -1 to 2 pi with delta step
    vector X=delta.CumSum();
    //--- calculate the hyperbolic arc tangent value for each value of the X vector
    vector Y=MathArctanh(X);

    //--- transfer the calculated values from vectors to arrays
    double x_array[],y_array[];
    X.Swap(x_array);
    Y.Swap(y_array);

    //--- draw a graph of the calculated vector values
    CurvePlot(x_array,y_array,clrDodgerBlue);

MathSwap

Change the order of bytes in the [ushort](#) type value.

```
ushort MathSwap(  
    ushort value    // value  
);
```

Parameters

value

[in] Value for changing the order of bytes.

Return Value

ushort value with the reverse byte order.

MathSwap

Change the order of bytes in the [uint](#) type value.

```
uint MathSwap(  
    uint value      // value  
);
```

Parameters

value

[in] Value for changing the order of bytes.

Return Value

uint value with the reverse byte order.

MathSwap

Change the order of bytes in the [ulong](#) type value.

```
ulong MathSwap(  
    ulong value     // value  
);
```

Parameters

value

[in] Value for changing the order of bytes.

Return Value

ulong value with the reverse byte order.

Example:

```
//+-----+
template <typename T>
string NumberToBinaryString(T x)
{
    string res = "";
    int i = -1;
    uchar size = sizeof(T)*8-1;
    ulong mask = (ulong)1<<size;
    while(!((x<<++i) & mask));
    for(; i <=size; i++)
        res += !((x<<i) & mask) ? "0" : "1";
    return res;
}
```

String Functions

This is a group of functions intended for working with data of the [string](#) type.

Function	Action
StringAdd	Adds a string to the end of another string
StringBufferLen	Returns the size of buffer allocated for the string
StringCompare	Compares two strings and returns 1 if the first string is greater than the second; 0 - if the strings are equal; -1 (minus 1) - if the first string is less than the second one
StringConcatenate	Forms a string of parameters passed
StringFill	Fills out a specified string by selected symbols
StringFind	Search for a substring in a string
StringGetCharacter	Returns the value of a number located in the specified string position
StringInit	Initializes string by specified symbols and provides the specified string length
StringLen	Returns the number of symbols in a string
StringSetLength	Sets a specified length (in characters) for a string
StringReplace	Replaces all the found substrings of a string by a set sequence of symbols
StringReserve	Reserves the buffer of a specified size for a string in memory.
StringSetCharacter	Returns a copy of a string with a changed value of a symbol in a specified position
StringSplit	Gets substrings by a specified separator from the specified string, returns the number of substrings obtained
StringSubstr	Extracts a substring from a text string starting from a specified position
StringToLower	Transforms all symbols of a selected string to lowercase
StringToUpper	Transforms all symbols of a selected string into capitals
StringTrimLeft	Cuts line feed characters, spaces and tabs in the left part of the string
StringTrimRight	Cuts line feed characters, spaces and tabs in the right part of the string

StringAdd

The function adds a substring to the end of a string.

```
bool StringAdd(  
    string& string_var,      // string, to which we add  
    string add_substring    // string, which is added  
);
```

Parameters

string_var

[in][out] String, to which another one is added.

add_substring

[in] String that is added to the end of a source string.

Return Value

In case of success returns true, otherwise false. In order to get an [error code](#), the [GetLastError\(\)](#) function should be called.

Example:

```
void OnStart()  
{  
    long length=1000000;  
    string a="a",b="b",c;  
    //--- first method  
    uint start=GetTickCount(),stop;  
    long i;  
    for(i=0;i<length;i++)  
    {  
        c=a+b;  
    }  
    stop=GetTickCount();  
    Print("time for 'c = a + b' = ",(stop-start)," milliseconds, i = ",i);  
  
    //--- second method  
    start=GetTickCount();  
    for(i=0;i<length;i++)  
    {  
        StringAdd(a,b);  
    }  
    stop=GetTickCount();  
    Print("time for 'StringAdd(a,b)' = ",(stop-start)," milliseconds, i = ",i);  
  
    //--- third method  
    start=GetTickCount();  
    a="a"; // re-initialize variable a  
    for(i=0;i<length;i++)
```

```
{
    StringConcatenate(c,a,b);
}
stop=GetTickCount();
Print("time for 'StringConcatenate(c,a,b)' = ",(stop-start)," milliseconds, i = ",i);
}
```

See also

[StringConcatenate](#), [StringSplit](#), [StringSubstr](#)

StringBufferLen

The function returns the size of buffer allocated for the string.

```
int StringBufferLen(  
    string string_var    // string  
)
```

Parameters

string_var
[in] String.

Return Value

The value 0 means that the string is constant and buffer size can't be changed. -1 means that the string belongs to the client terminal, and modification of the buffer contents can have indeterminate results.

Example:

```
void OnStart()  
{  
    long length=1000;  
    string a="a",b="b";  
    //---  
    long i;  
    Print("before: StringBufferLen(a) = ",StringBufferLen(a),  
        "   StringLen(a) = ",StringLen(a));  
    for(i=0;i<length;i++)  
    {  
        StringAdd(a,b);  
    }  
    Print("after: StringBufferLen(a) = ",StringBufferLen(a),  
        "   StringLen(a) = ",StringLen(a));  
}
```

See also

[StringAdd](#), [StringInit](#), [StringLen](#), [StringFill](#)

StringCompare

The function compares two strings and returns the comparison result in form of an integer.

```
int StringCompare(  
    const string& string1,           // the first string in the comparison  
    const string& string2,           // the second string in the comparison  
    bool case_sensitive=true         // case sensitivity mode selection for the  
);
```

Parameters

string1

[in] The first string.

string2

[in] The second string.

case_sensitive=true

[in] Case sensitivity mode selection. If it is true, then "A">"a". If it is false, then "A"="a". By default the value is equal to true.

Return Value

- -1 (minus one), if string1<string2
- 0 (zero), if string1=string2
- 1 (one), if string1>string2

Note

The strings are compared symbol by symbol, the symbols are compared in the alphabetic order in accordance with the current code page.

Example:

```
void OnStart()  
{  
    //--- what is larger - apple or home?  
    string s1="Apple";  
    string s2="home";  
  
    //--- compare case sensitive  
    int result1=StringCompare(s1,s2);  
    if(result1>0) PrintFormat("Case sensitive comparison: %s > %s",s1,s2);  
    else  
    {  
        if(result1<0) PrintFormat("Case sensitive comparison: %s < %s",s1,s2);  
        else PrintFormat("Case sensitive comparison: %s = %s",s1,s2);  
    }  
  
    //--- compare case-insensitive  
    int result2=StringCompare(s1,s2,false);  
    if(result2>0) PrintFormat("Case insensitive comparison: %s > %s",s1,s2);  
    else
```

```
{
    if(result2<0)PrintFormat("Case insensitive comparison: %s < %s",s1,s2);
    else PrintFormat("Case insensitive comparison: %s = %s",s1,s2);
}
/* Result
Case-sensitive comparison: Apple < home
Case insensitive comparison: Apple < home
*/
}
```

[String Type](#), [CharToString\(\)](#), [ShortToString\(\)](#), [StringToCharArray\(\)](#), [StringToShortArray\(\)](#), [StringGetCharacter\(\)](#), [Use of a Codepage](#)

StringConcatenate

The function forms a string of passed parameters and returns the size of the formed string. Parameters can be of any type. Number of parameters can't be less than 2 or more than 64.

```
int StringConcatenate(
    string& string_var,    // string to form
    void argument1         // first parameter of any simple type
    void argument2         // second parameter of any simple type
    ...                   // next parameter of any simple type
);
```

Parameters

string_var

[out] String that will be formed as a result of concatenation.

argumentN

[in] Any comma separated values. From 2 to 63 parameters of any simple type.

Return Value

Returns the string length, formed by concatenation of parameters transformed into string type. Parameters are transformed into strings according to the same rules as in [Print\(\)](#) and [Comment\(\)](#).

Example:

```
void OnStart()
{
    //--- declare and define variables participating in concatenation
    string text="";
    string text1="This script shows how the StringConcatenate() function works.\n";
    string text2="This is the second line, at the end of which there is a line break co
    string text3="This is line number ";
    int num3=3;
    string text3l=", the number of which is entered into the function as a separate pa
    string textN="\n";
    string text4="This is line number 4, preceded by a separate parameter with a line k
    int length=StringConcatenate(text, text1, text2, text3, num3, text3l, textN, tex
    Print(text, "\nLength of the resulting string = ", length);

    /*
    Result
    This script shows how the StringConcatenate() function works.
    This is the second line, at the end of which there is a line break control code.
    This is line number 3, the number of which is entered into the function as a separa
    This is line number 4, preceded by a separate parameter with a line break code.
    Line 5 includes a real number: 0.12345
    Length of the resulting string = 358
    */
}
```

See also

[StringAdd](#), [StringSplit](#), [StringSubstr](#)

StringFill

It fills out a selected string by specified symbols.

```
bool StringFill(  
    string&    string_var,      // string to fill  
    ushort    character        // symbol that will fill the string  
);
```

Parameters

string_var

[in][out] String, that will be filled out by the selected symbol.

character

[in] Symbol, by which the string will be filled out.

Return Value

In case of success returns true, otherwise - false. To get the [error code](#) call [GetLastError\(\)](#).

Note

Filling out a string at place means that symbols are inserted directly to the string without transitional operations of new string creation or copying. This allows to save the operation time.

Example:

```
void OnStart()  
{  
    string str;  
    StringInit(str,20,'_');  
    Print("str = ",str);  
    StringFill(str,0);  
    Print("str = ",str," : StringBufferLen(str) = ", StringBufferLen(str));  
}  
  
// Result  
//   str = _____  
//   str =   : StringBufferLen(str) = 20  
//
```

See also

[StringBufferLen](#), [StringLen](#), [StringInit](#)

StringFind

Search for a substring in a string.

```
int StringFind(
    string string_value,      // string in which search is made
    string match_substring,  // what is searched
    int start_pos=0          // from what position search starts
);
```

Parameters

string_value

[in] String, in which search is made.

match_substring

[in] Searched substring.

start_pos=0

[in] Position in the string from which search is started.

Return Value

Returns position number in a string, from which the searched substring starts, or -1, if the substring is not found.

Example:

```
#define RESERVE 100

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the symbol base currency and the profit currency
    string symbol_currency_base =SymbolInfoString(Symbol(), SYMBOL_CURRENCY_BASE);
    string symbol_currency_profit=SymbolInfoString(Symbol(), SYMBOL_CURRENCY_PROFIT);
    PrintFormat("Symbol Currency Base: %s\nSymbol Currency Profit: %s", symbol_currency_base, symbol_currency_profit);

    //--- in the loop through all symbols available on the server
    int total=SymbolsTotal(false), pos=-1;
    for(int i=0; i<total; i++)
    {
        //--- get the name of the next symbol
        string name=SymbolName(i, false);

        //--- look for a substring in the symbol name with the name of the base currency
        //--- if a substring is found, display the symbol name, its index in the current list
        pos = StringFind(name, symbol_currency_base);
        if(pos >= 0)
```

```

        PrintFormat("The '%s' symbol at index %u in the list contains the '%s' currency",
                    symbol, pos, symbol_currency_profit);
    }

    //--- look for a substring in the symbol name with the name of the quoted currency
    //--- if a substring is found, display the symbol name, its index in the current list
    pos = StringFind(name, symbol_currency_profit);
    if(pos >= 0)
        PrintFormat("The '%s' symbol at index %u in the list contains the '%s' currency",
                    symbol, pos, symbol_currency_profit);
    }

```

See also

[StringSubstr](#), [StringGetCharacter](#), [StringLen](#), [StringLen](#)

StringGetCharacter

Returns value of a symbol, located in the specified position of a string.

```
ushort StringGetCharacter(
    string string_value,    // string
    int    pos             // symbol position in the string
);
```

Parameters

string_value

[in] String.

pos

[in] Position of a symbol in the string. Can be from 0 to [StringLen](#)(text) -1.

Return Value

Symbol code or 0 in case of an error. To get the [error code](#) call [GetLastError\(\)](#).

Example:

```
void OnStart()
{
    //--- delete all comments on the chart
    Comment("");
    //--- declare a string, from which we will obtain the values of symbol codes and remember
    string message = "The script demonstrates the operation of the StringGetCharacter()";
    int    length  = StringLen(message);
    //--- declare a string variable, to which we will add the obtained symbols from the demo string
    string text    = "";
    //--- in the loop by the demo string length
    for(int i=0; i<length; i++)
    {
        //--- wait 1/10 seconds
        Sleep(100);
        //--- get a symbol from a string located at the loop index in the demo string
        ushort char_code=StringGetCharacter(message, i);
        //--- add a symbol to the displayed string and display the resulting string as a comment
        text+=ShortToString(char_code);
        Comment(text);
    }
    //--- wait two seconds and remove the comment from the chart
    Sleep(2000);
    Comment("");

    /*
    Result: the demo string appears on the screen character by character
    The script demonstrates the operation of the StringGetCharacter() function
    */
}
```

```
}
```

See also

[StringSetCharacter](#), [StringBufferLen](#), [StringLen](#), [StringFill](#), [StringInit](#), [StringToCharArray](#),
[StringToShortArray](#)

StringInit

Initializes a string by specified symbols and provides the specified string size.

```
bool StringInit(
    string&    string_var,      // string to initialize
    int        new_len=0,       // required string length after initialization
    ushort     character=0      // symbol, by which the string will be filled
);
```

Parameters

string_var

[in][out] String that should be initialized and deinitialized.

new_len=0

[in] String length after initialization. If length=0, it deinitializes the string, i.e. the string buffer is cleared and the buffer address is zeroed.

character=0

[in] Symbol to fill the string.

Return Value

In case of success returns true, otherwise - false. To get the [error code](#) call [GetLastError\(\)](#).

Note

If *character=0* and the length *new_len>0*, the buffer of the string of indicated length will be distributed and filled by zeroes. The string length will be equal to zero, because the whole buffer is filled out by string terminators.

Example:

```
void OnStart()
{
    //---
    string str;
    StringInit(str,200,0);
    Print("str = ",str," : StringBufferLen(str) = ",
        StringBufferLen(str)," StringLen(str) = ",StringLen(str));
}
/* Result
str = : StringBufferLen(str) = 200   StringLen(str) = 0
*/
```

See also

[StringBufferLen](#), [StringLen](#)

StringLen

Returns the number of symbols in a string.

```
int StringLen(  
    string string_value    // string  
);
```

Parameters

string_value

[in] String to calculate length.

Return Value

Number of symbols in a string without the ending zero.

Example:

```
void OnStart()  
{  
    //--- define the test string  
    string text="123456789012345";  
    //--- get the number of symbols in the string  
    int str_len=StringLen(text);  
    //--- display the string and the number of symbols in it in the log  
    PrintFormat("The StringLen() function returned the value of %d chars in string: '%s'", str_len, text);  
  
    /*  
    Result  
    The StringLen() function returned the value of 15 chars in string: '123456789012345'  
    */  
}
```

See also

[StringBufferLen](#), [StringTrimLeft](#), [StringTrimRight](#), [StringToCharArray](#), [StringToShortArray](#)

StringSetLength

Sets a specified length (in characters) for a string.

```
bool StringSetLength(  
    string&    string_var,      // string  
    uint       new_length      // new string length  
);
```

Parameters

string_var

[in][out] String, for which a new length in characters should be set.

new_capacity

[in] Required string length in characters. If *new_length* is less than the current size, the excessive characters are discarded.

Return Value

In case of successful execution, returns true, otherwise - false. To receive an [error](#) code, the [GetLastError\(\)](#) function should be called.

Note

TheStringSetLength() function does not change the size of the buffer allocated for a string.

Example:

```
void OnStart()  
{  
    //--- define the string  
    string text="123456789012345";  
  
    //--- display a string and its length in the log  
    PrintFormat("Before StringSetLength() the string '%s' has a size of %d characters",  
                text, StringLen(text));  
  
    //--- reduce the string size to 10 characters  
    StringSetLength(text, 10);  
  
    //--- display a string, changed due to StringSetLength() operation, and its new length  
    PrintFormat("After StringSetLength() the string is now '%s', and has a size of %d characters",  
                text, StringLen(text));  
  
    /*  
    Result  
    Before StringSetLength() the string '123456789012345' has a size of 15 characters  
    After StringSetLength() the string is now '1234567890', and has a size of 10 characters  
    */  
}
```

See also

[StringLen](#), [StringBufferLen](#), [StringReserve](#) [StringInit](#), [StringSetCharacter](#)

StringReplace

It replaces all the found substrings of a string by a set sequence of symbols.

```
int StringReplace(  
    string&      str,           // the string in which substrings will be replaced  
    const string find,         // the searched substring  
    const string replacement    // the substring that will be inserted to the found  
);
```

Parameters

str

[in][out] The string in which you are going to replace substrings.

find

[in] The desired substring to replace.

replacement

[in] The string that will be inserted instead of the found one.

Return Value

The function returns the number of replacements in case of success, otherwise -1. To get an [error](#) code call the [GetLastError\(\)](#) function.

Note

If the function has run successfully but no replacements have been made (the substring to replace was not found), it returns 0.

The error can result from incorrect *str* or *find* parameters (empty or non-initialized string, see [StringInit\(\)](#)). Besides, the error occurs if there is not enough memory to complete the replacement.

Example:

```
string text="The quick brown fox jumped over the lazy dog.";
int replaced=StringReplace(text,"quick","slow");
replaced+=StringReplace(text,"brown","black");
replaced+=StringReplace(text,"fox","bear");
Print("Replaced: ", replaced,". Result=",text);

// Result
// Replaced: 3. Result=The slow black bear jumped over the lazy dog.
//
```

See also

[StringSetCharacter\(\)](#), [StringSubstr\(\)](#)

StringReserve

Reserves the buffer of a specified size for a string in memory.

```
bool StringReserve(  
    string&    string_var,      // string  
    uint       new_capacity     // buffer size for storing a string  
);
```

Parameters

string_var

[in][out] String the buffer size should change the size for.

new_capacity

[in] Buffer size required for a string. If the new_capacity size is less than the string length, the size of the current buffer does not change.

Return Value

In case of successful execution, returns true, otherwise - false. To receive an [error](#) code, the [GetLastError\(\)](#) function should be called.

Note

Generally, the string size is not equal to the size of the buffer meant for storing the string. When creating a string, the appropriate buffer is usually allocated with a margin. The StringReserve() function allows managing the buffer size and specify the optimal size for future operations.

Unlike [StringInit\(\)](#), the StringReserve() function does not change the string contents and does not fill it with characters.

Example:

```
void OnStart()  
{  
    string s;  
    //--- check the operation speed without using StringReserve  
    ulong t0=GetMicrosecondCount();  
    for(int i=0; i< 1024; i++)  
        s+=" "+(string)i;  
    ulong msc_no_reserve=GetMicrosecondCount()-t0;  
    s=NULL;  
    //--- now, let's do the same using StringReserve  
    StringReserve(s,1024 * 3);  
    t0=GetMicrosecondCount();  
    for(int i=0; i< 1024; i++)  
        s+=" "+(string)i;  
    ulong msc_reserve=GetMicrosecondCount()-t0;  
    //--- check the time  
    Print("Test with StringReserve passed for "+(string)msc_reserve+" msc");  
    Print("Test without StringReserve passed for "+(string)msc_no_reserve+" msc");  
    /* Result
```

```
Test with StringReserve passed for 50 msc  
Test without StringReserve passed for 121 msc  
*/  
}
```

See also

[StringBufferLen](#), [StringSetLength](#), [StringInit](#), [StringSetCharacter](#)

StringSetCharacter

Returns copy of a string with a changed character in a specified position.

```
bool StringSetCharacter(
    string&    string_var,      // string
    int        pos,             // position
    ushort     character        // character
);
```

Parameters

string_var

[in][out] String.

pos

[in] Position of a character in a string. Can be from 0 to [StringLen\(text\)](#).

character

[in] Symbol code Unicode.

Return Value

In case of success returns true, otherwise false. In order to get an [error code](#), the [GetLastError\(\)](#) function should be called.

Note

If *pos* is less than [string length](#) and the symbol code value = 0, the string is cut off (but the [buffer size](#), distributed for the string remains unchanged). The string length becomes equal to *pos*.

If *pos* is equal to string length, the specified symbol is added at the string end, and the length is enlarged by one.

Example:

```
void OnStart()
{
    string str="0123456789";
    Print("before: str = ",str," ,StringBufferLen(str) = ",
        StringBufferLen(str),"   StringLen(str) = ",StringLen(str));
    //--- add zero value in the middle
    StringSetCharacter(str,6,0);
    Print("after: str = ",str," ,StringBufferLen(str) = ",
        StringBufferLen(str),"   StringLen(str) = ",StringLen(str));
    //--- add symbol at the end
    int size=StringLen(str);
    StringSetCharacter(str,size,'+');
    Print("addition: str = ",str," ,StringBufferLen(str) = ",
        StringBufferLen(str),"   StringLen(str) = ",StringLen(str));
}
/* Result
before: str = 0123456789 ,StringBufferLen(str) = 0   StringLen(str) = 10
```

```
after:  str = 012345 ,StringBufferLen(str) = 16   StringLen(str) = 6
addition: str = 012345+ ,StringBufferLen(str) = 16   StringLen(str) = 7
*/
```

See also

[StringBufferLen](#), [StringLen](#), [StringFill](#), [StringInit](#), [CharToString](#), [ShortToString](#), [CharArrayToString](#),
[ShortArrayToString](#)

StringSplit

Gets substrings by a specified separator from the specified string, returns the number of substrings obtained.

```
int StringSplit(
    const string    string_value,      // A string to search in
    const ushort    separator,        // A separator using which substrings will be se
    string          & result[]        // An array passed by reference to get the found
);
```

Parameters

string_value

[in] The string from which you need to get substrings. The string will not change.

pos

[in] The code of the separator character. To get the code, you can use the [StringGetCharacter\(\)](#) function.

result[]

[out] An array of strings where the obtained substrings are located.

Return Value

The number of substrings in the `result[]` array. If the separator is not found in the passed string, only one source string will be placed in the array.

If `string_value` is empty or `NULL`, the function will return zero. In case of an error the function returns -1. To get the [error](#) code, call the [GetLastError\(\)](#) function.

Example:

```
string to_split="_life_is_good_"; // A string to split into substrings
string sep="_";                  // A separator as a character
ushort u_sep;                    // The code of the separator character
string result[];                 // An array to get strings
//--- Get the separator code
u_sep=StringGetCharacter(sep,0);
//--- Split the string to substrings
int k=StringSplit(to_split,u_sep,result);
//--- Show a comment
PrintFormat("Strings obtained: %d. Used separator '%s' with the code %d",k,sep,u_sep);
//--- Now output all obtained strings
if(k>0)
{
    for(int i=0;i<k;i++)
    {
        PrintFormat("result[%d]=\"%s\"",i,result[i]);
    }
}
```

See also

[StringReplace\(\)](#), [StringSubstr\(\)](#), [StringConcatenate\(\)](#)

StringSubstr

Extracts a substring from a text string starting from the specified position.

```
string StringSubstr(  
    string  string_value,      // string  
    int     start_pos,        // position to start with  
    int     length=-1         // length of extracted string  
);
```

Parameters

string_value

[in] String to extract a substring from.

start_pos

[in] Initial position of a substring. Can be from 0 to [StringLen](#)(text) -1.

length=-1

[in] Length of an extracted substring. If the parameter value is equal to -1 or parameter isn't set, the substring will be extracted from the indicated position till the string end.

Return Value

Copy of a extracted substring, if possible. Otherwise returns an empty string.

Example:

```
void OnStart()  
{  
    //--- get the name of the current symbol  
    string name = Symbol();  
  
    //--- get the base and quoted symbol currencies  
    string base  = StringSubstr(name, 0, 3);  
    string quoted = StringSubstr(name, 3, 3);  
  
    //--- display the obtained symbol currencies in the log  
    PrintFormat("Symbol: %s. Currency base: %s, currency quoted: %s", name, base, quoted);  
  
    /*  
    Result  
    Symbol: EURUSD. Currency base: EUR, currency quoted: USD  
    */  
}
```

[StringSplit](#), [StringFind](#), [StringGetCharacter](#)

StringToLower

Transforms all symbols of a selected string into lowercase.

```
bool StringToLower(  
    string& string_var    // string to process  
);
```

Parameters

string_var
[in][out] String.

Return Value

In case of success returns true, otherwise - false. To get the [error code](#) call [GetLastError\(\)](#).

Example:

```
void OnStart()  
{  
    //--- define the source string in uppercase  
    string text=" - THIS STRING, WRITTEN IN UPPERCASE, MUST BE WRITTEN IN LOWERCASE";  
    //--- Display the source string in the log  
    Print("Source line:\n", text);  
    //--- convert all string characters to lowercase and display the result in the log  
    if(StringToLower(text))  
        Print("The original string after using the StringToLower() function:\n", text);  
  
    /*  
    Result  
    Source line:  
    - THIS STRING, WRITTEN IN UPPERCASE, MUST BE WRITTEN IN LOWERCASE  
    The original string after using the StringToLower() function:  
    - this string, written in uppercase, must be written in lowercase  
    */  
}
```

See also

[StringToUpper](#), [StringTrimLeft](#), [StringTrimRight](#)

StringToUpper

Transforms all symbols of a selected string into capitals.

```
bool StringToUpper(  
    string& string_var    // string to process  
);
```

Parameters

string_var
[in][out] String.

Return Value

In case of success returns true, otherwise - false. To get the [error code](#) call [GetLastError\(\)](#).

Example:

```
void OnStart()  
{  
    //--- define the source string in lowercase  
    string text=" - this string, written in lowercase, must be written in uppercase";  
    //--- Display the source string in the log  
    Print("Source line:\n", text);  
    //--- convert all string characters to uppercase and display the result in the log  
    if(StringToUpper(text))  
        Print("The original string after using the StringToUpper() function:\n", text);  
  
    /*  
    Result  
    Source line:  
    - this string, written in lowercase, must be written in uppercase  
    The original string after using the StringToUpper() function:  
    - THIS STRING, WRITTEN IN LOWERCASE, MUST BE WRITTEN IN UPPERCASE  
    */  
}
```

See also

[StringToLower](#), [StringTrimLeft](#), [StringTrimRight](#)

StringTrimLeft

The function cuts line feed characters, spaces and tabs in the left part of the string till the first meaningful symbol. The string is modified at place.

```
int StringTrimLeft(  
    string& string_var    // string to cut  
);
```

Parameters

string_var

[in][out] String that will be cut from the left.

Return Value

Returns the number of cut symbols.

Example:

```
void OnStart()  
{  
    //--- define the source string with six spaces on the left  
    string text="      All spaces on the left will be removed from this string";  
    //--- Display the source string in the log  
    PrintFormat("Source line:\n'%s'", text);  
    //--- remove all spaces on the left and display the number of removed characters and t  
    int num=StringTrimLeft(text);  
    PrintFormat("The StringTrimLeft() function removed %d chars from the left side. Now  
  
    /*  
    Result  
    Source line:  
    '      All spaces on the left will be removed from this string'  
    The StringTrimLeft() function removed 6 chars from the left side. Now the line look  
    'All spaces on the left will be removed from this string'  
    */  
}
```

See also

[StringTrimRight](#), [StringToLower](#), [StringToUpper](#)

StringTrimRight

The function cuts line feed characters, spaces and tabs in the right part of the string after the last meaningful symbol. The string is modified at place.

```
int StringTrimRight(  
    string& string_var    // string to cut  
);
```

Parameters

string_var

[in][out] String that will be cut from the right.

Return Value

Returns the number of cut symbols.

Example:

```
void OnStart()  
{  
    //--- define the source string with six spaces on the right  
    string text="All spaces on the right will be removed from this string    ";  
    //--- Display the source string in the log  
    PrintFormat("Source line:\n'%s'", text);  
    //--- remove all spaces on the right and display the number of removed characters and  
    int num=StringTrimRight(text);  
    PrintFormat("The StringTrimRight() function removed %d chars from the right side. Now the line looks like:  
  
    /*  
    Result  
    Source line:  
    'All spaces on the right will be removed from this string    '  
    The StringTrimRight() function removed 6 chars from the right side. Now the line looks like:  
    'All spaces on the right will be removed from this string'  
    */  
}
```

Date and Time

This is the group of functions for working with data of [datetime](#) type (an integer that represents the number of seconds elapsed from 0 hours of January 1, 1970).

To arrange high-resolution counters and timers, use the [GetTickCount\(\)](#) function, which produces values in milliseconds.

Function	Action
TimeCurrent	Returns the last known server time (time of the last quote receipt) in the datetime format
TimeTradeServer	Returns the current calculation time of the trade server
TimeLocal	Returns the local computer time in datetime format
TimeGMT	Returns GMT in datetime format with the Daylight Saving Time by local time of the computer, where the client terminal is running
TimeDaylightSavings	Returns the sign of Daylight Saving Time switch
TimeGMTOffset	Returns the current difference between GMT time and the local computer time in seconds, taking into account DST switch
TimeToStruct	Converts a datetime value into a variable of MqlDateTime structure type
StructToTime	Converts a variable of MqlDateTime structure type into a datetime value

TimeCurrent

Returns the last known server time, time of the last quote receipt for one of the symbols selected in the "Market Watch" window. In the [OnTick\(\)](#) handler, this function returns the time of the received handled tick. In other cases (for example, call in [handlers](#) OnInit(), OnDeinit(), OnTimer() and so on) this is the [time of the last quote receipt](#) for any symbol available in the "Market Watch" window, the time shown in the title of this window. The time value is formed on a trade server and does not depend on the time settings on your computer. There are 2 variants of the function.

Call without parameters

```
datetime TimeCurrent();
```

Call with MqlDateTime type parameter

```
datetime TimeCurrent(
    MqlDateTime& dt_struct    // structure type variable
);
```

Parameters

dt_struct

[out] [MqlDateTime](#) structure type variable.

Return Value

Value of [datetime](#) type

Note

If the MqlDateTime structure type variable has been passed as a parameter, it is filled accordingly.

To arrange high-resolution counters and timers, use the [GetTickCount\(\)](#) function, which produces values in milliseconds.

During testing in the strategy tester, TimeCurrent() is simulated according to historical data.

Example:

```
void OnStart()
{
    //--- declare the MqlDateTime variable to be filled with date/time data and get the time
    MqlDateTime tm={};
    datetime time1=TimeCurrent();    // first form of call: time of the last quote receipt
    datetime time2=TimeCurrent(tm);  // second form of call: time of the last quote receipt

    //--- display the result of receiving the date/time and filling the structure with the data
    PrintFormat("Tick time: %s\n- Year: %u\n- Month: %02u\n- Day: %02u\n- Hour: %02u\n- Min: %02u\n- Sec: %02u\n",
        (string)time1, tm.year, tm.mon, tm.day, tm.hour, tm.min, tm.sec, tm.daysec);
    /*
    result:
    Tick time: 2024.04.18 15:40:06
    - Year: 2024
    - Month: 04
    */
}
```

```
- Day: 18  
- Hour: 15  
- Min: 40  
- Sec: 06  
- Day of Year: 108  
- Day of Week: 4 (THURSDAY)  
*/  
}
```

TimeTradeServer

Returns the calculated current time of the trade server. Unlike [TimeCurrent\(\)](#), the calculation of the time value is performed in the client terminal and depends on the time settings on your computer. There are 2 variants of the function.

Call without parameters

```
datetime TimeTradeServer();
```

Call with MqlDateTime type parameter

```
datetime TimeTradeServer(
    MqlDateTime& dt_struct    // Variable of structure type
);
```

Parameters

dt_struct

[out] Variable of structure type [MqlDateTime](#).

Return Value

Value of [datetime](#) type

Note

If the MqlDateTime structure type variable has been passed as a parameter, it is filled accordingly.

To arrange high-resolution counters and timers, use the [GetTickCount\(\)](#) function, which produces values in milliseconds.

During testing in the strategy tester, TimeTradeServer() is simulated according to historical data and always equal to [TimeCurrent\(\)](#).

Example:

```
void OnStart()
{
    //--- declare the MqlDateTime variable to be filled with date/time data and get the time
    MqlDateTime tm={};
    datetime   time_current=TimeCurrent();           // first form of call: time
    datetime   time_server =TimeTradeServer(tm);     // second form of call: es
    int        difference  =int(time_current-time_server); // difference between Time

    //--- display the time of the last quote and the estimated current time of the trade s
    PrintFormat("Time Current: %s\nTime Trade Server: %s\n- Year: %u\n- Month: %02u\n-
                "- Hour: %02u\n- Min: %02u\n- Sec: %02u\n- Day of Year: %03u\n- Day of
                (string)time_current, (string)time_server, tm.year, tm.mon, tm.day, tm.
                EnumToString((ENUM_DAY_OF_WEEK)tm.day_of_week), difference);

    /*
    result:
    Time Current: 2024.04.18 16:10:14
    Time Trade Server: 2024.04.18 16:10:15
    */
}
```

```
- Year: 2024
- Month: 04
- Day: 18
- Hour: 16
- Min: 10
- Sec: 15
- Day of Year: 108
- Day of Week: 4 (THURSDAY)
Difference between Time Current and Time Trade Server: -1
*/
}
```

TimeLocal

Returns the local time of a computer, where the client terminal is running. There are 2 variants of the function.

Call without parameters

```
datetime TimeLocal();
```

Call with MqlDateTime type parameter

```
datetime TimeLocal(
    MqlDateTime& dt_struct    // Variable of structure type
);
```

Parameters

dt_struct

[out] Variable of structure type [MqlDateTime](#).

Return Value

Value of [datetime](#) type

Note

If the MqlDateTime structure type variable has been passed as a parameter, it is filled accordingly.

To arrange high-resolution counters and timers, use the [GetTickCount\(\)](#) function, which produces values in milliseconds.

During testing in the strategy tester, TimeLocal() is always equal to [TimeCurrent\(\)](#) simulated server time.

Example:

```
void OnStart()
{
    //--- declare the MqlDateTime variable to be filled with PC local time data
    MqlDateTime tm={};
    datetime time1=TimeLocal(); // first form of call: PC local time
    datetime time2=TimeLocal(tm); // second form of call: PC local time with filling

    //--- display the result of receiving PC local time and filling the structure with the
    PrintFormat("Local time: %s\n- Year: %u\n- Month: %02u\n- Day: %02u\n- Hour: %02u\n- Min: %02u\n- Sec: %02u",
        (string)time1, tm.year, tm.mon, tm.day, tm.hour, tm.min, tm.sec, tm.daysec);
    /*
    result:
    Local time: 2024.04.18 19:44:09
    - Year: 2024
    - Month: 04
    - Day: 18
    - Hour: 19
    - Min: 44
    - Sec: 09
    */
}
```

```
- Sec: 09
- Day of Year: 108
- Day of Week: 4 (THURSDAY)
*/
}
```

TimeGMT

Returns the GMT, which is calculated taking into account the DST switch by the local time on the computer where the client terminal is running. There are 2 variants of the function.

Call without parameters

```
datetime TimeGMT();
```

Call with MqlDateTime type parameter

```
datetime TimeGMT(
    MqlDateTime& dt_struct    // Variable of structure type
);
```

Parameters

dt_struct

[out] Variable of structure type [MqlDateTime](#).

Return Value

Value of [datetime](#) type

Note

If the MqlDateTime structure type variable has been passed as a parameter, it is filled accordingly.

To arrange high-resolution counters and timers, use the [GetTickCount\(\)](#) function, which produces values in milliseconds.

During testing in the strategy tester, TimeGMT() is always equal to [TimeTradeServer\(\)](#) simulated server time.

Example:

```
void OnStart()
{
    //--- declare the MqlDateTime variable to be filled with date/time data and get the PC
    MqlDateTime tm={};
    datetime time1=TimeLocal();           // first form of call: PC local time
    datetime time2=TimeGMT(tm);           // second form of call: GMT calculated from
    int shift=int(time1-time2)/3600;      // local time offset relative to GMT

    //--- display local time and GMT with the data of the filled MqlDateTime structure in
    PrintFormat("Time Local: %s\nTime GMT: %s\n- Year: %u\n- Month: %02u\n- Day: %02u\n-
                "- Hour: %02u\n- Min: %02u\n- Sec: %02u\n- Day of Year: %03u\n- Day of
                (string)time1, (string)time2, tm.year, tm.mon, tm.day, tm.hour, tm.min,
                EnumToString((ENUM_DAY_OF_WEEK)tm.day_of_week), shift);

    /*
    result:
    Time Local: 2024.04.18 19:37:23
    Time GMT: 2024.04.18 12:37:23
    - Year: 2024
```

```
- Month: 04
- Day: 18
- Hour: 12
- Min: 37
- Sec: 23
- Day of Year: 108
- Day of Week: 4 (THURSDAY)
Local time offset relative to GMT: +7
*/
}
```

TimeDaylightSavings

Returns correction for daylight saving time in seconds, if the switch to summer time has been made. It depends on the time settings of your computer.

```
int TimeDaylightSavings();
```

Return Value

If switch to winter (standard) time has been made, it returns 0.

Example:

```
void OnStart()
{
    //-- get daylight saving time adjustment in seconds
    int sec_dl=TimeDaylightSavings();

    //-- create the text describing the received value
    string text=(sec_dl==0 ? "Standard \"winter\" time is used" :
        StringFormat("Daylight saving time has been switched over. The correct

    //-- display a description of the daylight saving time adjustment in seconds in the l
    Print(text);
    /*
    result for "winter" time:
    Standard "winter" time is used

    result for "summer" time:
    Daylight saving time has been switched over. The correction is -3600 seconds
    */
}
```

TimeGMTOffset

Returns the current difference between GMT time and the local computer time in seconds, taking into account switch to winter or summer time. Depends on the time settings of your computer.

```
int TimeGMTOffset();
```

Return Value

The value of int type, representing the current difference between [GMT time](#) and the local time of the computer [TimeLocal](#) in seconds.

```
TimeGMTOffset() = TimeGMT() - TimeLocal()
```

Example:

```
void OnStart()
{
//--- get local time, GMT and the difference between GMT and local computer time in seconds
datetime time_local=TimeLocal();
datetime time_gmt  =TimeGMT();
int      offset    =TimeGMTOffset();

//--- show the obtained time and offset values in the log
PrintFormat("Local Time: %s, GMT Time: %s, Seconds Offset: %d", (string)time_local, (string)time_gmt, offset);
/*
result:
Local Time: 2024.04.18 19:35:52, GMT Time: 2024.04.18 12:35:52, Seconds Offset: -25200
*/
}
```

TimeToStruct

Converts a value of datetime type (number of seconds since 01.01.1970) into a structure variable [MqlDateTime](#).

```
bool TimeToStruct (
    datetime      dt,           // date and time
    MqlDateTime&  dt_struct     // structure for the adoption of values
);
```

Parameters

dt

[in] Date value to convert.

dt_struct

[out] Variable of structure type [MqlDateTime](#).

Return Value

True if successful, otherwise false. To get information about the error, call the [GetLastError\(\)](#) function.

Example:

```
void OnStart()
{
    //--- get the last known time of the server, declare the date/time structure and fill
    datetime   time=TimeCurrent();
    MqlDateTime tm  ={};
    if(!TimeToStruct(time,tm))
        Print("TimeToStruct() failed. Error ", GetLastError());

    //--- display the obtained server time and the result of filling the MqlDateTime struct
    PrintFormat("Server time: %s\n- Year: %u\n- Month: %02u\n- Day: %02u\n- Hour: %02u\n- Min: %02u\n- Sec: %02u\n",
        (string)time, tm.year, tm.mon, tm.day, tm.hour, tm.min, tm.sec, tm.day_
    /*
    result:
    Server time: 2024.04.18 15:47:27
    - Year: 2024
    - Month: 04
    - Day: 18
    - Hour: 15
    - Min: 47
    - Sec: 27
    - Day of Year: 108
    - Day of Week: 4 (THURSDAY)
    */
}
```

StructToTime

Converts a structure variable [MqlDateTime](#) into a value of [datetime](#) type and returns the resulting value.

```
datetime StructToTime(
    MqlDateTime& dt_struct    // structure of the date and time
);
```

Parameters

dt_struct

[in] Variable of structure type MqlDateTime.

Return Value

The value of datetime type containing the number of seconds since 01.01.1970.

Example:

```
#property script_show_inputs

input int   InpYear  = 0;    // Year
input int   InpMonth = 0;    // Month
input int   InpDay   = 0;    // Day
input int   InpHour  = 0;    // Hour
input int   InpMin   = 0;    // Minutes
input int   InpSec   = 0;    // Seconds

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- adjust the entered values and write them to variables
    int year = (InpYear<1970 ? 1970 : InpYear); // If the year entered is less than 1970
    int month= (InpMonth<1 ? 1 : InpMonth > 12 ? 12 : InpMonth);
    int day  = (InpDay <1 ? 1 : InpDay  > 31 ? 31 : InpDay);
    int hour = (InpHour <0 ? 0 : InpHour > 23 ? 23 : InpHour);
    int min  = (InpMin  <0 ? 0 : InpMin  > 59 ? 59 : InpMin);
    int sec  = (InpSec  <0 ? 0 : InpSec  > 59 ? 59 : InpSec);

    //--- display the entered values in the log
    PrintFormat("Entered date and time: %04u.%02u.%02u %02u:%02u:%02u", InpYear, InpMonth, InpDay, InpHour, InpMin, InpSec);

    //--- display the adjusted entered values in the log
    PrintFormat("Corrected date and time: %04u.%02u.%02u %02u:%02u:%02u", year, month, day, hour, min, sec);

    //--- write the input values to the corresponding structure fields
    MqlDateTime time_struct={};
    time_struct.year= year;
```

```
time_struct.mon = month;
time_struct.day = day;
time_struct.hour= hour;
time_struct.min = min;
time_struct.sec = sec;

//--- convert the date and time from the structure into a variable of datetime type and
datetime time = StructToTime(time_struct);

//--- display the result of conversion from an MqlDateTime structure type variable to
Print("Converted date and time: ",TimeToString(time,TIME_DATE|TIME_MINUTES|TIME_SECONDS));
/*
results if zero default values are entered:
Entered date and time: 0000.00.00 00:00:00
Corrected date and time: 1970.01.01 00:00:00
Converted date and time: 1970.01.01 00:00:00

results if the wrong day of the current year's February is entered:
Entered date and time: 2024.02.31 00:00:00
Corrected date and time: 2024.02.31 00:00:00
Converted date and time: 2024.03.02 00:00:00
*/
}
```

Account Information

Functions that return parameters of the current account.

Function	Action
<u>AccountInfoDouble</u>	Returns a value of double type of the corresponding account property
<u>AccountInfoInteger</u>	Returns a value of integer type (bool, int or long) of the corresponding account property
<u>AccountInfoString</u>	Returns a value string type corresponding account property

AccountInfoDouble

Returns the value of the appropriate account property.

```
double AccountInfoDouble(  
    ENUM_ACCOUNT_INFO_DOUBLE property_id    // Property identifier  
);
```

Parameters

property_id

[in] Property identifier. The value can be one of the values of [ENUM_ACCOUNT_INFO_DOUBLE](#).

Return Value

Value of [double](#) type.

Example:

```
void OnStart()  
{  
    //--- Show all the information available from the function AccountInfoDouble()  
    printf("ACCOUNT_BALANCE = %G", AccountInfoDouble(ACCOUNT_BALANCE));  
    printf("ACCOUNT_CREDIT = %G", AccountInfoDouble(ACCOUNT_CREDIT));  
    printf("ACCOUNT_PROFIT = %G", AccountInfoDouble(ACCOUNT_PROFIT));  
    printf("ACCOUNT_EQUITY = %G", AccountInfoDouble(ACCOUNT_EQUITY));  
    printf("ACCOUNT_MARGIN = %G", AccountInfoDouble(ACCOUNT_MARGIN));  
    printf("ACCOUNT_MARGIN_FREE = %G", AccountInfoDouble(ACCOUNT_MARGIN_FREE));  
    printf("ACCOUNT_MARGIN_LEVEL = %G", AccountInfoDouble(ACCOUNT_MARGIN_LEVEL));  
    printf("ACCOUNT_MARGIN_SO_CALL = %G", AccountInfoDouble(ACCOUNT_MARGIN_SO_CALL));  
    printf("ACCOUNT_MARGIN_SO_SO = %G", AccountInfoDouble(ACCOUNT_MARGIN_SO_SO));  
}
```

See also

[SymbolInfoDouble](#), [SymbolInfoString](#), [SymbolInfoInteger](#), [PrintFormat](#)

AccountInfoInteger

Returns the value of the appropriate account property.

```
long AccountInfoInteger(
    ENUM_ACCOUNT_INFO_INTEGER property_id    // Identifier of the property
);
```

Parameters

property_id

[in] Property identifier. The value can be one of the values of [ENUM_ACCOUNT_INFO_INTEGER](#).

Return Value

Value of [long](#) type.

Note

The property must be of [bool](#), [int](#) or [long](#) type.

Example:

```
void OnStart()
{
    //--- Show all the information available from the function AccountInfoInteger()
    printf("ACCOUNT_LOGIN = %d",AccountInfoInteger(ACCOUNT_LOGIN));
    printf("ACCOUNT_LEVERAGE = %d",AccountInfoInteger(ACCOUNT_LEVERAGE));
    bool thisAccountTradeAllowed=AccountInfoInteger(ACCOUNT_TRADE_ALLOWED);
    bool EATradeAllowed=AccountInfoInteger(ACCOUNT_TRADE_EXPERT);
    ENUM_ACCOUNT_TRADE_MODE tradeMode=(ENUM_ACCOUNT_TRADE_MODE)AccountInfoInteger(ACCOUNT_TRADE_MODE);
    ENUM_ACCOUNT_STOPOUT_MODE stopOutMode=(ENUM_ACCOUNT_STOPOUT_MODE)AccountInfoInteger(ACCOUNT_STOPOUT_MODE);

    //--- Inform about the possibility to perform a trade operation
    if(thisAccountTradeAllowed)
        Print("Trade for this account is permitted");
    else
        Print("Trade for this account is prohibited!");

    //--- Find out if it is possible to trade on this account by Expert Advisors
    if(EATradeAllowed)
        Print("Trade by Expert Advisors is permitted for this account");
    else
        Print("Trade by Expert Advisors is prohibited for this account!");

    //--- Find out the account type
    switch(tradeMode)
    {
        case(ACCOUNT_TRADE_MODE_DEMO):
            Print("This is a demo account");
            break;
        case(ACCOUNT_TRADE_MODE_CONTEST):
```

```
        Print("This is a competition account");
        break;
    default:Print("This is a real account!");
}

//--- Find out the StopOut level setting mode
switch(stopOutMode)
{
    case(ACCOUNT_STOPOUT_MODE_PERCENT):
        Print("The StopOut level is specified percentage");
        break;
    default:Print("The StopOut level is specified in monetary terms");
}
}
```

See also[Account Information](#)

AccountInfoString

Returns the value of the appropriate account property.

```
string AccountInfoString(  
    ENUM_ACCOUNT_INFO_STRING property_id    // Property identifier  
);
```

Parameters

property_id

[in] Property identifier. The value can be one of the values of [ENUM_ACCOUNT_INFO_STRING](#).

Return Value

Value of [string](#) type.

Example:

```
void OnStart()  
{  
    ///--- Show all the information available from the function AccountInfoString()  
    Print("The name of the broker = ",AccountInfoString(ACCOUNT_COMPANY));  
    Print("Deposit currency = ",AccountInfoString(ACCOUNT_CURRENCY));  
    Print("Client name = ",AccountInfoString(ACCOUNT_NAME));  
    Print("The name of the trade server = ",AccountInfoString(ACCOUNT_SERVER));  
}
```

[Account Information](#)

State Checking

Functions that return parameters of the current state of the client terminal

Function	Action
<u>GetLastError</u>	Returns the last error
<u>IsStopped</u>	Returns true, if an mql5 program has been commanded to stop its operation
<u>UninitializeReason</u>	Returns the code of the reason for deinitialization
<u>TerminalInfoInteger</u>	Returns an integer value of a corresponding property of the mql5 program environment
<u>TerminalInfoDouble</u>	Returns a double value of a corresponding property of the mql5 program environment
<u>TerminalInfoString</u>	Returns a string value of a corresponding property of the mql5 program environment
<u>MQLInfoInteger</u>	Returns an integer value of a corresponding property of a running mql5 program
<u>MQLInfoString</u>	Returns a string value of a corresponding property of a running mql5 program
<u>Symbol</u>	Returns the name of a symbol of the current chart
<u>Period</u>	Returns the current chart timeframe
<u>Digits</u>	Returns the number of decimal digits determining the accuracy of the price value of the current chart symbol
<u>Point</u>	Returns the point size of the current symbol in the quote currency

GetLastError

Returns the contents of the system variable [_LastError](#).

```
int GetLastError();
```

Return Value

Returns the value of the last [error](#) that occurred during the execution of an mql5 program.

Note

After the function call, the contents of `_LastError` are not reset. To reset this variable, you need to call [ResetLastError\(\)](#).

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    MqlRates rates[1]={};    // display the current bar data here

    //-- intentionally call a function with inappropriate parameters
    int res=CopyRates(NULL, PERIOD_CURRENT, 0, 2, rates);
    if(res!=2)
        PrintFormat("CopyRates() returned %d. LastError %d", res, GetLastError());

    //-- reset the last error code before copying the current bar data to the MqlRates st
    ResetLastError();

    //-- if the function does not work correctly, the error code will differ from 0
    CopyRates(NULL, PERIOD_CURRENT, 0, 1, rates);
    Print("CopyRates() error ", GetLastError());

    //-- print the array of obtained values
    ArrayPrint(rates);
}
```

See also

[Trade Server Return Codes](#)

IsStopped

Checks the forced shutdown of an mql5 program.

```
bool IsStopped();
```

Return Value

Returns true, if the [_StopFlag](#) system variable contains a value other than 0. A nonzero value is written into `_StopFlag`, if a mql5 program has been commanded to complete its operation. In this case, you must immediately terminate the program, otherwise the program will be completed forcibly from the outside after 3 seconds.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- in an endless loop with a stop check
    while(!IsStopped())
    {
        //--- display the local PC time on the chart
        Comment("Time Local: ", TimeToString(TimeLocal(), TIME_DATE|TIME_MINUTES|TIME_SECONDS), "\n");
        Sleep(16);
    }
    Print("The StopFlag is set. The program will be stopped.");

    //--- clean up
    Comment("");
}
```

UninitializeReason

Returns the code of a [reason for deinitialization](#).

```
int UninitializeReason();
```

Return Value

Returns the value of [_UninitReason](#) which is formed before [OnDeinit\(\)](#) is called. Value depends on the reasons that led to deinitialization.

Example:

```
//+-----+
//| Expert initialization function |
//+-----+
int OnInit()
{
//--- get the deinitialization reason code into the 'reason' variable
    int reason=UninitializeReason();
//--- create a message string with a deinitialization reason and send the message to the
    string message=StringFormat("%s: Uninitialize reason code: %d (%s)", __FUNCTION__, reason);
    Print(message);
//--- successful
    return(INIT_SUCCEEDED);
}

//+-----+
//| Expert deinitialization function |
//+-----+
void OnDeinit(const int reason)
{
//--- create a message string with a deinitialization reason code from the 'reason' for
    string message=StringFormat("%s: Uninitialize reason code: %d (%s)", __FUNCTION__, reason);
    Print(message);
}

//+-----+
//| Expert tick function |
//+-----+
void OnTick()
{
}

//+-----+
//| Return a description of the deinitialization reason code |
//+-----+
string UninitializeReasonDescription(const int reason)
{
    switch(reason)
    {
        //--- the EA has stopped working calling the ExpertRemove() function
        case REASON_PROGRAM :
```

```

        return("Expert Advisor terminated its operation by calling the ExpertRemove()
//--- program removed from a chart
case REASON_REMOVE :
    return("Program has been deleted from the chart");
//--- program recompiled
case REASON_RECOMPILE :
    return("Program has been recompiled");
//--- symbol or chart period changed
case REASON_CHARTCHANGE :
    return("Symbol or chart period has been changed");
//--- chart closed
case REASON_CHARTCLOSE :
    return("Chart has been closed");
//--- inputs changed by user
case REASON_PARAMETERS :
    return("Input parameters have been changed by a user");
//--- another account has been activated or reconnection to the trade server has
case REASON_ACCOUNT :
    return("Another account has been activated or reconnection to the trade server
//--- another chart template applied
case REASON_TEMPLATE :
    return("A new template has been applied");
//--- OnInit() handler returned a non-zero value
case REASON_INITFAILED :
    return("This value means that OnInit() handler has returned a nonzero value");
//--- terminal closed
case REASON_CLOSE :
    return("Terminal has been closed");
}

//--- deinitialization reason unknown
return("Unknown reason");
}

```

TerminalInfoInteger

Returns the value of a corresponding property of the mql5 program environment.

```
int TerminalInfoInteger(  
    int property_id    // identifier of a property  
);
```

Parameters

property_id

[in] Identifier of a property. Can be one of the values of the [ENUM_TERMINAL_INFO_INTEGER](#) enumeration.

Return Value

Value of int type.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the build number of the running terminal and its "64-bit terminal" property  
    int build = TerminalInfoInteger(TERMINAL_BUILD);  
    bool x64   = TerminalInfoInteger(TERMINAL_X64);  
  
    //--- print the obtained terminal data in the journal  
    PrintFormat("MetaTrader 5 %s build %d", (x64 ? "x64" : "x32"), build);  
    /*  
    result:  
    MetaTrader 5 x64 build 4330  
    */  
}
```

TerminalInfoDouble

Returns the value of a corresponding property of the mql5 program environment.

```
double TerminalInfoDouble(  
    int property_id    // identifier of a property  
);
```

Parameters

property_id

[in] Identifier of a property. Can be one of the values of the [ENUM_TERMINAL_INFO_DOUBLE](#) enumeration.

Return Value

Value of double type.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the build number of the running terminal and its "64-bit terminal" property  
    int build = TerminalInfoInteger(TERMINAL_BUILD);  
    bool x64 = TerminalInfoInteger(TERMINAL_X64);  
  
    //--- print the obtained terminal data in the journal  
    PrintFormat("MetaTrader 5 %s build %d", (x64 ? "x64" : "x32"), build);  
    /*  
    result:  
    MetaTrader 5 x64 build 4330  
    */  
}
```

TerminalInfoString

Returns the value of a corresponding property of the mql5 program environment. The property must be of string type.

```
string TerminalInfoString(
    int property_id    // identifier of a property
);
```

Parameters

property_id

[in] Identifier of a property. Can be one of the values of the [ENUM_TERMINAL_INFO_STRING](#) enumeration.

Return Value

Value of string type.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get OS and terminal data
    string os_ver  = TerminalInfoString(TERMINAL_OS_VERSION);    // user's OS
    string name    = TerminalInfoString(TERMINAL_NAME);          // terminal name
    string path    = TerminalInfoString(TERMINAL_PATH);           // folder the terminal
    string data    = TerminalInfoString(TERMINAL_DATA_PATH);      // folder for storing
    string common  = TerminalInfoString(TERMINAL_COMMONDATA_PATH); // common folder for

    //--- send the obtained data to the journal
    PrintFormat("OS: %s\nTerminal: %s\n- Path: %s\n- Data path: %s\n- Common Data path: %s\n",
        os_ver, name, path, data, common);
    /*
    OS: Windows 10 build 19045
    Terminal: MetaTrader 5
    - Path: E:\MetaQuotes\MetaTrader 5
    - Data path: E:\MetaQuotes\MetaTrader 5
    - Common Data path: C:\Users\admin\AppData\Roaming\MetaQuotes\Terminal\Common
    */
}
```

MQLInfoInteger

Returns the value of a corresponding property of a running mql5 program.

```
int MQLInfoInteger(  
    int property_id    // identifier of a property  
);
```

Parameters

property_id

[in] Identifier of a property. Can be one of values of the [ENUM_MQL_INFO_INTEGER](#) enumeration.

Return Value

Value of int type.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the values of available and consumed memory for the MQL program  
    int limit = MQLInfoInteger(MQL_MEMORY_LIMIT);    // maximum possible amount of dynam  
    int used  = MQLInfoInteger(MQL_MEMORY_USED);     // memory size used by MQL5 program  
  
    //--- send the received values to the journal  
    PrintFormat("Maximum possible amount of dynamic memory for MQL5 program: %d Mb\n"+  
                "Memory used by MQL5 program: %d Mb", limit, used);  
  
    /*  
    result  
    Maximum possible amount of dynamic memory for MQL5 program: 8388608 Mb  
    Memory used by MQL5 program: 2 Mb  
    */  
}
```

MQLInfoString

Returns the value of a corresponding property of a running mql5 program.

```
string MQLInfoString(  
    int property_id    // Identifier of a property  
);
```

Parameters

property_id

[in] Identifier of a property. Can be one of the [ENUM_MQL_INFO_STRING](#) enumeration.

Return Value

Value of string type.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the launched program data  
    string name = MQLInfoString(MQL_PROGRAM_NAME); // name of the launched MQL5 program  
    string path = MQLInfoString(MQL_PROGRAM_PATH); // running program path  
  
    //--- send the obtained data to the journal  
    PrintFormat("Name of the running MQL program: '%s'\nPath of the running MQL program:  
    /*  
    result:  
    Name of the running MQL program: 'MQLInfoString'  
    Path of the running MQL program: E:\MetaQuotes\MetaTrader 5\MQL5\Scripts\MQLInfoSt  
    */  
}
```

Symbol

Returns the name of a symbol of the current chart.

```
string Symbol();
```

Return Value

Value of the [_Symbol](#) system variable, which stores the name of the current chart symbol.

Note

Unlike Expert Advisors, indicators and scripts, services are not bound to a specific chart. Therefore, [Symbol\(\)](#) returns an empty string ("") for a service.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the current chart symbol name
    string name = Symbol();

    //--- send the obtained data to the journal
    PrintFormat("Current chart symbol name: '%s'", name);
    /*
    result
    Current chart symbol name: 'EURUSD'
    */
}
```

Period

Returns the current chart timeframe.

```
ENUM_TIMEFRAMES Period();
```

Return Value

The contents of the [_Period](#) variable that contains the value of the current chart timeframe. The value can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration.

Note

Unlike Expert Advisors, indicators and scripts, services are not bound to a specific chart. Therefore, [Period\(\)](#) returns 0 for a service.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get the timeframe value of the current chart and its description
    ENUM_TIMEFRAMES period    = Period();
    string          timeframe = StringSubstr(EnumToString(period), 7);

//--- send the obtained data to the journal
    PrintFormat("Current chart timeframe: %s\nTimeframe value: %s (%d)",
               timeframe, EnumToString(period), period);

/*
result:
Current chart timeframe: H4
Timeframe value: PERIOD_H4 (16388)
*/
}
```

See also

[PeriodSeconds](#), [Chart timeframes](#), [Date and Time](#), [Visibility of objects](#)

Digits

Returns the number of decimal digits determining the accuracy of price of the current chart symbol.

```
int Digits();
```

Return Value

The value of the [_Digits](#) variable which stores the number of decimal digits determining the accuracy of price of the current chart symbol.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get the number of decimal places for the current chart symbol
    int digits = Digits();

//--- send the obtained data to the journal
    Print("Number of decimal digits for the current chart symbol: ", digits);
    /*
    result:
    Number of decimal digits for the current chart symbol: 5
    */
}
```

Point

Returns the point size of the current symbol in the quote currency.

```
double Point();
```

Return Value

The value of the [_Point](#) variable which stores the point size of the current symbol in the quote currency.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get the current symbol point size in the quote currency
    double point = Point();

//--- send the obtained data to the journal
    Print("Point size of the current symbol in the quote currency: ", DoubleToString(point, 5));
    /*
    result:
    Point size of the current symbol in the quote currency: 0.00001
    */
}
```

Event Handling

The MQL5 language provides handling of certain [predefined events](#). The functions for handling these events should be defined in an MQL5 program: function name, return type, a set of parameters (if any) and their types should strictly correspond to the description of an event handling function.

The client terminal event handler uses the return and parameter types to identify functions processing an event. If a certain function has some parameters or a return type not corresponding to the descriptions below, such a function cannot be used for handling an event.

Function	Description
OnStart	The function is called when the Start event occurs to perform actions set in the script
OnInit	The function is called in indicators and EAs when the Init event occurs to initialize a launched MQL5 program
OnDeinit	The function is called in indicators and EAs when the Deinit event occurs to de-initialize a launched MQL5 program
OnTick	The function is called in EAs when the NewTick event occurs to handle a new quote
OnCalculate	The function is called in indicators when the Calculate event occurs to handle price data changes
OnTimer	The function is called in indicators and EAs during the Timer periodic event generated by the terminal at fixed time intervals
OnTrade	The function is called in EAs during the Trade event generated at the end of a trading operation on a trade server
OnTradeTransaction	The function is called in EAs when the TradeTransaction event occurs to process a trade request execution results
OnBookEvent	The function is called in EAs when the BookEvent event occurs to process changes in the market depth
OnChartEvent	The function is called in indicators and EAs when the ChartEvent event occurs to process chart changes made by a user or an MQL5 program
OnTester	The function is called in EAs when the Tester event occurs to perform necessary actions after testing an EA on history data
OnTesterInit	The function is called in EAs when the TesterInit event occurs to perform necessary actions before optimization in the strategy tester
OnTesterDeinit	The function is called in EAs when the TesterDeinit event occurs after EA optimization in the strategy tester
OnTesterPass	The function is called in EAs when the TesterPass even occurs to handle an arrival of a new data frame during EA optimization in the strategy tester

The client terminal sends incoming events to corresponding open charts. Also, events may be generated by charts ([chart events](#)) or mql5 programs ([custom events](#)). Generating graphical object creation/deletion events can be enabled/disabled by setting the [CHART_EVENT_OBJECT_CREATE](#) and [CHART_EVENT_OBJECT_DELETE](#) chart properties. Each mql5 application and chart have their own queue of events where all newly arrived events are placed.

A program gets events only from the chart it is running on. All events are handled one after another in the order of their receipt. If the queue already contains the [NewTick](#) event or this event is in the processing stage, then the new NewTick event is not added to mql5 application queue. Similarly, if the [ChartEvent](#) is already in an mql5 program queue or such an event is being handled, then a new event of this type is not placed into a queue. Timer event handling is processed in the same way - if the [Timer](#) event is already in the queue or is being handled, no new timer event is set into a queue.

Event queues have a limited but sufficient size, so the queue overflow is unlikely for a correctly developed program. When the queue overflows, new events are discarded without being set into a queue.

It is strongly recommended not to use infinite loops to handle events. Possible exceptions are scripts handling a single [Start](#) event.

[Libraries](#) do not handle any events.

OnStart

The function is called in scripts and services when the [Start](#) event occurs. The function is intended for one-time execution of actions implemented in a program. There are two function types.

The version that returns the result

```
int OnStart(void);
```

Return Value

The value of [int](#) type displayed in the Journal tab.

The entry "script script_name removed (result code N)" is created in the terminal journal after a script execution is complete. Here N is a value returned by the OnStart() function.

The entry "service service_name stopped (result code N)" is created in the terminal journal after a service execution is complete. Here N is a value returned by the OnStart() function.

The OnStart() call that returns the execution result is recommended for use since it not only allows for a script or service execution, but also returns an error code or other useful data to analyze the program execution result.

The version without a result return is left only for compatibility with old codes. It is not recommended for use

```
void OnStart(void);
```

Note

OnStart() is the only function for handling events in scripts and services. No other events are sent to these programs. In turn, the [Start](#) event is not passed to EAs and custom indicators.

Sample script:

```
//--- macros for working with colors
#define XRGB(r,g,b)      (0xFF000000|(uchar)(r)<<16)|(uchar)(g)<<8)|(uchar)(b))
#define GETRGB(clr)      ((clr)&0xFFFFFF)

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- set a downward candle color
    Comment("Set a downward candle color");
    ChartSetInteger(0,CHART_COLOR_CANDLE_BEAR,GetRandomColor());
    ChartRedraw(); // update the chart immediately without waiting for a new tick
    Sleep(1000);   // pause for 1 second to see all the changes
//--- set an upward candle color
    Comment("Set an upward candle color");
    ChartSetInteger(0,CHART_COLOR_CANDLE_BULL,GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set the background color
```

```

    Comment("Set the background color");
    ChartSetInteger(0, CHART_COLOR_BACKGROUND, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set color of Ask line
    Comment("Set color of Ask line");
    ChartSetInteger(0, CHART_COLOR_ASK, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set color of Bid line
    Comment("Set color of Bid line");
    ChartSetInteger(0, CHART_COLOR_BID, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set color of a downward bar and a downward candle frame
    Comment("Set color of a downward bar and a downward candle frame");
    ChartSetInteger(0, CHART_COLOR_CHART_DOWN, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set color of a chart line and Doji candlesticks
    Comment("Set color of a chart line and Doji candlesticks");
    ChartSetInteger(0, CHART_COLOR_CHART_LINE, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set color of an upward bar and an upward candle frame
    Comment("Set color of an upward bar and an upward candle frame");
    ChartSetInteger(0, CHART_COLOR_CHART_UP, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set color of axes, scale and OHLC line
    Comment("Set color of axes, scale and OHLC line");
    ChartSetInteger(0, CHART_COLOR_FOREGROUND, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set a grid color
    Comment("Set a grid color");
    ChartSetInteger(0, CHART_COLOR_GRID, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set Last price color
    Comment("Set Last price color");
    ChartSetInteger(0, CHART_COLOR_LAST, GetRandomColor());
    ChartRedraw();
    Sleep(1000);
//--- set color of Stop Loss and Take Profit order levels
    Comment("Set color of Stop Loss and Take Profit order levels");
    ChartSetInteger(0, CHART_COLOR_STOP_LEVEL, GetRandomColor());
    ChartRedraw();
    Sleep(1000);

```

```
//--- set color of volumes and market entry levels
    Comment("Set color of volumes and market entry levels");
    ChartSetInteger(0, CHART_COLOR_VOLUME, GetRandomColor());
    ChartRedraw();
}

//+-----+
//| Return a randomly generated color |
//+-----+
color GetRandomColor()
{
    color clr=(color)GETRGB(XRGB(rand()%255, rand()%255, rand()%255));
    return clr;
}
```

[Event handling functions](#), [Program running](#), [Client terminal events](#)

OnInit

The function is called in indicators and EAs when the [Init](#) event occurs. It is used to initialize a running MQL5 program. There are two function types.

The version that returns the result

```
int OnInit(void);
```

Return Value

[int](#) type value, zero means successful initialization.

When returning [INIT_FAILED](#), the EA is forcibly unloaded from the chart.

When returning [INIT_FAILED](#), the indicator is not unloaded from the chart. The indicator remaining on the chart is non-operational – [event handlers](#) are not called in the indicator.

The OnInit() call that returns the execution result is recommended for use since it not only allows for program initialization, but also returns an error code in case of an early program termination.

The version without a result return is left only for compatibility with old codes. It is not recommended for use

```
void OnInit(void);
```

Note

The Init event is generated immediately after loading an EA or an indicator. The event is not generated for scripts. The OnInit() function is used to initialize an MQL5 program. If OnInit() has a return value of [int](#) type, the non-zero return code means failed initialization and generates the [Deinit](#) event with the [REASON_INITFAILED](#) deinitialization reason code.

OnInit() function of [void](#) type always means successful initialization and is not recommended for use.

For [optimizing](#) the EA [inputs](#), it is recommended to use values from the [ENUM_INIT_RETCODE](#) enumeration as a return code. These values are intended for establishing the optimization process management, including selection of the most suitable [test agents](#). It is possible to request data on agent configuration and resources (number of cores, free memory amount, etc.) using the [TerminalInfoInteger\(\)](#) function during the EA initialization before launching the test. Based on the obtained data, you can either allow using the test agent or ban it from optimizing the EA.

ID	Description
INIT_SUCCEEDED	Initialization successful, EA test can be continued. This code means the same as the zero value - the EA initialization in the tester is successful.
INIT_FAILED	Initialization failed. There is no point in continuing the test due to unavoidable errors. For example, it is impossible to create an indicator necessary for the EA operation. The return of this value means the same as returning the value different from zero - EA initialization in the tester failed.

ID	Description
INIT_PARAMETERS_INCORRECT	<p>Designed to denote an incorrect set of input parameters by a programmer. In the general optimization table, the result string with this return code is highlighted in red.</p> <p>A test for such a set of EA inputs is not performed. The agent is ready to receive a new task.</p> <p>When this value is received, the strategy tester does not pass this task to other agents for repeated execution.</p>
INIT_AGENT_NOT_SUITABLE	<p>No program execution errors during initialization. However, for some reasons, the agent is not suitable for conducting a test. For example, there is not enough RAM, no OpenCL support, etc.</p> <p>After returning this code, the agent no longer receives tasks until the very end of this optimization.</p>

Using [OnInit\(\)](#) returning INIT_FAILED/INIT_PARAMETERS_INCORRECT in the tester have some peculiarities that should be considered when optimizing EAs:

- the set of parameters the OnInit() returned INIT_PARAMETERS_INCORRECT for is considered unsuitable for testing and is not used to obtain the next population during [genetic optimization](#). Too many "discarded" parameter sets may lead to incorrect results when searching for optimal EA parameters. The search algorithm assumes that the [optimization criterion](#) function is smooth and has no gaps on the entire multitude of input parameters.
- if OnInit() returns INIT_FAILED, this means that a test cannot be launched, and the EA is unloaded from the agent's memory. The EA is loaded again to perform the next pass with a new set of parameters. Launching the next optimization pass takes much more time as compared to calling TesterStop().

Sample OnInit() function for an EA

```
//--- input parameters
input int      ma_period=20; // moving average period

//--- handle of the indicator used in the EA
int indicator_handle;
//+-----+
//| Expert initialization function |
//+-----+
int OnInit()
{
//--- check ma_period validity
if(ma_period<=0)
{
PrintFormat("Invalid ma_period input value: %d",ma_period);
return (INIT_PARAMETERS_INCORRECT);
}
//--- during optimization
if(MQLInfoInteger(MQL_OPTIMIZATION))
{
```

```
//--- check available RAM for the agent
int available_memory_mb=TerminalInfoInteger(TERMINAL_MEMORY_TOTAL);
if(available_memory_mb<2000)
{
    PrintFormat("Insufficient memory for the test agent: %d MB",
                available_memory_mb);
    return (INIT_AGENT_NOT_SUITABLE);
}
}

//--- check for the indicator
indicator_handle=iCustom(_Symbol,_Period,"My_Indicator",ma_period);
if(indicator_handle==INVALID_HANDLE)
{
    PrintFormat("Failed to generate My_Indicator handle. Error code %d",
                GetLastError());
    return (INIT_FAILED);
}

//--- EA initialization successful
return(INIT_SUCCEEDED);
}
```

[OnDeinit](#), [Event handling functions](#), [Program running](#), [Client terminal events](#), [Initialization of variables](#), [Creating and deleting objects](#)

OnDeinit

The function is called in indicators and EAs when the [Deinit](#) event occurs. It is used to deinitialize a running MQL5 program.

```
void OnDeinit(
    const int reason    // deinitialization reason code
);
```

Parameters

reason

[in] Deinitialization reason code.

Return Value

No return value

Note

Deinit event is generated for EAs and indicators in the following cases:

- before a re-initialization due to the change of a symbol or a chart period the mql5 program is attached to;
- before a re-initialization due to the change of the [inputs](#);
- before unloading an mql5 program.

The *reason* parameter may have the following values:

Constant	Value	Description
REASON_PROGRAM	0	The EA has stopped working calling the ExpertRemove() function
REASON_REMOVE	1	Program removed from a chart
REASON_RECOMPILE	2	Program recompiled
REASON_CHARTCHANGE	3	A symbol or a chart period is changed
REASON_CHARTCLOSE	4	Chart closed
REASON_PARAMETERS	5	Inputs changed by a user
REASON_ACCOUNT	6	Another account has been activated or reconnection to the trade server has occurred due to changes in the account settings
REASON_TEMPLATE	7	Another chart template applied
REASON_INITFAILED	8	The OnInit() handler returned a non-zero value
REASON_CLOSE	9	Terminal closed

[EA](#) deinitialization reason codes can be received by the [UninitializeReason\(\)](#) function or from the predefined [_UninitReason](#) variable.

Sample [OnInit\(\)](#) and [OnDeinit\(\)](#) functions for the EA

```

input int fake_parameter=3;          // useless parameter
//+-----+
//| Expert initialization function      |
//+-----+
int OnInit()
{
//--- Get the number of a build where the program is compiled
    Print(__FUNCTION__, " Build #", __MQLBUILD__);
//--- Reset reason code can also be obtained in OnInit()
    Print(__FUNCTION__, " Deinitialization reason code can be received during the EA res
//--- The first way to get a deinitialization reason code
    Print(__FUNCTION__, " _UninitReason = ",getUninitReasonText(_UninitReason));
//--- The second way to get a deinitialization reason code
    Print(__FUNCTION__, " UninitializeReason() = ",getUninitReasonText(UninitializeReas
//---
    return(INIT_SUCCEEDED);
}
//+-----+
//| Expert deinitialization function    |
//+-----+
void OnDeinit(const int reason)
{
//--- The first way to get a deinitialization reason code
    Print(__FUNCTION__, " Deinitialization reason code = ",reason);
//--- The second way to get a deinitialization reason code
    Print(__FUNCTION__, " _UninitReason = ",getUninitReasonText(_UninitReason));
//--- The third way to get a deinitialization reason code
    Print(__FUNCTION__, " UninitializeReason() = ",getUninitReasonText(UninitializeReas
}
//+-----+
//| Return a textual description of the deinitialization reason code |
//+-----+
string getUninitReasonText(int reasonCode)
{
    string text="";
//---
    switch(reasonCode)
    {
        case REASON_ACCOUNT:
            text="Account was changed";break;
        case REASON_CHARTCHANGE:
            text="Symbol or timeframe was changed";break;
        case REASON_CHARTCLOSE:
            text="Chart was closed";break;
        case REASON_PARAMETERS:
            text="Input-parameter was changed";break;
        case REASON_RECOMPILE:
            text="Program "+__FILE__+" was recompiled";break;
    }
}

```

```
case REASON_REMOVE:
    text="Program "+__FILE__+" was removed from chart";break;
case REASON_TEMPLATE:
    text="New template was applied to chart";break;
default:text="Another reason";
}
//---
return text;
}
```

OnTick

The function is called in EAs when the [NewTick](#) event occurs to handle a new quote.

```
void OnTick(void);
```

Return Value

No return value

Note

The [NewTick](#) event is generated only for EAs upon receiving a new tick for a symbol of the chart the EA is attached to. There is no point in defining the OnTick() function in a custom indicator or a script since a NewTick event is not generated for them.

The Tick event is generated only for EAs, but this does not mean that EAs have to feature the OnTick() function, since Timer, BookEvent and ChartEvent events are also generated for EAs in addition to NewTick.

All events are handled one after another in the order of their receipt. If the queue already contains the [NewTick](#) event or this event is in the processing stage, then the new NewTick event is not added to mql5 application queue.

The NewTick event is generated regardless of whether auto trading is enabled (AutoTrading button). Disabled auto trading means only a ban on sending trade requests from an EA. The EA operation is not stopped.

Disabling auto trading by pressing the AutoTrading button does not interrupt the current execution of the OnTick() function.

Example of the EA featuring its entire trading logic in the OnTick() function

```
//+-----+
//|                                     TradeByATR.mq5 |

[Event handling functions](#), [Program running](#), [Client terminal events](#), [OnTimer](#), [OnBookEvent](#), [OnChartEvent](#)

OnCalculate

The function is called in the indicators when the [Calculate](#) event occurs for processing price data changes. There are two function types. Only one of them can be used within a single indicator.

Calculation based on data array

```
int OnCalculate(
    const int      rates_total,      // price[] array size
    const int      prev_calculated,  // number of handled bars at the previous call
    const int      begin,            // index number in the price[] array meaningful
    const double&   price[])         // array of values for calculation
    ;
```

Calculations based on the current timeframe timeseries

```
int OnCalculate(
    const int      rates_total,      // size of input time series
    const int      prev_calculated,  // number of handled bars at the previous call
    const datetime& time[],          // Time array
    const double&   open[],          // Open array
    const double&   high[],          // High array
    const double&   low[],           // Low array
    const double&   close[],         // Close array
    const long&     tick_volume[],    // Tick Volume array
    const long&     volume[],         // Real Volume array
    const int&      spread[])         // Spread array
    ;
```

Parameters

rates_total

[in] Size of the price[] array or input series available to the indicator for calculation. In the second function type, the parameter value corresponds to the number of bars on the chart it is launched at.

prev_calculated

[in] Contains the value returned by the OnCalculate() function during the previous call. It is designed to skip the bars that have not changed since the previous launch of this function.

begin

[in] Index value in the price[] array meaningful data starts from. It allows you to skip missing or initial data, for which there are no correct values.

price[]

[in] Array of values for calculations. One of the price [timeseries](#) or a calculated indicator buffer can be passed as the price[] array. Type of data passed for calculation can be defined using the [AppliedTo](#) predefined variable.

time{}

[in] Array with bar open time values.

open[]

[in] Array with Open price values.

high[]

[in] Array with High price values.

low[]

[in] Array with Low price values.

close[]

[in] Array with Close price values.

tick_volume[]

[in] Array with tick volume values.

volume[]

[in] Array with trade volume values.

spread[]

[in] Array with spread values for bars.

Return Value

int type value to be passed as the *prev_calculated* parameter during the next function call.

Note

If the OnCalculate() function is equal to zero, no indicator values are shown in the DataWindow of the client terminal.

If the price data have been changed since the last call of the OnCalculate() function (a deeper history has been loaded or gaps in the history have been filled), the value of the *prev_calculated* input parameter is set to zero by the terminal itself.

To define the indexing direction in the *time[]*, *open[]*, *high[]*, *low[]*, *close[]*, *tick_volume[]*, *volume[]* and *spread[]* arrays, call the [ArrayGetAsSeries\(\)](#) function. In order not to depend on defaults, call the [ArraySetAsSeries\(\)](#) function for the arrays to work with.

When using the first function type, a necessary timeseries or indicator is selected by a user as the *price[]* array in the Parameters tab when launching the indicator. To do this, specify the necessary element in the drop-down list of the ["Apply to"](#) field.

To get [custom indicator](#) values from other mql5 programs, the [iCustom\(\)](#) function is used. It returns the indicator handle for subsequent operations. It is also possible to specify the required *price []* array or the handle of another indicator. This parameter should be passed the last in the list of input variables of a custom indicator.

It is necessary to use the connection between the value returned by the OnCalculate() function and the *prev_calculated* second input parameter. When calling the function, the *prev_calculated* parameter contains the value returned by the OnCalculate() function during the previous call. This makes it possible to implement resource-saving algorithms for calculating a custom indicator in order to avoid repetitive calculations for the bars that have not changed since the previous launch of this function.

OnTimer

The function is called in EAs during the [Timer](#) event generated by the terminal at fixed time intervals.

```
void OnTimer(void);
```

Return Value

No return value

Note

The Timer event is periodically generated by the client terminal for an EA, which activated the timer using the [EventSetTimer\(\)](#) function. Usually, this function is called in the [OnInit\(\)](#) function. When the EA stops working, the timer should be eliminated using [EventKillTimer\(\)](#), which is usually called in the [OnDeinit\(\)](#) function.

Each Expert Advisor and each indicator work with its own timer receiving events solely from this timer. During mql5 application shutdown, the timer is forcibly destroyed in case it has been created but has not been disabled by [EventKillTimer\(\)](#) function.

If you need to receive timer events more frequently than once per second, use [EventSetMillisecondTimer\(\)](#) for creating a high-resolution timer.

In general, when the timer period is reduced, the testing time is increased, as the handler of timer events is called more often. When working in real-time mode, timer events are generated no more than 1 time in 10-16 milliseconds due to hardware limitations.

Only one timer can be launched for each program. Each mql5 application and chart have their own queue of events where all newly arrived events are placed. If the queue already contains [Timer](#) event or this event is in the processing stage, then the new Timer event is not added to mql5 application queue.

Sample EA with the OnTimer() handler

OnTrade

The function is called in EAs when the [Trade](#) event occurs. The function is meant for processing changes in order, position and trade lists.

```
void OnTrade(void);
```

Return Value

No return value

Note

OnTrade() is called only for Expert Advisors. It is not used in indicators and scripts even if you add there a function with the same name and type.

For any trade action (placing a pending order, opening/closing a position, placing stops, activating pending orders, etc.), the history of orders and trades and/or the list of positions and current orders is changed appropriately.

When handling an order, a trade server sends the terminal a message about the incoming [Trade](#) event. To retrieve relevant data on orders and trades from history, it is necessary to perform a trading history request using [HistorySelect\(\)](#) first.

The trade events are generated by the server in case of:

- changing active orders,
- changing positions,
- changing deals,
- changing trade history.

Each [Trade](#) event may appear as a result of one or several trade requests. Trade requests are sent to the server using [OrderSend\(\)](#) or [OrderSendAsync\(\)](#). Each request can lead to several trade events. You cannot rely on the statement "One request - one Trade event", since the processing of events may be performed in several stages, and each operation may change the state of orders, positions and the trade history.

[OnTrade\(\)](#) handler is called after the appropriate [OnTradeTransaction\(\)](#) calls. In general, there is no exact correlation in the number of OnTrade () and OnTradeTransaction () calls. One OnTrade() call corresponds to one or several OnTradeTransaction calls.

Sample EA with OnTrade() handler

```

[OrderSend](#), [OrderSendAsync](#), [OnTradeTransaction](#), [Client terminal events](#)

OnTradeTransaction

The function is called in EAs when the [TradeTransaction](#) event occurs. The function is meant for handling trade request execution results.

```
void OnTradeTransaction()
{
    const MqlTradeTransaction&    trans,    // trade transaction structure
    const MqlTradeRequest&        request,    // request structure
    const MqlTradeResult&         result    // response structure
};
```

Parameters

trans

[in] [MqlTradeTransaction](#) type variable describing a transaction made on a trading account.

request

[in] [MqlTradeRequest](#) type variable describing a trade request that led to a transaction. It contains the values for [TRADE_TRANSACTION_REQUEST](#) type transaction only.

result

[in] [MqlTradeResult](#) type variable containing an execution result of a trade request that led to a transaction. It contains the values for [TRADE_TRANSACTION_REQUEST](#) type transaction only.

Return Value

No return value

Note

OnTradeTransaction() is called to handle the [TradeTransaction](#) event sent by the trade server to the terminal in the following cases:

- sending a trade request from an MQL5 program using the [OrderSend\(\)/OrderSendAsync\(\)](#) functions and its subsequent execution;
- sending a trade request manually via the GUI and its subsequent execution;
- activations of pending and stop orders on the server;
- performing operations on the trade server side.

Data on transaction type is contained in the *type* field of the *trans* variable. Types of trade transactions are described in the [ENUM_TRADE_TRANSACTION_TYPE](#) enumeration:

- [TRADE_TRANSACTION_ORDER_ADD](#) - adding a new active order
- [TRADE_TRANSACTION_ORDER_UPDATE](#) - changing an existing order
- [TRADE_TRANSACTION_ORDER_DELETE](#) - deleting an order from the list of active ones
- [TRADE_TRANSACTION_DEAL_ADD](#) - adding a deal to history
- [TRADE_TRANSACTION_DEAL_UPDATE](#) - changing a deal in history
- [TRADE_TRANSACTION_DEAL_DELETE](#) - deleting a deal from history
- [TRADE_TRANSACTION_HISTORY_ADD](#) - adding an order to history as a result of execution or cancelation
- [TRADE_TRANSACTION_HISTORY_UPDATE](#) - changing an order in the order history
- [TRADE_TRANSACTION_HISTORY_DELETE](#) - deleting an order from the order history
- [TRADE_TRANSACTION_POSITION](#) - position change not related to a trade execution

- `TRADE_TRANSACTION_REQUEST` - notification that a trade request has been processed by the server and the result of its processing has been received.

When handling transactions of `TRADE_TRANSACTION_REQUEST` type, it is necessary to analyze the second and third parameters of the `OnTradeTransaction()` function - *request* and *result* - to receive additional information.

Sending a buy trade request leads to a chain of trade transactions on a trading account: 1) request is accepted for processing, 2) an appropriate purchase order is created for the account, 3) the order is then executed, 4) the executed order is removed from the list of active ones, 5) adding to the history of orders, 6) the subsequent transaction is added to history and 7) a new position is created. All these stages are [trade transactions](#). The arrival of each such transaction to the terminal is the [TradeTransaction](#) event. Priority of these transactions' arrival at the terminal is not guaranteed. Thus, you should not expect that one group of transactions will arrive after another one when developing your trading algorithm.

When transactions are processed by the EA's `OnTradeTransaction()` handler, the terminal goes on handling the incoming trade transactions. Thus, the trading account status may change at the course of `OnTradeTransaction()` operation. For example, while an MQL5 program handles adding a new order, it can be executed, deleted from the list of open orders and moved to history. The program is notified of all these events.

Transactions queue length comprises 1024 elements. If `OnTradeTransaction()` handles yet another transaction for too long, the previous ones can be superseded by new transactions in the queue.

[OnTrade\(\)](#) handler is called after the appropriate `OnTradeTransaction()` calls. In general, there is no exact correlation in the number of `OnTrade()` and `OnTradeTransaction()` calls. One `OnTrade()` call corresponds to one or several `OnTradeTransaction` calls.

Each [Trade](#) event may appear as a result of one or several trade requests. Trade requests are sent to the server using [OrderSend\(\)](#) or [OrderSendAsync\(\)](#). Each request can lead to several trade events. You cannot rely on the statement "One request - one Trade event", since the processing of events may be performed in several stages and each operation may change the state of orders, positions and the trade history.

Sample EA with `OnTradeTransaction()` handler

```
//+-----+
//|                                     OnTradeTransaction_Sample.mq5 |

OnBookEvent

The function is called in indicators and EAs when the [BookEvent](#) event occurs. It is meant for handling Depth of Market changes.

```
void OnBookEvent (
    const string& symbol // symbol
);
```

Parameters

symbol

[in] Name of a symbol the [BookEvent](#) has arrived for

Return Value

No return value

Note

To get the BookEvent events for any symbol, simply subscribe to receive them for this symbol using the [MarketBookAdd\(\)](#) function. To cancel subscription for receiving the BookEvent for a certain symbol, call the [MarketBookRelease\(\)](#) function.

The BookEvent broadcasts within the entire chart. This means that if one application on a chart subscribes to the BookEvent using the MarketBookAdd function, all other indicators and EAs launched on the same chart and having the OnBookEvent() handler receive this event as well. Therefore, it is necessary to analyze a symbol name passed to the OnBookEvent() handler as the *symbol* parameter.

Separate BookEvent counters sorted by symbols are provided for all applications running on the same chart. This means that each chart may have multiple subscriptions to different symbols, and a counter is provided for each symbol. Subscribing and unsubscribing from BookEvent changes the subscription counter for specified symbols only within one chart. In other words, there may be two adjacent charts to the BookEvent for the same symbol but different subscription counter values.

The initial subscription counter value is zero. At each [MarketBookAdd\(\)](#) call, the subscription counter for a specified symbol on the chart is increased by one (chart symbol and symbol in MarketBookAdd() do not have to match). When calling [MarketBookRelease\(\)](#), the counter of subscriptions for a specified symbol within the chart is decreased by one. The BookEvent events for any symbol are broadcast within the chart till the counter is equal to zero. Therefore, it is important that each MQL5 program that contains [MarketBookAdd \(\)](#) calls correctly unsubscribes from getting events for each symbol using [MarketBookRelease \(\)](#) at the end of its work. To achieve this, the number of [MarketBookAdd\(\)](#) and [MarketBookRelease\(\)](#) calls should be even for each call during the entire MQL5 program lifetime. Using flags or custom subscription counters within the program allows you to safely work with BookEvent events and prevents disabling subscriptions for getting this event in third-party programs within the same chart.

[BookEvent](#) events are never skipped and are always placed into a queue even if handling the previous BookEvent handling is not over yet.

Example

OnChartEvent

The function is called in indicators and EAs when the [ChartEvent](#) event occurs. The function is meant for handling chart changes made by a user or an MQL5 program.

```
void OnChartEvent ()
{
    const int      id,          // event ID
    const long&    lparam,      // long type event parameter
    const double&  dparam,      // double type event parameter
    const string&  sparam       // string type event parameter
};
```

Parameters

id

[in] Event ID from the [ENUM_CHART_EVENT](#) enumeration.

lparam

[in] [long](#) type event parameter

dparam

[in] [double](#) type event parameter

sparam

[in] [string](#) type event parameter

Return Value

No return value

Note

There are 11 types of events that can be handled using the predefined OnChartEvent() function. 65535 IDs from CHARTEVENT_CUSTOM to CHARTEVENT_CUSTOM_LAST inclusive are provided for custom events. To generate a custom event, use the [EventChartCustom\(\)](#) function.

Short event description from the [ENUM_CHART_EVENT](#) enumeration:

- CHARTEVENT_KEYDOWN – pressing a key on the keyboard when a chart window is in focus;
- CHARTEVENT_MOUSE_MOVE – moving the mouse and mouse button clicks (if [CHART_EVENT_MOUSE_MOVE](#)=true for a chart);
- CHARTEVENT_OBJECT_CREATE – create a [graphical object](#) (if [CHART_EVENT_OBJECT_CREATE](#)=true for a chart);
- CHARTEVENT_OBJECT_CHANGE – change object properties via the properties dialog;
- CHARTEVENT_OBJECT_DELETE – delete a graphical object (if [CHART_EVENT_OBJECT_DELETE](#)=true for a chart);
- CHARTEVENT_CLICK – clicking on a chart;
- CHARTEVENT_OBJECT_CLICK – mouse click on a graphical object belonging to a chart;
- CHARTEVENT_OBJECT_DRAG – dragging a graphical object with a mouse;
- CHARTEVENT_OBJECT_ENDEDIT – finish editing text in the Edit input box of a graphical object ([OBJ_EDIT](#));
- CHARTEVENT_CHART_CHANGE – change a chart;

- CHARTEVENT_CUSTOM+n – custom event ID, where n is within the range from 0 to 65535. CHARTEVENT_CUSTOM_LAST contains the last acceptable custom event ID (CHARTEVENT_CUSTOM+65535).

All [MQL5 programs](#) work in threads other than the main thread of the application. The main application thread is responsible for handling all Windows system messages and, in its turn, generates Windows messages for its own application as a result of this handling. For example, moving the mouse on a chart (WM_MOUSE_MOVE event) generates several system messages for subsequent rendering of the application window, and also sends internal messages to experts and indicators launched on the chart. A situation may occur, where the main application thread has not yet processed the WM_PAINT system message (and therefore has not yet rendered the modified chart), while an EA or an indicator has already received the mouse movement event. In this case, the chart property CHART_FIRST_VISIBLE_BAR will be changed only after the chart is rendered.

For each event type, the inputs of the OnChartEvent() function have certain values necessary for handling that event. The table lists events and values passed via the parameters.

Event	'id' parameter value	'lparam' parameter value	'dparam' parameter value	'sparam' parameter value
Keystroke event	CHARTEVENT_KEYDOWN	pressed button code	The number of keypresses generated while the key was held in the pressed state	String value of the bit mask, which describes the status of the keyboard keys
Mouse events (if CHART_EVENT_MOUSE_MOVE =true for a chart)	CHARTEVENT_MOUSE_MOVE	X coordinate	Y coordinate	String value of the bit mask, which describes the status of the mouse keys
Mouse wheel event (if CHART_EVENT_MOUSE_WHEEL =true for the chart)	CHARTEVENT_MOUSE_WHEEL	Flags of states of keys and mouse buttons, X and Y coordinates of the cursor. See the description in the example	The Delta value of the mouse wheel scroll	—
Creating a graphical object (if CHART_EVENT_OBJECT_CREATE =true for a chart)	CHARTEVENT_OBJECT_CREATE	—	—	Name of a created graphical object
Changing object properties via the properties dialog	CHARTEVENT_OBJECT_CHANGE	—	—	Name of a changed graphical object

Event	'id' parameter value	'lparam' parameter value	'dparam' parameter value	'sparam' parameter value
Removing a graphical object (if CHART_EVENT_OBJECT_DELETE =true for a chart)	CHARTEVENT_OBJECT_DELETE	—	—	Name of a removed graphical object
Mouse click on a chart	CHARTEVENT_CLICK	X coordinate	Y coordinate	—
Mouse click on a graphical object	CHARTEVENT_OBJECT_CLICK	X coordinate	Y coordinate	Name of a graphical object the event has occurred on
Moving a graphical object with mouse	CHARTEVENT_OBJECT_DRAG	—	—	Name of a moved graphical object
Finishing a text editing in the "Input field" graphical object input box	CHARTEVENT_OBJECT_ENDEDIT	—	—	Name of the "Input field" graphical object, in which text editing completed
Resizing the chart or modifying the chart properties via the properties dialog window	CHARTEVENT_CHART_CHANGE	—	—	—
Custom event with N number	CHARTEVENT_CUSTOM+N	Value defined by the EventChartCustom() function	Value defined by the EventChartCustom() function	Value defined by the EventChartCustom() function

OnTester

The function is called in Expert Advisors when the [Tester](#) event occurs to perform necessary actions after testing.

```
double OnTester(void);
```

Return Value

Value of the custom criterion optimization for assessing test results.

Note

The OnTester() function can be used only when testing EAs and is intended primarily for the calculation of a value that is used as a 'Custom max' criterion when optimizing input parameters.

During the genetic optimization, sorting results within one generation is performed in descending order. This means that the results with the highest value are deemed the best from the optimization criterion point of view. The worst values for such sorting are placed at the end and are subsequently discarded. Therefore, they do not take part in forming the next generation.

Thus, the OnTester() function allows you not only to create and save your own test results reports, but also control the optimization process to find the best parameters of the trading strategy.

Below is an **example** of calculating the custom criterion optimization. The idea is to calculate the linear regression of the balance graph. It is described in the article [Optimizing a strategy using balance graph and comparing results with "Balance + max Sharpe Ratio" criterion](#).

[FileOpen](#), [FileWrite](#), [FileLoad](#), [FileSave](#)

OnTesterInit

The function is called in EAs when the [TesterInit](#) event occurs to perform necessary actions before optimization in the strategy tester. There are two function types.

The version that returns the result

```
int OnTesterInit(void);
```

Return Value

[int](#) type value, zero means successful initialization of an EA launched on a chart before optimization starts.

The OnTesterInit() call that returns the execution result is recommended for use since it not only allows for program initialization, but also returns an error code in case of an early optimization stop. Return of any value other than **INIT_SUCCEEDED** (0) means an error, no optimization is launched.

The version without a result return is left only for compatibility with old codes. Not recommended for use

```
void OnTesterInit(void);
```

Note

The [TesterInit](#) event is generated before EA optimization in the strategy tester starts. At this event, an EA having OnTesterDeInit() or OnTesterPass() event handler is automatically downloaded on a separate terminal chart. It has the symbol and the period that have been specified in the tester.

Such an event receives the [TesterInit](#), [TesterDeinit](#) and [TesterPass](#) events, but not [Init](#), [Deinit](#) and [NewTick](#) ones. Accordingly, all necessary logic for processing the results of each pass during optimization should be implemented in the [OnTesterInit \(\)](#), [OnTesterDeinit \(\)](#) and [OnTesterPass \(\)](#) handlers.

The result of each single pass during a strategy optimization can be passed via a frame from the [OnTester \(\)](#) handler using the [FrameAdd \(\)](#) function.

The OnTesterInit() function is used to initiate an Expert Advisor before start of optimization for further [processing of optimization results](#). It is always used together with the OnTesterDeinit() handler.

The time for OnTesterInit() execution is limited. If it is exceeded, the EA is forcibly stopped, while the optimization itself is canceled. A message is displayed in the tester journal:

```
TesterOnTesterInit works too long. Tester cannot be initialized.
```

The example is taken from [OnTick](#). The OnTesterInit() handler is added for setting optimization parameters:

```

OnTesterDeinit

The function is called in EAs when the [TesterDeinit](#) event occurs after EA optimization.

```
void OnTesterDeinit(void);
```

Return Value

No return value

Note

The [TesterDeinit](#) event is generated after the end of EA optimization in the strategy tester.

An EA having [OnTesterDeinit\(\)](#) or [OnTesterPass\(\)](#) event handler is automatically downloaded on a separate terminal chart during the optimization start. It has the symbol and the period that have been specified in the tester. The function is designed for the final processing of all [optimization results](#).

Keep in mind that optimization frames sent by test agents using the [FrameAdd\(\)](#) function may come in bundles and take time to deliver. Therefore, not all frames, as well as [TesterPass](#) events, may arrive and be processed in [OnTesterPass\(\)](#) before the end of optimization. If you want to receive all belated frames in [OnTesterDeinit\(\)](#), place the code block using the [FrameNext\(\)](#) function.

OnTesterPass

The function is called in EAs when the [TesterPass](#) event occurs for handling a new data frame during EA optimization.

```
void OnTesterPass(void);
```

Return Value

No return value

Note

The [TesterPass](#) event is generated automatically when receiving a frame during an Expert Advisor optimization in the strategy tester.

An EA having [OnTesterDeinit\(\)](#) or [OnTesterPass\(\)](#) event handler is automatically downloaded on a separate terminal chart during the optimization start. It has the symbol and the period that have been specified in the tester. The function is meant for handling frames received from test agents during optimization. The frame containing test results should be sent from the [OnTester\(\)](#) handler using the [FrameAdd\(\)](#) function.

Keep in mind that optimization frames sent by test agents using the [FrameAdd\(\)](#) function may come in bundles and take time to deliver. Therefore, not all frames, as well as [TesterPass](#) events, may arrive and be processed in [OnTesterPass\(\)](#) before the end of optimization. If you want to receive all belated frames in [OnTesterDeinit\(\)](#), place the code block using the [FrameNext\(\)](#) function.

After completing [OnTesterDeinit\(\)](#) optimization, it is possible to sort all received frames again using the [FrameFirst\(\)/FrameFilter](#) and [FrameNext\(\)](#) functions.

Getting Market Information

These are functions intended for receiving information about the market state.

Function	Action
SymbolsTotal	Returns the number of available (selected in Market Watch or all) symbols
SymbolExist	Checks if a symbol with a specified name exists
SymbolName	Returns the name of a specified symbol
SymbolSelect	Selects a symbol in the Market Watch window or removes a symbol from the window
SymbolsSynchronized	Checks whether data of a selected symbol in the terminal are synchronized with data on the trade server
SymbolInfoDouble	Returns the double value of the symbol for the corresponding property
SymbolInfoInteger	Returns a value of an integer type (long, datetime, int or bool) of a specified symbol for the corresponding property
SymbolInfoString	Returns a value of the string type of a specified symbol for the corresponding property
SymbolInfoMarginRate	Returns the margin rates depending on the order type and direction
SymbolInfoTick	Returns the current prices for the specified symbol in a variable of the MqlTick type
SymbolInfoSessionQuote	Allows receiving time of beginning and end of the specified quoting sessions for a specified symbol and day of week.
SymbolInfoSessionTrade	Allows receiving time of beginning and end of the specified trading sessions for a specified symbol and day of week.
MarketBookAdd	Provides opening of Depth of Market for a selected symbol, and subscribes for receiving notifications of the DOM changes
MarketBookRelease	Provides closing of Depth of Market for a selected symbol, and cancels the subscription for receiving notifications of the DOM changes
MarketBookGet	Returns a structure array MqlBookInfo containing records of the Depth of Market of a specified symbol

SymbolsTotal

Returns the number of available (selected in Market Watch or all) symbols.

```
int SymbolsTotal(  
    bool selected // True - only symbols in MarketWatch  
);
```

Parameters

selected

[in] Request mode. Can be true or false.

Return Value

If the 'selected' parameter is true, the function returns the number of symbols selected in MarketWatch. If the value is false, it returns the total number of all symbols.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the number of available symbols  
    int total    = SymbolsTotal(false); // all symbols on the server  
    int selected = SymbolsTotal(true);  // all symbols added to the Market Watch  
  
    //--- send the obtained data to the journal  
    PrintFormat("Number of available symbols on the server: %d\n"+  
                "Number of available symbols selected in MarketWatch: %d", total, selected);  
    /*  
    result:  
    Number of available symbols on the server: 140  
    Number of available symbols selected in MarketWatch: 11  
    */  
}
```

SymbolExist

Checks if a symbol with a specified name exists.

```
bool SymbolExist(
    const string name,    // symbol name
    bool& is_custom      // custom symbol property
);
```

Parameters

name

[in] Symbol name.

is_custom

[out] Custom symbol property set upon successful execution. If true, the detected symbol is a [custom](#) one.

Return Value

If false, the symbol is not found among standard and [custom ones](#).

Example:

```
#define SYMBOL_NAME "GBPUSDn"
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- declare the custom symbol flag and check the presence of a symbol having its name
    bool custom = false;
    bool result = SymbolExist(SYMBOL_NAME, custom);

    //--- declare the default 'symbol not found' message text
    string text = StringFormat("The symbol '%s' was not found among either the standard or custom symbols.", SYMBOL_NAME);

    //--- if a symbol is found, create a message text depending on which list the symbol is found in
    if(result)
    {
        //--- if this is a standard symbol
        if(!custom)
            text = StringFormat("The '%s' symbol is available on the server.", SYMBOL_NAME);
        //--- if this is a custom symbol
        else
            text = StringFormat("The symbol '%s' was found in the list of custom symbols.", SYMBOL_NAME);
    }

    //--- send the message about the check result to the journal
    Print(text);
    /*
```

```
result for standard 'GBPUSD' symbol:  
The 'GBPUSD' symbol is available on the server.  
  
result for custom 'GBPUSDx' symbol:  
The symbol 'GBPUSDx' was found in the list of custom symbols.  
  
result for missing 'GBPUSDn' symbol:  
The symbol 'GBPUSDn' was not found among either the standard or custom symbols.  
*/  
}
```

See also

[SymbolsTotal](#), [SymbolSelect](#), [Custom symbols](#)

SymbolName

Returns the name of a symbol.

```
string SymbolName(  
    int    pos,           // number in the list  
    bool   selected       // true - only symbols in MarketWatch  
);
```

Parameters

pos

[in] Order number of a symbol.

selected

[in] Request mode. If the value is true, the symbol is taken from the list of symbols selected in MarketWatch. If the value is false, the symbol is taken from the general list.

Return Value

Value of string type with the symbol name.

Example:

```
#define SYMBOL_NAME "GBPHKD"  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- set the flag of the server symbol search result  
    bool found = false;  
  
    //--- find the 'SYMBOL_NAME' symbol in the list of all server symbols  
    int total = SymbolsTotal(false);  
    for(int i=0; i<total; i++)  
    {  
        //--- get a symbol name in the list by loop index  
        string name = SymbolName(i, false);  
  
        //--- if this is the desired symbol, send its name and position in the list to f  
        if(name == SYMBOL_NAME)  
        {  
            PrintFormat("The '%s' symbol was found in the list of server symbols at index  
            found = true;  
            break;  
        }  
    }  
  
    //--- if a symbol is not found on the server, report this before shutting down
```

```
if(!found)
    PrintFormat("The '%s' symbol was not found on the server.", SYMBOL_NAME);
}
```

SymbolSelect

Selects a symbol in the Market Watch window or removes a symbol from the window.

```
bool SymbolSelect(
    string name,      // symbol name
    bool select       // add or remove
);
```

Parameters

name

[in] Symbol name.

select

[in] Switch. If the value is false, a symbol should be removed from MarketWatch, otherwise a symbol should be selected in this window. A symbol can't be removed if the symbol chart is open, or there are open positions for this symbol.

Return Value

In case of failure returns false.

Example:

```
#define SYMBOL_NAME "GBPHKD"

//+-----+
//| Script program start function |
//+-----+

void OnStart()
{
    //--- check for the presence of a symbol in the lists, if not found, report it and cor
    bool custom = false;
    if(!SymbolExist(SYMBOL_NAME, custom))
    {
        PrintFormat("%s' symbol not found in the lists", SYMBOL_NAME);
        return;
    }

    //--- add a symbol to the Market Watch window
    ResetLastError();
    if(!SymbolSelect(SYMBOL_NAME, true))
    {
        Print("SymbolSelect() failed. Error ", GetLastError());
        return;
    }

    //--- if a symbol is successfully added to the list, get its index in the Market Watch
    int index = SymbolIndex(SYMBOL_NAME);
    PrintFormat("The '%s' symbol has been added to the MarketWatch list. Symbol index : ");
```

```

//--- now remove the symbol from the Market Watch window
ResetLastError();
if(!SymbolSelect(SYMBOL_NAME, false))
{
    Print("SymbolSelect() failed. Error ", GetLastError());
    return;
}

//--- if a symbol is successfully removed from the list, its index in the Market Watch
index = SymbolIndex(SYMBOL_NAME);
PrintFormat("The '%s' symbol has been removed from the MarketWatch list. Symbol index in the list is %d", SYMBOL_NAME, index);

/*
result:
The 'GBPHKD' symbol has been added to the MarketWatch list. Symbol index in the list is 0
The 'GBPHKD' symbol has been removed from the MarketWatch list. Symbol index in the list is 0
*/
}

//+-----+
//| Return the symbol index in the Market Watch symbol list |
//+-----+
int SymbolIndex(const string symbol)
{
    int total = SymbolsTotal(true);
    for(int i=0; i<total; i++)
    {
        string name = SymbolName(i, true);
        if(name == symbol)
            return i;
    }
    return(WRONG_VALUE);
}

```

SymbolsSynchronized

The function checks whether data of a selected symbol in the terminal are synchronized with data on the trade server.

```
bool SymbolsSynchronized(
    string name,      // symbol name
);
```

Parameters

name

[in] Symbol name.

Return value

If data are [synchronized](#), returns 'true'; otherwise returns 'false'.

Example:

```
#define SYMBOL_NAME "EURUSD"

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the flag for synchronizing data in the terminal using the 'SYMBOL_NAME' symbol
    bool sync = SymbolsSynchronized(SYMBOL_NAME);

    //--- create a message depending on the synchronization flag
    string text = StringFormat("The data on the '%s' symbol in the terminal is synchronized", SYMBOL_NAME);
    if(!sync)
        text = StringFormat("The data for the '%s' symbol in the terminal is not synchronized", SYMBOL_NAME);

    //--- send the obtained result to the journal
    Print(text);

    /*
    result for synchronized data:
    The data on the 'EURUSD' symbol in the terminal is synchronized with the data on the trade server.

    result for data not yet synchronized:
    The data for the 'GBPHKD' symbol in the terminal is not synchronized with the data on the trade server.
    */
}
```

See also

[SymbolInfoInteger](#), [Organizing Data Access](#)

SymbolInfoDouble

Returns the corresponding property of a specified symbol. There are 2 variants of the function.

1. Immediately returns the property value.

```
double SymbolInfoDouble(
    string          name,          // symbol
    ENUM_SYMBOL_INFO_DOUBLE prop_id // identifier of the property
);
```

2. Returns true or false depending on whether a function is successfully performed. In case of success, the value of the property is placed into a recipient variable, passed by reference by the last parameter.

```
bool SymbolInfoDouble(
    string          name,          // symbol
    ENUM_SYMBOL_INFO_DOUBLE prop_id, // identifier of the property
    double&         double_var    // here we accept the property value
);
```

Parameters

name

[in] Symbol name.

prop_id

[in] Identifier of a symbol property. The value can be one of the values of the [ENUM_SYMBOL_INFO_DOUBLE](#) enumeration.

double_var

[out] Variable of double type receiving the value of the requested property.

Return Value

The value of double type. In case of execution failure, information about the [error](#) can be obtained using [GetLastError\(\)](#) function:

- 5040 - invalid string parameter for specifying a symbol name,
- 4301 - unknown symbol (financial instrument),
- 4302 - symbol is not selected in "Market Watch" (not found in the list of available ones),
- 4303 - invalid identifier of a symbol property.

Note

It is recommended to use [SymbolInfoTick\(\)](#) if the function is used for getting information about the last tick. It may well be that not a single quote has appeared yet since the terminal is connected to a trading account. In such a case, the requested value will be indefinite.

In most cases, it is enough to use [SymbolInfoTick\(\)](#) function allowing a user to receive the values of Ask, Bid, Last, Volume and the time of the last tick's arrival during a single call.

The [SymbolInfoMarginRate\(\)](#) function provides data on the amount of charged margin depending on the order type and direction.

Example:

```
void OnTick()
{
    ///--- obtain spread from the symbol properties
    bool spreadfloat=SymbolInfoInteger(Symbol(),SYMBOL_SPREAD_FLOAT);
    string comm=StringFormat("Spread %s = %I64d points\r\n",
                             spreadfloat?"floating":"fixed",
                             SymbolInfoInteger(Symbol(),SYMBOL_SPREAD));
    ///--- now let's calculate the spread by ourselves
    double ask=SymbolInfoDouble(Symbol(),SYMBOL_ASK);
    double bid=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    double spread=ask-bid;
    int spread_points=(int)MathRound(spread/SymbolInfoDouble(Symbol(),SYMBOL_POINT));
    comm=comm+"Calculated spread = "+(string)spread_points+" points";
    Comment(comm);
}
```

SymbolInfoInteger

Returns the corresponding property of a specified symbol. There are 2 variants of the function.

1. Immediately returns the property value.

```
long SymbolInfoInteger(  
    string          name,          // symbol  
    ENUM_SYMBOL_INFO_INTEGER prop_id // identifier of a property  
  
);
```

2. Returns true or false depending on whether a function is successfully performed. In case of success, the value of the property is placed into a recipient variable, passed by reference by the last parameter.

```
bool SymbolInfoInteger(  
    string          name,          // symbol  
    ENUM_SYMBOL_INFO_INTEGER prop_id, // identifier of a property  
    long&          long_var      // here we accept the property value  
  
);
```

Parameters

name

[in] Symbol name.

prop_id

[in] Identifier of a symbol property. The value can be one of the values of the [ENUM_SYMBOL_INFO_INTEGER](#) enumeration.

long_var

[out] Variable of the long type receiving the value of the requested property.

Return Value

The value of long type. In case of execution failure, information about the [error](#) can be obtained using [GetLastError\(\)](#) function:

- 5040 - invalid string parameter for specifying a symbol name,
- 4301 - unknown symbol (financial instrument),
- 4302 - symbol is not selected in "Market Watch" (not found in the list of available ones),
- 4303 - invalid identifier of a symbol property.

Note

It is recommended to use [SymbolInfoTick\(\)](#) if the function is used for getting information about the last tick. It may well be that not a single quote has appeared yet since the terminal is connected to a trading account. In such a case, the requested value will be indefinite.

In most cases, it is enough to use [SymbolInfoTick\(\)](#) function allowing a user to receive the values of Ask, Bid, Last, Volume and the time of the last tick's arrival during a single call.

Example:

```
void OnTick()
{
    //--- obtain spread from the symbol properties
    bool spreadfloat=SymbolInfoInteger(Symbol(),SYMBOL_SPREAD_FLOAT);
    string comm=StringFormat("Spread %s = %I64d points\r\n",
                             spreadfloat?"floating":"fixed",
                             SymbolInfoInteger(Symbol(),SYMBOL_SPREAD));
    //--- now let's calculate the spread by ourselves
    double ask=SymbolInfoDouble(Symbol(),SYMBOL_ASK);
    double bid=SymbolInfoDouble(Symbol(),SYMBOL_BID);
    double spread=ask-bid;
    int spread_points=(int)MathRound(spread/SymbolInfoDouble(Symbol(),SYMBOL_POINT));
    comm=comm+"Calculated spread = "+(string)spread_points+" points";
    Comment(comm);
}
```

SymbolInfoString

Returns the corresponding property of a specified symbol. There are 2 variants of the function.

1. Immediately returns the property value.

```
string SymbolInfoString(
    string          name,          // Symbol
    ENUM_SYMBOL_INFO_STRING prop_id // Property identifier
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a placeholder variable passed by reference in the last parameter.

```
bool SymbolInfoString(
    string          name,          // Symbol
    ENUM_SYMBOL_INFO_STRING prop_id, // Property identifier
    string&         string_var    // here we accept the property value
);
```

Parameters

name

[in] Symbol name.

prop_id

[in] Identifier of a symbol property. The value can be one of the values of the [ENUM_SYMBOL_INFO_STRING](#) enumeration.

string_var

[out] Variable of the string type receiving the value of the requested property.

Return Value

The value of string type. In case of execution failure, information about the [error](#) can be obtained using [GetLastError\(\)](#) function:

- 5040 - invalid string parameter for specifying a symbol name,
- 4301 - unknown symbol (financial instrument),
- 4302 - symbol is not selected in "Market Watch" (not found in the list of available ones),
- 4303 - invalid identifier of a symbol property.

Note

It is recommended to use [SymbolInfoTick\(\)](#) if the function is used for getting information about the last tick. It may well be that not a single quote has appeared yet since the terminal is connected to a trading account. In such a case, the requested value will be indefinite.

In most cases, it is enough to use [SymbolInfoTick\(\)](#) function allowing a user to receive the values of Ask, Bid, Last, Volume and the time of the last tick's arrival during a single call.

Example:

```
#define SYMBOL_NAME "USDJPY"
```

```

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get string data for SYMBOL_NAME symbol
    string currency_base   = SymbolInfoString(SYMBOL_NAME, SYMBOL_CURRENCY_BASE); //
    string currency_profit = SymbolInfoString(SYMBOL_NAME, SYMBOL_CURRENCY_PROFIT); //
    string currency_margin = SymbolInfoString(SYMBOL_NAME, SYMBOL_CURRENCY_MARGIN); //
    string symbol_descript = SymbolInfoString(SYMBOL_NAME, SYMBOL_DESCRIPTION); //

//--- create a message text with the obtained data
    string text=StringFormat("Symbol %s:\n"+
                             "- Currency Base: %s\n"+
                             "- Currensy Profit: %s\n"+
                             "- Currency Margin: %s\n"+
                             "- Symbol Description: %s",
                             SYMBOL_NAME, currency_base,
                             currency_profit, currency_margin,
                             symbol_descript);

//--- send the obtained data to the journal
    Print(text);
    /*
    Symbol USDJPY:
    - Currency Base: USD
    - Currensy Profit: JPY
    - Currency Margin: USD
    - Symbol Description: US Dollar vs Yen
    */
}

```

SymbolInfoMarginRate

Returns the margin rates depending on the order type and direction.

```
bool SymbolInfoMarginRate(
    string          name,           // symbol name
    ENUM_ORDER_TYPE order_type,     // order type
    double&         initial_margin_rate, // initial margin rate
    double&         maintenance_margin_rate // maintenance margin rate
);
```

Parameters

name

[in] Symbol name.

order_type

[in] Order type.

initial_margin_rate

[in] A [double](#) type variable for receiving an initial margin rate. Initial margin is a security deposit for 1 lot deal in the appropriate direction. Multiplying the rate by the initial margin, we receive the amount of funds to be reserved on the account when placing an order of the specified type.

maintenance_margin_rate

[out] A [double](#) type variable for receiving a maintenance margin rate. Maintenance margin is a minimum amount for maintaining an open position of 1 lot in the appropriate direction. Multiplying the rate by the maintenance margin, we receive the amount of funds to be reserved on the account after an order of the specified type is activated.

Return Value

Returns true if request for properties is successful, otherwise false.

Example:

```
#define SYMBOL_NAME Symbol()

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- declare the variables the ratios are set into
    double initial_margin_rate = 0; // initial margin rate
    double maintenance_margin_rate = 0; // maintenance margin rate

    //--- get and send the SYMBOL_NAME symbol ratios for the Buy market order to the journal
    SymbolInfoMarginRatePrint(SYMBOL_NAME, ORDER_TYPE_BUY, initial_margin_rate, maintenance_margin_rate);

    //--- get and send the SYMBOL_NAME symbol ratios for the Sell market order to the journal
    SymbolInfoMarginRatePrint(SYMBOL_NAME, ORDER_TYPE_SELL, initial_margin_rate, maintenance_margin_rate);
}
```

```

/*
result:
Initial margin rate for symbol AFKS for the Buy market order: 0.225600
Maintenance margin rate for symbol AFKS for the Buy market order: 0.112800
Initial margin rate for symbol AFKS for the Sell market order: 0.254400
Maintenance margin rate for symbol AFKS for the Sell market order: 0.127200
*/
}

//+-----+
//| Send the margin ratios to the journal |
//+-----+
void SymbolInfoMarginRatePrint(const string symbol, const ENUM_ORDER_TYPE order_type,
{
//--- get the 'symbol' ratios for the order_type market order
ResetLastError();
if(!SymbolInfoMarginRate(symbol, order_type, initial_margin_rate, maintenance_margi
{
Print("SymbolInfoMarginRate() failed. Error ", GetLastError());
return;
}
}
//--- print the obtained ratio values
string type=(order_type==ORDER_TYPE_BUY ? "Buy" : order_type==ORDER_TYPE_SELL ? "Se
PrintFormat("Initial margin rate for symbol %s for the %s market order: %f\n"+
            "Maintenance margin rate for symbol %s for the %s market order: %f",
            SYMBOL_NAME, type, initial_margin_rate,
            SYMBOL_NAME, type, maintenance_margin_rate);
}

```

SymbolInfoTick

The function returns current prices of a specified symbol in a variable of the `MqlTick` type.

```
bool SymbolInfoTick(
    string      symbol,      // symbol name
    MqlTick&    tick         // reference to a structure
);
```

Parameters

symbol

[in] Symbol name.

tick

[out] Link to the structure of the [MqlTick](#) type, to which the current prices and time of the last price update will be placed.

Return Value

The function returns true if successful, otherwise returns false.

Example:

```
#define SYMBOL_NAME "EURUSD"

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- declare an array with the MqlTick structure type of dimension 1
    MqlTick tick[1]={};

    //--- get the latest prices for the SYMBOL_NAME symbol into the MqlTick structure
    if(!SymbolInfoTick(SYMBOL_NAME, tick[0]))
    {
        Print("SymbolInfoTick() failed. Error ", GetLastError());
        return;
    }

    //--- send the obtained data to the journal
    PrintFormat("Latest price data for the '%s' symbol:", SYMBOL_NAME);
    ArrayPrint(tick);
    /*
    result:
    Latest price data for the 'EURUSD' symbol:
                                [time]   [bid]   [ask] [last] [volume]   [time_msc] [flags] [volu
    [0] 2024.05.17 23:58:54 1.08685 1.08695 0.0000           0 1715990334319      6
    */
}
```

SymbolInfoSessionQuote

Allows receiving time of beginning and end of the specified quoting sessions for a specified symbol and day of week.

```
bool SymbolInfoSessionQuote(
    string          name,           // symbol name
    ENUM_DAY_OF_WEEK day_of_week,  // day of the week
    uint            session_index,  // session index
    datetime&       from,          // time of the session beginning
    datetime&       to             // time of the session end
);
```

Parameters

name

[in] Symbol name.

ENUM_DAY_OF_WEEK

[in] Day of the week, value of enumeration [ENUM_DAY_OF_WEEK](#).

uint

[in] Ordinal number of a session, whose beginning and end time we want to receive. Indexing of sessions starts with 0.

from

[out] Session beginning time in seconds from 00 hours 00 minutes, in the returned value date should be ignored.

to

[out] Session end time in seconds from 00 hours 00 minutes, in the returned value date should be ignored.

Return Value

If data for the specified session, symbol and day of the week are received, returns true, otherwise returns false.

Example:

```
#define SYMBOL_NAME    Symbol()
#define SESSION_INDEX  0

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- print the header with a symbol and SESSION_INDEX and
    //--- in a loop by day of the week from Mon to Fri, print the start and end times of t
    PrintFormat("Symbol %s, Quote session %d:", SYMBOL_NAME, SESSION_INDEX);
    for(int i=MONDAY; i<SATURDAY; i++)
```

```

        SymbolInfoSessionQuotePrint(SYMBOL_NAME, (ENUM_DAY_OF_WEEK)i, SESSION_INDEX);
    /*
    result:
    Symbol RU000A103661, Quote session 0:
    - Monday      06:45 - 00:00
    - Tuesday     06:45 - 00:00
    - Wednesday   06:45 - 00:00
    - Thursday    06:45 - 00:00
    - Friday      06:45 - 00:00
    */
}

//+-----+
//| Send the start and end times of the specified quote session      |
//| for the specified symbol and day of the week to the journal      |
//+-----+
void SymbolInfoSessionQuotePrint(const string symbol, const ENUM_DAY_OF_WEEK day_of_w
{
    //--- declare variables to record the beginning and end of the quote session
    datetime date_from; // session start time
    datetime date_to;   // session end time

    //--- get data from the quotation session by symbol and day of the week
    if(!SymbolInfoSessionQuote(symbol, day_of_week, session_index, date_from, date_to))
    {
        Print("SymbolInfoSessionQuote() failed. Error ", GetLastError());
        return;
    }

    //--- create the week day name from the enumeration constant
    string week_day=EnumToString(day_of_week);
    if(week_day.Lower())
        week_day.SetChar(0, ushort(week_day.GetChar(0)-32));

    //--- send data for the specified quote session to the journal
    PrintFormat("- %-10s %s - %s", week_day, TimeToString(date_from, TIME_MINUTES), Tir
}

```

See also

[Symbol Properties](#), [TimeToStr](#), [Data Structures](#)

SymbolInfoSessionTrade

Allows receiving time of beginning and end of the specified trading sessions for a specified symbol and day of week.

```
bool SymbolInfoSessionTrade(
    string          name,           // symbol name
    ENUM_DAY_OF_WEEK day_of_week,  // day of the week
    uint            session_index,  // session index
    datetime&       from,          // session beginning time
    datetime&       to             // session end time
);
```

Parameters

name

[in] Symbol name.

ENUM_DAY_OF_WEEK

[in] Day of the week, value of enumeration [ENUM_DAY_OF_WEEK](#).

uint

[in] Ordinal number of a session, whose beginning and end time we want to receive. Indexing of sessions starts with 0.

from

[out] Session beginning time in seconds from 00 hours 00 minutes, in the returned value date should be ignored.

to

[out] Session end time in seconds from 00 hours 00 minutes, in the returned value date should be ignored.

Return value

If data for the specified session, symbol and day of the week are received, returns true, otherwise returns false.

Example:

```
#define SYMBOL_NAME    Symbol()
#define SESSION_INDEX  0

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- print the header with a symbol and SESSION_INDEX and
    //--- in a loop by day of the week from Mon to Fri, print the start and end times of t
    PrintFormat("Symbol %s, Trade session %d:", SYMBOL_NAME, SESSION_INDEX);
    for(int i=MONDAY; i<SATURDAY; i++)
```

```

        SymbolInfoSessionTradePrint(SYMBOL_NAME, (ENUM_DAY_OF_WEEK)i, SESSION_INDEX);
    /*
    result:
    Symbol GBPUSD, Trade session 0:
    - Monday      00:15 - 23:55
    - Tuesday     00:15 - 23:55
    - Wednesday   00:15 - 23:55
    - Thursday    00:15 - 23:55
    - Friday      00:15 - 23:55
    */
}

//+-----+
//| Send the start and end times of the specified trade session      |
//| for the specified symbol and day of the week to the journal      |
//+-----+
void SymbolInfoSessionTradePrint(const string symbol, const ENUM_DAY_OF_WEEK day_of_w
{
    //--- declare variables to record the beginning and end of the trading session
    datetime date_from; // session start time
    datetime date_to;   // session end time

    //--- get data from the trading session by symbol and day of the week
    if(!SymbolInfoSessionTrade(symbol, day_of_week, session_index, date_from, date_to))
    {
        Print("SymbolInfoSessionTrade() failed. Error ", GetLastError());
        return;
    }

    //--- create the week day name from the enumeration constant
    string week_day=EnumToString(day_of_week);
    if(week_day.Lower())
        week_day.SetChar(0, ushort(week_day.GetChar(0)-32));

    //--- send data for the specified trading session to the journal
    PrintFormat("-- %-10s %s - %s", week_day, TimeToString(date_from, TIME_MINUTES), Tir
}

```

MarketBookAdd

Provides opening of Depth of Market for a selected symbol, and subscribes for receiving notifications of the DOM changes.

```
bool MarketBookAdd(
    string symbol    // symbol
);
```

Parameters

symbol

[in] The name of a symbol, whose Depth of Market is to be used in the Expert Advisor or script.

Return Value

The true value if opened successfully, otherwise false.

Note

Normally, this function must be called from the [OnInit\(\)](#) function or in the class constructor. To handle incoming alerts, in the Expert Advisor program must contain the function void [OnBookEvent](#)(string& symbol).

Example:

```
#define    SYMBOL_NAME    "GBPUSD"

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- open the market depth for SYMBOL_NAME symbol
    if(!MarketBookAdd(SYMBOL_NAME))
    {
        PrintFormat("MarketBookAdd(%) failed. Error ", SYMBOL_NAME, GetLastError());
        return;
    }

    //--- send the message about successfully opening the market depth to the journal
    PrintFormat("The MarketBook for the '%s' symbol was successfully opened and a subscrip

    //--- wait 2 seconds
    Sleep(2000);

    //--- upon completion, unsubscribe from the open market depth
    ResetLastError();
    if(MarketBookRelease(SYMBOL_NAME))
        PrintFormat("MarketBook for the '%s' symbol was successfully closed", SYMBOL_NAME)
    else
        PrintFormat("Error %d occurred when closing MarketBook using the '%s' symbol", C
```

```
/*  
result:  
The MarketBook for the 'GBPUSD' symbol was successfully opened and a subscription to  
MarketBook for the 'GBPUSD' symbol was successfully closed  
*/  
}
```

See also

[Structure of Depth of Market](#), [Structures and Classes](#)

MarketBookRelease

Provides closing of Depth of Market for a selected symbol, and cancels the subscription for receiving notifications of the DOM changes.

```
bool MarketBookRelease(
    string symbol    // symbol
);
```

Parameters

symbol

[in] Symbol name.

Return Value

The true value if closed successfully, otherwise false.

Note

Normally, this function must be called from the [OnDeinit\(\)](#) function, if the corresponding [MarketBookAdd\(\)](#) function has been called in the [OnInit\(\)](#) function. Or it must be called from the class destructor, if the corresponding [MarketBookAdd\(\)](#) function has been called from the class constructor.

Example:

```
#define SYMBOL_NAME "GBPUSD"

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- open the market depth for SYMBOL_NAME symbol
    if(!MarketBookAdd(SYMBOL_NAME))
    {
        PrintFormat("MarketBookAdd(%s) failed. Error ", SYMBOL_NAME, GetLastError());
        return;
    }

    //--- send the message about successfully opening the market depth to the journal
    PrintFormat("The MarketBook for the '%s' symbol was successfully opened and a subscrip

    //--- wait 2 seconds
    Sleep(2000);

    //--- upon completion, unsubscribe from the open market depth
    //--- send the message about successfully unsubscribing from the market depth or about
    ResetLastError();
    if(MarketBookRelease(SYMBOL_NAME))
        PrintFormat("MarketBook for the '%s' symbol was successfully closed", SYMBOL_NAME);
```

```
else
    PrintFormat("Error %d occurred when closing MarketBook using the '%s' symbol", C

/*
result:
The MarketBook for the 'GBPUSD' symbol was successfully opened and a subscription t
MarketBook for the 'GBPUSD' symbol was successfully closed
*/
}
```

See also

[Structure of Depth of Market](#), [Structures and Classes](#)

MarketBookGet

Returns a structure array [MqlBookInfo](#) containing records of the Depth of Market of a specified symbol.

```
bool MarketBookGet (
    string      symbol,      // symbol
    MqlBookInfo& book[]      // reference to an array
);
```

Parameters

symbol

[in] Symbol name.

book[]

[in] Reference to an array of Depth of Market records. The array can be pre-allocated for a sufficient number of records. If a [dynamic array](#) hasn't been pre-allocated in the operating memory, the client terminal will distribute the array itself.

Return Value

Returns true in case of success, otherwise false.

Note

The Depth of Market must be pre-opened by the [MarketBookAdd\(\)](#) function.

Example:

```
MqlBookInfo priceArray[];
bool getBook=MarketBookGet(NULL,priceArray);
if (getBook)
{
    int size=ArraySize(priceArray);
    Print("MarketBookInfo for ",Symbol());
    for(int i=0;i<size;i++)
    {
        Print(i+":",priceArray[i].price
            + "    Volume = "+priceArray[i].volume,
            " type = ",priceArray[i].type);
    }
}
else
{
    Print("Could not get contents of the symbol DOM ",Symbol());
}
```

Economic calendar functions

This section describes the functions for working with the [economic calendar](#) available directly in the MetaTrader platform. The economic calendar is a ready-made encyclopedia featuring descriptions of macroeconomic indicators, their release dates and degrees of importance. Relevant values of macroeconomic indicators are sent to the MetaTrader platform right at the moment of publication and are displayed on a chart as tags allowing you to visually track the required indicators by countries, currencies and importance.

All functions for working with the economic calendar use the trade server time ([TimeTradeServer](#)). This means that the time in the [MqlCalendarValue](#) structure and the time inputs in the [CalendarValueHistoryByEvent](#)/[CalendarValueHistory](#) functions are set in a trade server timezone, rather than a user's local time.

[Economic calendar functions](#) allow conducting the auto analysis of incoming events according to custom importance criteria from a perspective of necessary countries/currencies.

Function	Action
CalendarCountryById	Get a country description by its ID
CalendarEventById	Get an event description by its ID
CalendarValueById	Get an event value description by its ID
CalendarCountries	Get the array of country names available in the calendar
CalendarEventByCountry	Get the array of descriptions of all events available in the calendar by a specified country code
CalendarEventByCurrency	Get the array of descriptions of all events available in the calendar by a specified currency
CalendarValueHistoryByEvent	Get the array of values for all events in a specified time range by an event ID
CalendarValueHistory	Get the array of values for all events in a specified time range with the ability to sort by country and/or currency
CalendarValueLastByEvent	Get the array of event values by its ID since the calendar database status with a specified change_id
CalendarValueLast	Get the array of values for all events with the ability to sort by country and/or currency since the calendar database status with a specified change_id

CalendarCountryById

Get a country description by its ID.

```
bool CalendarCountryById(
    const long          country_id,      // country ID
    MqlCalendarCountry& country          // variable for receiving a country description
);
```

Parameters

country_id

[in] Country ID ([ISO 3166-1](#)).

country

[out] [MqlCalendarCountry](#) type variable for receiving a country description.

Return Value

Returns true if successful, otherwise - false. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 5402 - ERR_CALENDAR_NO_DATA (country is not found),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded).

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the list of countries from the economic calendar
    MqlCalendarCountry countries[];
    int count=CalendarCountries(countries);
    //--- check the result
    if(count==0)
        PrintFormat("CalendarCountries() returned 0! Error %d",GetLastError());
    //--- if there are two or more countries
    if(count>=2)
    {
        MqlCalendarCountry country;
        //--- now get a country description by its ID
        if(CalendarCountryById(countries[1].id, country))
        {
            //--- prepare a country description
            string descr="id = "+IntegerToString(country.id)+"\n";
            descr+=("name = " + country.name+"\n");
            descr+=("code = " + country.code+"\n");
            descr+=("currency = " + country.currency+"\n");
            descr+=("currency_symbol = " + country.currency_symbol+"\n");
```

```
        descr+=("url_name = " + country.url_name);  
        ///--- display a country description  
        Print(descr);  
    }  
    else  
        Print("CalendarCountryById() failed. Error ", GetLastError());  
    }  
    ///---  
    }  
    /*  
    Result:  
    id = 999  
    name = European Union  
    code = EU  
    currency = EUR  
    currency_symbol = €  
    url_name = european-union  
    */
```

See also

[CalendarCountries](#), [CalendarEventByCountry](#)

CalendarEventById

Get an event description by its ID.

```
bool CalendarEventById(  
    ulong          event_id,      // event ID  
    MqlCalendarEvent& event       // variable for receiving an event description  
);
```

Parameters

event_id

[in] Event ID.

event

[out] [MqlCalendarEvent](#) type variable for receiving an event description.

Return Value

Returns true if successful, otherwise - false. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 5402 - ERR_CALENDAR_NO_DATA (country is not found),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded).

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- country code for Germany (ISO 3166-1 Alpha-2)  
    string germany_code="DE";  
    //--- get Germany events  
    MqlCalendarEvent events[];  
    int events_count=CalendarEventByCountry(germany_code,events);  
    //--- display Germany events in the Journal  
    if(events_count>0)  
    {  
        PrintFormat("Germany events: %d",events_count);  
        ArrayPrint(events);  
    }  
    else  
    {  
        PrintFormat("Failed to receive events for the country code %s, error %d",  
            germany_code,GetLastError());  
        //--- script early completion  
        return;  
    }  
    //--- get description of the last event from the events[] array
```

```
MqlCalendarEvent event;
ulong event_id=events[events_count-1].id;
if(CalendarEventById(event_id,event))
{
    MqlCalendarCountry country;
    CalendarCountryById(event.country_id,country);
    PrintFormat("Event description with event_id=%d received",event_id);
    PrintFormat("Country: %s (country code = %d)",country.name,event.country_id);
    PrintFormat("Event name: %s",event.name);
    PrintFormat("Event code: %s",event.event_code);

[CalendarEventByCountry](#), [CalendarEventByCurrency](#), [CalendarValueById](#)

CalendarValueById

Get an event value description by its ID.

```
bool CalendarValueById(
    ulong          value_id,      // event value ID
    MqlCalendarValue& value       // variable for receiving an event value
);
```

Parameters

value_id

[in] Event value ID.

value

[out] [MqlCalendarValue](#) type variable for receiving an event description. See the [example of handling calendar events](#).

Return Value

Returns true if successful, otherwise - false. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 5402 - ERR_CALENDAR_NO_DATA (country is not found),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded).

Note

All functions for working with the economic calendar use the trade server time ([TimeTradeServer](#)). This means that the time in the [MqlCalendarValue](#) structure and the time inputs in the [CalendarValueHistoryByEvent](#)/[CalendarValueHistory](#) functions are set in a trade server timezone, rather than a user's local time.

The [MqlCalendarValue](#) structure provides methods for checking and setting values from the *actual_value*, *forecast_value*, *prev_value* and *revised_prev_value* fields. If no value is specified, the field stores **LONG_MIN** (-9223372036854775808).

Please note that the values stored in these field are multiplied by one million. It means that when you receive values in [MqlCalendarValue](#) using functions [CalendarValueById](#), [CalendarValueHistoryByEvent](#), [CalendarValueHistory](#), [CalendarValueLastByEvent](#) and [CalendarValueLast](#), you should check if the field values are equal to **LONG_MIN**; if a value is specified in a field, then you should divide the value by 1,000,000 in order to get the value. Another method to get the values is to check and to get values using the functions of the [MqlCalendarValue](#) structure.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- country code for Japan (ISO 3166-1 Alpha-2)
```

```

string japan_code="JP";
//--- set the boundaries of the interval we take the events from
datetime date_from=D'01.01.2018'; // take all events from 2018
datetime date_to=0; // 0 means all known events, including the ones
//--- get the array of the Japan event values
MqlCalendarValue values[];
int values_count=CalendarValueHistory(values,date_from,date_to,japan_code);
//--- move along the detected event values
if(values_count>0)
{
    PrintFormat("Number of values for Japan events: %d",values_count);
    //--- delete all "empty" values (actual_value== -9223372036854775808)
    for(int i=values_count-1;i>=0;i--)
    {
        if(values[i].actual_value== -9223372036854775808)
            ArrayRemove(values,i,1);
    }
    PrintFormat("Number of values after deleting empty ones: %d",ArraySize(values));
}
else
{
    PrintFormat("Failed to receive events for the country code %s, error %d",
        japan_code,GetLastError());
    //--- script early completion
    return;
}
//--- leave no more than 10 values in the values[] array
if(ArraySize(values)>10)
{
    PrintFormat("Reduce the list of values to 10 and display them");
    ArrayRemove(values,0,ArraySize(values)-10);
}
ArrayPrint(values);

//--- now let's display how to get an event value description based on the known value
for(int i=0;i<ArraySize(values);i++)
{
    MqlCalendarValue value;
    CalendarValueById(values[i].id,value);
    PrintFormat("%d: value_id=%d value=%d impact=%s",
        i,values[i].id,value.actual_value,EnumToString(ENUM_CALENDAR_EVENT_
    }
}
//---
}
/*
Result:
Number of values for Japan events: 1734
Number of values after deleting empty ones: 1017
Reduce the list of values to 10 and display them

```

CalendarCountries

Get the array of country names available in the Calendar.

```
int CalendarCountries(  
    MqlCalendarCountry& countries[] // array for receiving a list of Calendar  
);
```

Parameters

countries[]
[out] An array of [MqlCalendarCountry](#) type for receiving all Calendar countries' descriptions.

Return Value

Number of received descriptions. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded),
- 5400 - ERR_CALENDAR_MORE_DATA (array size is insufficient for receiving descriptions of all countries, only the ones that managed to fit in were received).

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the list of countries from the economic calendar  
    MqlCalendarCountry countries[];  
    int count=CalendarCountries(countries);  
    //--- display the array in the Journal  
    if(count>0)  
        ArrayPrint(countries);  
    else  
        PrintFormat("CalendarCountries() returned 0! Error %d",GetLastError());  
/*

[CalendarEventByCountry](#), [CalendarCountryById](#)

CalendarEventByCountry

Get the array of descriptions of all events available in the Calendar by a specified country code.

```
int  CalendarEventByCountry(
    string          country_code,      // country code name (ISO 3166-1 alpha-2)
    MqlCalendarEvent&  events[]        // variable for receiving the description array
);
```

Parameters

country_code

[in] Country code name (ISO 3166-1 alpha-2)

events[]

[out] [MqlCalendarEvent](#) type array for receiving descriptions of all events for a specified country.

Return Value

Number of received descriptions. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 4004 - ERR_NOT_ENOUGH_MEMORY (not enough memory for executing a request),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded),
- errors of failed execution of [ArrayResize\(\)](#)

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //-- country code for EU (ISO 3166-1 Alpha-2)
    string EU_code="EU";
    //-- get EU events
    MqlCalendarEvent events[];
    int events_count=CalendarEventByCountry(EU_code,events);
    //-- display EU events in the Journal
    if(events_count>0)
    {
        PrintFormat("EU events: %d",events_count);
        ArrayPrint(events);
    }
    //--
}
/*
Result:

CalendarEventByCurrency

Get the array of descriptions of all events available in the Calendar by a specified currency.

```
int CalendarEventByCurrency(
    const string      currency,      // country currency code name
    MqlCalendarEvent& events[]      // variable for receiving the description array
);
```

Parameters

currency

[in] Country currency code name.

events[]

[out] [MqlCalendarEvent](#) type array for receiving descriptions of all events for a specified currency.

Return Value

Number of received descriptions. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 4004 - ERR_NOT_ENOUGH_MEMORY (not enough memory for executing a request),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded),
- errors of failed execution of [ArrayResize\(\)](#)

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- declare the array for receiving economic calendar events
    MqlCalendarEvent events[];
    //--- get EU currency events
    int count = CalendarEventByCurrency("EUR",events);
    Print("count = ", count);
    //--- 10 events are sufficient for the current example
    if(count>10)
        ArrayResize(events,10);
    //--- display events in the Journal
    ArrayPrint(events);
}
/*
Result:

      [id] [type] [country_id] [unit] [importance]

[CalendarEventById](#), [CalendarEventByCountry](#)

CalendarValueHistoryByEvent

Get the array of values for all events in a specified time range by an event ID.

```
int CalendarValueHistoryByEvent(
    ulong          event_id,          // event ID
    MqlCalendarValue& values[],        // array for value descriptions
    datetime       datetime_from,     // left border of a time range
    datetime       datetime_to=0      // right border of a time range
);
```

Parameters

event_id

[in] Event ID.

values[]

[out] [MqlCalendarValue](#) type array for receiving event values. See the [example of handling calendar events](#).

datetime_from

[in] Initial date of a time range events are selected from by a specified ID, while *datetime_from* < *datetime_to*.

datetime_to=0

[in] End date of a time range events are selected from by a specified ID. If the *datetime_to* is not set (or is 0), all event values beginning from the specified *datetime_from* date in the Calendar database are returned (including the values of future events).

Return Value

If successful, return the number of available values in the 'values' array, otherwise -1. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 4004 - ERR_NOT_ENOUGH_MEMORY (not enough memory for executing a request),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded),
- 5400 - ERR_CALENDAR_MORE_DATA (array size is insufficient for receiving descriptions of all values, only the ones that managed to fit in were received),
- errors of failed execution of [ArrayResize\(\)](#)

The [MqlCalendarValue](#) structure provides methods for checking and setting values from the *actual_value*, *forecast_value*, *prev_value* and *revised_prev_value* fields. If no value is specified, the field stores **LONG_MIN** (-9223372036854775808).

Please note that the values stored in these field are multiplied by one million. It means that when you receive values in [MqlCalendarValue](#) using functions [CalendarValueById](#), [CalendarValueHistoryByEvent](#), [CalendarValueHistory](#), [CalendarValueLastByEvent](#) and [CalendarValueLast](#), you should check if the field values are equal to **LONG_MIN**; if a value is specified in a field, then you should divide the value by 1,000,000 in order to get the value. Another method to get the values is to check and to get values using the functions of the [MqlCalendarValue](#) structure.

Note

All functions for working with the economic calendar use the trade server time ([TimeTradeServer](#)). This means that the time in the [MqlCalendarValue](#) structure and the time inputs in the [CalendarValueHistoryByEvent](#)/[CalendarValueHistory](#) functions are set in a trade server timezone, rather than a user's local time.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- country code for EU (ISO 3166-1 Alpha-2)
    string EU_code="EU";
//--- get EU events
    MqlCalendarEvent events[];
    int events_count=CalendarEventByCountry(EU_code,events);
//--- display EU events in the Journal
    if(events_count>0)
    {
        PrintFormat("EU events: %d",events_count);
        //--- reduce the event list, 10 events are sufficient for analysis
        ArrayResize(events,10);
        ArrayPrint(events);
    }
//--- see that the "ECB Interest Rate Decision" event has event_id=999010007
    ulong event_id=events[6].id; // the event's ID may change in the Calendar, s
    string event_name=events[6].name; // name of a Calendar event

[CalendarCountries](#), [CalendarEventByCountry](#), [CalendarValueHistory](#), [CalendarEventById](#), [CalendarValueById](#)

CalendarValueHistory

Get the array of values for all events in a specified time range with the ability to sort by country and/or currency.

```
int CalendarValueHistory(
    MqlCalendarValue& values[],           // array for value descriptions
    datetime          datetime_from,      // left border of a time range
    datetime          datetime_to=0       // right border of a time range
    const string      country_code=NULL,  // country code name (ISO 3166-1 alpha-2)
    const string      currency=NULL       // country currency code name
);
```

Parameters

values[]

[out] [MqlCalendarValue](#) type array for receiving event values. See the [example of handling calendar events](#).

datetime_from

[in] Initial date of a time range events are selected from by a specified ID, while *datetime_from* < *datetime_to*.

datetime_to=0

[in] End date of a time range events are selected from by a specified ID. If the *datetime_to* is not set (or is 0), all event values beginning from the specified *datetime_from* date in the Calendar database are returned (including the values of future events).

country_code=NULL

[in] Country code name (ISO 3166-1 alpha-2)

currency=NULL

[in] Country currency code name.

Return Value

If successful, return the number of available values in the 'values' array, otherwise -1. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 4004 - ERR_NOT_ENOUGH_MEMORY (not enough memory for executing a request),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded),
- 5400 - ERR_CALENDAR_MORE_DATA (array size is insufficient for receiving descriptions of all values, only the ones that managed to fit in were received),
- errors of failed execution of [ArrayResize\(\)](#)

Note

All functions for working with the economic calendar use the trade server time ([TimeTradeServer](#)). This means that the time in the [MqlCalendarValue](#) structure and the time inputs in the [CalendarValueHistoryByEvent](#)/[CalendarValueHistory](#) functions are set in a trade server timezone, rather than a user's local time.

If the `events[]` array of fixed length was passed to the function and there was not enough space to save the entire result, the `ERR_CALENDAR_MORE_DATA` (5400) error is activated.

If the `datetime_to` is not set (or is 0), all event values beginning from the specified `datetime_from` date in the Calendar database are returned (including the values of future events).

For the `country_code` and `currency` filters, `NULL` and `""` values are equivalent and mean the absence of the filter.

For `country_code`, the `code` field of the [MqlCalendarCountry](#) structure, for example "US", "RU" or "EU", should be used.

For `currency`, the `currency` field of the [MqlCalendarCountry](#) structure, for example "USD", "RUB" or "EUR", should be used.

The filters are applied by conjunction, i.e. [logical 'AND'](#) is used to select only the values of events both conditions (country and currency) are simultaneously met for.

The `MqlCalendarValue` structure provides methods for checking and setting values from the `actual_value`, `forecast_value`, `prev_value` and `revised_prev_value` fields. If no value is specified, the field stores **LONG_MIN** (-9223372036854775808).

Please note that the values stored in these field are multiplied by one million. It means that when you receive values in `MqlCalendarValue` using functions [CalendarValueById](#), [CalendarValueHistoryByEvent](#), [CalendarValueHistory](#), [CalendarValueLastByEvent](#) and [CalendarValueLast](#), you should check if the field values are equal to **LONG_MIN**; if a value is specified in a field, then you should divide the value by 1,000,000 in order to get the value. Another method to get the values is to check and to get values using the functions of the `MqlCalendarValue` structure.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- country code for EU (ISO 3166-1 Alpha-2)
    string EU_code="EU";
    //--- get all EU event values
    MqlCalendarValue values[];
    //--- set the boundaries of the interval we take the events from
    datetime date_from=D'01.01.2018'; // take all events from 2018
    datetime date_to=0;                // 0 means all known events, including the ones
    //--- request EU event history since 2018 year
    if(CalendarValueHistory(values,date_from,date_to,EU_code))
    {
        PrintFormat("Received event values for country_code=%s: %d",
                    EU_code,ArraySize(values));
        //--- decrease the size of the array for outputting to the Journal
        ArrayResize(values,10);
    }
    //--- display event values in the Journal
    ArrayPrint(values);
}
```

```
    }
    else
    {
        PrintFormat("Error! Failed to receive events for country_code=%s",EU_code);
        PrintFormat("Error code: %d",GetLastError());
    }
//---
}

*/
```

See also

[CalendarCountries](#), [CalendarEventByCountry](#), [CalendarValueHistoryByEvent](#), [CalendarEventById](#), [CalendarValueById](#)

CalendarValueLastByEvent

Get the array of event values by its ID since the Calendar database status with a specified *change_id*.

```
int CalendarValueLastByEvent(
    ulong          event_id,      // event ID
    ulong&         change_id,     // Calendar change ID
    MqlCalendarValue& values[]    // array for value descriptions
);
```

Parameters

event_id

[in] Event ID.

change_id

[in][out] Change ID.

values[]

[out] [MqlCalendarValue](#) type array for receiving event values. See the [example of handling calendar events](#).

Return Value

Number of received event values. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 4004 - ERR_NOT_ENOUGH_MEMORY (not enough memory for executing a request),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded),
- 5400 - ERR_CALENDAR_MORE_DATA (array size is insufficient for receiving descriptions of all values, only the ones that managed to fit in were received),
- errors of failed execution of [ArrayResize\(\)](#)

Note

All functions for working with the economic calendar use the trade server time ([TimeTradeServer](#)). This means that the time in the [MqlCalendarValue](#) structure and the time inputs in the [CalendarValueHistoryByEvent](#)/[CalendarValueHistory](#) functions are set in a trade server timezone, rather than a user's local time.

If the *events[]* array of fixed length was passed to the function and there was not enough space to save the entire result, the ERR_CALENDAR_MORE_DATA (5400) error is activated.

If *change_id* = 0 is passed to the function, the function always returns zero but the current calendar database is returned to *change_id*.

The function returns the array for a specified news and a new *change_id* that can be used for subsequent calls of the function to receive the new values of the news. Thus, it is possible to update values for a specified news by calling this function with the last known *change_id*.

The [MqlCalendarValue](#) structure provides methods for checking and setting values from the *actual_value*, *forecast_value*, *prev_value* and *revised_prev_value* fields. If no value is specified, the field stores **LONG_MIN** (-9223372036854775808).

It means that when you receive values in `MqlCalendarValue` using functions [CalendarValueById](#), [CalendarValueHistoryByEvent](#), [CalendarValueHistory](#), [CalendarValueLastByEvent](#) and [CalendarValueLast](#), you should check if the field values are equal to `LONG_MIN`; if a value is specified in a field, then you should divide the value by 1,000,000 in order to get the value. Another method to get the values is to check and to get values using the functions of the `MqlCalendarValue` structure.

[CalendarValueLast](#), [CalendarValueHistory](#), [CalendarValueHistoryByEvent](#), [CalendarValueById](#)

CalendarValueLast

Get the array of values for all events with the ability to sort by country and/or currency since the calendar database status with a specified *change_id*.

```
int CalendarValueLast(
    ulong&          change_id,           // change ID
    MqlCalendarValue& values[],          // array for value descriptions
    const string    country_code=NULL,   // country code name (ISO 3166-1 alpha-2)
    const string    currency=NULL       // country currency code name
);
```

Parameters

change_id

[in][out] Change ID.

values[]

[out] [MqlCalendarValue](#) type array for receiving event values. See the [example of handling calendar events](#).

country_code=NULL

[in] Country code name (ISO 3166-1 alpha-2)

currency=NULL

[in] Country currency code name.

Return Value

Number of received event values. To get information about an error, call the [GetLastError\(\)](#) function. Possible errors:

- 4001 - ERR_INTERNAL_ERROR (general runtime error),
- 4004 - ERR_NOT_ENOUGH_MEMORY (not enough memory for executing a request),
- 5401 - ERR_CALENDAR_TIMEOUT (request time limit exceeded),
- 5400 - ERR_CALENDAR_MORE_DATA (array size is insufficient for receiving descriptions of all values, only the ones that managed to fit in were received),
- errors of failed execution of [ArrayResize\(\)](#)

Note

All functions for working with the economic calendar use the trade server time ([TimeTradeServer](#)). This means that the time in the [MqlCalendarValue](#) structure and the time inputs in the [CalendarValueHistoryByEvent](#)/[CalendarValueHistory](#) functions are set in a trade server timezone, rather than a user's local time.

If the *events[]* array of fixed length was passed to the function and there was not enough space to save the entire result, the ERR_CALENDAR_MORE_DATA (5400) error is activated.

If *change_id* = 0 is passed to the function, you will get the current *change_id* of the calendar database to that parameter; and the function returns 0

For the *country_code* and *currency* filters, NULL and "" values are equivalent and mean the absence of the filter.

For *country_code*, the *code* field of the [MqlCalendarCountry](#) structure, for example "US", "RU" or "EU", should be used.

For *currency*, the *currency* field of the [MqlCalendarCountry](#) structure, for example "USD", "RUB" or "EUR", should be used.

The filters are applied by conjunction, i.e. [logical 'AND'](#) is used to select only the values of events both conditions (country and currency) are simultaneously met for

The function returns the array for a specified news and a new *change_id* that can be used for subsequent calls of the function to receive the new values of the news. Thus, it is possible to update values for a specified news by calling this function with the last known *change_id*.

The [MqlCalendarValue](#) structure provides methods for checking and setting values from the *actual_value*, *forecast_value*, *prev_value* and *revised_prev_value* fields. If no value is specified, the field stores **LONG_MIN** (-9223372036854775808).

Please note that the values stored in these field are multiplied by one million. It means that when you receive values in [MqlCalendarValue](#) using functions [CalendarValueById](#), [CalendarValueHistoryByEvent](#), [CalendarValueHistory](#), [CalendarValueLastByEvent](#) and [CalendarValueLast](#), you should check if the field values are equal to **LONG_MIN**; if a value is specified in a field, then you should divide the value by 1,000,000 in order to get the value. Another method to get the values is to check and to get values using the functions of the [MqlCalendarValue](#) structure.

Access to Timeseries and Indicator Data

These are functions for working with timeseries and indicators. A timeseries differs from the usual data array by its reverse ordering - elements of timeseries are indexed from the end of an array to its begin (from the most recent data to the oldest ones). To copy the time-series values and indicator data, it's recommended to use [dynamic arrays](#) only, because copying functions are designed to allocate the necessary size of arrays that receive values.

There is an **important exception** to this rule: if timeseries and indicator values need to be copied often, for example at each call of [OnTick\(\)](#) in Expert Advisors or at each call of [OnCalculate\(\)](#) in indicators, in this case one should better use [statically distributed arrays](#), because **operations of memory allocation** for dynamic arrays **require additional time**, and this will have effect during testing and optimization.

When using functions accessing timeseries and indicator values, indexing direction should be taken into account. This is described in the [Indexing Direction in Arrays, Buffers and Timeseries](#) section.

Access to indicator and timeseries data is implemented irrespective of the fact whether the requested data are ready (the so called [asynchronous access](#)). This is critically important for the calculation of custom indicator, so if there are no data, functions of *Copy...()* type immediately return an error. However, when accessing from Expert Advisors and scripts, several attempts to receive data are made in a small pause, which is aimed at providing some time necessary to download required timeseries or to calculate indicator values.

The [Organizing Data Access](#) section describes details of receiving, storing and requesting price data in the MetaTrader 5 client terminal.

It is historically accepted that an access to the price data in an array is performed from the end of the data. Physically, the new data are always written at the array end, but the index of the array is always

equal to zero. The 0 index in the timeseries array denotes data of the current bar, i.e. the bar that corresponds to the unfinished time interval in this timeframe.

A timeframe is the time period, during which a single price bar is formed. There are 21 predefined [standard timeframes](#).

Function	Action
SeriesInfoInteger	Returns information about the state of historical data
Bars	Returns the number of bars count in the history for a specified symbol and period
BarsCalculated	Returns the number of calculated data in an indicator buffer or -1 in the case of error (data hasn't been calculated yet)
IndicatorCreate	Returns the handle to the specified technical indicator created by an array of MqlParam type parameters
IndicatorParameters	Based on the specified handle, returns the number of input parameters of the indicator, as well as the values and types of the parameters
IndicatorRelease	Removes an indicator handle and releases the calculation block of the indicator, if it's not used by anyone else
CopyBuffer	Gets data of a specified buffer from a specified indicator into an array
CopyRates	Gets history data of the Rates structure for a specified symbol and period into an array
CopySeries	Gets the synchronized timeseries from the Rates structure for the specified symbol-period and the specified amount
CopyTime	Gets history data on bar opening time for a specified symbol and period into an array
CopyOpen	Gets history data on bar opening price for a specified symbol and period into an array
CopyHigh	Gets history data on maximal bar price for a specified symbol and period into an array
CopyLow	Gets history data on minimal bar price for a specified symbol and period into an array
CopyClose	Gets history data on bar closing price for a specified symbol and period into an array
CopyTickVolume	Gets history data on tick volumes for a specified symbol and period into an array
CopyRealVolume	Gets history data on trade volumes for a specified symbol and period into an array
CopySpread	Gets history data on spreads for a specified symbol and period into an array

Function	Action
<u>CopyTicks</u>	Gets ticks in the MqlTick format into ticks_array
<u>CopyTicksRange</u>	Gets ticks in the MqlTick format within the specified date range to ticks_array
<u>iBars</u>	Returns the number of bars of a corresponding symbol and period, available in history
<u>iBarShift</u>	Returns the index of the bar corresponding to the specified time
<u>iClose</u>	Returns the Close price of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iHigh</u>	Returns the High price of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iHighest</u>	Returns the index of the highest value found on the corresponding chart (shift relative to the current bar)
<u>iLow</u>	Returns the Low price of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iLowest</u>	Returns the index of the smallest value found on the corresponding chart (shift relative to the current bar)
<u>iOpen</u>	Returns the Open price of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iTime</u>	Returns the opening time of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iTickVolume</u>	Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iRealVolume</u>	Returns the real volume of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iVolume</u>	Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart
<u>iSpread</u>	Returns the spread value of the bar (indicated by the 'shift' parameter) on the corresponding chart

Despite the fact that by using the [ArraySetAsSeries\(\)](#) function it is possible to set up in [arrays](#) access to elements like that in timeseries, it should be remembered that the array elements are physically stored in one and the same order - only indexing direction changes. To demonstrate this fact let's perform an example:

```

datetime TimeAsSeries[];
//--- set access to the array like to a timeseries
ArraySetAsSeries(TimeAsSeries,true);
ResetLastError();
int copied=CopyTime(NULL,0,0,10,TimeAsSeries);
if(copied<=0)

```

```

    {
        Print("The copy operation of the open time values for last 10 bars has failed");
        return;
    }
    Print("TimeCurrent =",TimeCurrent());
    Print("ArraySize(Time) =",ArraySize(TimeAsSeries));
    int size=ArraySize(TimeAsSeries);
    for(int i=0;i<size;i++)
    {
        Print("TimeAsSeries["+i+"] =",TimeAsSeries[i]);
    }

    datetime ArrayNotSeries[];
    ArraySetAsSeries(ArrayNotSeries,false);
    ResetLastError();
    copied=CopyTime(NULL,0,0,10,ArrayNotSeries);
    if(copied<=0)
    {
        Print("The copy operation of the open time values for last 10 bars has failed");
        return;
    }
    size=ArraySize(ArrayNotSeries);
    for(int i=size-1;i>=0;i--)
    {
        Print("ArrayNotSeries["+i+"] =",ArrayNotSeries[i]);
    }

```

As a result we will get the output like this:

```

TimeCurrent = 2009.06.11 14:16:23
ArraySize(Time) = 10
TimeAsSeries[0] = 2009.06.11 14:00:00
TimeAsSeries[1] = 2009.06.11 13:00:00
TimeAsSeries[2] = 2009.06.11 12:00:00
TimeAsSeries[3] = 2009.06.11 11:00:00
TimeAsSeries[4] = 2009.06.11 10:00:00
TimeAsSeries[5] = 2009.06.11 09:00:00
TimeAsSeries[6] = 2009.06.11 08:00:00
TimeAsSeries[7] = 2009.06.11 07:00:00
TimeAsSeries[8] = 2009.06.11 06:00:00
TimeAsSeries[9] = 2009.06.11 05:00:00

ArrayNotSeries[9] = 2009.06.11 14:00:00
ArrayNotSeries[8] = 2009.06.11 13:00:00
ArrayNotSeries[7] = 2009.06.11 12:00:00
ArrayNotSeries[6] = 2009.06.11 11:00:00
ArrayNotSeries[5] = 2009.06.11 10:00:00
ArrayNotSeries[4] = 2009.06.11 09:00:00
ArrayNotSeries[3] = 2009.06.11 08:00:00

```

```
ArrayNotSeries[2] = 2009.06.11 07:00:00  
ArrayNotSeries[1] = 2009.06.11 06:00:00  
ArrayNotSeries[0] = 2009.06.11 05:00:00
```

As we see from the output, as the index of TimeAsSeries array increases, the time value of the index decreases, i.e. we move from the present to the past. For the common array ArrayNotSeries the result is different - as index grows, we move from past to present.

[ArrayIsDynamic](#), [ArrayGetAsSeries](#), [ArraySetAsSeries](#), [ArrayIsSeries](#)

Indexing Direction in Arrays, Buffers and Timeseries

The default indexing of all arrays and indicator buffers is left to right. The index of the first element is always equal to zero. Thus, the very first element of an array or indicator buffer with index 0 is by default on the extreme left position, while the last element is on the extreme right position.

An indicator buffer is a [dynamic array](#) of type double, whose size is managed by the client terminals, so that it always corresponds to the number of bars the indicator is calculated on. A usual dynamic array of type double is assigned as an indicator buffer using the [SetIndexBuffer\(\)](#) function. Indicator buffers do not require setting of their size using function [ArrayResize\(\)](#) - this will be done by the executing system of the terminal.

[Timeseries](#) are arrays with reverse indexing, i.e. the first element of a timeseries is in the extreme right position, and the last element is in the extreme left position. Timeseries being used for storing history price data and contain the time information, we can say that the newest data are placed in the extreme right position of the timeseries, while the oldest data are in the extreme left position.

So the timeseries element with index 0 contains the information about the latest quote of a symbol. If a timeseries contains data on a daily timeframe, data of the current yet uncompleted day are located on the zero position, and the position with index 1 contains yesterday data.

Changing the Indexing Direction

Function [ArraySetAsSeries\(\)](#) allows changing the method of accessing elements of a dynamic array; the physical order of data storing in the computer memory is not changed at that. This function simply changes the method of addressing array elements, so when copying one array to another using function [ArrayCopy\(\)](#), the contents of the recipient array will not depend on the indexing direction in the source array.

Direction of indexing cannot be changed for statically distributed arrays. Even if an array was passed as a parameter to a function, attempts to change the indexing direction inside this function will bring no effect.

For indicator buffers, like for usual arrays, indexing direction can also be set as backward (like in timeseries), i.e. reference to the zero position in the indicator buffer will mean reference to the last value on the corresponding indicator buffer and this will correspond to the value of the indicator on the latest bar. Still, the physical location of indicator bars will be unchanged.

Receiving Price Data in Indicators

Each [custom indicator](#) must necessarily contain the [OnCalculate\(\)](#) function, to which price data required for calculating values in indicator buffers are passed. Indexing direction in these passed arrays can be found out using function [ArrayGetAsSeries\(\)](#).

Arrays [passed to the function](#) reflect price data, i.e. these arrays have the sign of a timeseries and function [ArrayIsSeries\(\)](#) will return true when checking these arrays. However, in any case indexing direction should be checked only by function [ArrayGetAsSeries\(\)](#).

In order not to be dependent on default values, [ArraySetAsSeries\(\)](#) should be unconditionally called for the arrays you are going to work with, and set the required direction.

Receiving Price Data and Indicator Values

Default indexing direction of all arrays in Expert Advisors, indicators and scripts is left-to-right. If necessary, in any mql5 program you can request timeseries values on any symbol and timeframe, as well as values of indicators calculated on any symbol and timeframe.

Use functions `Copy...()` for these purposes:

- [CopyBuffer](#) - copy values of an indicator buffer to an array of double type;
- [CopyRates](#) - copy price history to an array of structures [MqlRates](#);
- [CopyTime](#) - copy Time values to an array of datetime type;
- [CopyOpen](#) - copy Open values to an array of double type;
- [CopyHigh](#) - copy High values to an array of double type;
- [CopyLow](#) - copy Low values to an array of double type;
- [CopyClose](#) - copy Close values to an array of double type;
- [CopyTickVolume](#) - copy tick volumes to an array of long type;
- [CopyRealVolume](#) - copy equity volumes to a long type array;
- [CopySpread](#) - copy the spread history to an array of int type;

All these functions work in a similar way. Let's consider the data obtaining mechanism on the example of `CopyBuffer()`. It is implied that the indexing direction of requested data is that of timeseries, and the position with index 0 (zero) stores data of the current yet uncompleted bar. In order to get access to these data we need to copy the necessary volume of data into the recipient array, e.g. into array *buffer*.

When copying we need to specify the starting position in the source array, starting from which data will be copied to the recipient array. In case of success, the specified number of elements will be copied to the recipient array from the source array (from the indicator buffer in this case). Irrespective of the indexing value set in the recipient array, copying is always performed as is shown in the above figure.

If it is expected that price data will be handled in a loop with a large number of iterations, it is advisable that you check the fact of forced program termination using the [IsStopped\(\)](#) function:

```
int copied=CopyBuffer(ma_handle, // Indicator handle
    0, // The index of the indicator buffer
    0, // Start position for copying
    number, // Number of values to copy
    Buffer // The array that receives the values
```

```

        );
    if(copied<0) return;
    int k=0;
    while(k<copied && !IsStopped())
    {
        //--- Get the value for the k index
        double value=Buffer[k];
        // ...
        // work with value
        k++;
    }

```

Example:

```

input int per=10; // period of the exponent
int ma_handle;    // indicator handle
//+-----+
//| Expert initialization function |
//+-----+
int OnInit()
{
    //---
    ma_handle=iMA(_Symbol,0,per,0,MODE_EMA,PRICE_CLOSE);
    //---
    return(INIT_SUCCEEDED);
}
//+-----+
//| Expert tick function |
//+-----+
void OnTick()
{
    //---
    double ema[10];
    int copied=CopyBuffer(ma_handle, // indicator handle
                          0,          // index of the indicator buffer
                          0,          // starting position to copy from
                          10,         // number of values for copying
                          ema         // value receiving array
                          );
    if(copied<0) return;
    // .... further code
}

```

[Organizing Data Access](#)

Organizing Data Access

In this section questions connected with obtaining, storing and requesting price data ([timeseries](#)) are considered.

Receiving Data from a Trade Server

Before price data become available in the MetaTrader 5 terminal, they must be received and processed. To receive data, connection to the MetaTrader 5 trade server must be established. Data are received in the form of packed blocks of minute bars from the server upon the request of a terminal.

The mechanism of server reference for data doesn't depend on how the request has been initiated - by a user when navigating in a chart or in a program way in the MQL5 language.

Storing Intermediate Data

Data received from a server are automatically unpacked and saved in the HCC intermediate format. Data on each symbol are written into a separate folder: *terminal_directory\bases\server_name\history\symbol_name*. For example, data on EURUSD received from the MetaQuotes-Demo server will be stored in *terminal_directory\bases\MetaQuotes-Demo\history\EURUSD*.

Data are written into files with .hcc extension. Each file stores data of minute bars for one year. For example, the file named 2009.hcc in the EURUSD folder contains minute bars of EURUSD for year 2009. These files are used for preparing price data for all timeframes and are not intended for direct access.

Obtaining Data on a Necessary Timeframe out of Intermediate Data

Intermediate HCC files are used as the data source for building price data for requested timeframes in the HC format. Data of HC format are timeseries that are maximally prepared for a quick access. They are created upon a request of a chart or a MQL5 program. The volume of data should not exceed the value of the "Max bars in charts" parameter. Data are stored for further using in files with hc extension.

To save resources, data on a timeframe are stored and saved in RAM only if necessary. If not called for a long time, they are released from RAM and saved into a file. For each timeframe, data are prepared regardless of whether there are ready data for other timeframes or not. Rules of forming and accessing data are the same for all timeframes. I.e., despite the fact that the unit data stored in HCC is one minute (M1), the availability of HCC data doesn't mean the availability of data on M1 timeframe as HC in the same volume.

Receipt of new data from a server calls automatic update of used price data in HC format of all timeframes. It also leads to the recalculation of all indicators that implicitly use them as input data for calculations.

Parameter "Max bars in chart"

The "Max bars in charts" parameter restricts number of bars in HC format available to charts, indicators and mql5 programs. This is valid for all available timeframes and serves, first of all, to save computer resources.

When setting a large value of this parameter, it should be remembered, that if deep history price data for small timeframes are available, memory used for storing timeseries and indicator buffers can become hundreds of megabytes and reach the RAM restriction for the client terminal program (2Gb for 32-bit applications of MS Windows).

Change of the "Max bars in charts" comes into effect after the client terminal is restarted. Change of this parameter causes neither automatic referring to a server for additional data, nor forming of additional bars of timeseries. Additional price data are requested from the server, and timeseries are updated taking into account the new limitation, in case of either chart scroll to the area with no data, or when data are requested by a mql5 program.

Volume of data requested from the server corresponds to the required number of bars of this timeframe with the "Max bars in charts" parameter taken into account. The restriction set by this parameter is not strict, and in some cases the number of available bars for a timeframe can be a little more than the current parameter value.

Data Availability

Presence of data on HCC format or even in the prepared for using HC format does not always denote the absolute availability of these data to be shown in a chart or to be used in MQL5 programs.

When accessing to price data or indicator values from a mql5 program it should be remembered that their availability in a certain moment of time or starting from a certain moment of time is not guaranteed. It is connected with the fact that with the purpose of saving resources, the full copy of data necessary for a mql5 program isn't stored in MetaTrader 5; only direct access to the terminal database is given.

The price history for all timeframes is built from common data of HCC format, and any update of data from a server leads to the update of data for all timeframes and to the recalculation of indicators. Due to this access to data can be closed, even if these data were available a moment ago.

Synchronization of the Terminal Data and Server Data

Since a mql5 program can call data from any symbol and timeframe, there is a possibility that data of a necessary timeseries are not formed yet in the terminal or the necessary price data aren't synchronized with the trade server. In this case it's hard to predict the latency time.

Algorithms using "do-nothing" loops are not the best solution. The only exception in this case are scripts, because they do not have any alternative algorithm choice due to not having event handling. For custom indicators such algorithms, as well as any other "do-nothing" loops are strongly not recommended, because they lead to termination of calculation of all indicators and any other handling of price data of the symbol.

For Expert Advisors and indicators, it is better to use the [event model](#) of handling. If during handling of OnTick() or OnCalculate() event, data receipt for the required timeseries failed, you should exit the event handler, relying on the access availability during the next call of the handler.

Example of a Script for Adding History

Let's consider the example of a script that executes a request to receive history for the selected symbol from a trade server. The script is intended for running in a chart of a selected symbol;

timeframe doesn't matter, because, as it was mentioned above, price data are received from a trade server as packed one minute data, from which any predefined timeseries is constructed then.

Write all actions concerning data receipt as a separate function `CheckLoadHistory(symbol, timeframe, start_date)`:

```
int CheckLoadHistory(string symbol,ENUM_TIMEFRAMES period,datetime start_date)
{
}
```

The `CheckLoadHistory()` function is designed as a universal function that can be called from any program (Expert Advisor, script or indicator); and therefore it requires three input parameters: symbol name, period and start date to indicate the beginning of price history you need.

Insert necessary checks into the function code before requesting the missing history. First of all, we should make sure that the symbol name and period value are correct:

```
if(symbol==NULL || symbol=="") symbol=Symbol();
if(period==PERIOD_CURRENT) period=Period();
```

Then let's make sure that the symbol is available in the MarketWatch window, i.e., the history for the symbol will be available when sending a request to a trade server. If there is no such a symbol in MarketWatch, add it using the [SymbolSelect\(\)](#) function.

```
if(!SymbolInfoInteger(symbol,SYMBOL_SELECT))
{
    if(GetLastError()==ERR_MARKET_UNKNOWN_SYMBOL) return(-1);
    SymbolSelect(symbol,true);
}
```

Now we should receive the start date of the available history for the indicated symbol/period pair. Perhaps, the value of the input parameter `startdate`, passed to `CheckLoadHistory()`, is within the available history; then request to a trade server is not needed. In order to obtain the very first date for the symbol-period as of the moment, the [SeriesInfoInteger\(\)](#) function with the [SERIES_FIRSTDATE](#) modifier is used.

```
SeriesInfoInteger(symbol,period,SERIES_FIRSTDATE,first_date);
if(first_date>0 && first_date<=start_date) return(1);
```

The next important check is checking the type of the program, from which the function is called. Note that it is not desirable to send a request to update the timeseries from indicator with the same period. The undesirability of requesting data on the same symbol-period as that of the indicator is conditioned by the fact that update of history data is performed in the same thread where the indicator operates. So the possibility of deadlock occurrence is high. To check this use the [MQL5InfoInteger\(\)](#) function with the [MQL5_PROGRAM_TYPE](#) modifier.

```
if(MQL5InfoInteger(MQL5_PROGRAM_TYPE)==PROGRAM_INDICATOR && Period()==period && Sym
return(-4);
```

If all the checks have been passed successfully, make the last attempt to do without referring to the trade server. First let's find out the start date, for which minute data in HCC format are available. Request this value using the `SeriesInfoInteger()` function with the [SERIES_TERMINAL_FIRSTDATE](#) modifier and again compare it to the value of the `start_date` parameter.

```

if (SeriesInfoInteger(symbol, PERIOD_M1, SERIES_TERMINAL_FIRSTDATE, first_date))
{
    //--- there is loaded data to build timeseries
    if (first_date > 0)
    {
        //--- force timeseries build
        CopyTime(symbol, period, first_date + PeriodSeconds(period), 1, times);
        //--- check date
        if (SeriesInfoInteger(symbol, period, SERIES_FIRSTDATE, first_date))
            if (first_date > 0 && first_date <= start_date) return (2);
    }
}

```

If after all the checks the execution thread is still in the body of the `CheckLoadHistory()` function, it means there is a necessity to request the missing price data from a trade server. First, return the value of "Max bars in chart" using the [TerminalInfoInteger\(\)](#) function:

```
int maxBars = TerminalInfoInteger(TERMINAL_MAXBARS);
```

We'll need it to prevent requesting extra data. Then find the very first date in the symbol history on the trade server (regardless of the period) using already known function `SeriesInfoInteger()` with the [SERIES_SERVER_FIRSTDATE](#) modifier.

```

datetime first_server_date = 0;
while (!SeriesInfoInteger(symbol, PERIOD_M1, SERIES_SERVER_FIRSTDATE, first_server_date))
    Sleep(5);

```

Since the request is an asynchronous operation, the function is called in the loop with a small delay of 5 milliseconds until the `first_server_date` variable receives a value, or the loop execution is terminated by a user (`IsStopped()` will return *true* in this case). Let's indicate a correct value of the start date, starting from which we request price data from a trade server.

```

if (first_server_date > start_date) start_date = first_server_date;
if (first_date > 0 && first_date < first_server_date)
    Print("Warning: first server date ", first_server_date, " for ",
symbol, " does not match to first series date ", first_date);

```

If the start date `first_server_date` of the server is lower than the start date `first_date` of the symbol in HCC format, the corresponding entry will be output in the journal.

Now we are ready to make a request to a trade server asking for missing price data. Make the request in the form of a loop and start filling out its body:

```

while (!IsStopped())
{
    //1. wait for synchronization between the re-built timeseries and intermediate data
    //2. receive the current number of bars in this timeseries
    //    if bars is larger than MaxBarsInChart, we can exit, work is over
    //3. obtain the start date first_date in the re-built timeseries and compare it
    //    if first_date is lower than start_date, we can exit, work is over
    //4. request from a server a new part of history - 100 bars starting from last date
}

```

The first three points are implemented by already known means.

```
while(!IsStopped())
{
    //--- 1.wait till timeseries re-build process is over
    while(!SeriesInfoInteger(symbol,period,SERIES_SYNCHRONIZED) && !IsStopped())
        Sleep(5);
    //--- 2.request how many bars we have
    int bars=Bars(symbol,period);
    if(bars>0)
    {
        //--- bars more than ones that can be drawn in the chart, exit
        if(bars>=max_bars) return(-2);
        //--- 3. return the current start date in the timeseries
        if(SeriesInfoInteger(symbol,period,SERIES_FIRSTDATE,first_date))
            // start date was earlier than that requested, task completed
            if(first_date>0 && first_date<=start_date) return(0);
    }
    //4. Request from a server a new part of history - 100 bars starting from last a
}
```

The last fourth point is left - requesting history. We can't refer to a server directly, but any [Copy-function](#) automatically initiates request sending to a server, if the history in HCC format is not enough. Since the time of the very first start date in the *first_date* variable is the simple and natural criterion to evaluate the request execution degree, then the easiest way is to use the [CopyTime\(\)](#) function.

When calling functions that copy any data from timeseries, it should be noted that the *start* parameter (number of the bar, starting from which price data should be copied) must always be within the available terminal history. If you have only 100 bars, it meaningless to try copying 300 bars starting from the bar with the index 500. Such a request will be understood as an erroneous and won't be handled, i.e. no additional history will be loaded from a trade server.

That's why we'll copy bars in groups of 100 starting from the bar with the *bars* index. This will provide the smooth loading of missing history from a trade server. Actually a little more than the requested 100 bars will be loaded, while server sends oversized history.

```
int copied=CopyTime(symbol,period,bars,100,times);
```

After the copying operation, we should analyze the number of copied elements. If the attempt fails, then value of the *copied* will be equal to null and the value of the *fail_cnt* counter will be increased by 1. After 100 failing attempts, the operation of the function will be stopped.

```
int fail_cnt=0;
...
int copied=CopyTime(symbol,period,bars,100,times);
if(copied>0)
{
    //--- check data
    if(times[0]<=start_date) return(0); // the copied value is smaller, ready
    if(bars+copied>=max_bars) return(-2); // bars are more than can be drawn in the
```

```

        fail_cnt=0;
    }
    else
    {
        //--- no more than 100 failing attempts in succession
        fail_cnt++;
        if(fail_cnt>=100) return(-5);
        Sleep(10);
    }

```

So, not only correct handling of the current situation at each moment of execution is implemented in the function, but also the termination code is returned, that can be handled after calling the CheckLoadHistory() function for getting additional information. For example, this way:

```

int res=CheckLoadHistory(InpLoadedSymbol,InpLoadedPeriod,InpStartDate);
switch(res)
{
    case -1 : Print("Unknown symbol ",InpLoadedSymbol); break;
    case -2 : Print("More requested bars than can be drawn in the chart"); break;
    case -3 : Print("Execution stopped by user"); break;
    case -4 : Print("Indicator mustn't load its own data"); break;
    case -5 : Print("Loading failed"); break;
    case 0 : Print("All data loaded"); break;
    case 1 : Print("Already available data in timeseries are enough"); break;
    case 2 : Print("Timeseries is built from available terminal data"); break;
    default : Print("Execution result undefined");
}

```

The full code of the function can be found in the example of a script that shows the correct organization of access to any data with the handling of request's results.

Code:

```

        case PERIOD_MN1: return("Monthly");
    }
//---
    return("unknown period");
}

```

SeriesInfoInteger

Returns information about the state of historical data. There are 2 variants of function calls.

Directly returns the property value.

```
long SeriesInfoInteger(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    ENUM_SERIES_INFO_INTEGER prop_id,  // property identifier
);
```

Returns true or false depending on the success of the function run.

```
bool SeriesInfoInteger(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    ENUM_SERIES_INFO_INTEGER prop_id,  // property ID
    long&           long_var          // variable for getting info
);
```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

prop_id

[in] Identifier of the requested property, value of the [ENUM_SERIES_INFO_INTEGER](#) enumeration.

long_var

[out] Variable to which the value of the requested property is placed.

Return Value

In the first case, it returns value of the long type.

For the second case, it returns true, if the specified property is available and its value has been placed into long_var variable, otherwise it returns false. For more details about an [error](#), call [GetLastError\(\)](#).

Example:

```
void OnStart()
{
    //---
    Print("Total number of bars for the symbol-period at this moment = ",
        SeriesInfoInteger(Symbol(), Period(), SERIES_BARS_COUNT));

    Print("The first date for the symbol-period at this moment = ",
        (datetime)SeriesInfoInteger(Symbol(), Period(), SERIES_FIRSTDATE));
}
```

```
Print("The first date in the history for the symbol-period on the server = ",  
      (datetime)SeriesInfoInteger(Symbol(),Period(),SERIES_SERVER_FIRSTDATE));  
  
Print("Symbol data are synchronized = ",  
      (bool)SeriesInfoInteger(Symbol(),Period(),SERIES_SYNCHRONIZED));  
}
```

Bars

Returns the number of bars count in the history for a specified symbol and period. There are 2 variants of functions calls.

Request all of the history bars

```
int Bars(  
    string          symbol_name,    // symbol name  
    ENUM_TIMEFRAMES timeframe      // period  
);
```

Request the history bars for the selected time interval

```
int Bars(  
    string          symbol_name,    // symbol name  
    ENUM_TIMEFRAMES timeframe,      // period  
    datetime        start_time,     // start date and time  
    datetime        stop_time       // end date and time  
);
```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_time

[in] Bar time corresponding to the first element.

stop_time

[in] Bar time corresponding to the last element.

Return Value

If the *start_time* and *stop_time* parameters are defined, the function returns the number of bars in the specified time interval, otherwise it returns the total number of bars.

Note

If data for the timeseries with specified parameters are not formed in the terminal by the time of the `Bars()` function call, or data of the timeseries are not [synchronized](#) with a trade server by the moment of the function call, the function returns a zero value.

When requesting the number of bars in a specified time interval, only bars with an open time falling within the interval are considered. For example, if the current day of the week is Saturday and the request is made for the number of W1 bars with *start_time*=last_tuesday and *stop_time*=last_friday, the function will return 0 since the open time of a W1 timeframe is always Sunday and not a single W1 bar falls within the specified interval.

Sample request for the number of all history bars:

```

int bars=Bars(_Symbol,_Period);
if(bars>0)
{
    Print("Number of bars in the terminal history for the symbol-period at the moment");
}
else //no available bars
{
    //--- data on the symbol might be not synchronized with data on the server
    bool synchronized=false;
    //--- loop counter
    int attempts=0;
    // make 5 attempts to wait for synchronization
    while(attempts<5)
    {
        if(SeriesInfoInteger(Symbol(),0,SERIES_SYNCHRONIZED))
        {
            //--- synchronization done, exit
            synchronized=true;
            break;
        }
        //--- increase the counter
        attempts++;
        //--- wait 10 milliseconds till the next iteration
        Sleep(10);
    }
    //--- exit the loop after synchronization
    if(synchronized)
    {
        Print("Number of bars in the terminal history for the symbol-period at the moment");
        Print("The first date in the terminal history for the symbol-period at the moment");
        Print((datetime)SeriesInfoInteger(Symbol(),0,SERIES_FIRSTDATE));
        Print("The first date in the history for the symbol on the server = ",
            (datetime)SeriesInfoInteger(Symbol(),0,SERIES_SERVER_FIRSTDATE));
    }
    //--- synchronization of data didn't happen
    else
    {
        Print("Failed to get number of bars for ",_Symbol);
    }
}

```

Sample request for the number of bars in the specified interval:

```

int n;
datetime date1 = D'2016.09.02 23:55'; // Friday
datetime date2 = D'2016.09.05 00:00'; // Monday
datetime date3 = D'2016.09.08 00:00'; // Thursday
//---
n=Bars(_Symbol,PERIOD_H1,D'2016.09.02 02:05',D'2016.09.02 10:55');

```

```
Print("Number of bars: ",n); // Output: "Number of bars: 8", H2 bar is considered :
n=Bars(_Symbol,PERIOD_D1,date1,date2);
Print("Number of bars: ",n); // Output: "Number of bars: 1", since an open time of
n=Bars(_Symbol,PERIOD_W1,date2,date3);
Print("Number of bars: ",n); // Output: "Number of bars: 0", since not a single W1
```

See also[Event Handling Functions](#)

BarsCalculated

Returns the number of calculated data for the specified indicator.

```
int BarsCalculated(  
    int indicator_handle, // indicator handle  
);
```

Parameters

indicator_handle

[in] The indicator handle, returned by the corresponding indicator function.

Return Value

Returns the amount of calculated data in the indicator buffer or -1 in the case of error (data not calculated yet)

Note

The function is useful when it's necessary to get the indicator data immediately after its creation (indicator handle is available).

Example:

```
void OnStart()  
{  
    double Ups[];  
    //--- set timeseries ordering for the arrays  
    ArraySetAsSeries(Ups,true);  
    //--- create handle for the Fractal Indicator  
    int FractalsHandle=iFractals(NULL,0);  
    //--- reset the error code  
    ResetLastError();  
    //--- try to copy the indicator values  
    int i,copied=CopyBuffer(FractalsHandle,0,0,1000,Ups);  
    if(copied<=0)  
    {  
        Sleep(50);  
        for(i=0;i<100;i++)  
        {  
            if(BarsCalculated(FractalsHandle)>0)  
                break;  
            Sleep(50);  
        }  
        copied=CopyBuffer(FractalsHandle,0,0,1000,Ups);  
        if(copied<=0)  
        {  
            Print("Failed to copy upper fractals. Error = ",GetLastError(),  
                "i = ",i," copied = ",copied);  
            return;  
        }  
    }  
}
```

```
    else
        Print("Upper fractals copied",
            "i = ", i, "    copied = ", copied);
    }
    else Print("Upper fractals copied. ArraySize = ", ArraySize(Ups));
}
```

IndicatorCreate

The function returns the handle of a specified technical indicator created based on the array of parameters of [MqlParam](#) type.

```
int IndicatorCreate(
    string          symbol,           // symbol name
    ENUM_TIMEFRAMES period,          // timeframe
    ENUM_INDICATOR  indicator_type,  // indicator type from the enum
    int             parameters_cnt=0, // number of parameters
    const MqlParam& parameters_array[]=NULL, // array of parameters
);
```

Parameters

symbol

[in] Name of a symbol, on data of which the indicator is calculated. [NULL](#) means the current symbol.

period

[in] The value of the timeframe can be one of values of the [ENUM_TIMEFRAMES](#) enumeration, 0 means the current timeframe.

indicator_type

[in] Indicator type, can be one of values of the [ENUM_INDICATOR](#) enumeration.

parameters_cnt

[in] The number of parameters passed in the `parameters_array[]` array. The array elements have a special structure type [MqlParam](#). By default, zero - parameters are not passed. If you specify a non-zero number of parameters, the parameter `parameters_array` is obligatory. You can pass no more than 64 parameters.

parameters_array[]=NULL

[in] An array of [MqlParam](#) type, whose elements contain the type and value of each input parameter of a [technical indicator](#).

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#).

Note

If the indicator handle of `IND_CUSTOM` type is created, the *type* field of the first element of the array of input parameters `parameters_array` must have the `TYPE_STRING` value of the [ENUM_DATATYPE](#) enumeration, and the *string_value* field of the first element must contain the name of the custom indicator. The custom indicator must be compiled (file with EX5 extension) and located in the directory MQL5/Indicators of the client terminal or in a subdirectory.

Indicators that require testing are defined automatically from the call of the `iCustom()` function, if the corresponding parameter is set through a [constant string](#). For all other cases (use of the [IndicatorCreate\(\)](#) function or use of a non-constant string in the parameter that sets the indicator name) the property [#property tester_indicator](#) is required:

```
#property tester_indicator "indicator_name.ex5"
```

If [the first form of the call](#) is used in a custom indicator, you can additionally indicate as the last parameter on what data it will be calculated when passing input parameters. If the "Apply to" parameter is not specified explicitly, the default calculation is based on the [PRICE_CLOSE](#) values.

Example:

```
void OnStart()
{
    MqlParam params[];
    int      h_MA, h_MACD;
    //--- create iMA("EURUSD", PERIOD_M15, 8, 0, MODE_EMA, PRICE_CLOSE);
    ArrayResize(params, 4);
    //--- set ma_period
    params[0].type      =TYPE_INT;
    params[0].integer_value=8;
    //--- set ma_shift
    params[1].type      =TYPE_INT;
    params[1].integer_value=0;
    //--- set ma_method
    params[2].type      =TYPE_INT;
    params[2].integer_value=MODE_EMA;
    //--- set applied_price
    params[3].type      =TYPE_INT;
    params[3].integer_value=PRICE_CLOSE;
    //--- create MA
    h_MA=IndicatorCreate("EURUSD", PERIOD_M15, IND_MA, 4, params);
    //--- create iMACD("EURUSD", PERIOD_M15, 12, 26, 9, h_MA);
    ArrayResize(params, 4);
    //--- set fast ma_period
    params[0].type      =TYPE_INT;
    params[0].integer_value=12;
    //--- set slow ma_period
    params[1].type      =TYPE_INT;
    params[1].integer_value=26;
    //--- set smooth period for difference
    params[2].type      =TYPE_INT;
    params[2].integer_value=9;
    //--- set indicator handle as applied_price
    params[3].type      =TYPE_INT;
    params[3].integer_value=h_MA;
    //--- create MACD based on moving average
    h_MACD=IndicatorCreate("EURUSD", PERIOD_M15, IND_MACD, 4, params);
    //--- use indicators
    //--- . . .
    //--- release indicators (first h_MACD)
    IndicatorRelease(h_MACD);
    IndicatorRelease(h_MA);
}
```

IndicatorParameters

Based on the specified handle, returns the number of input parameters of the indicator, as well as the values and types of the parameters.

```
int IndicatorParameters(
    int          indicator_handle,    // indicator handle
    ENUM_INDICATOR& indicator_type,    // a variable for receiving the indicator type
    MqlParam&     parameters[]        // an array for receiving parameters
);
```

Parameters

indicator_handle

[in] The handle of the indicator, for which you need to know the number of parameters its is calculated on.

indicator_type

[out] A variable of the [ENUM_INDICATOR](#) type, into which the indicator type will be written.

parameters[]

[out] A dynamic array for receiving values of the [MqlParam](#) type, into which the list of indicator parameters will be written. The array size is returned by the `IndicatorParameters()` function.

Return Value

The number of input parameters of the indicator with the specified handle. In case of an error returns -1. For more details about the error call the [GetLastError\(\)](#) function.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- The number of windows on the chart (at least one main window is always present)
    int windows=(int)ChartGetInteger(0,CHART_WINDOWS_TOTAL);
    //--- Go through the chart windows
    for(int w=0;w<windows;w++)
    {
        //--- The number of indicators in this window/subwindow
        int total=ChartIndicatorsTotal(0,w);
        //--- Take all indicators in the window
        for(int i=0;i<total;i++)
        {
            //--- Get the short name of the indicator
            string name=ChartIndicatorName(0,w,i);
            //--- Get the indicator handle
            int handle=ChartIndicatorGet(0,w,name);
            //--- Add to log
        }
    }
}
```

```

PrintFormat("Window=%d,  indicator #%d,  handle=%d",w,i,handle);
//---
MqlParam parameters[];
ENUM_INDICATOR indicator_type;
int params=IndicatorParameters(handle,indicator_type,parameters);
//--- The header of the message
string par_info="Short name "+name+", type "
                +EnumToString(ENUM_INDICATOR(indicator_type))+"\r\n";

//---
for(int p=0;p<params;p++)
{
    par_info+=StringFormat("parameter %d: type=%s, long_value=%d, double_value=%d, string_value=%s",
                           p,
                           EnumToString((ENUM_DATATYPE)parameters[p].type),
                           parameters[p].integer_value,
                           parameters[p].double_value,
                           parameters[p].string_value
                           );

    }
    Print(par_info);
}
//--- Done for all indicators in the window
}
//---
}

```

[ChartIndicatorGet\(\)](#)

IndicatorRelease

The function removes an indicator handle and releases the calculation block of the indicator, if it's not used by anyone else.

```
bool IndicatorRelease(
    int      indicator_handle    // indicator handle
);
```

Return Value

Returns true in case of success, otherwise returns false.

Note

The function allows removing an indicator handle, if it's no longer needed, thus saving memory. The handle is removed immediately, the calculation block is deleted in some time (if it's not called anymore).

When working in the [strategy tester](#), the IndicatorRelease() function is not executed.

Example:

```
//+-----+
//|                                     Test_IndicatorRelease.mq5 |
//|                                     Copyright 2010, MetaQuotes Software Corp. |

if(CopyBuffer(MA_handle,0,0,2,values)==2 && values[0]!=EMPTY_VALUE)
{
//--- remember in the global variable value on the last but one bar
if(GlobalVariableSet("MA_value",values[0]))
{
//--- free the handle of the indicator
if(!IndicatorRelease(MA_handle))
Print("IndicatorRelease() failed. Error ",GetLastError());
else MA_handle=INVALID_HANDLE;
}
else
Print("GlobalVariableSet failed. Error ",GetLastError());
}
}
}
//---
}

```

CopyBuffer

Gets data of a specified buffer of a certain indicator in the necessary quantity.

Counting of elements of copied data (indicator buffer with the index buffer_num) from the starting position is performed from the present to the past, i.e., starting position of 0 means the current bar (indicator value for the current bar).

When copying the yet unknown amount of data, it is recommended to use a [dynamic array](#) as a buffer[] recipient buffer, because the CopyBuffer() function tries to allocate the size of the receiving array to the size of the copied data. If an indicator buffer (array that is pre-allocated for storing indicator values by the [SetIndexBufer\(\)](#) function) is used as the buffer[] recipient array, partial copying is allowed. An example can be found in the Awesome_Oscillator.mql5 custom indicator in the standard terminal package.

If you need to make a partial copy of the indicator values into another array (non-indicator buffer), you should use an intermediate array, to which the desired number is copied. After that conduct the element-wise copying of the required number of values into the required places of a receiving array from this intermediate one.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyBuffer(
    int      indicator_handle,    // indicator handle
    int      buffer_num,         // indicator buffer number
    int      start_pos,          // start position
    int      count,              // amount to copy
    double   buffer[])           // target array to copy
);
```

Call by the start date and the number of required elements

```
int CopyBuffer(
    int      indicator_handle,    // indicator handle
```

```

int      buffer_num,           // indicator buffer number
datetime start_time,          // start date and time
int      count,               // amount to copy
double   buffer[]             // target array to copy
);

```

Call by the start and end dates of a required time interval

```

int CopyBuffer(
    int      indicator_handle,   // indicator handle
    int      buffer_num,        // indicator buffer number
    datetime start_time,        // start date and time
    datetime stop_time,         // end date and time
    double   buffer[]           // target array to copy
);

```

Parameters

indicator_handle

[in] The indicator handle, returned by the corresponding indicator function.

buffer_num

[in] The indicator buffer number.

start_pos

[in] The position of the first element to copy.

count

[in] Data count to copy.

start_time

[in] Bar time, corresponding to the first element.

stop_time

[in] Bar time, corresponding to the last element.

buffer[]

[out] Array of [double](#) type.

Return Value

Returns the copied data count or -1 in case of an [error](#).

Note

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration.

Example:

```
//+-----+
//|                                     TestCopyBuffer3.mq5 |
//|                                     Copyright 2009, MetaQuotes Software Corp. |

}
```

```
//+-----+
//| Custom indicator iteration function |
//+-----+

int OnCalculate(const int rates_total,
               const int prev_calculated,
               const datetime &time[],
               const double &open[],
               const double &high[],
               const double &low[],
               const double &close[],
               const long &tick_volume[],
               const long &volume[],
               const int &spread[])
{
    //--- check if all data calculated
    if(BarsCalculated(ma_handle)<rates_total) return(0);
    //--- we can copy not all data
    int to_copy;
    if(prev_calculated>rates_total || prev_calculated<=0) to_copy=rates_total;
    else
    {
        to_copy=rates_total-prev_calculated;
        //--- last value is always copied
        to_copy++;
    }
    //--- try to copy
    if(CopyBuffer(ma_handle,0,0,to_copy,MABuffer)<=0) return(0);
    //--- return value of prev_calculated for next call
    return(rates_total);
}
//+-----+
```

The above example illustrates how an indicator buffer is filled out with the values of another indicator buffer from the indicator on the same symbol/period.

See a detailed example of history requesting data in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

See also

[Properties of Custom Indicators](#), [SetIndexBuffer](#)

CopyRates

Gets history data of [MqlRates](#) structure of a specified symbol-period in specified quantity into the `rates_array` array. The elements ordering of the copied data is from present to the past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyRates(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,        // start position
    int             count,            // data count to copy
    MqlRates        rates_array[]     // target array to copy
);
```

Call by the start date and the number of required elements

```
int CopyRates(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,            // data count to copy
    MqlRates        rates_array[]     // target array to copy
);
```

Call by the start and end dates of a required time interval

```
int CopyRates(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // end date and time
MqlRates    rates_array[]    // target array to copy
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_time

[in] Bar time for the first element to copy.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

rates_array[]

[out] Array of [MqlRates](#) type.

Return Value

Returns the number of copied elements or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

Example:

```
void OnStart()
{
    //---
    MqlRates rates[];
    ArraySetAsSeries(rates,true);
    int copied=CopyRates(Symbol(),0,0,100,rates);
    if(copied>0)
    {
        Print("Bars copied: "+copied);
        string format="open = %G, high = %G, low = %G, close = %G, volume = %d";
        string out;
        int size=fmin(copied,10);
        for(int i=0;i<size;i++)
        {
            out=i+": "+TimeToString(rates[i].time);
            out=out+" "+StringFormat(format,
                                    rates[i].open,
                                    rates[i].high,
                                    rates[i].low,
                                    rates[i].close,
                                    rates[i].tick_volume);

            Print(out);
        }
    }
    else Print("Failed to get history data for the symbol ",Symbol());
}
```

See a detailed example of requesting history data in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),

- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopySeries

Gets the synchronized timeseries from the [MqlRates](#) structure for the specified symbol-period and the specified amount. The data is received into the specified set of arrays. Elements are counted down from the present to the past, which means that the starting position equal to 0 means the current bar.

If the data amount to be copied is unknown, it is recommended to use the [dynamic array](#) for the receiving arrays, since if the data amount exceeds what an array can contain, this can cause the attempt to redistribute the array to fit all of the requested data.

If you need to copy a predetermined amount of data, it is recommended to use a [statistically allocated buffer](#) to avoid unnecessary memory reallocation.

The property of the receiving array — `as_series=true` or `as_series=false` — will be ignored: during copying, the oldest timeseries element will be copied to the beginning of the physical memory allocated for the array.

```
int CopySeries(
    string          symbol_name,           // symbol name
    ENUM_TIMEFRAMES timeframe,            // period
    int             start_pos,             // start position
    int             count,                 // amount to copy
    ulong           rates_mask,            // combination of flags to specify the requested data
    void&           array1[],              // array to receive the data of the first copy
    void&           array2[],              // array to receive the data of the second copy
    ...
);
```

Parameters*symbol_name*

[in] Symbol.

timeframe

[in] Period.

start_pos

[in] First copied element index.

count

[in] Number of copied elements.

rates_mask[in] A combination of flags from the [ENUM_COPY_RATES](#) enumeration.*array1, array2, ...*[out] Array of the appropriate type to receive the timeseries from the [MqlRates](#) structure. The order of the arrays passed to the function must match the order of the fields in the MqlRates structure.**Return Value**The number of copied elements or -1 if [error](#) occurs.**Note**

If the entire interval of the requested data is beyond the data available on the server, the function returns -1. If the requested data is beyond [TERMINAL_MAXBARS](#) (the maximum number of bars on the chart), the function also returns -1.

When requesting data from an indicator, the function immediately returns -1 if requested timeseries are not constructed yet or they should be downloaded from the server. However, this will initiate data download/constructing itself.

When requesting data from an Expert Advisor or a script, [download from the server](#) is initiated if the terminal does not have the appropriate data locally, or construction of the necessary timeseries starts if the data can be constructed from the local history but they are not ready yet. The function returns the amount of data that is ready by the time the timeout expires, however the history download continues, and the function returns more data during the next similar request.

Difference between CopySeries and CopyRates

The CopySeries function allows obtaining only the necessary timeseries into different specified arrays during one call, while all of timeseries data will be synchronized. This means that all values in the resulting arrays at a certain index N will belong to the same bar on the specified Symbol/Timeframe pair. Therefore, there is no need for the programmer to ensure the synchronization of all received timeseries by the bar opening time.

Unlike CopyRates, which returns the full set of timeseries as an MqlRates array, the CopySeries function allows the programmer to get only the required timeseries as separate arrays. This can be

done by specifying a combination of flags to select the type of timeseries. The order of the arrays passed to the function must match the order of the fields in the [MqlRates](#) structure:

```
struct MqlRates
{
    datetime time;           // period start time
    double   open;           // open price
    double   high;           // high price for the period
    double   low;            // low price for the period
    double   close;          // close price
    long     tick_volume;    // tick volume
    int      spread;         // spread
    long     real_volume;    // exchange volume
}
```

Thus, if you need to get the values of the *time*, *close* and *real_volume* timeseries for the last 100 bars of the current Symbol/Timeframe, you should use the following call:

```
datetime time[];
double   close[];
long     volume[];
CopySeries(NULL,0,0,100,COPY_RATES_TIME|COPY_RATES_CLOSE|COPY_RATES_VOLUME_REAL,time,c
```

Mind the order of the arrays "*time*, *close*, *volume*" – it must match the order of the fields in the [MqlRates](#) structure. The order of values in the *rates_mask* does not matter. The mask could be as follows:

```
COPY_RATES_VOLUME_REAL|COPY_RATES_TIME|COPY_RATES_CLOSE
```

Example:

```
//--- input parameters
input datetime InpDateFrom=D'2022.01.01 00:00:00';
input datetime InpDateTo  =D'2023.01.01 00:00:00';
input uint     InpCount    =20;
//+-----+
//| Script program start function |
//+-----+
void OnStart(void)
{
    //--- arrays to get timeseries from the MqlRates price structure
    double   open[];
    double   close[];
    float    closef[];
    datetime time1[], time2[];
    //--- request close prices to a double array
    ResetLastError();
    int res1=CopySeries(NULL, PERIOD_CURRENT, 0, InpCount,
                        COPY_RATES_TIME|COPY_RATES_CLOSE, time1, close);
    PrintFormat("1. CopySeries returns %d values. Error code=%d", res1, GetLastError());
}
```

```

ArrayPrint(close);

//--- now also request open prices; use float array for close prices
ResetLastError();
int res2=CopySeries(NULL, PERIOD_CURRENT, 0, InpCount,
                    COPY_RATES_TIME|COPY_RATES_CLOSE|COPY_RATES_OPEN, time2, open,
PrintFormat("2. CopySeries returns %d values. Error code=%d", res2, GetLastError());
ArrayPrint(closef);
//--- Compare the received data
if((res1==res2) && (time1[0]==time2[0]))
{
Print(" | Time          |      Open      | Close double | Close float |");
for(int i=0; i<10; i++)
{
PrintFormat("%d | %s |    %.5f    |    %.5f    |    %.5f    |",
            i, TimeToString(time1[i]), open[i], close[i], closef[i]);
}
}
//--- Result
1. CopySeries returns 20 values. Error code=0
[ 0] 1.06722 1.06733 1.06653 1.06520 1.06573 1.06649 1.06694 1.06675 1.06684 1.0

CopyTime

The function gets to time_array history data of bar opening time for the specified symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - as_series=true or as_series=false. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyTime(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,         // start position
    int             count,             // data count to copy
    datetime        time_array[]      // target array to copy open times
);
```

Call by the start date and the number of required elements

```
int CopyTime(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,             // data count to copy
    datetime        time_array[]      // target array to copy open times
);
```

Call by the start and end dates of a required time interval

```
int CopyTime(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // stop date and time
datetime    time_array[]     // target array to copy open times
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] Bar time corresponding to the last element to copy.

time_array[]

[out] Array of [datetime](#) type.

Return Value

Returns the copied data count or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

See a detailed example of requesting history data in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopyOpen

The function gets into `open_array` the history data of bar open prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyOpen(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,        // start position
    int             count,            // data count to copy
    double          open_array[]      // target array to copy open prices
);
```

Call by the start date and the number of required elements

```
int CopyOpen(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,            // data count to copy
    double          open_array[]      // target array for bar open prices
);
```

Call by the start and end dates of a required time interval

```
int CopyOpen(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,       // start date and time
datetime    stop_time,        // stop date and time
double      open_array[]      // target array for bar open values
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] The start time for the last element to copy.

open_array[]

[out] Array of [double](#) type.

Return Value

Returns the number of element in the array or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

See a detailed example of requesting history data in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopyHigh

The function gets into `high_array` the history data of highest bar prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyHigh(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,        // start position
    int             count,            // data count to copy
    double          high_array[]      // target array to copy
);
```

Call by the start date and the number of required elements

```
int CopyHigh(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,            // data count to copy
    double          high_array[]      // target array to copy
);
```

Call by the start and end dates of a required time interval

```
int CopyHigh(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // stop date and time
double      high_array[]     // target array to copy
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

high_array[]

[out] Array of [double](#) type.

Return Value

Returns the copied data count or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

int sec=t%60;  
printf("High[%d] = %G Low[%d] = %G",  
        sec,iHigh(Symbol(),0,sec),  
        sec,iLow(Symbol(),0,sec));  
}
```

See a detailed example of requesting history data in the [Methods of Object Binding](#) section. The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopyLow

The function gets into `low_array` the history data of minimal bar prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyLow(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,        // start position
    int             count,            // data count to copy
    double          low_array[]       // target array to copy
);
```

Call by the start date and the number of required elements

```
int CopyLow(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,            // data count to copy
    double          low_array[]       // target array to copy
);
```

Call by the start and end dates of a required time interval

```
int CopyLow(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // stop date and time
double      low_array[]      // target array to copy
);

```

Parameters

symbol_name

[in] Symbol.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] Bar time, corresponding to the first element to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

low_array[]

[out] Array of [double](#) type.

Return Value

Returns the copied data count or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

See a detailed example of requesting history data in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopyClose

The function gets into `close_array` the history data of bar close prices for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyClose(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,         // start position
    int             count,             // data count to copy
    double          close_array[]     // target array to copy
);
```

Call by the start date and the number of required elements

```
int CopyClose(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,             // data count to copy
    double          close_array[]     // target array to copy
);
```

Call by the start and end dates of a required time interval

```
int CopyClose(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // stop date and time
double      close_array[]     // target array to copy
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

close_array[]

[out] Array of [double](#) type.

Return Value

Returns the copied data count or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

See a detailed example of history data requesting in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopyTickVolume

The function gets into `volume_array` the history data of tick volumes for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyTickVolume(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,         // start position
    int             count,             // data count to copy
    long           volume_array[]      // target array for tick volumes
);
```

Call by the start date and the number of required elements

```
int CopyTickVolume(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,             // data count to copy
    long           volume_array[]      // target array for tick volumes
);
```

Call by the start and end dates of a required time interval

```
int CopyTickVolume(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // stop date and time
long        volume_array[]    // target array for tick volumes
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

volume_array[]

[out] Array of [long](#) type.

Return Value

Returns the copied data count or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

Example:

```
#property indicator_separate_window
#property indicator_buffers 1
#property indicator_plots 1
//---- plot TickVolume
#property indicator_label1 "TickVolume"

//--- indicator buffers mapping
SetIndexBuffer(0,TickVolumeBuffer,INDICATOR_DATA);
IndicatorSetInteger(INDICATOR_DIGITS,0);
//---
}
//+-----+
//| Custom indicator iteration function |
//+-----+
int OnCalculate(const int rates_total,
               const int prev_calculated,
               const datetime &time[],
               const double &open[],
               const double &high[],
               const double &low[],
               const double &close[],
               const long &tick_volume[],
               const long &volume[],
```

```

        const int &spread[]
    {
        //---
        if (prev_calculated==0)
        {
            long timeseries[];
            ArraySetAsSeries(timeseries,true);
            int prices=CopyTickVolume(Symbol(),0,0,bars,timeseries);
            for(int i=0;i<rates_total-prices;i++) TickVolumeBuffer[i]=0.0;
            for(int i=0;i<prices;i++) TickVolumeBuffer[rates_total-1-i]=timeseries[prices-1-i];
            Print("We have received the following number of TickVolume values: "+prices);
        }
        else
        {
            long timeseries[];
            int prices=CopyTickVolume(Symbol(),0,0,1,timeseries);
            TickVolumeBuffer[rates_total-1]=timeseries[0];
        }
        //--- return value of prev_calculated for next call
        return(rates_total);
    }

```

See a detailed example of history data requesting in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopyRealVolume

The function gets into `volume_array` the history data of trade volumes for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopyRealVolume(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,        // start position
    int             count,            // data count to copy
    long            volume_array[]    // target array for volumes values
);
```

Call by the start date and the number of required elements

```
int CopyRealVolume(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,            // data count to copy
    long            volume_array[]    // target array for volumes values
);
```

Call by the start and end dates of a required time interval

```
int CopyRealVolume(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // stop date and time
long        volume_array[]    // target array for volumes values
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

volume_array[]

[out] Array of [long](#) type.

Return Value

Returns the copied data count or -1 in the case of [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

See an example of history data requesting in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopySpread

The function gets into `spread_array` the history data of spread values for the selected symbol-period pair in the specified quantity. It should be noted that elements ordering is from present to past, i.e., starting position of 0 means the current bar.

When copying the yet unknown amount of data, it is recommended to use [dynamic array](#) as a target array, because if the requested data count is less (or more) than the length of the target array, function tries to reallocate the memory so that the requested data fit entirely.

If you know the amount of data you need to copy, it should better be done to a [statically allocated buffer](#), in order to prevent the allocation of excessive memory.

No matter what is the property of the target array - `as_series=true` or `as_series=false`. Data will be copied so that the oldest element will be located at the start of the physical memory allocated for the array. There are 3 variants of function calls.

Call by the first position and the number of required elements

```
int CopySpread(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    int             start_pos,        // start position
    int             count,            // data count to copy
    int             spread_array[]    // target array for spread values
);
```

Call by the start date and the number of required elements

```
int CopySpread(
    string          symbol_name,      // symbol name
    ENUM_TIMEFRAMES timeframe,        // period
    datetime        start_time,       // start date and time
    int             count,            // data count to copy
    int             spread_array[]    // target array for spread values
);
```

Call by the start and end dates of a required time interval

```
int CopySpread(
```

```

string      symbol_name,      // symbol name
ENUM_TIMEFRAMES timeframe,    // period
datetime    start_time,      // start date and time
datetime    stop_time,       // stop date and time
int         spread_array[]    // target array for spread values
);

```

Parameters

symbol_name

[in] Symbol name.

timeframe

[in] Period.

start_pos

[in] The start position for the first element to copy.

count

[in] Data count to copy.

start_time

[in] The start time for the first element to copy.

stop_time

[in] Bar time, corresponding to the last element to copy.

spread_array[]

[out] Array of [int](#) type.

Return Value

Returns the copied data count or -1 in case of an [error](#).

Note

If the whole interval of requested data is out of the available data on the server, the function returns -1. If data outside [TERMINAL_MAXBARS](#) (maximal number of bars on the chart) is requested, the function will also return -1.

When requesting data from the indicator, if requested timeseries are not yet built or they need to be downloaded from the server, the function will immediately return -1, but the process of downloading/building will be initiated.

When requesting data from an Expert Advisor or script, [downloading from the server](#) will be initiated, if the terminal does not have these data locally, or building of a required timeseries will start, if data can be built from the local history but they are not ready yet. The function will return the amount of data that will be ready by the moment of timeout expiration, but history downloading will continue, and at the next similar request the function will return more data.

When requesting data by the start date and the number of required elements, only data whose date is less than (earlier) or equal to the date specified will be returned. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always less or equal to the specified one.

When requesting data in a specified range of dates, only data from this interval will be returned. The interval is set and counted up to seconds. It means, the open time of any bar, for which value is returned (volume, spread, value on the indicator buffer, prices Open, High, Low, Close or open time Time) is always within the requested interval.

Thus, if the current day is Saturday, at the attempt to copy data on a week timeframe specifying *start_time=Last_Tuesday* and *stop_time=Last_Friday* the function will return 0, because the open time on a week timeframe is always Sunday, but one week bar does not fall into the specified interval.

If you need to return value corresponding to the current uncompleted bar, you can use the first form of call specifying *start_pos=0* and *count=1*.

Example:

```
#property indicator_separate_window
#property indicator_buffers 1
#property indicator_plots 1
//---- plot Spread
#property indicator_label1 "Spread"
#property indicator_type1 DRAW_HISTOGRAM
#property indicator_color1 clrRed
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
//--- input parameters
input int bars=3000;
//--- indicator buffers

        }
        else
        {
            double Ask,Bid;
            Ask=SymbolInfoDouble(Symbol(),SYMBOL_ASK);
            Bid=SymbolInfoDouble(Symbol(),SYMBOL_BID);
            Comment("Ask = ",Ask," Bid = ",Bid);
            SpreadBuffer[rates_total-1]=(Ask-Bid)/Point();
        }
        //--- return value of prev_calculated for next call
        return(rates_total);
    }

```

See an example of history data requesting in section [Methods of Object Binding](#). The script available in that section shows how to get the values of indicator [iFractals](#) on the last 1000 bars and how to display the last 10 up and 10 down fractals on the chart. A similar technique can be used for all indicators that have missing data and that are usually drawn using the following [styles](#):

- [DRAW_SECTION](#),
- [DRAW_ARROW](#),
- [DRAW_ZIGZAG](#),
- [DRAW_COLOR_SECTION](#),
- [DRAW_COLOR_ARROW](#),
- [DRAW_COLOR_ZIGZAG](#).

CopyTicks

The function receives ticks in the [MqlTick](#) format into `ticks_array`. In this case, ticks are indexed from the past to the present, i.e. the 0 indexed tick is the oldest one in the array. For tick analysis, check the `flags` field, which shows what exactly has changed in the tick.

```
int CopyTicks(
    string          symbol_name,           // Symbol name
    MqlTick&        ticks_array[],         // Tick receiving array
    uint            flags=COPY_TICKS_ALL,  // The flag that determines the type of request
    ulong           from=0,                // The date from which you want to request ticks
    uint            count=0                // The number of ticks that you want to receive
);
```

Parameters

symbol_name

[in] Symbol.

ticks_array

[out] An array of the [MqlTick](#) type for receiving ticks.

flags

[in] A flag to define the type of the requested ticks. [COPY_TICKS_INFO](#) - ticks with Bid and/or Ask changes, [COPY_TICKS_TRADE](#) - ticks with changes in Last and Volume, [COPY_TICKS_ALL](#) - all ticks. For any type of request, the values of the previous tick are added to the remaining fields of the `MqlTick` structure.

from

[in] The date from which you want to request ticks. In milliseconds since 1970.01.01. If *from*=0, the last *count* ticks will be returned.

count

[in] The number of requested ticks. If the 'from' and 'count' parameters are not specified, all available recent ticks (but not more than 2000) will be written to `ticks_array[]`.

Returned value

The number of copied tick or -1 in case of an [error](#).

Note

The `CopyTicks()` function allows requesting and analyzing all received ticks. The first call of `CopyTicks()` initiates synchronization of the symbol's tick database stored on the hard disk. If the local database does not provide all the requested ticks, then missing ticks will be automatically downloaded from the trade server. Ticks beginning with the *from* date specified in `CopyTicks()` till the current moment will be synchronized. After that, all ticks arriving for this symbol will be added to the tick database thus keeping it in the synchronized state.

If the *from* and *count* parameters are not specified, all available recent ticks (but not more than 2000) will be written to `ticks_array[]`. The *flags* parameter allows specifying the type of required ticks.

COPY_TICKS_INFO - ticks with Bid and/or Ask price changes are returned. Data of other fields will also be added. For example, if only the Bid has changed, the *ask* and *volume* fields will be filled with last known values. To find out exactly what has changed, analyze the *flags* field, which will have the value of TICK_FLAG_BID and/or TICK_FLAG_ASK. If a tick has zero values of the Bid and Ask prices, and the flags show that these data have changed (*flags*=TICK_FLAG_BID|TICK_FLAG_ASK), this means that the order book (Market Depth) is empty. In other words, there are no buy and sell orders.

COPY_TICKS_TRADE - ticks with the Last price and volume changes are returned. Data of other fields will also be added, i.e. last known values of Bid and Ask will be specified in the appropriate fields. To find out exactly what has changed, analyze the *flags* field, which will have the TICK_FLAG_LAST and TICK_FLAG_VOLUME value.

COPY_TICKS_ALL - all ticks with any change are returned. Unchanged fields will be filled with last known values.

Call of CopyTicks() with the COPY_TICKS_ALL flag immediately returns all ticks from the request interval, while calls in other modes require some time to process and select ticks, therefore they do not provide significant speed advantage.

When requesting ticks (either **COPY_TICKS_INFO** or **COPY_TICKS_TRADE**), every tick contains full price information as of the time of the tick (*bid*, *ask*, *last* and *volume*). This feature is provided for an easier analysis of the trade state at the time of each tick, so there is no need to request a deep tick history and search for the values of other fields.

In indicators, the CopyTicks() function returns the result: when called from an indicator, CopyTick() immediately returns all available ticks of a symbol, and will launch synchronization of the tick database, if available data is not enough. All indicators in one symbol operate in one common thread, so the indicator cannot wait for the completion of synchronization. After synchronization, CopyTicks() will return all requested ticks during the next call. In indicators, the [OnCalculate\(\)](#) function is called after the arrival of each tick.

CopyTicks() can wait for the result for 45 seconds in Expert Advisors and scripts: as distinct from indicators, every Expert Advisor and script operate in a separate thread, and therefore can wait 45 seconds till the completion of synchronization. If the required amount of ticks fails to be synchronized during this time, CopyTicks() will return available ticks by timeout and will continue synchronization. [OnTick\(\)](#) in Expert Advisor is not a handler of every tick, it only notifies an Expert Advisor about changes in the market. It can be a batch of changes: the terminal can simultaneously make a few ticks, but OnTick() will be called only once to notify the EA of the latest market state.

The rate of data return: the terminal stores in the fast access cache 4,096 last ticks for each instrument (65,536 ticks for symbols with a running Market Depth). If requested ticks for the current trading session are beyond the cache, CopyTicks() calls the ticks stored in the terminal memory. These requests require more time for execution. The slowest requests are those requesting ticks for other days, since the data is read from the disk in this case.

Example:

CopyTicksRange

The function receives ticks in the [MqlTick](#) format within the specified date range to ticks_array. Indexing goes from the past to the present meaning that a tick with the index 0 is the oldest one in the array. For tick analysis, check the *flags* field, which shows what exactly has changed.

```
int CopyTicksRange(
    const string      symbol_name,           // symbol name
    MqlTick&          ticks_array[],         // tick receiving array
    uint              flags=COPY_TICKS_ALL,  // flag that defines the type of the ticks
    ulong             from_msc=0,            // date, starting from which ticks are req
    ulong             to_msc=0               // date, up to which ticks are requested
);
```

Parameters

symbol_name

[in] Symbol.

ticks_array

[out] [MqlTick](#) static or dynamic array for receiving ticks. If the static array cannot hold all the ticks from the requested time interval, the maximum possible amount of ticks is received. In this case, the function generates the error [ERR_HISTORY_SMALL_BUFFER](#) (4407) .

flags

[in] A flag to define the type of the requested ticks. [COPY_TICKS_INFO](#) - ticks with Bid and/or Ask changes, [COPY_TICKS_TRADE](#) - ticks with changes in Last and Volume, [COPY_TICKS_ALL](#) - all ticks. For any type of request, the values of the previous tick are added to the remaining fields of the MqlTick structure.

from_msc

[in] The date, from which you want to request ticks. In milliseconds since 1970.01.01. If the *from_msc* parameter is not specified, ticks from the beginning of the history are sent. Ticks with the time >= from_msc are sent.

to_msc

[in] The date, up to which you want to request ticks. In milliseconds since 01.01.1970. Ticks with the time <= to_msc are sent. If the *to_msc* parameter is not specified, all ticks up to the end of the history are sent.

Return Value

The number of copied tick or -1 in case of an error. [GetLastError\(\)](#) is able to return the following errors:

- [ERR_HISTORY_TIMEOUT](#) - ticks synchronization waiting time is up, the function has sent all it had.
- [ERR_HISTORY_SMALL_BUFFER](#) - static buffer is too small. Only the amount the array can store has been sent.
- [ERR_NOT_ENOUGH_MEMORY](#) - insufficient memory for receiving a history from the specified range to the dynamic tick array. Failed to allocate enough memory for the tick array.

Note

The `CopyTicksRange()` function is used for requesting ticks strictly from a specified range, for example, from a certain day in history. At the same time, `CopyTicks()` allows specifying only a start date, for example - receive all ticks from the beginning of the month till the current moment.

[SymbolInfoTick](#), [Structure for Current Prices](#), [OnTick](#), [CopyTicks](#)

iBars

Returns the number of bars of a corresponding symbol and period, available in history.

```
int iBars(  
    const string      symbol,          // Symbol  
    ENUM_TIMEFRAMES  timeframe        // Period  
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

Return Value

The number of bars of a corresponding symbol and period, available in history, but no more than allowed by the "Max bars in chart" parameter in platform settings.

Example:

```
Print("Bar count on the 'EURUSD,H1' is ", iBars("EURUSD", PERIOD_H1));
```

See also

[Bars](#)

iBarShift

Search bar by time. The function returns the index of the bar corresponding to the specified time.

```
int iBarShift(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    datetime          time,            // Time
    bool              exact=false      // Mode
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. `PERIOD_CURRENT` means the current chart period.

time

[in] Time value to search for.

exact=false

[in] A return value, in case the bar with the specified time is not found. If *exact=false*, *iBarShift* returns the index of the nearest bar, the Open time of which is less than the specified time (*time_open<time*). If such a bar is not found (history before the specified time is not available), then the function returns -1. If *exact=true*, *iBarShift* does not search for a nearest bar but immediately returns -1.

Return Value

The index of the bar corresponding to the specified time. If the bar corresponding to the specified time is not found (there is a gap in the history), the function returns -1 or the index of the nearest bar (depending on the 'exact' parameter).

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- The date is on Sunday
    datetime time=D'2002.04.25 12:00';
    string symbol="GBPUSD";
    ENUM_TIMEFRAMES tf=PERIOD_H1;
    bool exact=false;

    //--- If there is no bar at the specified time, iBarShift will return the index of the
    int bar_index=iBarShift(symbol,tf,time,exact);
    //--- Check the error code after the call of iBarShift()
    int error=GetLastError();
```

```

      Time of bar #64 is 2018.06.08 23:00 (FRIDAY)  
   2. GBPUSD PERIOD_H1 2018.06.10 12:00 (SUNDAY):bar index is -1 (exact=true)  
*/
```

iClose

Returns the Close price of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
double iClose(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The Close price of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
input int shift=0;
//+-----+
//| Function-event handler "tick" |
//+-----+
void OnTick()
{
    datetime time = iTime(Symbol(),Period(),shift);
    double open = iOpen(Symbol(),Period(),shift);
    double high = iHigh(Symbol(),Period(),shift);
    double low = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume= iVolume(Symbol(),0,shift);
    int bars = iBars(NULL,0);

    Comment(Symbol(),"",EnumToString(Period()),"\n",
```

```
"Time: " , TimeToString(time, TIME_DATE | TIME_SECONDS), "\n",  
"Open: " , DoubleToString(open, Digits()), "\n",  
"High: " , DoubleToString(high, Digits()), "\n",  
"Low: " , DoubleToString(low, Digits()), "\n",  
"Close: " , DoubleToString(close, Digits()), "\n",  
"Volume: ", IntegerToString(volume), "\n",  
"Bars: " , IntegerToString(bars), "\n"  
);  
}
```

iHigh

Returns the High price of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
double iHigh(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The High price of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
input int shift=0;
//+-----+
//| Function-event handler "tick" |
//+-----+
void OnTick()
{
    datetime time = iTime(Symbol(),Period(),shift);
    double open = iOpen(Symbol(),Period(),shift);
    double high = iHigh(Symbol(),Period(),shift);
    double low = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume= iVolume(Symbol(),0,shift);
    int bars = iBars(NULL,0);

    Comment(Symbol(),"",EnumToString(Period()),"\n",
```

```
"Time: " , TimeToString(time, TIME_DATE | TIME_SECONDS), "\n",  
"Open: " , DoubleToString(open, Digits()), "\n",  
"High: " , DoubleToString(high, Digits()), "\n",  
"Low: " , DoubleToString(low, Digits()), "\n",  
"Close: " , DoubleToString(close, Digits()), "\n",  
"Volume: " , IntegerToString(volume), "\n",  
"Bars: " , IntegerToString(bars), "\n"  
);  
}
```

[CopyHigh](#), [CopyRates](#)

iHighest

Returns the index of the highest value found on the corresponding chart (shift relative to the current bar).

```
int iHighest(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    ENUM_SERIESMODE   type,            // Timeseries identifier
    int               count=WHOLE_ARRAY, // Number of elements
    int               start=0           // Index
);
```

Parameters

symbol

[in] The symbol, on which the search will be performed. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

type

[in] The identifier of the timeseries, in which the search will be performed. Can be equal to any value from [ENUM_SERIESMODE](#).

count=WHOLE_ARRAY

[in] The number of elements in the timeseries (from the current bar towards index increasing direction), among which the search should be performed.

start=0

[in] The index (shift relative to the current bar) of the initial bar, from which search for the highest value begins. Negative values are ignored and replaced with a zero value.

Return Value

The index of the highest value found on the corresponding chart (shift relative to the current bar) or -1 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Example:

```
double val;
//--- Calculation of the highest Close value among 20 consecutive bars
//--- From index 4 to index 23 inclusive, on the current timeframe
int val_index=iHighest(NULL,0,MODE_CLOSE,20,4);
if(val_index!=-1)
    val=High[val_index];
else
    PrintFormat("iHighest() call error. Error code=%d",GetLastError());
```

iLow

Returns the Low price of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
double iLow(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The Low price of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
input int shift=0;
//+-----+
//| Function-event handler "tick" |
//+-----+
void OnTick()
{
    datetime time = iTime(Symbol(),Period(),shift);
    double   open  = iOpen(Symbol(),Period(),shift);
    double   high  = iHigh(Symbol(),Period(),shift);
    double   low   = iLow(Symbol(),Period(),shift);
    double   close = iClose(NULL,PERIOD_CURRENT,shift);
    long     volume= iVolume(Symbol(),0,shift);
    int      bars  = iBars(NULL,0);

    Comment(Symbol()," ",EnumToString(Period()),"\n",
```

```
"Time: " , TimeToString(time, TIME_DATE|TIME_SECONDS), "\n",  
"Open: " , DoubleToString(open, Digits()), "\n",  
"High: " , DoubleToString(high, Digits()), "\n",  
"Low: " , DoubleToString(low, Digits()), "\n",  
"Close: " , DoubleToString(close, Digits()), "\n",  
"Volume: " , IntegerToString(volume), "\n",  
"Bars: " , IntegerToString(bars), "\n"  
);  
}
```

iLowest

Returns the index of the smallest value found on the corresponding chart (shift relative to the current bar).

```
int iLowest(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES   timeframe,        // Period
    ENUM_SERIESMODE    type,            // Timeseries identifier
    int               count=WHOLE_ARRAY, // Number of elements
    int               start=0           // Index
);
```

Parameters

symbol

[in] The symbol, on which the search will be performed. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

type

[in] The identifier of the timeseries, in which the search will be performed. Can be equal to any value from [ENUM_SERIESMODE](#).

count=WHOLE_ARRAY

[in] The number of elements in the timeseries (from the current bar towards index increasing direction), among which the search should be performed.

start=0

[in] The index (shift relative to the current bar) of the initial bar, from which search for the lowest value begins. Negative values are ignored and replaced with a zero value.

Return Value

The index of the lowest value found on the corresponding chart (shift relative to the current bar) or -1 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Example:

```
double val;
//--- Search for a bar with the lowest value of the real volume among 15 consecutive bars
//--- From index 10 to index 24 inclusive, on the current timeframe
int val_index=iLowest(NULL,0,MODE_REAL_VOLUME,15,10);
if(val_index!=-1)
    val=Low[val_index];
else
    PrintFormat("iLowest() call error. Error code=%d",GetLastError());
```

iOpen

Returns the Open price of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
double iOpen(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The Open price of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
input int shift=0;
//+-----+
//| Function-event handler "tick" |
//+-----+
void OnTick()
{
    datetime time = iTime(Symbol(),Period(),shift);
    double open = iOpen(Symbol(),Period(),shift);
    double high = iHigh(Symbol(),Period(),shift);
    double low = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume= iVolume(Symbol(),0,shift);
    int bars = iBars(NULL,0);

    Comment(Symbol(),"",EnumToString(Period()),"\n",
```

```
"Time: " , TimeToString(time, TIME_DATE | TIME_SECONDS), "\n",  
"Open: " , DoubleToString(open, Digits()), "\n",  
"High: " , DoubleToString(high, Digits()), "\n",  
"Low: " , DoubleToString(low, Digits()), "\n",  
"Close: " , DoubleToString(close, Digits()), "\n",  
"Volume: " , IntegerToString(volume), "\n",  
"Bars: " , IntegerToString(bars), "\n"  
);  
}
```

iTime

Returns the opening time of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
datetime iTime(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The opening time of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- The date is on Sunday
    datetime time=D'2018.06.10 12:00';

iRealVolume

Returns the real volume of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
long iRealVolume(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES   timeframe,       // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The real volume of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
input int shift=0;
//+-----+
//| Function-event handler "tick" |
//+-----+
void OnTick()
{
    datetime time = iTime(Symbol(),Period(),shift);
    double   open  = iOpen(Symbol(),Period(),shift);
    double   high  = iHigh(Symbol(),Period(),shift);
    double   low   = iLow(Symbol(),Period(),shift);
    double   close = iClose(NULL,PERIOD_CURRENT,shift);
    long     volume= iVolume(Symbol(),0,shift);
    int      bars  = iBars(NULL,0);

    Comment(Symbol(),"",EnumToString(Period()),"\n",
```

```

iVolume

Returns the tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
long iVolume(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES   timeframe,       // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The tick volume of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
input int shift=0;
//+-----+
//| Function-event handler "tick" |
//+-----+
void OnTick()
{
    datetime time = iTime(Symbol(),Period(),shift);
    double open = iOpen(Symbol(),Period(),shift);

    double low = iLow(Symbol(),Period(),shift);
    double close = iClose(NULL,PERIOD_CURRENT,shift);
    long volume= iVolume(Symbol(),0,shift);
    int bars = iBars(NULL,0);

    Comment(Symbol(),"",EnumToString(Period()),"\n",
```

```
"Time: " , TimeToString(time, TIME_DATE | TIME_SECONDS), "\n",  
"Open: " , DoubleToString(open, Digits()), "\n",  
"High: " , DoubleToString(high, Digits()), "\n",  
"Low: " , DoubleToString(low, Digits()), "\n",  
"Close: " , DoubleToString(close, Digits()), "\n",  
"Volume: " , IntegerToString(volume), "\n",  
"Bars: " , IntegerToString(bars), "\n"  
);  
}
```

See also

[CopyTickVolume](#), [CopyRates](#)

iSpread

Returns the spread value of the bar (indicated by the 'shift' parameter) on the corresponding chart.

```
long iSpread(
    const string      symbol,           // Symbol
    ENUM_TIMEFRAMES  timeframe,        // Period
    int               shift             // Shift
);
```

Parameters

symbol

[in] The symbol name of the financial instrument. [NULL](#) means the current symbol.

timeframe

[in] Period. It can be one of the values of the [ENUM_TIMEFRAMES](#) enumeration. 0 means the current chart period.

shift

[in] The index of the received value from the timeseries (backward shift by specified number of bars relative to the current bar).

Return Value

The Spread value of the bar (indicated by the 'shift' parameter) on the corresponding chart or 0 in case of an error. For [error](#) details, call the [GetLastError\(\)](#) function.

Note

The function always returns actual data. For this purpose it performs a request to the timeseries for the specified symbol/period during each call. This means that if there is no ready data during the first function call, some time may be taken to prepare the result.

The function does not store previous calls results, and there is no local cache for quick value return.

Example:

```
input int shift=0;
//+-----+
//| Function-event handler "tick" |
//+-----+
void OnTick()
{
    datetime time = iTime(Symbol(),Period(),shift);
    double   open  = iOpen(Symbol(),Period(),shift);
    double   high  = iHigh(Symbol(),Period(),shift);
    double   low   = iLow(Symbol(),Period(),shift);
    double   close = iClose(NULL,PERIOD_CURRENT,shift);
    long     volume= iVolume(Symbol(),0,shift);
    int      bars  = iBars(NULL,0);

    Comment(Symbol()," ",EnumToString(Period()),"\n",
```

```
"Time: " , TimeToString(time, TIME_DATE | TIME_SECONDS), "\n",  
"Open: " , DoubleToString(open, Digits()), "\n",  
"High: " , DoubleToString(high, Digits()), "\n",  
"Low: " , DoubleToString(low, Digits()), "\n",  
"Close: " , DoubleToString(close, Digits()), "\n",  
"Volume: " , IntegerToString(volume), "\n",  
"Bars: " , IntegerToString(bars), "\n"  
);  
}
```

Custom symbols

Functions for creating and editing the custom symbol properties.

When connecting the terminal to a certain trade server, a user is able to [work with time series](#) of the financial symbols provided by a broker. Available financial symbols are displayed as a list in the Market Watch window. A separate group of functions allows [receiving data on the symbol properties](#), trading sessions and market depth updates.

The group of functions described in this section allows creating custom symbols. To do this, users are able to apply the trade server's existing symbols, text files or external data sources.

Function	Action
CustomSymbolCreate	Create a custom symbol with the specified name in the specified group
CustomSymbolDelete	Delete a custom symbol with the specified name
CustomSymbolSetInteger	Set the integer type property value for a custom symbol
CustomSymbolSetDouble	Set the real type property value for a custom symbol
CustomSymbolSetString	Set the string type property value for a custom symbol
CustomSymbolSetMarginRate	Set the margin rates depending on the order type and direction for a custom symbol
CustomSymbolSetSessionQuote	Set the start and end time of the specified quotation session for the specified symbol and week day
CustomSymbolSetSessionTrade	Set the start and end time of the specified trading session for the specified symbol and week day
CustomRatesDelete	Delete all bars from the price history of the custom symbol in the specified time interval
CustomRatesReplace	Fully replace the price history of the custom symbol within the specified time interval with the data from the MqlRates type array
CustomRatesUpdate	Add missing bars to the custom symbol history and replace existing data with the ones from the MqlRates type array
CustomTicksAdd	Adds data from an array of the MqlTick type to the price history of a custom symbol. The custom symbol must be selected in the Market Watch window
CustomTicksDelete	Delete all ticks from the price history of the custom symbol in the specified time interval
CustomTicksReplace	Fully replace the price history of the custom symbol within the specified time interval with the data from the MqlTick type array
CustomBookAdd	Passes the status of the Depth of Market for a custom symbol

CustomSymbolCreate

Creates a custom symbol with the specified name in the specified group.

```
bool CustomSymbolCreate(
    const string      symbol_name,           // custom symbol name
    const string      symbol_path="",       // name of a group a symbol is to be created
    const string      symbol_origin=NULL    // name of a symbol used as a basis to create
);
```

Parameters

symbol_name

[in] Custom symbol name. It should not contain groups or subgroups the symbol is located in.

symbol_path=""

[in] The group name a symbol is located in.

symbol_origin=NULL

[in] Name of a symbol the [properties](#) of a created custom symbol are to be copied from. After creating a custom symbol, any property value can be changed to a necessary one using the appropriate functions.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

All custom symbols are created in the special Custom section. If a group name is not specified (the *symbol_path* parameter in the CustomSymbolCreate function contains an empty string or NULL), a custom symbol is generated in the Custom section root. Here we can draw an analogy with the file system, where groups and subgroups can be viewed as folders and subfolders

The symbol and group names may only contain Latin letters without punctuation, spaces or special characters (may only contain ".", "_", "&" and "#"). It is not recommended to use characters <, >, :, ", /, |, ?, *.

The custom symbol name should be unique regardless of a group name it is created in. If a symbol with the same name already exists, the CustomSymbolCreate() function returns 'false', while the subsequent [GetLastError\(\)](#) call returns the error 5300 (ERR_NOT_CUSTOM_SYMBOL) or 5304 (ERR_CUSTOM_SYMBOL_EXIST).

The length of the symbol name should not exceed 31 characters. Otherwise, CustomSymbolCreate() returns 'false' and the error 5302 - ERR_CUSTOM_SYMBOL_NAME_LONG is activated.

The *symbol_path* parameter can be set in two ways:

- only a group name without a name of the custom symbol, for example - "CFD\\Metals". It is best to use this option to avoid errors.
- or <group> name + groups separator "\\<custom symbol name>", for example - "CFD\\Metals\\Platinum". In this case, the group name should end with the exact name of the custom symbol. In case of a mismatch, the custom symbol is still created, but not in the intended group. For example, if *symbol_path*="CFD\\Metals\\Platinum" and *symbol_name*="platinum" (register error),

then a custom symbol named "platinum" is created in the "Custom\CFD\Metals\Platinum" group. The `SymbolInfoGetString("platinum",SYMBOL_PATH)` function returns the "Custom\CFD\Metals\Platinum\platinum" value.

Note that the [SYMBOL_PATH](#) property returns the path with the symbol name at the end. Therefore, it cannot be copied without changes if you want to create a custom symbol in the exact same group. In this case, it is necessary to cut the symbol name in order not to get the result described above.

If a non-existent symbol is set as the `symbol_origin` parameter, then the custom symbol is created empty as if the `symbol_origin` parameter is not set. The error 4301 - `ERR_MARKET_UNKNOWN_SYMBOL` is activated in that case.

The `symbol_path` parameter length should not exceed 127 characters considering "Custom\\", "\\\" groups separators and the symbol name if it is specified at the end.

Example:

```
//+-----+
//|                                     CustomSymbolCreate.mq5 |
//|                                     Copyright 2024, MetaQuotes Ltd. |

CustomSymbolDelete

Deletes a custom symbol with the specified name.

```
bool CustomSymbolDelete(
    const string    symbol_name    // custom symbol name
);
```

Parameters

symbol

[in] Custom symbol name. It should not match the name of an already existing symbol.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

The custom symbol displayed in the Market Watch or the one a chart is opened for cannot be deleted.

Example:

```
//+-----+
//|                                     CustomSymbolDelete.mq5 |
//|                                     Copyright 2024, MetaQuotes Ltd. |

/*
result:
Custom symbol 'EURUSD.C' exists: true
Custom symbol 'EURUSD.C' removed
Custom symbol 'EURUSD.C' exists: false
*/
}
```

See also

[SymbolName](#), [SymbolSelect](#), [CustomSymbolCreate](#)

CustomSymbolSetInteger

Sets the integer type property value for a custom symbol.

```
bool CustomSymbolSetInteger(
    const string          symbol_name,      // symbol name
    ENUM_SYMBOL_INFO_INTEGER property_id,   // property ID
    long                 property_value     // property value
);
```

Parameters

symbol_name

[in] Custom symbol name.

property_id

[in] Symbol property ID. The value can be one of the values of the [ENUM_SYMBOL_INFO_INTEGER](#) enumeration.

property_value

[in] A long type variable containing the property value.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

The minute and tick history of the custom symbol is completely removed if any of these properties is changed in the symbol specification:

- SYMBOL_CHART_MODE - price type for constructing bars (Bid or Last)
- SYMBOL_DIGITS - number of digits after the decimal point to display the price

After deleting the custom symbol history, the terminal attempts to create a new history using the updated properties. The same happens when the custom symbol properties are changed manually.

Example:

```
//+-----+
//|                                     CustomSymbolSetInteger.mq5 |

}
```

See also

[SymbolInfoInteger](#)

CustomSymbolSetDouble

Sets the real type property value for a custom symbol.

```
bool CustomSymbolSetDouble(
    const string      symbol_name,      // symbol name
    ENUM_SYMBOL_INFO_DOUBLE property_id, // property ID
    double            property_value    // property value
);
```

Parameters

symbol_name

[in] Custom symbol name.

property_id

[in] Symbol property ID. The value can be one of the values of the [ENUM_SYMBOL_INFO_DOUBLE](#) enumeration.

property_value

[in] A double type variable containing the property value.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

The minute and tick history of the custom symbol is completely removed if any of these properties is changed in the symbol specification:

- SYMBOL_POINT - one point value
- SYMBOL_TRADE_TICK_SIZE - value of a tick that specifies the minimum allowable price change
- SYMBOL_TRADE_TICK_VALUE - one-tick price change value for a profitable position

After deleting the custom symbol history, the terminal attempts to create a new history using the updated properties. The same happens when the custom symbol properties are changed manually.

Example:

```
//+-----+
//|                                     CustomSymbolSetDouble.mq5 |

[SymbolInfoDouble](#)

CustomSymbolSetString

Sets the string type property value for a custom symbol.

```
bool CustomSymbolSetString(
    const string      symbol_name,      // symbol name
    ENUM_SYMBOL_INFO_STRING property_id, // property ID
    string            property_value    // property value
);
```

Parameters

symbol_name

[in] Custom symbol name.

property_id

[in] Symbol property ID. The value can be one of the values of the [ENUM_SYMBOL_INFO_STRING](#) enumeration.

property_value

[in] A string type variable containing the property value.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

The minute and tick history of the custom symbol is completely removed if the SYMBOL_FORMULA property (setting the equation for the custom symbol price construction) is changed in the symbol specification. After deleting the custom symbol history, the terminal attempts to create a new history using the new equation. The same happens when the custom symbol equation is changed manually.

Example:

```
//+-----+
//|                                     CustomSymbolSetString.mq5 |

[SymbolInfoString](#)

CustomSymbolSetMarginRate

Sets the margin rates depending on the order type and direction for a custom symbol.

```
bool CustomSymbolSetMarginRate(
    const string      symbol_name,           // symbol name
    ENUM_ORDER_TYPE   order_type,           // order type
    double            initial_margin_rate,    // initial margin rate
    double            maintenance_margin_rate // maintenance margin rate
);
```

Parameters

symbol_name

[in] Custom symbol name.

order_type

[in] Order type.

initial_margin_rate

[in] A [double](#) type variable with an initial margin rate. Initial margin is a security deposit for 1 lot deal in the appropriate direction. Multiplying the rate by the initial margin, we receive the amount of funds to be reserved on the account when placing an order of the specified type.

maintenance_margin_rate

[in] A [double](#) type variable with a maintenance margin rate. Maintenance margin is a minimum amount for maintaining an open position of 1 lot in the appropriate direction. Multiplying the rate by the maintenance margin, we receive the amount of funds to be reserved on the account after an order of the specified type is activated.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Example:

```
//+-----+

[SymbolInfoMarginRate](#)

CustomSymbolSetSessionQuote

Sets the start and end time of the specified quotation session for the specified symbol and week day.

```
bool CustomSymbolSetSessionQuote(
    const string      symbol_name,           // symbol name
    ENUM_DAY_OF_WEEK  day_of_week,          // week day
    uint              session_index,         // session index
    datetime           from,                 // session start time
    datetime           to                    // session end time
);
```

Parameters

symbol_name

[in] Custom symbol name.

ENUM_DAY_OF_WEEK

[in] Week day, value from the [ENUM_DAY_OF_WEEK](#) enumeration.

uint

[in] Index of the session, for which start and end times are to be set. Session indexing starts from 0.

from

[in] Session start time in seconds from 00:00, data value in the variable is ignored.

to

[in] Session end time in seconds from 00:00, data value in the variable is ignored.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

If the session with the specified *session_index* already exists, the function simply edits the beginning and end of the session.

If zero start and end parameters have been passed for the session (*from=0* and *to=0*), the appropriate session with the *session_index* is deleted, while the session indexing is shifted downwards.

Sessions can be added only sequentially. In other words, you can add *session_index=1* only if the session with the index 0 already exists. If this rule is broken, a new session is not created, while the function itself returns 'false'.

Example:

```
//+-----+
//|                                         CustomSymbolSetSessionQuote.mq5 |

[SymbolInfoSessionQuote](#), [Symbol info](#), [TimeToStr](#), [Date structure](#)

CustomSymbolSetSessionTrade

Sets the start and end time of the specified trading session for the specified symbol and week day.

```
bool CustomSymbolSetSessionTrade(
    const string      symbol_name,      // symbol name
    ENUM_DAY_OF_WEEK day_of_week,      // week day
    uint              session_index,    // session index
    datetime           from,            // session start time
    datetime           to               // session end time
);
```

Parameters

symbol_name

[in] Custom symbol name.

ENUM_DAY_OF_WEEK

[in] Week day, value from the [ENUM_DAY_OF_WEEK](#) enumeration.

uint

[in] Index of the session, for which start and end times are to be set. Session indexing starts from 0.

from

[in] Session start time in seconds from 00:00, data value in the variable is ignored.

to

[in] Session end time in seconds from 00:00, data value in the variable is ignored.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

If the session with the specified *session_index* already exists, the function simply edits the beginning and end of the session.

If zero start and end parameters have been passed for the session (*from=0* and *to=0*), the appropriate session with the *session_index* is deleted, while the session indexing is shifted downwards.

Sessions can be added only sequentially. In other words, you can add *session_index=1* only if the session with the index 0 already exists. If this rule is broken, a new session is not created, while the function itself returns 'false'.

Example:

```
//+-----+
//|                                         CustomSymbolSetSessionTrade.mq5 |

CustomRatesDelete

Deletes all bars from the price history of the custom symbol in the specified time interval.

```
int CustomRatesDelete(
    const string      symbol,      // symbol name
    datetime          from,        // start date
    datetime          to,          // end date
);
```

Parameters

symbol

[in] Custom symbol name.

from

[in] Time of the first bar in the price history within the specified range to be removed.

to

[in] Time of the last bar in the price history within the specified range to be removed.

Return Value

Number of deleted bars or -1 in case of an [error](#).

Example:

```
//+-----+

[CustomRatesReplace](#), [CustomRatesUpdate](#), [CopyRates](#)

CustomRatesReplace

Fully replaces the price history of the custom symbol within the specified time interval with the data from the [MqlRates](#) type array.

```
int CustomRatesReplace(  
    const string      symbol,           // symbol name  
    datetime          from,             // start date  
    datetime          to,               // end date  
    const MqlRates&   rates[],          // array for the data to be applied to a custom symbol  
    uint              count=WHOLE_ARRAY // number of the rates[] array elements to be replaced  
);
```

Parameters

symbol

[in] Custom symbol name.

from

[in] Time of the first bar in the price history within the specified range to be updated.

to

[in] Time of the last bar in the price history within the specified range to be updated.

rates[]

[in] Array of the [MqlRates](#) type history data for M1.

count=WHOLE_ARRAY

[in] Number of the *rates[]* array elements to be used for replacement. [WHOLE_ARRAY](#) means that all *rates[]* array elements should be used for replacement.

Return Value

Number of updated bars or -1 in case of an [error](#).

Note

If the bar from the *rates[]* array goes beyond the specified range, it is ignored. If such a bar is already present in the price history and enters the given range, it is replaced. All other bars in the current price history outside the specified range remain unchanged. The *rates[]* array data should be correct regarding OHLC prices, while the bars opening time should correspond to the M1 [timeframe](#).

[CustomRatesDelete](#), [CustomRatesUpdate](#), [CopyRates](#)

CustomRatesUpdate

Adds missing bars to the custom symbol history and replaces existing data with the ones from the [MqlRates](#) type array.

```
int CustomRatesUpdate(
    const string      symbol,           // custom symbol name
    const MqlRates&    rates[],         // array for the data to be applied to a custom symbol
    uint              count=WHOLE_ARRAY // number of the rates[] array elements to be used
);
```

Parameters

symbol

[in] Custom symbol name.

rates[]

[in] Array of the [MqlRates](#) type history data for M1.

count=WHOLE_ARRAY

[in] Number of the *rates[]* array elements to be used for update. [WHOLE_ARRAY](#) means that all *rates[]* array elements should be used.

Return Value

Number of updated bars or -1 in case of an [error](#).

Note

If there is no bar from the *rates[]* array in the current custom symbol history, it is added. If such a bar already exists, it is replaced. All other bars in the current price history remain unchanged. The *rates[]* array data should be correct regarding OHLC prices, while the bars opening time should correspond to the M1 [timeframe](#).

See also

[CustomRatesReplace](#), [CustomRatesDelete](#), [CopyRates](#)

CustomTicksAdd

Adds data from an array of the [MqlTick](#) type to the price history of a custom symbol. The custom symbol must be [selected](#) in the Market Watch window.

```
int CustomTicksAdd(
    const string      symbol,           // Symbol name
    const MqlTick&    ticks[],         // The array with tick data that should be app
    uint              count=WHOLE_ARRAY // number of the ticks[] array elements to be
);
```

Parameters

symbol

[in] The name of the custom symbol.

ticks[]

[in] An array of tick data of the [MqlTick](#) type arranged in order of time from earlier data to more recent ones, i.e. $\text{ticks}[k].\text{time_msc} \leq \text{ticks}[n].\text{time_msc}$, if $k < n$.

count=WHOLE_ARRAY

[in] Number of the *ticks[]* array elements to be used for adding. [WHOLE_ARRAY](#) means that all *ticks[]* array elements should be used.

Return Value

The number of added ticks or -1 in case of an [error](#).

Further Note

The [CustomTicksAdd](#) function only works for custom symbols opened in the Market Watch window. If the symbol is not selected in Market Watch, then you should add ticks using [CustomTicksReplace](#).

The CustomTicksAdd function allows transmitting ticks as if they are delivered from the broker's server. Data are sent to the Market Watch window instead of being written directly to the tick database. The terminal then saves ticks from the Market Watch to a database. If the amount of data transmitted during one function call is large, the behavior of the function changes in order to reduce resource usage. If more than 256 ticks are passed, data is divided into two parts. The first, i.e. the larger part is written directly to the tick database (as it is done in [CustomTicksReplace](#)). The second part containing 128 ticks is passed to the Market Watch window, from which the terminal saves the ticks to a database.

The [MqlTick](#) structure has two fields with the time value: time (the tick time in seconds) and time_msc (the tick time in milliseconds), which are counted from January 1, 1970. These fields in the added ticks are processed in the following order:

1. If $\text{ticks}[k].\text{time_msc} \neq 0$, we use it to fill the $\text{ticks}[k].\text{time}$ field, i.e. $\text{ticks}[k].\text{time} = \text{ticks}[k].\text{time_msc} / 1000$ (integer division) is set for the tick
2. If $\text{ticks}[k].\text{time_msc} = 0$ and $\text{ticks}[k].\text{time} \neq 0$, time in milliseconds is obtained by multiplying by 1000, i.e. $\text{ticks}[k].\text{time_msc} = \text{ticks}[k].\text{time} * 1000$
3. If $\text{ticks}[k].\text{time_msc} = 0$ and $\text{ticks}[k].\text{time} = 0$, the current [trade server time](#) up to a millisecond as of the moment of CustomTicksAdd call is written to these fields.

If the value of ticks[k].bid, ticks[k].ask, ticks[k].last or ticks[k].volume is greater than zero, a combination of appropriate flags is written to the ticks[k].flags field:

- TICK_FLAG_BID - the tick has changed the bid price
- TICK_FLAG_ASK - the tick has changed the ask price
- TICK_FLAG_LAST - the tick has changed the last deal price
- TICK_FLAG_VOLUME - the tick has changed the volume

If the value of a field is less than or equal to zero, the corresponding flag is not written to the ticks[k].flags field.

Flags TICK_FLAG_BUY and TICK_FLAG_SELL are not added to the history of a custom symbol.

Example:

```

CustomTicksDelete

Deletes all ticks from the price history of the custom symbol in the specified time interval.

```
int CustomTicksDelete(  
    const string    symbol,           // symbol name  
    long           from_msc,         // start date  
    long           to_msc            // end date  
);
```

Parameters

- symbol*
[in] Custom symbol name.
- from_msc*
[in] Time of the first tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.
- to_msc*
[in] Time of the last tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.

Return Value

Number of deleted ticks or -1 in case of an [error](#).

Example:

```

See also

[CustomRatesDelete](#), [CustomRatesUpdate](#), [CustomTicksReplace](#), [CopyTicks](#), [CopyTicksRange](#)

CustomTicksReplace

Fully replaces the price history of the custom symbol within the specified time interval with the data from the [MqlTick](#) type array.

```
int CustomTicksReplace(
    const string      symbol,           // symbol name
    long              from_msc,         // start date
    long              to_msc,           // end date
    const MqlTick&     ticks[],         // array for the data to be applied to a custom symbol
    uint              count=WHOLE_ARRAY // number of the ticks[] array elements to be used
);
```

Parameters

symbol

[in] Custom symbol name.

from_msc

[in] Time of the first tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.

to_msc

[in] Time of the last tick in the price history within the specified range to be removed. Time in milliseconds since 01.01.1970.

ticks[]

[in] Array of the [MqlTick](#) type tick data ordered in time in ascending order.

count=WHOLE_ARRAY

[in] Number of the *ticks[]* array elements to be used for replacement in the specified time interval. [WHOLE_ARRAY](#) means that all *ticks[]* array elements should be used.

Return Value

Number of updated ticks or -1 in case of an [error](#).

Note

Since several ticks may often have the same time up to a millisecond in a stream of quotes (accurate tick time is stored in the *time_msc* field of the [MqlTick](#) structure), the [CustomTicksReplace](#) function does not automatically sort out the *ticks[]* array elements by time. Therefore, the array of ticks must be pre-arranged in time ascending order.

The ticks are replaced consecutively, day after day, until the time specified in *to_msc* or until an error occurs. The first day from the specified range is processed followed by the next one, etc. As soon as the mismatch between the tick time and the ascending (non-descending) order is detected, the tick replacement stops on the current day. All ticks from the previous days are successfully replaced, while the current day (at the moment of a wrong tick) and all the remaining days in the specified interval remain unchanged.

If the *ticks[]* array contains no tick data for any day (generally, any time interval), a "hole" corresponding to the missing data appears in the custom symbol history after the tick data from *ticks[]* are applied. In other words, the call of [CustomTicksReplace](#) with missing ticks is

equivalent to deleting part of the tick history, as if [CustomTicksDelete](#) with the "hole" interval is called.

If the tick database has no data for the specified time interval, CustomTicksReplace will add to the database ticks from the ticks[] array.

The CustomTicksReplace function works directly with the tick database.

CustomBookAdd

Passes the status of the Depth of Market for a custom symbol. The function allows broadcasting the Depth of Market as if the prices arrive from a broker's server.

```
bool CustomBookAdd(
    const string      symbol,           // symbol name
    const MqlBookInfo& books[]          // array with descriptions of the Depth of M
    uint              count=WHOLE_ARRAY // number of elements to be used
);
```

Parameters

symbol

[in] Custom symbol name.

books[]

[in] The array of [MqlBookInfo](#) type data fully describing the Depth of Market status — all buy and sell requests. The passed Depth of Market status completely replaces the previous one.

count=WHOLE_ARRAY

[in] The number of 'books' array elements to be passed to the function. The entire array is used by default.

Return Value

true - success, otherwise - false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

The [CustomBookAdd](#) function works only for custom symbols the Depth of Market is opened for — via the platform interface or the [MarketBookAdd](#) function.

When throwing the Depth of Market in, the symbol's Bid and Ask prices are not updated. You should control the change of the best prices and throw in the ticks using [CustomTicksAdd](#).

The function verifies the accuracy of transmitted data: the type, price and volume must be indicated for each element. Furthermore, `MqlBookInfo.volume` and `MqlBookInfo.volume_real` must not be zero or negative; if both volumes are negative, this will be considered an error. You can specify any of the volumes or both of them: the one that is indicated or is positive will be used:

```
volume=-1 && volume_real=2 - volume_real=2 will be used,
a volume=3 && volume_real=0 - volume=3 will be used.
```

The `MqlBookInfo.volume_real` extended accuracy volume has a higher priority over the regular `MqlBookInfo.volume`. If both values are specified for the Depth of Market element, the `volume_real` one is used.

The order of the `MqlBookInfo` elements in the 'books' array does not matter. When saving the data, the terminal sorts them by price on its own.

When saving data, the "Book depth" ([SYMBOL_TICKS_BOOKDEPTH](#)) parameter of the recipient custom symbol is checked. If the number of sell requests exceeds this value in the passed Depth of Market, the excess levels are discarded. The same is true for buy requests.

Sample filling of the 'books' array:

Depth of Market status		Filling books[]
Volume	Price	
100.00	1.14337	books[0].type=BOOK_TYPE_SELL;
50.00	1.14336	books[0].price=1.14337;
40.00	1.14335	books[0].volume=100;
10.00	1.14333	books[1].type=BOOK_TYPE_SELL;
		books[1].price=1.14330;
		books[1].volume=50;
10.00	1.14322	books[2].type=BOOK_TYPE_SELL;
90.00	1.14320	books[2].price=1.14335;
100.00	1.14319	books[2].volume=40;
10.00	1.14318	books[3].type=BOOK_TYPE_SELL;
		books[3].price=1.14333;
		books[3].volume=10;
		books[4].type=BOOK_TYPE_BUY;
		books[4].price=1.14322;
		books[4].volume=10;
		books[5].type=BOOK_TYPE_BUY;
		books[5].price=1.14320;
		books[5].volume=90;
		books[6].type=BOOK_TYPE_BUY;
		books[6].price=1.14319;
		books[6].volume=100;
		books[7].type=BOOK_TYPE_BUY;
		books[7].price=1.14318;
		books[7].volume=10;

Example:

```
//+-----+
//| Expert initialization function |
//+-----+
int OnInit()
{
//--- enable the Depth of Market for a symbol we are to retrieve data from
    MarketBookAdd(Symbol());
    return(INIT_SUCCEEDED);
}
//+-----+
//| Expert deinitialization function |
//+-----+
void OnDeinit(const int reason)
{
}
//+-----+
//| Tick function |
//+-----+
void OnTick(void)
{
    MqlTick ticks[];
    ArrayResize(ticks,1);
}
```

```

//--- copy the current prices from the common symbol to the custom one
if(SymbolInfoTick(Symbol(),ticks[0]))
{
    string symbol_name=Symbol()+".SYN";
    CustomTicksAdd(symbol_name,ticks);
}
}
//+-----+
//| Book function |
//+-----+
void OnBookEvent(const string &book_symbol)
{
//--- copy the current Depth of Market status from the common symbol to the custom one
if(book_symbol==Symbol())
{
    MqlBookInfo book_array[];
    if(MarketBookGet(Symbol(),book_array))
    {
        string symbol_name=Symbol()+".SYN";
        CustomBookAdd(symbol_name,book_array);
    }
}
}
//+-----+

```

Chart Operations

Functions for setting chart properties ([ChartSetInteger](#), [ChartSetDouble](#), [ChartSetString](#)) are asynchronous and are used for sending update commands to a chart. If these functions are executed successfully, the command is included in the common queue of the chart events. Chart property changes are implemented along with handling of the events queue of this chart.

Thus, do not expect an immediate update of the chart after calling asynchronous functions. Use the [ChartRedraw\(\)](#) function to forcibly update the chart appearance and properties.

Function	Action
ChartApplyTemplate	Applies a specific template from a specified file to the chart
ChartSaveTemplate	Saves current chart settings in a template with a specified name
ChartWindowFind	Returns the number of a subwindow where an indicator is drawn
ChartTimePriceToXY	Converts the coordinates of a chart from the time/price representation to the X and Y coordinates
ChartXYToTimePrice	Converts the X and Y coordinates on a chart to the time and price values
ChartOpen	Opens a new chart with the specified symbol and period
ChartClose	Closes the specified chart
ChartFirst	Returns the ID of the first chart of the client terminal
ChartNext	Returns the chart ID of the chart next to the specified one
ChartSymbol	Returns the symbol name of the specified chart
ChartPeriod	Returns the period value of the specified chart
ChartRedraw	Calls a forced redrawing of a specified chart
ChartSetDouble	Sets the double value for a corresponding property of the specified chart
ChartSetInteger	Sets the integer value (datetime, int, color, bool or char) for a corresponding property of the specified chart
ChartSetString	Sets the string value for a corresponding property of the specified chart
ChartGetDouble	Returns the double value property of the specified chart
ChartGetInteger	Returns the integer value property of the specified chart
ChartGetString	Returns the string value property of the specified chart
ChartNavigate	Performs shift of the specified chart by the specified number of bars relative to the specified position in the chart
ChartID	Returns the ID of the current chart

Function	Action
<u>ChartIndicatorAdd</u>	Adds an indicator with the specified handle into a specified chart window
<u>ChartIndicatorDelete</u>	Removes an indicator with a specified name from the specified chart window
<u>ChartIndicatorGet</u>	Returns the handle of the indicator with the specified short name in the specified chart window
<u>ChartIndicatorName</u>	Returns the short name of the indicator by the number in the indicators list on the specified chart window
<u>ChartIndicatorsTotal</u>	Returns the number of all indicators applied to the specified chart window.
<u>ChartWindowOnDropped</u>	Returns the number (index) of the chart subwindow the Expert Advisor or script has been dropped to
<u>ChartPriceOnDropped</u>	Returns the price coordinate of the chart point the Expert Advisor or script has been dropped to
<u>ChartTimeOnDropped</u>	Returns the time coordinate of the chart point the Expert Advisor or script has been dropped to
<u>ChartXOnDropped</u>	Returns the X coordinate of the chart point the Expert Advisor or script has been dropped to
<u>ChartYOnDropped</u>	Returns the Y coordinate of the chart point the Expert Advisor or script has been dropped to
<u>ChartSetSymbolPeriod</u>	Changes the symbol value and a period of the specified chart
<u>ChartScreenShot</u>	Provides a screenshot of the chart of its current state in a GIF, PNG or BMP format depending on specified extension

ChartApplyTemplate

Applies a specific template from a specified file to the chart. The command is added to chart messages queue and will be executed after processing of all previous commands.

```
bool ChartApplyTemplate(  
    long      chart_id,    // Chart ID  
    const string filename  // Template file name  
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

filename

[in] The name of the file containing the template.

Return Value

Returns true if the command has been added to chart queue, otherwise false. To get an information about the [error](#), call the [GetLastError\(\)](#) function.

Note

The Expert Advisor will be unloaded and will not be able to continue operating in case of successful loading of a new template to the chart it is attached to.

When applying the template to the chart, trade permissions may be limited due to security reasons:

Live trading permission cannot be extended for the Expert Advisors launched by applying the template using ChartApplyTemplate() function.

If the mql5-program calling ChartApplyTemplate() function has no permission to trade, the Expert Advisor launched via the template will also not be able to trade regardless of the template settings.

If the mql5-program calling ChartApplyTemplate() function has permission to trade, while there is no such permission in the template settings, the Expert Advisor launched via the template will not be able to trade.

Using Templates

The resources of the MQL5 language allow setting multiple chart properties, including colors using the [ChartSetInteger\(\)](#) function:

- Chart background color;
- Color of the axes, scale and the OHLC line;
- Grid color;
- Color of volumes and position open levels;
- Color of the up bar, shadow and edge of a bullish candlestick;
- Color of the down bar, shadow and edge of a bearish candlestick;
- Color of the chart line and Doji candlesticks;

- Color of the bullish candlestick body;
- Color of the bearish candlestick body;
- Color of the Bid price line;
- Color of the Ask price line;
- Color of the line of the last deal price (Last);
- Color of the stop order levels (Stop Loss and Take Profit).

Besides, there can be multiple [graphical objects](#) and [indicators](#) on a chart. You may set up a chart with all the necessary indicators once and then save it as a template. Such a template can be applied to any chart.

The [ChartApplyTemplate\(\)](#) function is intended for using a previously saved template, and it can be used in any mql5 program. The path to the file that stores the template is passed as the second parameter to ChartApplyTemplate(). The template file is searched according to the following rules:

- if the backslash "\" separator (written as "\\") is placed at the beginning of the path, the template is searched for relative to the path `_terminal_data_directory\MQL5`,
- if there is no backslash, the template is searched for relative to the executable EX5 file, in which ChartApplyTemplate() is called;
- if a template is not found in the first two variants, the search is performed in the folder `terminal_directory\Profiles\Templates\`.

Here `terminal_directory` is the folder from which the MetaTrader 5 Client Terminal is running, and `terminal_data_directory` is the folder, in which editable files are stored, its location depends on the operating system, user name and computer's security settings. Normally they are different folders, but in some cases they may coincide.

The location of folders `terminal_data_directory` and `terminal_directory` can be obtained using the [TerminalInfoString\(\)](#) function.

```
//--- directory from which the terminal is started
string terminal_path=TerminalInfoString(TERMINAL_PATH);
Print("Terminal directory:",terminal_path);
//--- terminal data directory, in which the MQL5 folder with EAs and indicators is located
string terminal_data_path=TerminalInfoString(TERMINAL_DATA_PATH);
Print("Terminal data directory:",terminal_data_path);
```

For example:

```
//--- search for a template in terminal_data_directory\MQL5\
ChartApplyTemplate(0,"\\first_template.tpl")
//--- search for a template in directory_of_EX5_file\, then in folder terminal_data_directory\
ChartApplyTemplate(0,"second_template.tpl")
//--- search for a template in directory_of_EX5_file\My_templates\, then in folder terminal_data_directory\
ChartApplyTemplate(0,"My_templates\\third_template.tpl")
```

Templates are not resources, they cannot be included into an executable EX5 file.

Example:

```
//+-----+
//| Script program start function |
//+-----+
```

```
void OnStart()
{
//--- example of applying template, located in \MQL5\Files
if(FileIsExist("my_template.tpl"))
{
    Print("The file my_template.tpl found in \Files'");
    //--- apply template
    if(CharApplyTemplate(0,"\\Files\\my_template.tpl"))
    {
        Print("The template 'my_template.tpl' applied successfully");
        //--- redraw chart
        ChartRedraw();
    }
    else
        Print("Failed to apply 'my_template.tpl', error code ",GetLastError());
}
else
{
    Print("File 'my_template.tpl' not found in "
        +TerminalInfoString(TERMINAL_PATH)+"\\MQL5\\Files");
}
}
```

[Resources](#)

ChartSaveTemplate

Saves current chart settings in a template with a specified name.

```
bool ChartSaveTemplate(
    long      chart_id,      // Chart ID
    const string filename    // Filename to save the template
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

filename

[in] The filename to save the template. The ".tpl" extension will be added to the filename automatically; there is no need to specify it. The template is saved in **data_folder\Profiles\Templates** and can be used for manual application in the terminal. If a template with the same filename already exists, the contents of this file will be overwritten.

Return Value

If successful, the function returns true, otherwise it returns false. To get information about [the error](#), call the [GetLastError\(\)](#) function.

Note

Using templates, you can save chart settings with all applied indicators and graphical objects, to then apply it to another chart.

Example:

```

[ChartApplyTemplate\(\)](#), [Resources](#)

ChartWindowFind

The function returns the number of a subwindow where an indicator is drawn. There are 2 variants of the function.

1. The function searches in the indicated chart for the subwindow with the specified "short name" of the indicator (the short name is displayed in the left top part of the subwindow), and it returns the subwindow number in case of success.

```
int ChartWindowFind(
    long      chart_id,           // chart identifier
    string     indicator_shortcode // short indicator name, see INDICATOR\_SHORTNAME
```

2. The function must be called from a custom indicator. It returns the number of the subwindow where the indicator is working.

```
int ChartWindowFind();
```

Parameters

chart_id

[in] Chart ID. 0 denotes the current chart.

indicator_shortcode

[in] Short name of the indicator.

Return Value

Subwindow number in case of success. In case of failure the function returns -1.

Note

If the second variant of the function (without parameters) is called from a script or Expert Advisor, the function returns -1.

Don't mix up the short name of an indicator and a file name, which is specified when an indicator is created using [iCustom\(\)](#) and [IndicatorCreate\(\)](#) functions. If the indicator's short name is not set explicitly, then the name of the file containing the source code of the indicator, is specified in it during compilation.

It is important to correctly form the short name of an indicator, which is recorded in the [INDICATOR_SHORTNAME](#) property using the [IndicatorSetString\(\)](#) function. It is recommended that the short name contains values of the indicator's input parameters, because the indicator deleted from a chart in the [ChartIndicatorDelete\(\)](#) function is identified by its short name.

Example:

```
#property script_show_inputs
//--- input parameters
input string  shortcode="MACD(12,26,9)";
//+-----+
//| Returns number of the chart window with this indicator |
//+-----+
int GetIndicatorSubWindowNumber(long chartID=0, string short_name="")
```

```

{
    int window=-1;
    //---
    if ((ENUM_PROGRAM_TYPE)MQL5InfoInteger(MQL5_PROGRAM_TYPE)==PROGRAM_INDICATOR)
    {
        //--- the function is called from the indicator, name is not required
        window=ChartWindowFind();
    }
    else
    {
        //--- the function is called from an Expert Advisor or script
        window=ChartWindowFind(0,short_name);
        if(window==-1) Print(__FUNCTION__+"(): Error = ",GetLastError());
    }
    //---
    return(window);
}
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //---
    int window=GetIndicatorSubWindowNumber(0,shortname);
    if(window!=-1)
        Print("Indicator "+shortname+" is in the window #"+(string)window);
    else
        Print("Indicator "+shortname+" is not found. window = "+(string)window);
}

```

See also

[ObjectCreate\(\)](#), [ObjectFind\(\)](#)

ChartTimePriceToXY

Converts the coordinates of a chart from the time/price representation to the X and Y coordinates.

```
bool ChartTimePriceToXY(
    long      chart_id,    // Chart ID
    int       sub_window,  // The number of the subwindow
    datetime  time,        // Time on the chart
    double    price,       // Price on the chart
    int&      x,           // The X coordinate for the time on the chart
    int&      y            // The Y coordinates for the price on the chart
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

sub_window

[in] The number of the chart subwindow. 0 means the main chart window.

time

[in] The time value on the chart, for which the value in pixels along the X axis will be received. The origin is in the upper left corner of the main chart window.

price

[in] The price value on the chart, for which the value in pixels along the Y axis will be received. The origin is in the upper left corner of the main chart window.

x

[out] The variable, into which the conversion of time to X will be received.

y

[out] The variable, into which the conversion of price to Y will be received.

Return Value

Returns true if successful, otherwise false. To get information about [the error](#), call the [GetLastError\(\)](#) function.

Example:

```
#define BAR_NUMBER 0 // number of the bar we get the price and time from

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- copy data of a single bar by the BAR_NUMBER index
    MqlRates rates[]={};
    if(CopyRates(_Symbol, _Period, BAR_NUMBER, 1, rates)!=1)
```

```
{
    PrintFormat("CopyRates() failed for bar %d. Error %d", BAR_NUMBER, GetLastError());
    return;
}

//--- convert the obtained price and time into chart pixel coordinates
int x=0, y=0;
ResetLastError();
if(!ChartTimePriceToXY(ChartID(), 0, rates[0].time, rates[0].close, x, y))
{
    Print("ChartTimePriceToXY() failed. Error ", GetLastError());
    return;
}

//--- print the obtained result in the journal
PrintFormat("For bar[%d] with opening time %s and price %.2f, the chart coordinates are: x=%d, y=%d",
    BAR_NUMBER, rates[0].time, rates[0].close, x, y);

/*
result:
For bar[0] with opening time 2024.08.09 15:06 and price 1.27378, the chart coordinates are: x=0, y=0
*/
}
```

See also[ChartXYToTimePrice\(\)](#)

ChartXYToTimePrice

Converts the X and Y coordinates on a chart to the time and price values.

```
bool ChartXYToTimePrice(
    long      chart_id,    // Chart ID
    int       x,           // The X coordinate on the chart
    int       y,           // The Y coordinate on the chart
    int&      sub_window,  // The number of the subwindow
    datetime& time,        // Time on the chart
    double&   price        // Price on the chart
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

x

[in] The X coordinate.

y

[in] The Y coordinate.

sub_window

[out] The variable, into which the chart subwindow number will be written. 0 means the main chart window.

time

[out] The time value on the chart, for which the value in pixels along the X axis will be received. The origin is in the upper left corner of the main chart window.

price

[out] The price value on the chart, for which the value in pixels along the Y axis will be received. The origin is in the upper left corner of the main chart window.

Return Value

Returns true if successful, otherwise false. To get information about [the error](#), call the [GetLastError\(\)](#) function.

Example:

```
//+-----+
//| ChartEvent function |
//+-----+
void OnChartEvent(const int id,
                  const long &lparam,
                  const double &dparam,
                  const string &sparam)
{
    //-- Show the event parameters on the chart
```

```

Comment(__FUNCTION__,": id=",id," lparam=",lparam," dparam=",dparam," sparam=",sparam);
//--- If this is an event of a mouse click on the chart
if(id==CHARTEVENT_CLICK)
{
    //--- Prepare variables
    int      x      =(int)lparam;
    int      y      =(int)dparam;
    datetime dt      =0;
    double   price   =0;
    int      window  =0;
    //--- Convert the X and Y coordinates in terms of date/time
    if(CharTimePriceToXY(0,x,y,window,dt,price))
    {
        PrintFormat("Window=%d X=%d Y=%d => Time=%s Price=%G",window,x,y,TimeToString(dt),price);
        //--- Perform reverse conversion: (X,Y) => (Time,Price)
        if(CharXYToTimePrice(0,x,y,window,dt,price))
        {
            PrintFormat("Time=%s Price=%G => X=%d Y=%d",TimeToString(dt),price,x,y);
        }
        else
        {
            Print("CharXYToTimePrice return error code: ",GetLastError());
        }
        //--- delete lines
        ObjectDelete(0,"V Line");
        ObjectDelete(0,"H Line");
        //--- create horizontal and vertical lines of the crosshair
        ObjectCreate(0,"H Line",OBJ_HLINE,window,dt,price);
        ObjectCreate(0,"V Line",OBJ_VLINE,window,dt,price);
        ChartRedraw(0);
    }
    else
    {
        Print("CharTimePriceToXY return error code: ",GetLastError());
        Print("+-----+");
    }
}
}

```

[CharTimePriceToXY\(\)](#)

ChartOpen

Opens a new chart with the specified symbol and period.

```
long ChartOpen(
    string      symbol,      // Symbol name
    ENUM_TIMEFRAMES period   // Period
);
```

Parameters

symbol

[in] Chart symbol. [NULL](#) means the symbol of the current chart (the Expert Advisor is attached to).

period

[in] Chart period (timeframe). Can be one of the [ENUM_TIMEFRAMES](#) values. 0 means the current chart period.

Return Value

If successful, it returns the opened chart ID. Otherwise returns 0.

Note

The maximum possible number of simultaneously open charts in the terminal can't exceed the [CHARTS_MAX](#) value.

Example:

```
#define CHART_SYMBOL  NULL
#define CHART_PERIOD  PERIOD_CURRENT

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- set a new chart symbol and timeframe
    string symbol=CHART_SYMBOL;
    if(symbol==NULL)
        symbol=Symbol();
    ENUM_TIMEFRAMES timeframe = (CHART_PERIOD==PERIOD_CURRENT ? Period() : CHART_PERIOD);

    //--- open a new chart with the specified symbol and period
    long chart_id=ChartOpen(symbol, timeframe);
    if(chart_id==0)
    {
        Print("ChartOpen() failed. Error ", GetLastError());
        return;
    }
}
```

```
//--- print open chart parameters in the journal
PrintFormat("A new chart of the %s symbol has been opened with a period of %s and C
            symbol, StringSubstr(EnumToString(timeframe), 7), chart_id);

/*
result:
A new chart of the GBPUSD symbol has been opened with a period of M1 and ChartID 13
*/
}
```

ChartFirst

Returns the ID of the first chart of the client terminal.

```
long ChartFirst();
```

Return Value

Chart ID.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get the ID of the very first chart opened in the client terminal
    long      chart_id= ChartFirst();

//--- additionally get the chart symbol and period using the obtained ID
    string      symbol  = ChartSymbol(chart_id);
    ENUM_TIMEFRAMES period = ChartPeriod(chart_id);

//--- display the description of the client terminal first chart in the journal
    PrintFormat("ID of the first chart of the client terminal: %I64d, chart symbol: %s,
/*
    result:
    ID of the first chart of the client terminal: 133246248352168440, chart symbol: EUR
*/
}
```

ChartNext

Returns the chart ID of the chart next to the specified one.

```
long ChartNext(  
    long chart_id    // Chart ID  
);
```

Parameters

chart_id

[in] Chart ID. 0 does not mean the current chart. 0 means "return the first chart ID".

Return Value

Chart ID. If this is the end of the chart list, it returns -1.

Example:

```
//--- variables for chart ID  
long currChart,prevChart=ChartFirst();  
int i=0,limit=100;  
Print("ChartFirst =",ChartSymbol(prevChart)," ID =",prevChart);  
while(i<limit)// We have certainly not more than 100 open charts  
{  
    currChart=ChartNext(prevChart); // Get the new chart ID by using the previous chart ID  
    if(currChart<0) break;           // Have reached the end of the chart list  
    Print(i,ChartSymbol(currChart)," ID =",currChart);  
    prevChart=currChart;// let's save the current chart ID for the ChartNext()  
    i++;// Do not forget to increase the counter  
}
```

ChartClose

Closes the specified chart.

```
bool ChartClose(
    long chart_id=0    // Chart ID
);
```

Parameters

chart_id=0

[in] Chart ID. 0 means the current chart.

Return Value

If successful, returns true, otherwise false.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //-- open a new chart with the same symbol and period as the current one
    long chart_id=ChartOpen(_Symbol, _Period);
    if(chart_id==0)
    {
        Print("ChartOpen() failed. Error ", GetLastError());
        return;
    }

    //-- print open chart parameters in the journal
    PrintFormat("A new chart of the %s symbol has been opened with a period of %s and C
        _Symbol, StringSubstr(EnumToString(_Period), 7), chart_id);

    //-- wait two seconds and close the newly opened chart
    PrintFormat("Waiting 3 seconds before closing a newly opened chart with ID %I64d .
    Sleep(3000);
    ResetLastError();
    if(!ChartClose(chart_id))
    {
        Print("ChartClose() failed. Error ", GetLastError());
        return;
    }

    //-- print successful chart closure message in the journal
    PrintFormat("The chart with ID %I64d was successfully closed", chart_id);
    /*
    result:
    A new chart of the GBPUSD symbol has been opened with a period of M1 and ChartID 13
```

```
Waiting 3 seconds before closing a newly opened chart with ID 133346697706632016 .  
The chart with ID 133346697706632016 was successfully closed  
*/  
}
```

ChartSymbol

Returns the symbol name for the specified chart.

```
string ChartSymbol(  
    long chart_id=0      // Chart ID  
);
```

Parameters

chart_id=0

[in] Chart ID. 0 means the current chart.

Return Value

If chart does not exist, the result will be an empty string.

Example:

```
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- get the current chart symbol and display the obtained value in the journal  
    string chart_symbol = ChartSymbol();  
    Print("Current chart symbol: ", chart_symbol);  
  
    //--- take the existing (in this case, the current) chart ID  
    long chart_id=ChartID();  
    chart_symbol=ChartSymbol(chart_id);  
    PrintFormat("Chart symbol with ID %I64d: %s", chart_id, chart_symbol);  
  
    //--- set a random chart ID when receiving a symbol  
    chart_symbol = ChartSymbol(1234567890);  
    if(chart_symbol=="")  
        Print("The chart with ID 1234567890 does not exist");  
    else  
        Print("Chart symbol with ID 1234567890: ", chart_symbol);  
    /*  
    result:  
    Current chart symbol: GBPUSD  
    Chart symbol with ID 132966427583395104: GBPUSD  
    The chart with ID 1234567890 does not exist  
    */  
}
```

[ChartSetSymbolPeriod](#)

ChartPeriod

Returns the timeframe [period](#) of specified chart.

```
ENUM_TIMEFRAMES ChartPeriod(
    long chart_id=0      // Chart ID
);
```

Parameters

chart_id=0

[in] Chart ID. 0 means the current chart.

Return Value

The function returns one of the [ENUM_TIMEFRAMES](#) values. If chart does not exist, it returns 0.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //-- get the current chart period and display the obtained value in the journal
    ENUM_TIMEFRAMES period=ChartPeriod();
    Print("Current chart period: ", EnumToString(period));

    //-- take the existing (in this case, the current) chart ID
    long chart_id=ChartID();
    period=ChartPeriod(chart_id);
    PrintFormat("Chart period with ID %I64d: %s", chart_id, EnumToString(period));

    //-- set a random chart ID
    period=ChartPeriod(1234567890);
    if(period==0)
        Print("The chart with ID 1234567890 does not exist");
    else
        Print("Chart period with ID 1234567890: ", EnumToString(period));
    /*
    result:
    Current chart period: PERIOD_M15
    Chart period with ID 133510090240498505: PERIOD_M15
    The chart with ID 1234567890 does not exist
    */
}
```

ChartRedraw

This function calls a forced redrawing of a specified chart.

```
void ChartRedraw(
    long chart_id=0    // Chart ID
);
```

Parameters

chart_id=0

[in] Chart ID. 0 means the current chart.

Note

Usually it is used after changing the [object properties](#).

Example:

```
#define WIDTH 50 // rectangle width in bars

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the current chart ID and set the graphical object name
    long chart_id = ChartID();
    string obj_name = MQLInfoString(MQL_PROGRAM_NAME)+"_RectLabel";

    //--- get two rectangle time coordinates
    datetime time1 = iTime(_Symbol, _Period, WIDTH);
    datetime time2 = iTime(_Symbol, _Period, 0);
    if(time1==0 || time2==0)
    {
        Print("Error getting time ", GetLastError());
        return;
    }

    //--- get the maximum and minimum prices in the range of the rectangle width
    double price1 = HighestHigh(_Symbol, _Period, 0, WIDTH);
    double price2 = LowestLow(_Symbol, _Period, 0, WIDTH);
    if(price1==EMPTY_VALUE || price2==EMPTY_VALUE)
        return;

    //--- create a rectangle object
    Print("Create a wheat-colored rectangle");
    if(!ObjectCreate(chart_id, obj_name, OBJ_RECTANGLE, 0, time1, price1, time2, price2))
    {
        Print("ObjectCreate() failed. Error ", GetLastError());
        return;
    }
}
```

```

    }

    //--- fill the rectangle with the original color
    ObjectSetInteger(chart_id, obj_name, OBJPROP_FILL, true);
    ObjectSetInteger(chart_id, obj_name, OBJPROP_BACK, true);
    ObjectSetInteger(chart_id, obj_name, OBJPROP_COLOR, clrWheat);
    ChartRedraw();

    //--- wait a second, fill the rectangle with the DodgerBlue color and update the chart
    Sleep(1000);
    Print("Change color to DodgerBlue");
    ObjectSetInteger(chart_id, obj_name, OBJPROP_COLOR, clrDodgerBlue);
    ChartRedraw();

    //--- wait a second, fill the rectangle with the LimeGreen color and update the chart
    Sleep(1000);
    Print("Change color to LimeGreen");
    ObjectSetInteger(chart_id, obj_name, OBJPROP_COLOR, clrLimeGreen);
    ChartRedraw();

    //--- wait a second, fill the rectangle with the OrangeRed color and update the chart
    Sleep(1000);
    Print("Change color to OrangeRed");
    ObjectSetInteger(chart_id, obj_name, OBJPROP_COLOR, clrOrangeRed);
    ChartRedraw();

    //--- wait a second, fill the rectangle with the Wheat color and update the chart
    Sleep(1000);
    Print("Reset color to original");
    ObjectSetInteger(chart_id, obj_name, OBJPROP_COLOR, clrWheat);
    ChartRedraw();

    //--- after three seconds, remove the object from the chart
    Sleep(3000);
    Print("Delete the rectangle");
    ObjectDelete(chart_id, obj_name);
}

//+-----+
//| Return the maximum High in the specified range of bars |
//+-----+
double HighestHigh(const string symbol, const ENUM_TIMEFRAMES timeframe, const uint start)
{
    ResetLastError();
    int index=iHighest(symbol, timeframe, MODE_HIGH, count, start);
    if(index==-1)
    {
        PrintFormat("%s: iHighest() failed. Error %d", __FUNCTION__, GetLastError());
        return(EMPTY_VALUE);
    }
}

```

```

GetLastError();
double price=iHigh(symbol, timeframe, index);
if(price==0)
{
    PrintFormat("%s: iHigh() failed. Error %d",__FUNCTION__, GetLastError());
    return(EMPTY_VALUE);
}
return(price);
}

//+-----+
//| Return the minimum Low in the specified range of bars |
//+-----+
double LowestLow(const string symbol, const ENUM_TIMEFRAMES timeframe, const uint start)
{
    ResetLastError();
    int index=iLowest(symbol, timeframe, MODE_LOW, count, start);
    if(index==-1)
    {
        PrintFormat("%s: iLowest() failed. Error %d",__FUNCTION__, GetLastError());
        return(EMPTY_VALUE);
    }
    GetLastError();
    double price=iLow(symbol, timeframe, index);
    if(price==0)
    {
        PrintFormat("%s: iLow() failed. Error %d",__FUNCTION__, GetLastError());
        return(EMPTY_VALUE);
    }
    return(price);
}

```

See also

[Objects functions](#)

ChartSetDouble

Sets a value for a corresponding property of the specified chart. Chart property should be of a [double](#) type. The command is added to chart messages queue and will be executed after processing of all previous commands.

```
bool ChartSetDouble(
    long          chart_id,    // Chart ID
    ENUM_CHART_PROPERTY_DOUBLE prop_id, // Property ID
    double        value       // Value
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

prop_id

[in] Chart property ID. Can be one of the [ENUM_CHART_PROPERTY_DOUBLE](#) values (except the read-only properties).

value

[in] Property value.

Return Value

Returns true if the command has been added to chart queue, otherwise false. To get an information about the [error](#), call the [GetLastError\(\)](#) function.

Note

The function is asynchronous, which means that the function does not wait for the execution of the command, which has been successfully added to the queue of specified the chart. Instead, it immediately returns control. The property will only change after the handling of the appropriate command from the chart queue. To immediately execute commands from the chart queue, call the [ChartRedraw](#) function.

If you want to immediately change several chart properties at once, then the corresponding functions ([ChartSetString](#), [ChartSetDouble](#), [ChartSetString](#)) should be executed in one code block, after which you should call [ChartRedraw](#) once.

To check the command execution result, you can use a function, which requests the specified chart property ([ChartGetInteger](#), [ChartGetDouble](#), [ChartSetString](#)). However, note that these functions are synchronous and wait for execution results.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the current chart ID
    long chart_id = ChartID();
```

```
//--- save the initial offset of the zero bar from the right edge in percentage and the
double shift = ChartGetDouble(chart_id, CHART_SHIFT_SIZE);
bool scroll= ChartGetInteger(chart_id,CHART_AUTOSCROLL);

//--- reset the auto scroll chart flag
ChartSetInteger(chart_id, CHART_AUTOSCROLL, true);
PrintFormat("Initial chart shift size: %.2f", shift);

//--- in the loop from 2.0% to 50.0% with the step of 0.5%
for(int i=20; i<=500; i+=5)
{
    //--- set the shift size as i / 10 and print the specified value in the journal
    ChartSetDouble(chart_id, CHART_SHIFT_SIZE, i/10.0);
    PrintFormat("Set chart shift size to %.1f%%", i/10.0);

    //--- keep the chart zero bar at the specified shift distance
    ChartNavigate(chart_id, CHART_END, 0);

    //--- wait a bit
    Sleep(16);
}

//--- set the initial chart shift and auto scroll
Print("Set the chart shift size to the initial value of ", shift);
ChartSetDouble(ChartID(), CHART_SHIFT_SIZE, shift);
ChartSetInteger(chart_id, CHART_AUTOSCROLL, scroll);
}
```

ChartSetInteger

Sets a value for a corresponding property of the specified chart. Chart property must be [datetime](#), [int](#), [color](#), [bool](#) or [char](#). The command is added to chart messages queue and will be executed after processing of all previous commands.

```
bool ChartSetInteger(
    long          chart_id,      // Chart ID
    ENUM_CHART_PROPERTY_INTEGER prop_id, // Property ID
    long          value         // Value
);
```

Sets a value for a corresponding property of the specified subwindow.

```
bool ChartSetInteger(
    long          chart_id,      // Chart ID
    ENUM_CHART_PROPERTY_INTEGER prop_id, // Property ID
    int          sub_window,    // Subwindow number
    long          value         // Value
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

prop_id

[in] Chart property ID. It can be one of the [ENUM_CHART_PROPERTY_INTEGER](#) value (except the read-only properties).

sub_window

[in] Number of the chart subwindow. For the first case, the default value is 0 (main chart window). The most of the properties do not require a subwindow number.

value

[in] Property value.

Return Value

Returns true if the command has been added to chart queue, otherwise false. To get an information about the [error](#), call the [GetLastError\(\)](#) function.

Note

The function is asynchronous, which means that the function does not wait for the execution of the command, which has been successfully added to the queue of specified the chart. Instead, it immediately returns control. The property will only change after the handling of the appropriate command from the chart queue. To immediately execute commands from the chart queue, call the [ChartRedraw](#) function.

If you want to immediately change several chart properties at once, then the corresponding functions ([ChartSetString](#), [ChartSetDouble](#), [ChartSetString](#)) should be executed in one code block, after which you should call [ChartRedraw](#) once.

To check the command execution result, you can use a function, which requests the specified chart property ([ChartGetInteger](#), [ChartGetDouble](#), [ChartSetString](#)). However, note that these functions are synchronous and wait for execution results.

Example:

```
//+-----+
//| Expert initialization function |
//+-----+
void OnInit()
{
//--- Enabling events of mouse movements on the chart window
    ChartSetInteger(0,CHART_EVENT_MOUSE_MOVE,1);
//--- Forced updating of chart properties ensures readiness for event processing
    ChartRedraw();
}
//+-----+
//| MouseState |
//+-----+
string MouseState(uint state)
{
    string res;
    res+="\nML: " +(((state& 1)== 1)?"DN":"UP"); // mouse left
    res+="\nMR: " +(((state& 2)== 2)?"DN":"UP"); // mouse right
    res+="\nMM: " +(((state&16)==16)?"DN":"UP"); // mouse middle
    res+="\nMX: " +(((state&32)==32)?"DN":"UP"); // mouse first X key
    res+="\nMY: " +(((state&64)==64)?"DN":"UP"); // mouse second X key
    res+="\nSHIFT: " +(((state& 4)== 4)?"DN":"UP"); // shift key
    res+="\nCTRL: " +(((state& 8)== 8)?"DN":"UP"); // control key
    return(res);
}
//+-----+
//| ChartEvent function |
//+-----+
void OnChartEvent(const int id,const long &lparam,const double &dparam,const string &sparam)
{
    if(id==CHART_EVENT_MOUSE_MOVE)
        Comment("POINT: ",(int)lparam,",", (int)dparam,"\n",MouseState((uint)sparam));
}
```

ChartSetString

Sets a value for a corresponding property of the specified chart. Chart property must be of the string type. The command is added to chart messages queue and will be executed after processing of all previous commands.

```
bool ChartSetString(  
    long                chart_id,    // Chart ID  
    ENUM_CHART_PROPERTY_STRING prop_id, // Property ID  
    string              str_value    // Value  
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

prop_id

[in] Chart property ID. Its value can be one of the [ENUM_CHART_PROPERTY_STRING](#) values (except the read-only properties).

str_value

[in] Property value string. String length cannot exceed 2045 characters (extra characters will be truncated).

Return Value

Returns true if the command has been added to chart queue, otherwise false. To get an information about the [error](#), call the [GetLastError\(\)](#) function.

Note

ChartSetString can be used for a comment output on the chart instead of the [Comment](#) function.

The function is asynchronous, which means that the function does not wait for the execution of the command, which has been successfully added to the queue of specified the chart. Instead, it immediately returns control. The property will only change after the handling of the appropriate command from the chart queue. To immediately execute commands from the chart queue, call the [ChartRedraw](#) function.

If you want to immediately change several chart properties at once, then the corresponding functions ([ChartSetString](#), [ChartSetDouble](#), [ChartSetInteger](#)) should be executed in one code block, after which you should call [ChartRedraw](#) once.

To check the command execution result, you can use a function, which requests the specified chart property ([ChartGetInteger](#), [ChartGetDouble](#), [ChartGetString](#)). However, note that these functions are synchronous and wait for execution results.

Example:

```
void OnTick()  
{  
    //---  
    double Ask,Bid;
```

```
int Spread;  
Ask=SymbolInfoDouble(Symbol(),SYMBOL_ASK);  
Bid=SymbolInfoDouble(Symbol(),SYMBOL_BID);  
Spread=SymbolInfoInteger(Symbol(),SYMBOL_SPREAD);  
string comment=StringFormat("Display prices:\nAsk = %G\nBid = %G\nSpread = %d",  
                             Ask,Bid,Spread);  
ChartSetString(0,CHART_COMMENT,comment);  
}
```

See also

[Comment](#), [ChartGetString](#)

ChartGetDouble

Returns the value of a corresponding property of the specified chart. Chart property must be of double type. There are 2 variants of the function calls.

1. Returns the property value directly.

```
double ChartGetDouble(
    long          chart_id,          // Chart ID
    ENUM_CHART_PROPERTY_DOUBLE prop_id, // Property ID
    int           sub_window=0      // subwindow number, if necessary
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable double_var passed by reference.

```
bool ChartGetDouble(
    long          chart_id,          // Chart ID
    ENUM_CHART_PROPERTY_DOUBLE prop_id, // Property ID
    int           sub_window,       // Subwindow number
    double&       double_var        // Target variable for the chart prop
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

prop_id

[in] Chart property ID. This value can be one of the [ENUM_CHART_PROPERTY_DOUBLE](#) values.

sub_window

[in] Number of the chart subwindow. For the first case, the default value is 0 (main chart window). The most of the properties do not require a subwindow number.

double_var

[out] Target variable of double type for the requested property.

Return Value

The value of double type.

For the second call case it returns true if the specified property is available and its value has been placed into double_var variable, otherwise returns false. To get an additional information about the [error](#), it is necessary to call the function [GetLastError\(\)](#).

Note

The function is synchronous, which means that it waits for the execution of all the commands that have been added to the chart queue prior to its call.

Example:

```
void OnStart ()
```

```
{  
    double priceMin=ChartGetDouble(0,CHART_PRICE_MIN,0);  
    double priceMax=ChartGetDouble(0,CHART_PRICE_MAX,0);  
    Print("CHART_PRICE_MIN =",priceMin);  
    Print("CHART_PRICE_MAX =",priceMax);  
}
```

ChartGetInteger

Returns the value of a corresponding property of the specified chart. Chart property must be of [datetime](#), [int](#) or [bool](#) type. There are 2 variants of the function calls.

1. Returns the property value directly.

```
long ChartGetInteger(
    long          chart_id,          // Chart ID
    ENUM_CHART_PROPERTY_INTEGER prop_id, // Property ID
    int           sub_window=0      // subwindow number, if necessary
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable long_var passed by reference.

```
bool ChartGetInteger(
    long          chart_id,          // Chart ID
    ENUM_CHART_PROPERTY_INTEGER prop_id, // Property ID
    int           sub_window=0      // subwindow number
    long&         long_var          // Target variable for the property
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

prop_id

[in] Chart property ID. This value can be one of the [ENUM_CHART_PROPERTY_INTEGER](#) values.

sub_window

[in] Number of the chart subwindow. For the first case, the default value is 0 (main chart window). The most of the properties do not require a subwindow number.

long_var

[out] Target variable of long type for the requested property.

Return Value

The value of long type.

For the second call case it returns true if specified property is available and its value has been stored into long_var variable, otherwise returns false. To get additional information about the [error](#), it is necessary to call the function [GetLastError\(\)](#).

Note

The function is synchronous, which means that it waits for the execution of all the commands that have been added to the chart queue prior to its call.

Example:

```
void OnStart ()
```

```
{  
    int height=ChartGetInteger(0,CHART_HEIGHT_IN_PIXELS,0);  
    int width=ChartGetInteger(0,CHART_WIDTH_IN_PIXELS,0);  
    Print("CHART_HEIGHT_IN_PIXELS =",height,"pixels");  
    Print("CHART_WIDTH_IN_PIXELS =",width,"pixels");  
}
```

ChartGetString

Returns the value of a corresponding property of the specified chart. Chart property must be of string type. There are 2 variants of the function call.

1. Returns the property value directly.

```
string ChartGetString(
    long          chart_id,      // Chart ID
    ENUM_CHART_PROPERTY_STRING prop_id // Property ID
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable string_var passed by reference.

```
bool ChartGetString(
    long          chart_id,      // Chart ID
    ENUM_CHART_PROPERTY_STRING prop_id, // Property ID
    string&       string_var    // Target variable for the property
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

prop_id

[in] Chart property ID. This value can be one of the [ENUM_CHART_PROPERTY_STRING](#) values.

string_var

[out] Target variable of string type for the requested property.

Return Value

The value of string type.

For the second call case it returns true if the specified property is available and its value has been stored into string_var variable, otherwise returns false. To get additional information about the [error](#), it is necessary to call the function [GetLastError\(\)](#).

Note

ChartGetString can be used for reading comments plotted on the chart using the [Comment](#) or [ChartSetString](#) functions.

The function is synchronous, which means that it waits for the execution of all the commands that have been added to the chart queue prior to its call.

Example:

```
void OnStart()
{
    ChartSetString(0, CHART_COMMENT, "Test comment.\nSecond line.\nThird!");
    ChartRedraw();
}
```

```
Sleep(1000);  
string comm=ChartGetString(0, CHART_COMMENT);  
Print(comm);  
}
```

See also

[Comment](#), [ChartSetString](#)

ChartNavigate

Performs shift of the specified chart by the specified number of bars relative to the specified position in the chart.

```
bool ChartNavigate (
    long          chart_id,      // Chart ID
    ENUM_CHART_POSITION position, // Position
    int           shift=0       // Shift value
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

position

[in] Chart position to perform a shift. Can be one of the [ENUM_CHART_POSITION](#) values.

shift=0

[in] Number of bars to shift the chart. Positive value means the right shift (to the end of chart), negative value means the left shift (to the beginning of chart). The zero shift can be used to navigate to the beginning or end of chart.

Return Value

Returns true if successful, otherwise returns false.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get handle of the current chart
    long handle=ChartID();
    string comm="";
    if(handle>0) // if successful, additionally set up the chart
    {
        //--- disable auto scroll
        ChartSetInteger(handle,CHART_AUTOSCROLL,false);
        //--- set a shift from the right chart border
        ChartSetInteger(handle,CHART_SHIFT,true);
        //--- draw candlesticks
        ChartSetInteger(handle,CHART_MODE,CHART_CANDLES);
        //--- set the display mode for tick volumes
        ChartSetInteger(handle,CHART_SHOW_VOLUMES,CHART_VOLUME_TICK);

        //--- prepare a text to output in Comment()
        comm="Scroll 10 bars to the right of the history start";
        //--- show comment
```

```

Comment(comm);
//--- scroll 10 bars to the right of the history start
ChartNavigate(handle,CHART_BEGIN,10);
//--- get the number of the first bar visible on the chart (numeration like in t
long first_bar=ChartGetInteger(0,CHART_FIRST_VISIBLE_BAR,0);
//--- add line feed character
comm=comm+"\r\n";
//--- add to comment
comm=comm+"The first bar on the chart is number "+IntegerToString(first_bar)+"\n";
//--- show comment
Comment(comm);
//--- wait 5 seconds to see how the chart moves
Sleep(5000);

//--- add to the comment text
comm=comm+"\r\n"+"Scroll 10 bars to the left of the right chart border";
Comment(comm);
//--- scroll 10 bars to the left of the right chart border
ChartNavigate(handle,CHART_END,-10);
//--- get the number of the first bar visible on the chart (numeration like in t
first_bar=ChartGetInteger(0,CHART_FIRST_VISIBLE_BAR,0);
comm=comm+"\r\n";
comm=comm+"The first bar on the chart is number "+IntegerToString(first_bar)+"\n";
Comment(comm);
//--- wait 5 seconds to see how the chart moves
Sleep(5000);

//--- new block of chart scrolling
comm=comm+"\r\n"+"Scroll 300 bars to the right of the history start";
Comment(comm);
//--- scroll 300 bars to the right of the history start
ChartNavigate(handle,CHART_BEGIN,300);
first_bar=ChartGetInteger(0,CHART_FIRST_VISIBLE_BAR,0);
comm=comm+"\r\n";
comm=comm+"The first bar on the chart is number "+IntegerToString(first_bar)+"\n";
Comment(comm);
//--- wait 5 seconds to see how the chart moves
Sleep(5000);

//--- new block of chart scrolling
comm=comm+"\r\n"+"Scroll 300 bars to the left of the right chart border";
Comment(comm);
//--- scroll 300 bars to the left of the right chart border
ChartNavigate(handle,CHART_END,-300);
first_bar=ChartGetInteger(0,CHART_FIRST_VISIBLE_BAR,0);
comm=comm+"\r\n";
comm=comm+"The first bar on the chart is number "+IntegerToString(first_bar)+"\n";
Comment(comm);
}

```

}

ChartID

Returns the ID of the current chart.

```
long ChartID();
```

Return Value

Value of [long](#) type.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- variables for chart identifiers
    long curr_chart=ChartFirst();
    int i=0;
//--- print the first chart data in the journal
    PrintFormat("Chart[%d] ID: %I64d, symbol: %s", i, curr_chart, ChartSymbol(curr_chart));

//--- until the open chart limit is reached (CHARTS_MAX)
    while(!IsStopped() && i < CHARTS_MAX)
    {
        //--- increase the chart counter
        i++;
        //--- get the next chart ID based on the previous one
        curr_chart=ChartNext(curr_chart);

        //--- terminate the loop if the end of the chart list is reached
        if(curr_chart<0)
            break;

        //--- print the next chart data in the journal
        PrintFormat("Chart[%d] ID: %I64d, symbol: %s", i, curr_chart, ChartSymbol(curr_chart));
    }
}
/*
result:
Chart[0] ID: 133246248352168440, symbol: EURUSD
Chart[1] ID: 133346697706632015, symbol: USDJPY
Chart[2] ID: 133246248352168439, symbol: GBPUSD
Chart[3] ID: 133346697706632009, symbol: RU000A103661
Chart[4] ID: 133346697706632010, symbol: AEM4
Chart[5] ID: 133346697706632011, symbol: AA.SPB
Chart[6] ID: 133346697706632012, symbol: ALLFUTMIX
Chart[7] ID: 133346697706632013, symbol: EURUSD
Chart[8] ID: 133346697706632014, symbol: SBER
*/
```

}

ChartIndicatorAdd

Adds an indicator with the specified handle into a specified chart window. Indicator and chart should be generated on the same symbol and time frame.

```
bool ChartIndicatorAdd(
    long  chart_id,           // chart ID
    int   sub_window         // number of the sub-window
    int   indicator_handle    // handle of the indicator
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

sub_window

[in] The number of the chart sub-window. 0 means the main chart window. To add an indicator in a new window, the parameter must be one greater than the index of the last existing window, i.e. equal to [CHART_WINDOWS_TOTAL](#). If the value of the parameter is greater than [CHART_WINDOWS_TOTAL](#), a new window will not be created, and the indicator will not be added.

indicator_handle

[in] The handle of the indicator.

Return Value

The function returns true in case of success, otherwise it returns false. In order to obtain information about the [error](#), call the [GetLastError\(\)](#) function. Error 4114 means that a chart and an added indicator differ by their symbol or time frame.

Note

If an indicator that should be drawn in a separate subwindow (for example, built-in [iMACD](#) or a custom indicator with specified [#property indicator_separate_window](#) property) is applied to the main chart window, it may not be visible though it will still be present in the list of indicators. This means that the scale of the indicator is different from the scale of the price chart, and applied indicator's values do not fit in the displayed range of the price chart. In this case, [GetLastError\(\)](#) returns zero code indicating the absence of an error. The values of such "invisible" indicator can be seen in Data Window and received from other MQL5 applications.

Example:

```
#property description "Expert Advisor demonstrating the work with ChartIndicatorAdd()
#property description "After launching on the chart (and receiving the error in Journal)
#property description "the Expert Advisor's properties and specify correct <symbol> and
#property description "MACD indicator will be added on the chart."

//--- input parameters
input string      symbol="AUDUSD";      // symbol name
input ENUM_TIMEFRAMES period=PERIOD_M12; // time frame
input int         fast_ema_period=12;    // fast MACD period
input int         slow_ema_period=26;    // slow MACD period
```

```

input int      signal_period=9;           // signal period
input ENUM_APPLIED_PRICE apr=PRICE_CLOSE; // price type for MACD calculation

int indicator_handle=INVALID_HANDLE;

//+-----+

    PrintFormat("Adding MACD indicator on %d chart window",subwindow);
    if(!ChartIndicatorAdd(0,subwindow,indicator_handle))
    {
        PrintFormat("Failed to add MACD indicator on %d chart window. Error code %d",
            subwindow,GetLastError());
    }
    //--- Indicator added successfully
    return(true);
}

```

See Also

[ChartIndicatorDelete\(\)](#), [ChartIndicatorName\(\)](#), [ChartIndicatorsTotal\(\)](#), [iCustom\(\)](#), [IndicatorCreate\(\)](#)

ChartIndicatorDelete

Removes an indicator with a specified name from the specified chart window.

```
bool ChartIndicatorDelete(
    long      chart_id,           // chart id
    int       sub_window         // number of the subwindow
    const string indicator_shortcode // short name of the indicator
);
```

Parameters

chart_id

[in] Chart ID. 0 denotes the current chart.

sub_window

[in] Number of the chart subwindow. 0 denotes the main chart subwindow.

const indicator_shortcode

[in] The short name of the indicator which is set in the [INDICATOR_SHORTNAME](#) property with the [IndicatorSetString\(\)](#) function. To get the short name of an indicator use the [ChartIndicatorName\(\)](#) function.

Return Value

Returns true in case of successful deletion of the indicator. Otherwise it returns false. To get [error](#) details use the [GetLastError\(\)](#) function.

Note

If two indicators with identical short names exist in the chart subwindow, the first one in a row will be deleted.

If other indicators on this chart are based on the values of the indicator that is being deleted, such indicators will also be deleted.

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions [iCustom\(\)](#) and [IndicatorCreate\(\)](#). If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

Deletion of an indicator from a chart doesn't mean that its calculation part will be deleted from the terminal memory. To release the indicator handle use the [IndicatorRelease\(\)](#) function.

The indicator's short name should be formed correctly. It will be written to the [INDICATOR_SHORTNAME](#) property using the [IndicatorSetString\(\)](#) function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the [ChartIndicatorDelete\(\)](#) function is identified by the short name.

Example of deleting an indicator after initialization has failed:

ChartIndicatorGet

Returns the handle of the indicator with the specified short name in the specified chart window.

```
int ChartIndicatorGet(
    long      chart_id,           // Chart ID
    int       sub_window         // The number of the subwindow
    const string indicator_shortcode // Short name of the indicator
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

sub_window

[in] The number of the chart subwindow. 0 means the main chart window.

const indicator_shortcode

[in] The short name of the indicator, which is set in the [INDICATOR_SHORTNAME](#) property using the [IndicatorSetString\(\)](#) function. To get the short name of an indicator, use the [ChartIndicatorName\(\)](#) function.

Return Value

Returns an indicator handle if successful, otherwise returns [INVALID_HANDLE](#). To get information about [the error](#), call the [GetLastError\(\)](#) function.

Note

The indicator handle obtained using the [ChartIndicatorGet\(\)](#) function increases the internal indicator usage counter. The terminal runtime system keeps all indicators, whose counter is greater than zero, loaded. Therefore, the indicator handle that is no longer needed should be immediately and explicitly released using [IndicatorRelease\(\)](#) in the same program that received it, as shown in the example below. Otherwise, it will be impossible to find the “abandoned” handle and release it from another program correctly.

When creating an indicator, be careful forming its short name, which is written in the [INDICATOR_SHORTNAME](#) property using the [IndicatorSetString\(\)](#) function. It is recommended that a short name should contain the values of input parameters of the indicator, since the indicator is identified in the [ChartIndicatorGet\(\)](#) function based on its short name.

Another way to identify the indicator is to get a list of its parameters for a given handle using the [IndicatorParameters\(\)](#) function and then to analyze the obtained values.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //-- The number of windows on the chart (at least one main window is always present)
    int windows=(int)ChartGetInteger(0, CHART_WINDOWS_TOTAL);
```

```
//--- Check all windows
for(int w=0;w<windows;w++)
{
    //--- the number of indicators in this window/subwindow
    int total=ChartIndicatorsTotal(0,w);
    //--- Go through all indicators in the window
    for(int i=0;i<total;i++)
    {
        //--- get the short name of an indicator
        string name=ChartIndicatorName(0,w,i);
        //--- get the handle of an indicator
        int handle=ChartIndicatorGet(0,w,name);
        //--- Add to log
        PrintFormat("Window=%d, index=%d, name=%s, handle=%d",w,i,name,handle);
        //--- You should obligatorily release the indicator handle when it is no longer needed
        IndicatorRelease(handle);
    }
}
```

See also

[ChartIndicatorAdd\(\)](#), [ChartIndicatorName\(\)](#), [ChartIndicatorsTotal\(\)](#), [IndicatorParameters\(\)](#)

ChartIndicatorName

Returns the short name of the indicator by the number in the indicators list on the specified chart window.

```
string ChartIndicatorName (
    long   chart_id,      // chart id
    int    sub_window     // number of the subwindow
    int    index          // index of the indicator in the list of indicators added to t
);
```

Parameters

chart_id

[in] Chart ID. 0 denotes the current chart.

sub_window

[in] Number of the chart subwindow. 0 denotes the main chart subwindow.

index

[in] the index of the indicator in the list of indicators. The numeration of indicators start with zero, i.e. the first indicator in the list has the 0 index. To obtain the number of indicators in the list use the [ChartIndicatorsTotal\(\)](#) function.

Return Value

The short name of the indicator which is set in the [INDICATOR_SHORTNAME](#) property with the [IndicatorSetString\(\)](#) function. To get [error](#) details use the [GetLastError\(\)](#) function.

Note

Do not confuse the indicator short name and the file name that is specified when creating an indicator using functions [iCustom\(\)](#) and [IndicatorCreate\(\)](#). If the short name of an indicator is not set explicitly, then the name of the file containing the source code of the indicator will be specified during compilation.

The indicator's short name should be formed correctly. It will be written to the [INDICATOR_SHORTNAME](#) property using the [IndicatorSetString\(\)](#) function. It is recommended that the short name should contain values of all the input parameters of the indicator, because the indicator to be deleted from the chart by the [ChartIndicatorDelete\(\)](#) function is identified by the short name.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart ()
{
    //--- get the current chart ID and the number of its subwindows, including the main w
    long chart_id = ChartID();
    int wnd_total= (int)ChartGetInteger(0,CHART_WINDOWS_TOTAL);
```

```

//--- iterate over all current chart windows in a loop
for(int w=0; w<wnd_total; w++)
{
    //--- get the number of indicators attached to the chart window specified by the
    int ind_total=ChartIndicatorsTotal(chart_id, w);

    //--- print the header for the selected chart window
    PrintFormat("Chart window %d indicators: ", w);

    //--- get in the loop and write to the variable all the names of indicators attached
    string ind_names="";
    for(int i=0; i<ind_total; i++)
    {
        ind_names+="  "+ChartIndicatorName(chart_id, w, i)+(i<ind_total-1 ? "\n": "")
    }
    //--- print the obtained list of names of all indicators, attached to the specified
    Print(ind_names);
}
/*
result:
Chart window 0 indicators:
  AMA(9,2,30)
  SAR(0.02,0.20)
  Fractals
Chart window 1 indicators:
  RSI(14)
  AMA(9,2,30)
Chart window 2 indicators:
  MFI(14)
*/
}

```

See also

[ChartIndicatorAdd\(\)](#), [ChartIndicatorDelete\(\)](#), [ChartIndicatorsTotal\(\)](#), [iCustom\(\)](#), [IndicatorCreate\(\)](#), [IndicatorSetString\(\)](#)

ChartIndicatorsTotal

Returns the number of all indicators applied to the specified chart window.

```
int ChartIndicatorsTotal(
    long  chart_id,      // chart id
    int   sub_window     // number of the subwindow
);
```

Parameters

chart_id

[in] Chart ID. 0 denotes the current chart.

sub_window

[in] Number of the chart subwindow. 0 denotes the main chart subwindow.

Return Value

The number of indicators in the specified chart window. To get [error](#) details use the [GetLastError\(\)](#) function.

Note

The function allows going searching through all the indicators attached to the chart. The number of all the windows of the chart can be obtained from the [CHART_WINDOWS_TOTAL](#) property using the [ChartGetInteger\(\)](#) function.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the current chart ID and the number of its subwindows, including the main window
    long chart_id = ChartID();
    int wnd_total= (int)ChartGetInteger(0,CHART_WINDOWS_TOTAL);

    //--- iterate over all current chart windows in a loop
    for(int w=0; w<wnd_total; w++)
    {
        //--- get the number of indicators attached to the chart window specified by the window number
        int ind_total=ChartIndicatorsTotal(chart_id, w);

        //--- get the number of indicators attached to the specified chart window
        PrintFormat("Chart ID %I64d, subwindow %d. Attached indicators: %d", chart_id, w, ind_total);
    }
    /*
    result:
    Chart ID 133246248352168439, subwindow 0. Attached indicators: 3
    Chart ID 133246248352168439, subwindow 1. Attached indicators: 2
    */
}
```

```
Chart ID 133246248352168439, subwindow 2. Attached indicators: 1
*/
}
```

ChartWindowOnDropped

Returns the number (index) of the chart subwindow the Expert Advisor or script has been dropped to. 0 means the main chart window.

```
int ChartWindowOnDropped();
```

Return Value

Value of [int](#) type.

Example:

```
int myWindow=ChartWindowOnDropped();  
int windowsTotal=ChartGetInteger(0,CHART_WINDOWS_TOTAL);  
Print("Script is running on the window #"+myWindow+  
      ". Total windows on the chart "+ChartSymbol()+":",windowsTotal);
```

See also

[ChartPriceOnDropped](#), [ChartTimeOnDropped](#), [ChartXOnDropped](#), [ChartYOnDropped](#)

ChartPriceOnDropped

Returns the price coordinate corresponding to the chart point the Expert Advisor or script has been dropped to.

```
double ChartPriceOnDropped();
```

Return Value

Value of [double](#) type.

Example:

```
double p=ChartPriceOnDropped();  
Print("ChartPriceOnDropped() = ",p);
```

See also

[ChartXOnDropped](#), [ChartYOnDropped](#)

ChartTimeOnDropped

Returns the time coordinate corresponding to the chart point the Expert Advisor or script has been dropped to.

```
datetime ChartTimeOnDropped();
```

Return Value

Value of [datetime](#) type.

Example:

```
datetime t=ChartTimeOnDropped();  
Print("Script was dropped on the "+t);
```

See also

[ChartXOnDropped](#), [ChartYOnDropped](#)

ChartXOnDropped

Returns the X coordinate of the chart point the Expert Advisor or script has been dropped to.

```
int ChartXOnDropped();
```

Return Value

The X coordinate value.

Note

X axis direction from left to right.

Example:

```
int X=ChartXOnDropped();  
int Y=ChartYOnDropped();  
Print(" (X,Y) = (" +X+" , "+Y+" ) ");
```

See also

[ChartWindowOnDropped](#), [ChartPriceOnDropped](#), [ChartTimeOnDropped](#)

ChartYOnDropped

Returns the Y coordinate of the chart point the Expert Advisor or script has been dropped to.

```
int ChartYOnDropped();
```

Return Value

The Y coordinate value.

Note

Y axis direction from top to bottom.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get and print the X and Y coordinates of the chart point the script was dropped
    int x=ChartXOnDropped();
    int y=ChartYOnDropped();
    PrintFormat("Script dropped to coordinates X = %d, Y = %d", x, y);
    /*
    result:
    Script dropped to coordinates X = 429, Y = 114
    */
}
```

[ChartWindowOnDropped](#), [ChartPriceOnDropped](#), [ChartTimeOnDropped](#)

ChartSetSymbolPeriod

Changes the symbol and period of the specified chart. The function is asynchronous, i.e. it sends the command and does not wait for its execution completion. The command is added to chart messages queue and will be executed after processing of all previous commands.

```
bool ChartSetSymbolPeriod(
    long      chart_id,    // Chart ID
    string     symbol,      // Symbol name
    ENUM_TIMEFRAMES period // Period
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

symbol

[in] Chart symbol. [NULL](#) value means the current chart symbol (Expert Advisor is attached to)

period

[in] Chart period (timeframe). Can be one of the [ENUM_TIMEFRAMES](#) values. 0 means the current chart period.

Return Value

Returns true if the command has been added to chart queue, otherwise false. To get an information about the [error](#), call the [GetLastError\(\)](#) function.

Note

The symbol/period change leads to the re-initialization of the Expert Advisor attached to a chart.

The call of ChartSetSymbolPeriod with the same symbol and timeframe can be used to update the chart (similar to the terminal's Refresh command). In its turn, the chart update triggers recalculation of the indicators attached to it. Thus, you are able to calculate an indicator on the chart even if there are no ticks (e.g., on weekends).

Example:

```
#define SYMBOL "GBPUSD"
#define PERIOD PERIOD_H1

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the current chart ID, symbol and period
    long      chart_id= ChartID();
    string     symbol  = Symbol();
    ENUM_TIMEFRAMES period = Period();
```

```

//--- report in the journal on replacing the current chart symbol and period with the
    PrintFormat("Change the %s symbol and the %s period of the chart %I64u to %s %s",
        symbol, TimeframeDescription(period), chart_id, SYMBOL, TimeframeDescr

//--- change the chart symbol and period
    ChartSetSymbolPeriod(chart_id, SYMBOL, PERIOD);
    /*
    result:
    Change the EURUSD symbol and the M1 period of the chart 133246248352168440 to GBPUSD
    */
}
//+-----+
//| Return the chart period description |
//+-----+
string TimeframeDescription(const ENUM_TIMEFRAMES timeframe)
{
    return(StringSubstr(EnumToString(timeframe), 7));
}

```

See also

[ChartSymbol](#), [ChartPeriod](#)

ChartScreenShot

The function provides a screenshot of the chart in its current state in the GIF, PNG or BMP format depending on specified extension.

```
bool ChartScreenShot(
    long      chart_id,           // Chart ID
    string     filename,          // Symbol name
    int        width,             // Width
    int        height,            // Height
    ENUM_ALIGN_MODE align_mode=ALIGN_RIGHT // Alignment type
);
```

Parameters

chart_id

[in] Chart ID. 0 means the current chart.

filename

[in] Screenshot file name. Cannot exceed 63 characters. Screenshot files are placed in the \Files directory.

width

[in] Screenshot width in pixels.

height

[in] Screenshot height in pixels.

align_mode=ALIGN_RIGHT

[in] Output mode of a narrow screenshot. A value of the [ENUM_ALIGN_MODE](#) enumeration. ALIGN_RIGHT means align to the right margin (the output from the end). ALIGN_LEFT means Left justify.

Return Value

Returns true if successful, otherwise false.

Note

If you need to take a screenshot from a chart from a certain position, first it's necessary to position the graph using the [ChartNavigate\(\)](#) function. If the horizontal size of the screenshot is smaller than the chart window, either the right part of the chart window, or its left part is output, depending on the align_mode settings.

Example:

```
#property description "The Expert Advisor demonstrates how to create a series of screenshots
#property description "chart using the ChartScreenShot() function. For convenience, the
#property description "shown on the chart. The height and width of images is defined t

#define WIDTH 800 // Image width to call ChartScreenShot()
#define HEIGHT 600 // Image height to call ChartScreenShot()
```

```

//--- input parameters
input int    pictures=5;    // The number of images in the series
int         mode=-1;        // -1 denotes a shift to the right edge of the chart, 1
int         bars_shift=300; // The number of bars when scrolling the chart using Cha
//+-----+
//| Expert initialization function                                     |
//+-----+
void OnInit()
{
//--- Disable chart autoscroll
    ChartSetInteger(0,CHART_AUTOSCROLL,false);
//--- Set the shift of the right edge of the chart
    ChartSetInteger(0,CHART_SHIFT,true);
//--- Show a candlestick chart
    ChartSetInteger(0,CHART_MODE,CHART_CANDLES);
//---
    Print("Preparation of the Expert Advisor is completed");
}
//+-----+
//| Expert tick function                                           |
//+-----+
void OnTick()
{
//---

}
//+-----+
//| ChartEvent function                                           |
//+-----+
void OnChartEvent(const int id,
                  const long &lparam,
                  const double &dparam,
                  const string &sparam)
{
//--- Show the name of the function, call time and event identifier
    Print(__FUNCTION__,TimeCurrent(),"  id=",id,"  mode=",mode);
//--- Handle the CHARTEVENT_CLICK event ("A mouse click on the chart")
    if(id==CHARTEVENT_CLICK)
    {
        //--- Initial shift from the chart edge
        int pos=0;
        //--- Operation with the left chart edge
        if(mode>0)
        {
            //--- Scroll the chart to the left edge
            ChartNavigate(0,CHART_BEGIN,pos);
            for(int i=0;i<pictures;i++)
            {

Trade Functions

This is the group of functions intended for managing trading activities.

Before you proceed to study the trade functions of the platform, you must have a clear understanding of the basic terms: order, deal and position:

- An order is an instruction given to a broker to buy or sell a financial instrument. There are two main types of orders: Market and Pending. In addition, there are special Take Profit and Stop Loss levels.
- A deal is the commercial exchange (buying or selling) of a financial security. Buying is executed at the demand price (Ask), and Sell is performed at the supply price (Bid). A deal can be opened as a result of market order execution or pending order triggering. Note that in some cases, execution of an order can result in several deals.
- A position is a trade obligation, i.e. the number of bought or sold contracts of a financial instrument. A long position is financial security bought expecting the security price go higher. A short position is an obligation to supply a security expecting the price will fall in future.

General information about trading operations is available in the [client terminal help](#).

Trading functions can be used in Expert Advisors and scripts. Trading functions can be called only if in the properties of the Expert Advisor or script the "Allow live trading" checkbox is enabled.

Trading can be allowed or prohibited depending on various factors described in the [Trade Permission](#) section.

Function	Action
OrderCalcMargin	Calculates the margin required for the specified order type, in the deposit currency
OrderCalcProfit	Calculates the profit based on the parameters passed, in the deposit currency
OrderCheck	Checks if there are enough funds to execute the required trade operation .
OrderSend	Sends trade requests to a server
OrderSendAsync	Asynchronously sends trade requests without waiting for the trade response of the trade server
PositionsTotal	Returns the number of open positions
PositionGetSymbol	Returns the symbol corresponding to the open position
PositionSelect	Chooses an open position for further working with it
PositionSelectByTicket	Selects a position to work with by the ticket number specified in it
PositionGetDouble	Returns the requested property of an open position (double)
PositionGetInteger	Returns the requested property of an open position (datetime or int)
PositionGetString	Returns the requested property of an open position (string)

Function	Action
<u>PositionGetTicket</u>	Returns the ticket of the position with the specified index in the list of open positions
<u>OrdersTotal</u>	Returns the number of orders
<u>OrderGetTicket</u>	Return the ticket of a corresponding order
<u>OrderSelect</u>	Selects a order for further working with it
<u>OrderGetDouble</u>	Returns the requested property of the order (double)
<u>OrderGetInteger</u>	Returns the requested property of the order (datetime or int)
<u>OrderGetString</u>	Returns the requested property of the order (string)
<u>HistorySelect</u>	Retrieves the history of transactions and orders for the specified period of the server time
<u>HistorySelectByPosition</u>	Requests the history of deals with a specified <u>position identifier</u> .
<u>HistoryOrderSelect</u>	Selects an order in the history for further working with it
<u>HistoryOrdersTotal</u>	Returns the number of orders in the history
<u>HistoryOrderGetTicket</u>	Return order ticket of a corresponding order in the history
<u>HistoryOrderGetDouble</u>	Returns the requested property of an order in the history (double)
<u>HistoryOrderGetInteger</u>	Returns the requested property of an order in the history (datetime or int)
<u>HistoryOrderGetString</u>	Returns the requested property of an order in the history (string)
<u>HistoryDealSelect</u>	Selects a deal in the history for further calling it through appropriate functions
<u>HistoryDealsTotal</u>	Returns the number of deals in the history
<u>HistoryDealGetTicket</u>	Returns a ticket of a corresponding deal in the history
<u>HistoryDealGetDouble</u>	Returns the requested property of a deal in the history (double)
<u>HistoryDealGetInteger</u>	Returns the requested property of a deal in the history (datetime or int)
<u>HistoryDealGetString</u>	Returns the requested property of a deal in the history (string)

OrderCalcMargin

The function calculates the margin required for the specified order type, on the current account, in the current market environment not taking into account current pending orders and open positions. It allows the evaluation of margin for the trade operation planned. The value is returned in the account currency.

```
bool OrderCalcMargin(
    ENUM_ORDER_TYPE   action,           // type of order
    string             symbol,           // symbol name
    double             volume,           // volume
    double             price,            // open price
    double&            margin            // variable for obtaining the margin value
);
```

Parameters

action

[in] The order type, can be one of the values of the [ENUM_ORDER_TYPE](#) enumeration.

symbol

[in] Symbol name.

volume

[in] Volume of the trade operation.

price

[in] Open price.

margin

[out] The variable, to which the value of the required margin will be written in case the function is successfully executed. The calculation is performed as if there were no pending orders and open positions on the current account. The margin value depends on many factors, and can differ in different market environments.

Return Value

The function returns true in case of success; otherwise it returns false. In order to obtain information about the [error](#), call the [GetLastError\(\)](#) function.

Example:

```
#define VOLUME      1.0    // order volume
#define DEVIATION    100   // distance for setting a pending order
#define STOP_LIMIT  50     // order StopLimit distance

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    string currency=AccountInfoString(ACCOUNT_CURRENCY);
```

```

int array_types[8]={ORDER_TYPE_BUY,
                    ORDER_TYPE_SELL,
                    ORDER_TYPE_BUY_LIMIT,
                    ORDER_TYPE_SELL_LIMIT,
                    ORDER_TYPE_BUY_STOP,
                    ORDER_TYPE_SELL_STOP,
                    ORDER_TYPE_BUY_STOP_LIMIT,
                    ORDER_TYPE_SELL_STOP_LIMIT };

//--- in a loop by the order type array
for(int i=0; i<(int)array_types.Size(); i++)
{
    //--- depending on the order type, get ORDER_TYPE_BUY or ORDER_TYPE_SELL type
    ENUM_ORDER_TYPE type=MarketOrderByOrderType((ENUM_ORDER_TYPE)array_types[i]);

    //--- depending on the order type, get the price
    double price=PriceByOrderType(_Symbol, type);

    //--- get the amount of margin required for the order type specified in 'action'
    double margin=EMPTY_VALUE;
    ResetLastError();
    if(!OrderCalcMargin(type, _Symbol, VOLUME, price, margin))
    {
        Print("OrderCalcMargin() failed. Error ",GetLastError());
        continue;
    }

    //--- print the result in the journal
    PrintFormat("Margin required for %.2f %s order at price %.2f on %s symbol: %.2f",
                VOLUME, _Symbol, price, margin);
}
/*
result:
Margin required for 1.00 Buy order at price 1.31668 on GBPUSD symbol: 1316.68 USD
Margin required for 1.00 Sell order at price 1.31661 on GBPUSD symbol: 1316.61 USD
Margin required for 1.00 Buy Limit order at price 1.31568 on GBPUSD symbol: 1315.68 USD
Margin required for 1.00 Sell Limit order at price 1.31761 on GBPUSD symbol: 1317.61 USD

OrderCalcProfit

The function calculates the profit for the current account, in the current market conditions, based on the parameters passed. The function is used for pre-evaluation of the result of a trade operation. The value is returned in the account currency.

```
bool OrderCalcProfit(
    ENUM_ORDER_TYPE    action,          // type of the order (ORDER_TYPE_BUY or ORDER_TYPE_SELL)
    string              symbol,          // symbol name
    double              volume,          // volume
    double              price_open,      // open price
    double              price_close,     // close price
    double&             profit           // variable for obtaining the profit value
);
```

Parameters

action

[in] Type of the order, can be one of the two values of the [ENUM_ORDER_TYPE](#) enumeration: ORDER_TYPE_BUY or ORDER_TYPE_SELL.

symbol

[in] Symbol name.

volume

[in] Volume of the trade operation.

price_open

[in] Open price.

price_close

[in] Close price.

profit

[out] The variable, to which the calculated value of the profit will be written in case the function is successfully executed. The estimated profit value depends on many factors, and can differ in different market environments.

Return Value

The function returns true in case of success; otherwise it returns false. If an invalid order type is specified, the function will return false. In order to obtain information about the [error](#), call [GetLastError\(\)](#).

Example:

```
#define VOLUME      1.0    // order volume
#define DEVIATION   100    // number of points before the close price

//+-----+
//| Script program start function |
//+-----+
```

```

OrderCheck

The OrderCheck() function checks if there are enough money to execute a required [trade operation](#). The check results are placed to the fields of the [MqlTradeCheckResult](#) structure.

```
bool OrderCheck(
    MqlTradeRequest&    request,    // request structure
    MqlTradeCheckResult& result    // result structure
);
```

Parameters

request

[in] Pointer to the structure of the [MqlTradeRequest](#) type, which describes the required trade action.

result

[in,out] Pointer to the structure of the [MqlTradeCheckResult](#) type, to which the check result will be placed.

Return Value

If funds are not enough for the operation, or parameters are filled out incorrectly, the function returns false. In case of a successful basic check of structures (check of pointers), it returns true. **However, this is not an indication that the requested trade operation is sure to be successfully executed.** For a more detailed description of the function execution result, analyze the fields of the *result* structure.

In order to obtain information about the [error](#), call the [GetLastError\(\)](#) function.

Example:

```
#define    DEVIATION      5           // allowed deviation from the price
#define    VOLUME        1.0         // order volume
#define    EXPERT_MAGIC   123        // MagicNumber
#define    DIRECTION      ORDER_TYPE_BUY // opened position direction (ORDER_TYPE_BUY or ORDER_TYPE_SELL)

//+-----+

[OrderSend\(\)](#), [Trade Operation Types](#), [Trade Request Structure](#), [Structure of Request Check Results](#), [Structure of a Trade Request Result](#)

OrderSend

The OrderSend() function is used for executing [trade operations](#) by sending [requests](#) to a trade server.

```
bool OrderSend(
    MqlTradeRequest& request,      // query structure
    MqlTradeResult& result        // structure of the answer
);
```

Parameters

request

[in] Pointer to a structure of [MqlTradeRequest](#) type describing the trade activity of the client.

result

[in,out] Pointer to a structure of [MqlTradeResult](#) type describing the result of trade operation in case of a successful completion (if true is returned).

Return Value

In case of a successful basic check of structures (index checking) returns true. **However, this is not a sign of successful execution of a trade operation.** For a more detailed description of the function execution result, analyze the fields of *result* structure.

Note

The trade requests go through several stages of checking on a trade server. First of all, it checks if all the required fields of the *request* parameter are filled out correctly. If there are no errors, the server accepts the order for further processing. If the order is successfully accepted by the trade server, the OrderSend() function returns true.

It is recommended to check the request before sending it to a trade server. To check requests, use the [OrderCheck\(\)](#) function. It checks if there are enough funds to execute the trade operation, and returns many useful parameters in the [results of trade request checking](#):

- [return code](#) containing information about errors in the checked request;
- balance value that will appear after the trade operation is executed;
- equity value that will appear after the trade operation is executed;
- floating point value that will appear after the trade operation is executed;
- margin required for the trade operation;
- amount of free equity that will remain after the execution of the trade operation;
- the margin level that will be set after the trade operation is executed;
- comment to the reply code, error description.

When sending a market order (MqlTradeRequest.action=[TRADE_ACTION_DEAL](#)), the successful result of the OrderSend() function does not mean that the order has been executed (appropriate trades have been performed). In this case, 'true' means only that the order has been successfully placed in the trading system for further execution. The trade server can fill in the *deal or order* field values in the returned [result structure](#), if it is aware of these data when forming a response to an OrderSend() call. Generally, event(s) of executing trades corresponding to an order may happen after sending a response to the OrderSend() call. Therefore, for any type of a trade request, when receiving the OrderSend() execution result, we should first check the *retcode* trade server response code and the

retcode_external external system response code (if necessary) available in the obtained [result structure](#).

Each accepted order is stored on the trade server awaiting processing until one of the conditions for its execution occurs:

- expiration,
- appearance of an opposite request,
- order execution when the execution price appears,
- a request to cancel the order is received.

At the moment of the order processing, the trade server sends to the terminal a message about the occurrence of the [Trade](#) event, which can be processed by the [OnTrade\(\)](#) function.

The result of executing the trade request on a server sent by OrderSend() function can be tracked by [OnTradeTransaction](#) handler. It should be noted that OnTradeTransaction handler will be called several times when executing one trade request.

For example, when sending a market buy order, it is handled, an appropriate buy order is created for the account, the order is then executed and removed from the list of the open ones, then it is added to the orders history, an appropriate deal is added to the history and a new position is created. OnTradeTransaction function will be called for each of these events.

Example:

```
//--- value for ORDER_MAGIC
input long order_magic=55555;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- make sure that the account is demo
if(AccountInfoInteger(ACCOUNT_TRADE_MODE)==ACCOUNT_TRADE_MODE_REAL)
{
Alert("Script operation is not allowed on a live account!");
return;
}
//--- place or delete order
if(GetOrdersTotalByMagic(order_magic)==0)
{
//--- no current orders - place an order
uint res=SendRandomPendingOrder(order_magic);
Print("Return code of the trade server ",res);
}
else // there are orders - delete orders
{
DeleteAllOrdersByMagic(order_magic);
}
//---
}
//+-----+
```

[Trade Operation Types](#), [Trade Request Structure](#), [Structure of Request Check Results](#), [Structure of a Trade Request Result](#)

OrderSendAsync

The OrderSendAsync() function is used for conducting asynchronous [trade operations](#) without waiting for the trade server's response to a sent [request](#). The function is designed for high-frequency trading, when under the terms of the trading algorithm it is unacceptable to waste time waiting for a response from the server.

```
bool OrderSendAsync(  
    MqlTradeRequest& request,    // Request structure  
    MqlTradeResult& result      // Response structure  
);
```

Parameters

request

[in] A pointer to a structure of the [MqlTradeRequest](#) type that describes the trade action of the client.

result

[in,out] A pointer to a structure of the [MqlTradeResult](#) type that describes the result of a trade operation in case of successful execution of the function (if true is returned).

Return Value

Returns true if the request is sent to a trade server. In case the request is not sent, it returns false. In case the request is sent, in the *result* variable the response code contains [TRADE_RETCODE_PLACED](#) value (code 10008) - "order placed". Successful execution means only the fact of sending, but does not give any guarantee that the request has reached the trade server and has been accepted for processing. When processing the received request, a trade server sends a reply to a client terminal notifying of change in the current state of positions, orders and deals, which leads to the generation of the [Trade](#) event.

The result of executing the trade request on a server sent by OrderSendAsync() function can be tracked by [OnTradeTransaction](#) handler. It should be noted that OnTradeTransaction handler will be called several times when executing one trade request.

For example, when sending a market buy order, it is handled, an appropriate buy order is created for the account, the order is then executed and removed from the list of the open ones, then it is added to the orders history, an appropriate deal is added to the history and a new position is created. OnTradeTransaction function will be called for each of these events. To get such a data, the function parameters should be analyzed:

- **trans** - this parameter gets [MqlTradeTransaction](#) structure describing a trade transaction applied to a trade account;
- **request** - this parameter gets [MqlTradeRequest](#) structure describing the trade request resulted in a trade transaction;
- **result** - this parameter gets [MqlTradeResult](#) structure describing a trade request execution result.

Note

In terms of purposes and parameters, the function is similar to [OrderSend\(\)](#), but unlike it, it is asynchronous, i.e. does not hold the program operation while waiting for the function execution result. You can compare the rate of trade operations of these two functions using the sample Expert Advisor.

Example:

```

```

PositionsTotal

Returns the number of open positions.

```
int PositionsTotal();
```

Return Value

Value of [int](#) type.

Note

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get and print the number of open positions on the account in the journal
    int total=PositionsTotal();
    Print("Number of open positions on account: ", total);
    /*
    result:
    Number of open positions on account: 2
    */
}
```

See also

[PositionGetSymbol\(\)](#), [PositionSelect\(\)](#), [Position Properties](#)

PositionGetSymbol

Returns the symbol corresponding to the open position and automatically selects the position for further working with it using functions [PositionGetDouble](#), [PositionGetInteger](#), [PositionGetString](#).

```
string PositionGetSymbol(
    int index    // Number in the list of positions
);
```

Parameters

index

[in] Number of the position in the list of open positions.

Return Value

Value of the [string](#) type. If the position was not found, an empty string will be returned. To get an [error code](#), call the [GetLastError\(\)](#) function.

Note

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get the number of open positions on the account
    int total=PositionsTotal();
    for(int i=0; i<total; i++)
    {
        //--- get position symbol by i loop index
        ResetLastError();
        string symbol=PositionGetSymbol(i);

        //--- if the position symbol is successfully received, then the position at the
        //--- and we can obtain its properties using PositionGetDouble, PositionGetInteger
        if(symbol!="")
        {
            ENUM_POSITION_TYPE type=(ENUM_POSITION_TYPE)PositionGetInteger(POSITION_TYPE)
            PrintFormat("Position symbol at index %d: %s, position type: %s", i, symbol,
                type);
        }
        else
    }
```

```
    {  
        PrintFormat("PositionGetSymbol(%d) failed. Error %d", i, GetLastError());  
        continue;  
    }  
}  
/*  
result:  
Position symbol at index 0: GBPUSD, position type: SELL  
Position symbol at index 1: EURUSD, position type: BUY  
*/  
}
```

See also

[PositionsTotal\(\)](#), [PositionSelect\(\)](#), [Position Properties](#)

PositionSelect

Chooses an open position for further working with it. Returns true if the function is successfully completed. Returns false in case of failure. To obtain information about the error, call [GetLastError\(\)](#).

```
bool PositionSelect(
    string symbol    // Symbol name
);
```

Parameters

symbol

[in] Name of the financial security.

Return Value

Value of the bool type.

Note

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol. In this case, PositionSelect will select a position with the lowest ticket.

Function PositionSelect() copies data about a position into the program environment, and further calls of [PositionGetDouble\(\)](#), [PositionGetInteger\(\)](#) and [PositionGetString\(\)](#) return the earlier copied data. This means that the position itself may no longer exist (or its volume, direction, etc. has changed), but data of this position still can be obtained. To ensure receipt of fresh data about a position, it is recommended to call PositionSelect() right before referring to them.

Example:

```
#define SYMBOL_NAME "EURUSD"

//+-----+
//| Script program start function |
//+-----+

void OnStart()
{
    //--- select a position on a specified symbol
    if(!PositionSelect(SYMBOL_NAME))
    {
        PrintFormat("PositionSelect(%s) failed. Error %d",SYMBOL_NAME, GetLastError());
        return;
    }

    //--- if a position is selected, we can obtain its data using PositionGetDouble(), Pos
    //--- get the selected position ticket
    ResetLastError();
```

```
long ticket=PositionGetInteger(POSITION_TICKET);
if(ticket==0)
{
    PrintFormat("Failed to get %s position ticket. Error %d", SYMBOL_NAME, GetLastError());
    return;
}

//--- if a ticket is successfully received, print the selected position symbol and ticket
PrintFormat("The position that is selected on the %s symbol has ticket %I64d", SYMBOL_NAME, ticket);
/*
result:
The position that is selected on the EURUSD symbol has ticket 2810846623
*/
}
```

See also

[PositionGetSymbol\(\)](#), [PositionsTotal\(\)](#), [Position Properties](#)

PositionSelectByTicket

Selects an open position to work with based on the ticket number specified in the position. If successful, returns true. Returns false if the function failed. Call [GetLastError\(\)](#) for error details.

```
bool PositionSelectByTicket(
    ulong   ticket    // Position ticket
);
```

Parameters

ticket

[in] Position ticket.

Return Value

A value of the bool type.

Note

The PositionSelectByTicket() function copies position data to the program environment. Further calls of [PositionGetDouble\(\)](#), [PositionGetInteger\(\)](#) and [PositionGetString\(\)](#) return the previously copied data. Even if a position does not exist already (or its size, direction etc. has changed), the data may still be received sometimes. To make sure that you receive valid position data, it is recommended to call PositionSelectByTicket() before you access the data.

Example:

```
#define   EXPERT_MAGIC 123456    // MagicNumber

//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- declare and initialize the request and result structures
    MqlTradeRequest request={};
    MqlTradeResult  result ={};

    //--- fill in trade request parameters to open a long position
    request.action   = TRADE_ACTION_DEAL;           // trading operation type
    request.symbol   = Symbol();                    // symbol
    request.volume   = 0.1;                         // volume of 0.1 lot
    request.type     = ORDER_TYPE_BUY;              // order type
    request.price    = SymbolInfoDouble(Symbol(), SYMBOL_ASK); // open price
    request.deviation = 5;                          // allowed deviation from price
    request.magic    = EXPERT_MAGIC;                // order MagicNumber

    //--- send a request. If failed to send a request, display the error code and complete
    if(!OrderSend(request, result))
    {
        PrintFormat("OrderSend error ", GetLastError());
    }
}
```

```

        return;
    }

//--- display operation data
    PrintFormat("Trade request result: retcode: %u, deal: %I64u, order: %I64u", result.

//--- get the position ticket from the trade operation result and select the position
//--- the ticket of a newly opened position corresponds to the ticket of the order the
    ulong ticket=result.order;
    ResetLastError();
    if(!PositionSelectByTicket(ticket))
    {
        PrintFormat("PositionSelectByTicket(%I64u) failed. Error %d", ticket, GetLastError());
        return;
    }

//--- display the data of a position, selected by ticket, in the journal
    ENUM_POSITION_TYPE type = (ENUM_POSITION_TYPE)PositionGetInteger(POSITION_TYPE);
    long time = PositionGetInteger(POSITION_TIME_MSC);
    double price = PositionGetDouble(POSITION_PRICE_OPEN);
    double volume= PositionGetDouble(POSITION_VOLUME);
    string symbol= PositionGetString(POSITION_SYMBOL);
    int digits= (int)SymbolInfoInteger(symbol, SYMBOL_DIGITS);
    PrintFormat("Current selected position: %s %.2f %s #%I64u at %.*f, %s",
                symbol, volume, (type==POSITION_TYPE_BUY ? "Buy" : "Sell"), ticket, digits, price);
    /*
    result:
    Trade request result: retcode: 10009, deal: 2778100901, order: 2803905975
    Current selected position: EURUSD 0.10 Buy #2803905975 at 1.10672, 2024.09.02 12:09:00
    */
}

//+-----+
//| Return time with milliseconds |
//+-----+
string TimeMscToString(const long time_msc, int flags=TIME_DATE|TIME_MINUTES|TIME_SECONDS)
{
    return(TimeToString(time_msc/1000, flags) + "." + IntegerToString(time_msc %1000, 3));
}

```

[PositionGetSymbol\(\)](#), [PositionsTotal\(\)](#), [Position Properties](#)

PositionGetDouble

The function returns the requested property of an open position, pre-selected using [PositionGetSymbol](#) or [PositionSelect](#). The position property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```
double PositionGetDouble(
    ENUM_POSITION_PROPERTY_DOUBLE property_id    // Property identifier
);
```

2. Returns true or false, depending on the success of the function execution. If successful, the value of the property is placed in a receiving variable passed by reference by the last parameter.

```
bool PositionGetDouble(
    ENUM_POSITION_PROPERTY_DOUBLE property_id,    // Property identifier
    double& double_var    // Here we accept the property value
);
```

Parameters

property_id

[in] Identifier of a position property. The value can be one of the values of the [ENUM_POSITION_PROPERTY_DOUBLE](#) enumeration.

double_var

[out] Variable of the double type, accepting the value of the requested property.

Return Value

Value of the [double](#) type. If the function fails, 0 is returned.

Note

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call [PositionSelect\(\)](#) right before referring to them.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- in a loop by all account positions
```

```

int total=PositionsTotal();
for(int i=0; i<total; i++)
{
    //--- get the ticket of the next position by automatically selecting a position
    ulong ticket=PositionGetTicket(i);
    if(ticket==0)
        continue;

    //--- get the position type and display the header for the list of position real
    string type=(PositionGetInteger(POSITION_TYPE)==POSITION_TYPE ? "Buy" : "Sell");
    PrintFormat("Double properties of an open position %s #I64u:", type, ticket);

    //--- print all the real properties of the selected position under the header
    PositionPropertiesDoublePrint(15);
}
/*

[PositionGetSymbol\(\)](#), [PositionSelect\(\)](#), [Position Properties](#)

PositionGetInteger

The function returns the requested property of an open position, pre-selected using [PositionGetSymbol](#) or [PositionSelect](#). The position property should be of datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

```
long PositionGetInteger(
    ENUM_POSITION_PROPERTY_INTEGER property_id    // Property identifier
);
```

2. Returns true or false, depending on the success of the function execution. If successful, the value of the property is placed in a receiving variables passed by reference by the last parameter.

```
bool PositionGetInteger(
    ENUM_POSITION_PROPERTY_INTEGER property_id,    // Property identifier
    long& long_var                                // Here we accept the property value
);
```

Parameters

property_id

[in] Identifier of a position property. The value can be one of the values of the [ENUM_POSITION_PROPERTY_INTEGER](#) enumeration.

long_var

[out] Variable of the long type accepting the value of the requested property.

Return Value

Value of the [long](#) type. If the function fails, 0 is returned.

Note

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call [PositionSelect\(\)](#) right before referring to them.

Example:

```
//+-----+
//| Trade function                                     |
//+-----+
void OnTrade()
{
    //--- check if a position is present and display the time of its changing
```

```

    if(PositionSelect(_Symbol))
    {
//--- receive position ID for further work
        ulong position_ID=PositionGetInteger(POSITION_IDENTIFIER);
        Print(_Symbol," position #",position_ID);
//--- receive the time of position forming in milliseconds since 01.01.1970
        long create_time_msc=PositionGetInteger(POSITION_TIME_MSC);
        PrintFormat("Position #%%d  POSITION_TIME_MSC = %%i64 milliseconds => %%s",position_ID,
            create_time_msc,TimeToString(create_time_msc/1000));
//--- receive the time of the position's last change in seconds since 01.01.1970
        long update_time_sec=PositionGetInteger(POSITION_TIME_UPDATE);
        PrintFormat("Position #%%d  POSITION_TIME_UPDATE = %%i64 seconds => %%s",
            position_ID,update_time_sec,TimeToString(update_time_sec));
//--- receive the time of the position's last change in milliseconds since 01.01.1970

PositionGetString

The function returns the requested property of an open position, pre-selected using [PositionGetSymbol](#) or [PositionSelect](#). The position property should be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```
string PositionGetString(
    ENUM_POSITION_PROPERTY_STRING property_id    // Property identifier
);
```

2. Returns true or false, depending on the success of the function execution. If successful, the value of the property is placed in a receiving variables passed by reference by the last parameter.

```
bool PositionGetString(
    ENUM_POSITION_PROPERTY_STRING property_id,    // Property identifier
    string& string_var    // Here we accept the property value
);
```

Parameters

property_id

[in] Identifier of a position property. The value can be one of the values of the [ENUM_POSITION_PROPERTY_STRING](#) enumeration.

string_var

[out] Variable of the string type accepting the value of the requested property.

Return Value

Value of the [string](#) type. If the function fails, an empty string is returned.

Note

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call [PositionSelect\(\)](#) right before referring to them.

Example:

```

```
header="External ID:";
w=(header_width==0 ? header.Length()+1 : header_width);
if(!PositionGetString(POSITION_EXTERNAL_ID, value))
    return;
PrintFormat("%-*s%-s", w, header, value);
}
```

See also

[PositionGetSymbol\(\)](#), [PositionSelect\(\)](#), [Position Properties](#)

PositionGetTicket

The function returns the ticket of a position with the specified index in the list of open positions and automatically selects the position to work with using functions [PositionGetDouble](#), [PositionGetInteger](#), [PositionGetString](#).

```
ulong PositionGetTicket (
    int index      // The number of a position in the list
);
```

Parameters

index

[in] The index of a position in the list of open positions, numeration starts with 0.

Return Value

The ticket of the position. Returns 0 if the function fails.

Note

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

To ensure receipt of fresh data about a position, it is recommended to call [PositionSelect\(\)](#) right before referring to them.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- in a loop by all account positions
    int total=PositionsTotal();
    for(int i=0; i<total; i++)
    {
        //--- get the ticket of the next position by automatically selecting a position
        ulong ticket=PositionGetTicket(i);
        if(ticket==0)
            continue;

        //--- get the position type and display the description of the selected position
        string type=(PositionGetInteger(POSITION_TYPE)==POSITION_TYPE ? "Buy" : "Sell");
        PrintFormat("[%d] Selected position %s #I64u", i, type, ticket);
    }
    /*
```

```
result:  
[0] Selected position Sell #2810802718  
[1] Selected position Buy #2810802919  
*/  
}
```

See also

[PositionGetSymbol\(\)](#), [PositionSelect\(\)](#), [Position Properties](#)

OrdersTotal

Returns the number of current orders.

```
int OrdersTotal();
```

Return Value

Value of the [int](#) type.

Note

Do not confuse current [pending orders](#) with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal. An order is a request to conduct a [transaction](#), while a position is a result of one or more [deals](#).

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- get and print in the journal the number of active pending orders on the account
    int total=OrdersTotal();
    Print("Number of active pending orders on the account: ", total);
    /*
    result:
    Number of active pending orders on the account: 2
    */
}
```

See also

[OrderSelect\(\)](#), [OrderGetTicket\(\)](#), [Order Properties](#)

OrderGetTicket

Returns ticket of a corresponding order and automatically selects the order for further working with it using functions.

```
ulong OrderGetTicket(  
    int index    // Number in the list of orders  
);
```

Parameters

index

[in] Number of an order in the list of current orders.

Return Value

Value of the [ulong](#) type. If the function fails, 0 is returned.

Note

Do not confuse current [pending orders](#) with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal. An order is a request to conduct a [transaction](#), while a position is a result of one or more [deals](#).

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

Function OrderGetTicket() copies data about an order into the program environment, and further calls of [OrderGetDouble\(\)](#), [OrderGetInteger\(\)](#), [OrderGetString\(\)](#) return the earlier copied data. This means that the order itself may no longer exist (or its open price, Stop Loss/Take Profit levels or expiration has changed), but data of this order still can be obtained. To ensure receipt of fresh data about an order, it is recommended to call OrderGetTicket() right before referring to them.

Example:

```
void OnStart()  
{  
    ///--- variables for returning values from order properties  
    ulong    ticket;  
    double   open_price;  
    double   initial_volume;  
    datetime time_setup;  
    string    symbol;  
    string    type;  
    long     order_magic;  
    long     positionID;  
    ///--- number of current pending orders  
    uint     total=OrdersTotal();
```

```

//--- go through orders in a loop
for(uint i=0;i<total;i++)
{
    //--- return order ticket by its position in the list
    if((ticket=OrderGetTicket(i))>0)
    {
        //--- return order properties
        open_price    =OrderGetDouble(ORDER_PRICE_OPEN);
        time_setup    =(datetime)OrderGetInteger(ORDER_TIME_SETUP);
        symbol        =OrderGetString(ORDER_SYMBOL);
        order_magic    =OrderGetInteger(ORDER_MAGIC);
        positionID    =OrderGetInteger(ORDER_POSITION_ID);
        initial_volume=OrderGetDouble(ORDER_VOLUME_INITIAL);
        type          =EnumToString(ENUM_ORDER_TYPE(OrderGetInteger(ORDER_TYPE)));
        //--- prepare and show information about the order
        printf("#ticket %d %s %G %s at %G was set up at %s",
            ticket,                // order ticket
            type,                  // type
            initial_volume,        // placed volume
            symbol,                // symbol
            open_price,            // specified open price
            TimeToString(time_setup)// time of order placing
        );
    }
}
//---
}

```

See also

[OrdersTotal\(\)](#), [OrderSelect\(\)](#), [OrderGetInteger\(\)](#)

OrderSelect

Selects an order to work with. Returns true if the function has been successfully completed. Returns false if the function completion has failed. For more information about an error call [GetLastError\(\)](#).

```
bool OrderSelect(
    ulong ticket    // Order ticket
);
```

Parameters

ticket

[in] Order ticket.

Return Value

Value of the bool type.

Note

Do not confuse current [pending orders](#) with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

Function OrderSelect() copies data about an order into the program environment, and further calls of [OrderGetDouble\(\)](#), [OrderGetInteger\(\)](#), [OrderGetString\(\)](#) return the earlier copied data. This means that the order itself may no longer exist (or its open price, Stop Loss/Take Profit levels or expiration has changed), but data of this order still can be obtained. To ensure receipt of fresh data about an order, it is recommended to call OrderSelect() right before referring to them.

Example:

```

```

See also

[OrderGetInteger\(\)](#), [OrderGetDouble\(\)](#), [OrderGetString\(\)](#), [OrderCalcProfit\(\)](#), [OrderGetTicket\(\)](#), [Order Properties](#)

OrderGetDouble

Returns the requested property of an order, pre-selected using [OrderGetTicket](#) or [OrderSelect](#). The order property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```
double OrderGetDouble(
    ENUM_ORDER_PROPERTY_DOUBLE property_id // Property identifier
);
```

2. Returns true or false, depending on the success of a function. If successful, the value of the property is placed in a target variable passed by reference by the last parameter.

```
bool OrderGetDouble(
    ENUM_ORDER_PROPERTY_DOUBLE property_id, // Property identifier
    double& double_var // Here we accept the property value
);
```

Parameters

property_id

[in] Identifier of the order property. The value can be one of the values of the [ENUM_ORDER_PROPERTY_DOUBLE](#) enumeration.

double_var

[out] Variable of the double type that accepts the value of the requested property.

Return Value

Value of the [double](#) type. If the function fails, 0 is returned.

Note

Do not confuse current [pending orders](#) with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

To ensure receipt of fresh data about an order, it is recommended to call [OrderSelect\(\)](#) right before referring to them.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
```

```

//--- in a loop by the list of all account orders
int total=OrdersTotal();
for(int i=0; i<total; i++)
{

}

```

See also

[OrdersTotal\(\)](#), [OrderGetTicket\(\)](#), [Order Properties](#)

OrderGetInteger

Returns the requested order property, pre-selected using [OrderGetTicket](#) or [OrderSelect](#). Order property must be of the datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

```
long OrderGetInteger(
    ENUM_ORDER_PROPERTY_INTEGER property_id // Property identifier
);
```

2. Returns true or false depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool OrderGetInteger(
    ENUM_ORDER_PROPERTY_INTEGER property_id, // Property identifier
    long& long_var // Here we accept the property value
);
```

Parameters

property_id

[in] Identifier of the order property. The value can be one of the values of the [ENUM_ORDER_PROPERTY_INTEGER](#) enumeration.

long_var

[out] Variable of the long type that accepts the value of the requested property.

Return Value

Value of the [long](#) type. If the function fails, 0 is returned.

Note

Do not confuse current [pending orders](#) with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

To ensure receipt of fresh data about an order, it is recommended to call [OrderSelect\(\)](#) right before referring to them.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
```

```

//--- in a loop by the list of all account orders
int total=OrdersTotal();
for(int i=0; i<total; i++)
{
    //--- get the order ticket in the list by the loop index
    ulong ticket=OrderGetTicket(i);
    if(ticket==0)
        continue;

[OrdersTotal\(\)](#), [OrderGetTicket\(\)](#), [Order Properties](#)

OrderGetString

Returns the requested order property, pre-selected using [OrderGetTicket](#) or [OrderSelect](#). The order property must be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```
string OrderGetString(
    ENUM_ORDER_PROPERTY_STRING property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool OrderGetString(
    ENUM_ORDER_PROPERTY_STRING property_id, // Property identifier
    string& string_var // Here we accept the property value
);
```

Parameters

property_id

[in] Identifier of the order property. The value can be one of the values of the [ENUM_ORDER_PROPERTY_STRING](#) enumeration.

string_var

[out] Variable of the string type that accepts the value of the requested property.

Return Value

Value of the [string](#) type.

Note

Do not confuse current [pending orders](#) with positions, which are also displayed on the "Trade" tab of the "Toolbox" of the client terminal.

For the "netting" interpretation of positions ([ACCOUNT_MARGIN_MODE_RETAIL_NETTING](#) and [ACCOUNT_MARGIN_MODE_EXCHANGE](#)), only one [position](#) can exist for a [symbol](#) at any moment of time. This position is a result of one or more [deals](#). Do not confuse positions with valid [pending orders](#), which are also displayed on the Trading tab of the Toolbox window.

If individual positions are allowed ([ACCOUNT_MARGIN_MODE_RETAIL_HEDGING](#)), multiple positions can be open for one symbol.

To ensure receipt of fresh data about an order, it is recommended to call [OrderSelect\(\)](#) right before referring to them.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
```

```

//--- in a loop by the list of all account orders
int total=OrdersTotal();
for(int i=0; i<total; i++)
{
    //--- get the order ticket in the list by the loop index
    ulong ticket=OrderGetTicket(i);
    if(ticket==0)
        continue;

    //--- get the order type and display the header for the list of string properties
    string type=OrderTypeDescription((ENUM_ORDER_TYPE)OrderGetInteger(ORDER_TYPE));
    PrintFormat("String properties of an active pending order %s #I64u:", type, ticket);

    //--- print all the string properties of the selected order under the header
    OrderPropertiesStringPrint(13);
}
/*

HistorySelect

Retrieves the history of deals and orders for the specified period of server time.

```
bool HistorySelect(
    datetime from_date,    // From date
    datetime to_date       // To date
);
```

Parameters

from_date

[in] Start date of the request.

to_date

[in] End date of the request.

Return Value

It returns true if successful, otherwise returns false.

Note

HistorySelect() creates a list of orders and a list of trades in a mql5-program, for further referring to the list elements using corresponding functions. The deals list size can be returned using the [HistoryDealsTotal\(\)](#) function; the size of the list of orders in the history can be obtained using [HistoryOrdersTotal\(\)](#). Selection in the list of orders should be better performed by [HistoryOrderGetTicket\(\)](#), for items in the list of deals [HistoryDealGetTicket\(\)](#) suits better.

After using [HistoryOrderSelect\(\)](#), the list of history orders available to the mql5 program is reset and filled again by the found order, if [the search of an order by the ticket](#) has been completed successfully. The same applies to the list of deals available to the mql5 program - it is reset by [HistoryDealSelect\(\)](#) and filled again in case of a successful receipt of a deal by ticket number.

Example:

```
void OnStart()
{
    color BuyColor =clrBlue;
    color SellColor=clrRed;
    //--- request trade history
    HistorySelect(0,TimeCurrent());
    //--- create objects
    string name;
    uint total=HistoryDealsTotal();
    ulong ticket=0;
    double price;
    double profit;
    datetime time;
    string symbol;
    long type;
    long entry;
    //--- for all deals
```

```

for(uint i=0;i<total;i++)
{
    //--- try to get deals ticket
    if((ticket=HistoryDealGetTicket(i))>0)
    {
        //--- get deals properties
        price =HistoryDealGetDouble(ticket,DEAL_PRICE);
        time  =(datetime)HistoryDealGetInteger(ticket,DEAL_TIME);
        symbol=HistoryDealGetString(ticket,DEAL_SYMBOL);
        type  =HistoryDealGetInteger(ticket,DEAL_TYPE);
        entry =HistoryDealGetInteger(ticket,DEAL_ENTRY);
        profit=HistoryDealGetDouble(ticket,DEAL_PROFIT);
        //--- only for current symbol
        if(price && time && symbol==Symbol())
        {
            //--- create price object
            name="TradeHistory_Deal_"+string(ticket);
            if(entry) ObjectCreate(0,name,OBJ_ARROW_RIGHT_PRICE,0,time,price,0,0);
            else      ObjectCreate(0,name,OBJ_ARROW_LEFT_PRICE,0,time,price,0,0);
            //--- set object properties
            ObjectSetInteger(0,name,OBJPROP_SELECTABLE,0);
            ObjectSetInteger(0,name,OBJPROP_BACK,0);
            ObjectSetInteger(0,name,OBJPROP_COLOR,type?BuyColor:SellColor);
            if(profit!=0) ObjectSetString(0,name,OBJPROP_TEXT,"Profit: "+string(profit));
        }
    }
}

//--- apply on chart
ChartRedraw();
}

```

See also

[HistoryOrderSelect\(\)](#), [HistoryDealSelect\(\)](#)

HistorySelectByPosition

Retrieves the history of deals and orders having the specified position identifier.

```
bool HistorySelectByPosition(
    long position_id // position identifier - POSITION\_IDENTIFIER
);
```

Parameters

position_id

[in] Position identifier that is set to every executed order and every deal.

Return Value

It returns true if successful, otherwise returns false.

Note

Do not confuse orders of a trading history with current [pending orders](#) that appear on the "Trade" tab of the "Toolbox" bar. The list of [orders](#) that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

HistorySelectByPosition() creates in a mql5 program a list of orders and a list of deals with a specified [position identifier](#) for further reference to the elements of the list using the appropriate functions. To know the size of the list of deals, use function [HistoryDealsTotal\(\)](#), the size of the list of orders in the history can be obtained using [HistoryOrdersTotal\(\)](#). To run through elements of the orders list, use [HistoryOrderGetTicket\(\)](#), for elements of the deals list - [HistoryDealGetTicket\(\)](#).

After using [HistoryOrderSelect\(\)](#), list of history orders available to the mql5 program is reset and filled again with the found order, if [search of an order by its ticket](#) was successful. The same refers to the list of deals available to the mql5 program - it is reset by function [HistoryDealSelect\(\)](#) and is filled out again if a deal was found successfully by the ticket number.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    long pos_id_array[]; // array for storing position IDs

    //-- request the entire history
    if(!HistorySelect(0, TimeCurrent()))
    {
        Print("HistorySelect() failed. Error ", GetLastError());
        return;
    }

    //-- collect all Position IDs from pending orders only in the array
    int total=HistoryOrdersTotal();
    for(int i=0; i<total; i++)
```

```

{
    ulong ticket=HistoryOrderGetTicket(i);
    if(ticket==0)
        continue;

```

See also

[HistorySelect\(\)](#), [HistoryOrderGetTicket\(\)](#), [Order Properties](#)

HistoryOrderSelect

Selects an order from the history for further calling it through appropriate functions. It returns true if the function has been successfully completed. Returns false if the function has failed. For more details on error call [GetLastError\(\)](#).

```
bool HistoryOrderSelect (
    ulong ticket    // Order ticket
);
```

Parameters

ticket

[in] Order ticket.

Return Value

Returns true if successful, otherwise false.

Note

Do not confuse orders of a trading history with current [pending orders](#) that appear on the "Trade" tab of the "Toolbox" bar. The list of [orders](#) that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

HistoryOrderSelect() clears in a mql5-program the list of orders from a history, available for calls, and copies to it a single order, if the execution of HistoryOrderSelect () has been completed successfully. If you need to go through all orders selected by [HistorySelect\(\)](#), you should better use [HistoryOrderGetTicket\(\)](#).

Example:

```
#define TICKET 1819621374 // ticket of any known order, for example, from the a
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- select a historical order by the ticket specified in TICKET
    if(!HistoryOrderSelect(TICKET))
    {
        PrintFormat("HistoryOrderSelect(%I64u) failed. Error %d", TICKET, GetLastError());
        return;
    }

    //--- if an order is successfully selected, get its data and display the order descrip
    ENUM_ORDER_TYPE order_type = (ENUM_ORDER_TYPE)HistoryOrderGetInteger(TICKET, ORI
    ENUM_ORDER_STATE order_state = (ENUM_ORDER_STATE)HistoryOrderGetInteger(TICKET, OF
    ENUM_ORDER_REASON order_reason = (ENUM_ORDER_REASON)HistoryOrderGetInteger(TICKET, C

HistoryOrdersTotal

Returns the number of orders in the history. Prior to calling HistoryOrdersTotal(), first it is necessary to receive the history of deals and orders using the [HistorySelect\(\)](#) or [HistorySelectByPosition\(\)](#) function.

```
int HistoryOrdersTotal();
```

Return Value

Value of the [int](#) type.

Note

Do not confuse orders of a trading history with current [pending orders](#) that appear on the "Trade" tab of the "Toolbox" bar. The list of [orders](#) that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- request all the existing history on the account
    if(!HistorySelect(0, TimeCurrent()))
    {
        Print("HistorySelect() failed. Error ", GetLastError());
        return;
    }

    //--- get the number of orders in the list and display it in the journal
    int total=HistoryOrdersTotal();
    Print("Number of historical orders on the account: ", total);
    /*
    result:
    Number of historical orders on the account: 496
    */
}
```

HistoryOrderGetTicket

Return the ticket of a corresponding order in the history. Prior to calling HistoryOrderGetTicket(), first it is necessary to receive the history of deals and orders using the [HistorySelect\(\)](#) or [HistorySelectByPosition\(\)](#) function.

```
ulong HistoryOrderGetTicket(  
    int index      // Number in the list of orders  
);
```

Parameters

index

[in] Number of the order in the list of orders.

Return Value

Value of the [ulong](#) type. If the function fails, 0 is returned.

Note

Do not confuse orders of a trading history with current [pending orders](#) that appear on the "Trade" tab of the "Toolbox" bar. The list of [orders](#) that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

HistoryOrderGetDouble

Returns the requested order property. The order property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```
double HistoryOrderGetDouble(
    ulong          ticket_number,    // Ticket
    ENUM_ORDER_PROPERTY_DOUBLE property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool HistoryOrderGetDouble(
    ulong          ticket_number,    // Ticket
    ENUM_ORDER_PROPERTY_DOUBLE property_id, // Property identifier
    double&        double_var       // Here we accept the property value
);
```

Parameters

ticket_number

[in] Order ticket.

property_id

[in] Identifier of the order property. The value can be one of the values of the [ENUM_ORDER_PROPERTY_DOUBLE](#) enumeration.

double_var

[out] Variable of the double type that accepts the value of the requested property.

Return Value

Value of the [double](#) type.

Note

Do not confuse orders of a trading history with current [pending orders](#) that appear on the "Trade" tab of the "Toolbox" bar. The list of [orders](#) that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

HistoryOrderGetInteger

Returns the requested property of an order. The order property must be of datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

```
long HistoryOrderGetInteger(
    ulong          ticket_number,    // Ticket
    ENUM_ORDER_PROPERTY_INTEGER property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool HistoryOrderGetInteger(
    ulong          ticket_number,    // Ticket
    ENUM_ORDER_PROPERTY_INTEGER property_id, // Property identifier
    long&          long_var         // Here we accept the property value
);
```

Parameters

ticket_number

[in] Order ticket.

property_id

[in] Identifier of the order property. The value can be one of the values of the [ENUM_ORDER_PROPERTY_INTEGER](#) enumeration.

long_var

[out] Variable of the long type that accepts the value of the requested property.

Return Value

Value of the [long](#) type.

Note

Do not confuse orders of a trading history with current [pending orders](#) that appear on the "Trade" tab of the "Toolbox" bar. The list of [orders](#) that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

Example:

```
//+-----+
//| Trade function |
//+-----+
void OnTrade()
{
    //--- receive the last order's ticket from week's trading history
    ulong last_order=GetLastOrderTicket();

HistoryOrderGetString

Returns the requested property of an order. The order property must be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```
string HistoryOrderGetString(
    ulong          ticket_number,    // Ticket
    ENUM_ORDER_PROPERTY_STRING property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool HistoryOrderGetString(
    ulong          ticket_number,    // Ticket
    ENUM_ORDER_PROPERTY_STRING property_id, // Property identifier
    string&        string_var       // Here we accept the property value
);
```

Parameters

ticket_number

[in] Order ticket.

property_id

[in] Identifier of the order property. The value can be one of the values of the [ENUM_ORDER_PROPERTY_STRING](#) enumeration.

string_var

[out] Variable of the string type.

Return Value

Value of the [string](#) type.

Note

Do not confuse orders of a trading history with current [pending orders](#) that appear on the "Trade" tab of the "Toolbox" bar. The list of [orders](#) that were canceled or have led to a transaction, can be viewed in the "History" tab of "Toolbox" of the client terminal.

[HistorySelect\(\)](#), [HistoryOrdersTotal\(\)](#), [HistoryOrderSelect\(\)](#), [Order Properties](#)

HistoryDealSelect

Selects a deal in the history for further calling it through appropriate functions. It returns true if the function has been successfully completed. Returns false if the function has failed. For more details on error call [GetLastError\(\)](#).

```
bool HistoryDealSelect(
    ulong ticket    // Deal ticket
);
```

Parameters

ticket

[in] Deal ticket.

Return Value

Returns true if successful, otherwise false.

Note

Do not confuse [orders](#), [deals](#) and [positions](#). Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

HistoryDealSelect() clears in a mql5-program the list of deals available for reference, and copies the single deal, if the execution of HistoryDealSelect() has been completed successfully. If you need to go through all deals selected by the [HistorySelect\(\)](#) function, you should better use [HistoryDealGetTicket\(\)](#).

Example:

```
#define TICKET 2620919264 // ticket of any known deal, for example, from the te

long ExtTicket=TICKET; // set the specified ticket to the variable from the
// or handle deals in the OnTradeTransaction() handle

//+-----+
//| Expert TradeTransaction handler |
//+-----+
void OnTradeTransaction(const MqlTradeTransaction& trans,
    const MqlTradeRequest& request,
    const MqlTradeResult& result)
{
    //--- if a transaction is adding a deal to history
    if(trans.type==TRADE_TRANSACTION_DEAL_ADD)
    {
        //--- select a deal by ticket, get its data and display the deal description in
        HistoryDealSelectProcess(trans.deal);
    }
}

//+-----+
//| Script program start function |
```

```

//+-----+
void OnStart()
{
//--- select a deal by ticket, get its data and display the deal description in the journal
HistoryDealSelectProcess(ExtTicket);
/*
result:
(Position ID #2645974677) EURUSD Deal Out 0.10 Buy #2620919264 by order #2646028965
*/
}
//+-----+

}

```

See also

[HistorySelect\(\)](#), [HistoryDealGetTicket\(\)](#), [Deal Properties](#)

HistoryDealsTotal

Returns the number of deal in history. Prior to calling HistoryDealsTotal(), first it is necessary to receive the history of deals and orders using the [HistorySelect\(\)](#) or [HistorySelectByPosition\(\)](#) function.

```
int HistoryDealsTotal();
```

Return Value

Value of the [int](#) type.

Note

Do not confuse [orders](#), [deals](#) and [positions](#). Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- request all the existing history on the account
if(!HistorySelect(0, TimeCurrent()))
{
    Print("HistorySelect() failed. Error ", GetLastError());
    return;
}

//--- get the number of deals in the list and display it in the journal
int total=HistoryDealsTotal();
Print("Number of historical deals on the account: ", total);
/*
result:
Number of historical deals on the account: 339
*/
}
```

[HistorySelect\(\)](#), [HistoryDealGetTicket\(\)](#), [Deal Properties](#)

HistoryDealGetTicket

The function selects a deal for further processing and returns the deal ticket in history. Prior to calling `HistoryDealGetTicket()`, first it is necessary to receive the history of deals and orders using the [HistorySelect\(\)](#) or [HistorySelectByPosition\(\)](#) function.

```
ulong HistoryDealGetTicket (
    int index      // ticket deal
);
```

Parameters

index

[in] Number of a deal in the list of deals

Return Value

Value of the [ulong](#) type. If the function fails, 0 is returned.

Note

Do not confuse [orders](#), [deals](#) and [positions](#). Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

Example:

```
void OnStart()
{
    ulong deal_ticket;           // deal ticket
    ulong order_ticket;          // ticket of the order the deal was executed on
    datetime transaction_time;    // time of a deal execution
    long deal_type ;             // type of a trade operation
    long position_ID;            // position ID
    string deal_description;      // operation description
    double volume;               // operation volume
    string symbol;               // symbol of the deal

    //--- set the start and end date to request the history of deals
    datetime from_date=0;        // from the very beginning
    datetime to_date=TimeCurrent(); // till the current moment
    //--- request the history of deals in the specified period
    HistorySelect(from_date,to_date);
    //--- total number in the list of deals

HistoryDealGetDouble

Returns the requested property of a deal. The deal property must be of the double type. There are 2 variants of the function.

1. Immediately returns the property value.

```
double HistoryDealGetDouble(
    ulong          ticket_number,    // Ticket
    ENUM_DEAL_PROPERTY_DOUBLE property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool HistoryDealGetDouble(
    ulong          ticket_number,    // Ticket
    ENUM_DEAL_PROPERTY_DOUBLE property_id, // Property identifier
    double&        double_var       // Here we accept the property value
);
```

Parameters

ticket_number

[in] Deal ticket.

property_id

[in] Identifier of a deal property. The value can be one of the values of the [ENUM_DEAL_PROPERTY_DOUBLE](#) enumeration.

double_var

[out] Variable of the double type that accepts the value of the requested property.

Return Value

Value of the [double](#) type.

Note

Do not confuse [orders](#), [deals](#) and [positions](#). Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- request deal and order history
    if(!HistorySelect(0, TimeCurrent()))
    {
        Print("HistorySelect() failed. Error ", GetLastError());
    }
}
```

```

        return;
    }

//--- in a loop by the list of deals in the account history
    int total=HistoryDealsTotal();
    for(int i=0; i<total; i++)

HistoryDealGetInteger

Returns the requested property of a deal. The deal property must be of the datetime, int type. There are 2 variants of the function.

1. Immediately returns the property value.

```
long HistoryDealGetInteger (
    ulong          ticket_number,    // Ticket
    ENUM_DEAL_PROPERTY_INTEGER property_id    // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool HistoryDealGetInteger (
    ulong          ticket_number,    // Ticket
    ENUM_DEAL_PROPERTY_INTEGER property_id,    // Property identifier
    long&          long_var         // Here we accept the property value
);
```

Parameters

ticket_number

[in] Trade ticket.

property_id

[in] Identifier of the deal property. The value can be one of the values of the [ENUM_DEAL_PROPERTY_INTEGER](#) enumeration.

long_var

[out] Variable of the long type that accepts the value of the requested property.

Return Value

Value of the [long](#) type.

Note

Do not confuse [orders](#), [deals](#) and [positions](#). Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

Example:

```
//+-----+
//| Trade function |
//+-----+
void OnTrade()
{

HistoryDealGetString

Returns the requested property of a deal. The deal property must be of the string type. There are 2 variants of the function.

1. Immediately returns the property value.

```
string HistoryDealGetString(
    ulong          ticket_number,    // Ticket
    ENUM_DEAL_PROPERTY_STRING property_id // Property identifier
);
```

2. Returns true or false, depending on the success of the function. If successful, the value of the property is placed into a target variable passed by reference by the last parameter.

```
bool HistoryDealGetString(
    ulong          ticket_number,    // Ticket
    ENUM_DEAL_PROPERTY_STRING property_id, // Property identifier
    string&        string_var       // Here we accept the property value
);
```

Parameters

ticket_number

[in] Deal ticket.

property_id

[in] Identifier of the deal property. The value can be one of the values of the [ENUM_DEAL_PROPERTY_STRING](#) enumeration.

string_var

[out] Variable of the string type that accepts the value of the requested property.

Return Value

Value of the [string](#) type.

Note

Do not confuse [orders](#), [deals](#) and [positions](#). Each deal is the result of the execution of an order, each position is the summary result of one or more deals.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- request deal and order history
    if(!HistorySelect(0, TimeCurrent()))
    {
        Print("HistorySelect() failed. Error ", GetLastError());
    }
}
```

```

        return;
    }

//--- in a loop by the list of deals in the account history
    int total=HistoryDealsTotal();
    for(int i=0; i<total; i++)
    {
        //--- get the ticket of the next deal (the deal is automatically selected to get
        ulong ticket=HistoryDealGetTicket(i);
        if(ticket==0)
            continue;

        //--- get the type and direction of the deal and display the header for the list
        string type=DealTypeDescription((ENUM_DEAL_TYPE)HistoryDealGetInteger(ticket, DEAL_TYPE));
        string entry=DealEntryDescription((ENUM_DEAL_ENTRY)HistoryDealGetInteger(ticket, DEAL_ENTRY));
        PrintFormat("String properties of an deal %s entry %s #I64u:", type, entry, ticket);

        //--- print all the real properties of the selected deal under the header
        HistoryDealPropertiesStringPrint(ticket, 13);
    }

Trade Signals

This is the group of functions intended for managing trade signals. The functions allow:

- get information about trade signals, available for copying,
- get and set the signal copy settings,
- subscribe and unsubscribe to the signal copying using MQL5 language functions.

Function	Action
SignalBaseGetDouble	Returns the value of double type property for selected signal
SignalBaseGetInteger	Returns the value of integer type property for selected signal
SignalBaseGetString	Returns the value of string type property for selected signal
SignalBaseSelect	Selects a signal from signals, available in terminal for further working with it
SignalBaseTotal	Returns the total amount of signals, available in terminal
SignalInfoGetDouble	Returns the value of double type property of signal copy settings
SignalInfoGetInteger	Returns the value of integer type property of signal copy settings
SignalInfoGetString	Returns the value of string type property of signal copy settings
SignalInfoSetDouble	Sets the value of double type property of signal copy settings
SignalInfoSetInteger	Sets the value of integer type property of signal copy settings
SignalSubscribe	Subscribes to the trading signal
SignalUnsubscribe	Cancels subscription

SignalBaseGetDouble

Returns the value of [double](#) type property for selected signal.

```
double SignalBaseGetDouble(  
    ENUM_SIGNAL_BASE_DOUBLE    property_id,    // property identifier  
);
```

Parameters

property_id

[in] Signal property identifier. The value can be one of the values of the [ENUM_SIGNAL_BASE_DOUBLE](#) enumeration.

Return Value

The value of [double](#) type property of the selected signal.

SignalBaseGetInteger

Returns the value of [integer](#) type property for selected signal.

```
long SignalBaseGetInteger(  
    ENUM_SIGNAL_BASE_INTEGER    property_id,    // property identifier  
);
```

Parameters

property_id

[in] Signal property identifier. The value can be one of the values of the [ENUM_SIGNAL_BASE_INTEGER](#) enumeration.

Return Value

The value of [integer](#) type property of the selected signal.

SignalBaseGetString

Returns the value of [string](#) type property for selected signal.

```
string SignalBaseGetString(  
    ENUM_SIGNAL_BASE_STRING    property_id,    // property identifier  
);
```

Parameters

property_id

[in] Signal property identifier. The value can be one of the values of the [ENUM_SIGNAL_BASE_STRING](#) enumeration.

Return Value

The value of [string](#) type property of the selected signal.

SignalBaseSelect

Selects a signal from signals, available in terminal for further working with it.

```
bool SignalBaseSelect(  
    int index // signal index  
);
```

Parameters

index

[in] Signal index in base of trading signals.

Return Value

Returns true if successful, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Example:

```
void OnStart()  
{  
    //--- get total amount of signals in the terminal  
    int total=SignalBaseTotal();  
    //--- process all signals  
    for(int i=0;i<total;i++)  
    {  
        //--- select the signal by index  
        if(SignalBaseSelect(i))  
        {  
            //--- get signal properties  
            long id =SignalBaseGetInteger(SIGNAL_BASE_ID); // signal id  
            long pips =SignalBaseGetInteger(SIGNAL_BASE_PIPS); // profit in pips  
            long subscr=SignalBaseGetInteger(SIGNAL_BASE_SUBSCRIBERS); // number of subscribers  
            string name =SignalBaseGetString(SIGNAL_BASE_NAME); // signal name  
            double price =SignalBaseGetDouble(SIGNAL_BASE_PRICE); // signal price  
            string curr =SignalBaseGetString(SIGNAL_BASE_CURRENCY); // signal currency  
            //--- print all profitable free signals with subscribers  
            if(price==0.0 && pips>0 && subscr>0)  
                PrintFormat("id=%d, name=\"%s\", currency=%s, pips=%d, subscribers=%d",id,name,curr,pips,subscr);  
        }  
        else PrintFormat("Error in call of SignalBaseSelect. Error code=%d",GetLastError());  
    }  
}
```

SignalBaseTotal

Returns the total amount of signals, available in terminal.

```
int SignalBaseTotal();
```

Return Value

The total amount of signals, available in terminal.

SignalInfoGetDouble

Returns the value of [double](#) type property of signal copy settings.

```
double SignalInfoGetDouble(  
    ENUM_SIGNAL_INFO_DOUBLE    property_id,    // property identifier  
);
```

Parameters

property_id

[in] Signal copy settings property identifier. The value can be one of the values of the [ENUM_SIGNAL_INFO_DOUBLE](#) enumeration.

Return Value

The value of [double](#) type property of signal copy settings.

SignalInfoGetInteger

Returns the value of [integer](#) type property of signal copy settings.

```
long  SignalInfoGetInteger (
    ENUM_SIGNAL_INFO_INTEGER  property_id,    // property identifier
);
```

Parameters

property_id

[in] Signal copy settings property identifier. The value can be one of the values of the [ENUM_SIGNAL_INFO_INTEGER](#) enumeration.

Return Value

The value of [integer](#) type property of signal copy settings.

SignalInfoGetString

Returns the value of [string](#) type property of signal copy settings.

```
string SignalInfoGetString(  
    ENUM_SIGNAL_INFO_STRING    property_id,    // property identifier  
);
```

Parameters

property_id

[in] Signal copy settings property identifier. The value can be one of the values of the [ENUM_SIGNAL_INFO_STRING](#) enumeration.

Return Value

The value of [string](#) type property of signal copy settings.

SignalInfoSetDouble

Sets the value of [double](#) type property of signal copy settings.

```
bool SignalInfoSetDouble(  
    ENUM_SIGNAL_INFO_DOUBLE    property_id,    // property identifier  
    double                     value           // new value  
);
```

Parameters

property_id

[in] Signal copy settings property identifier. The value can be one of the values of the [ENUM_SIGNAL_INFO_DOUBLE](#) enumeration.

value

[in] The value of signal copy settings property.

Return Value

Returns true if property has been changed, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

SignalInfoSetInteger

Sets the value of [integer](#) type property of signal copy settings.

```
bool SignalInfoSetInteger (
    ENUM_SIGNAL_INFO_INTEGER    property_id,    // property identifier
    long                        value           // new value
);
```

Parameters

property_id

[in] Signal copy settings property identifier. The value can be one of the values of the [ENUM_SIGNAL_INFO_INTEGER](#) enumeration.

value

[in] The value of signal copy settings property.

Return Value

Returns true if property has been changed, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

SignalSubscribe

Subscribes to the trading signal.

```
bool SignalSubscribe(  
    long    signal_id    // signal id  
);
```

Parameters

signal_id

[in] Signal identifier.

Return Value

Returns true if subscription was successful, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

SignalUnsubscribe

Cancels subscription.

```
bool SignalUnsubscribe();
```

Return Value

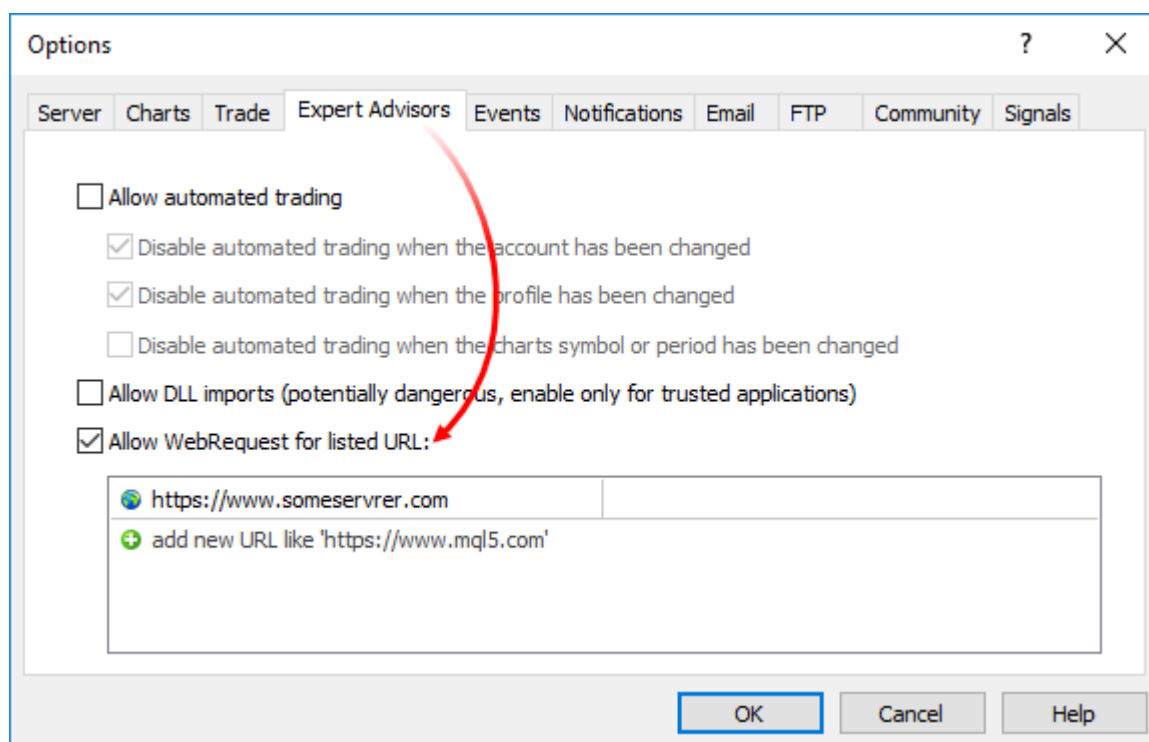

Returns true if subscription has been canceled successfully, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Network functions

MQL5 programs can exchange data with remote servers, as well as send push notifications, emails and data via FTP.

- The [Socket*](#) group of functions allows establishing a TCP connection (including a secure TLS) with a remote host via system sockets. The operation principle is simple: [create a socket](#), [connect to the server](#) and start [reading](#) and [writing](#) data.
- The [WebRequest](#) function is designed to work with web resources and allows sending HTTP requests (including GET and POST) easily.
- [SendFTP](#), [SendMail](#) and [SendNotification](#) are more simple functions for sending files, emails and mobile notifications.

For end-user security, the list of allowed IP addresses is implemented on the client terminal side. The list contains IP addresses the MQL5 program is allowed to connect to via the [Socket*](#) and [WebRequest](#) functions. For example, if the program needs to connect to <https://www.someserver.com>, this address should be explicitly indicated by a terminal user in the list. An address cannot be added programmatically.

Add an explicit message to the MQL5 program to notify a user of the need for additional configuration. You can do that via [#property description](#), [Alert](#) or [Print](#).

Function	Action
SocketCreate	Create a socket with specified flags and return its handle
SocketClose	Close a socket
SocketConnect	Connect to the server with timeout control
SocketIsConnected	Checks if the socket is currently connected

Function	Action
<u>SocketIsReadable</u>	Get a number of bytes that can be read from a socket
<u>SocketIsWritable</u>	Check whether data can be written to a socket at the current time
<u>SocketTimeouts</u>	Set timeouts for receiving and sending data for a socket system object
<u>SocketRead</u>	Read data from a socket
<u>SocketSend</u>	Write data to a socket
<u>SocketTlsHandshake</u>	Initiate secure TLS (SSL) connection to a specified host via TLS Handshake protocol
<u>SocketTlsCertificate</u>	Get data on the certificate used to secure network connection
<u>SocketTlsRead</u>	Read data from secure TLS connection
<u>SocketTlsReadAvailable</u>	Read all available data from secure TLS connection
<u>SocketTlsSend</u>	Send data via secure TLS connection
<u>WebRequest</u>	Send an HTTP request to a specified server
<u>SendFTP</u>	Send a file to an address specified on the FTP tab
<u>SendMail</u>	Send an email to an address specified in the Email tab of the options window
<u>SendNotification</u>	Send push notifications to mobile terminals whose MetaQuotes IDs are specified in the Notifications tab

SocketCreate

Create a socket with specified flags and return its handle.

```
int SocketCreate(
    uint    flags    // flags
);
```

Parameters

flags

[in] Combination of flags defining the mode of working with a socket. Currently, only one flag is supported – `SOCKET_DEFAULT`.

Return Value

In case of a successful socket creation, return its handle, otherwise [INVALID_HANDLE](#).

Notes

To free up computer memory from an unused socket, call [SocketClose](#) for it.

You can create a maximum of 128 sockets from one MQL5 program. If the limit is exceeded, the error 5271 (`ERR_NETSOCKET_TOO_MANY_OPENED`) is written to [LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

        SocketClose(socket);
    }
    else
        Print("Failed to create a socket, error ",GetLastError());
}
//+-----+

```

SocketClose

Close a socket.

```
bool SocketClose(
    const int socket    // socket handle
);
```

Parameters

socket

[in] Handle of a socket to be closed. The handle is returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [LastError](#).

Return Value

Returns true if successful, otherwise false.

Note

If a connection via [SocketConnect](#) was previously created for a socket, it is discontinued.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

```
//+-----+
//|                                     SocketExample.mq5 |

        }
        else
        {
            Print("Connection to ",Address,":",Port," failed, error ",GetLastError());
        }
        //--- close a socket after using
        SocketClose(socket);
    }
    else
        Print("Failed to create a socket, error ",GetLastError());
}
//+-----+

```

SocketConnect

Connect to the server with timeout control.

```
bool SocketConnect(
    int          socket,           // socket
    const string server,          // connection address
    uint         port,            // connection port
    uint         timeout_receive_ms // connection timeout
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [_LastError](#).

server

[in] Domain name of the server you want to connect to or its IP address.

port

[in] Connection port number.

timeout_receive_ms

[in] Connection timeout in milliseconds. If connection is not established within that time interval, attempts are stopped.

Return Value

If connection is successful, return true, otherwise false.

Note

Connection address should be added to the list of allowed ones on the client terminal side (Tools \ Options \ Expert Advisors).

If connection fails, error 5272 (ERR_NETSOCKET_CANNOT_CONNECT) is written to [_LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

    }  
    //+-----+
```

SocketIsConnected

Checks if the socket is currently connected.

```
bool SocketIsConnected(
    const int socket    // socket handle
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate\(\)](#) function. When an incorrect handle is passed to [LastError](#), the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

Return Value

Returns true if the socket is connected, otherwise - false.

Note

The SocketIsConnected() function allows checking the current socket connection status.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

```
//+-----+
//|                                     SocketIsConnected.mq5 |

[SocketConnect](#), [SocketIsWritable](#), [SocketCreate](#), [SocketClose](#)

SocketIsReadable

Get a number of bytes that can be read from a socket.

```
uint SocketIsReadable(
    const int socket    // socket handle
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed to [_LastError](#), the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

Return Value

Number of bytes that can be read. In case of an error, 0 is returned.

Note

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

Before calling [SocketRead](#), check if the socket features data for reading. Otherwise, if there are no data, the [SocketRead](#) function waits for data within timeout_ms delaying the program execution.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

```
//+-----+
//|                                     SocketExample.mq5 |

    else
        Print("Failed to create a socket, error ",GetLastError());
}
//+-----+

```

SocketIsWritable

Check whether data can be written to a socket at the current time.

```
bool SocketIsWritable(
    const int  socket      // socket handle
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [LastError](#).

Return Value

Return true if writing is possible, otherwise false.

Note

This function allows you to check whether it is possible to write data to a socket right now.

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

```
//+-----+
//|                                     SocketIsWritable.mq5 |

            {
                result+=CharArrayToString(rsp,0,rsp_len);
                //--- display response header only
                int header_end=StringFind(result,"\r\n\r\n");

                if(header_end>0)

```

```
        {
            Print("HTTP answer header received:");
            Print(StringSubstr(result,0,header_end));
            return(true);
        }
        //-- update read timeout expiration time
        timeout_check=GetTickCount64()+timeout_ms;
    }
}
}
while(GetTickCount64()<timeout_check && !IsStopped());

return(false);
}
```

SocketTimeouts

Set timeouts for receiving and sending data for a socket system object.

```
bool SocketTimeouts(
    int          socket,           // socket
    uint         timeout_send_ms,  // data sending timeout
    uint         timeout_receive_ms // data obtaining timeout
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [_LastError](#).

timeout_send_ms

[in] Data sending timeout in milliseconds.

timeout_receive_ms

[in] Data obtaining timeout in milliseconds.

Return Value

Returns true if successful, otherwise false.

Note

Do not confuse system object timeouts with the ones set when reading data via [SocketRead](#). SocketTimeout sets timeouts once for a socket object in the operating system. These timeouts are to be applied to all functions for reading and sending data via this socket. In SocketRead, the timeout is set for a certain data reading operation.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

```
//+-----+
//|                                     SocketTimeouts.mq5 |
//|                                     Copyright 2024, MetaQuotes Ltd. |
//|                                     https://www.mql5.com |
//+-----+
#property copyright "Copyright 2024, MetaQuotes Ltd."
#property link      "https://www.mql5.com"
#property version   "1.00"

#define TIMEOUT_SEND      5000
#define TIMEOUT_RECEIVE   5000

//+-----+
//| Script program start function |
//+-----+
```

```
void OnStart(void)
{
    ///--- create a socket and get its handle
    int socket=SocketCreate();

    if(socket==INVALID_HANDLE)
    {
        Print("SocketCreate() failed. Error ",GetLastError());
        return;
    }
    ///--- set timeouts for receiving and sending data for a socket system object
    if(SocketTimeouts(socket,TIMEOUT_SEND,TIMEOUT_RECEIVE))
        PrintFormat("timeouts were successfully set",socket,TIMEOUT_SEND,TIMEOUT_RECEIVE);
    else
        PrintFormat("SocketTimeouts(%d, %I64d, %I64d) failed. Error %d",socket,TIMEOUT_S
    ///--- close socket
    SocketClose(socket);
}
```

SocketRead

Read data from a socket.

```
int SocketRead(  
    int          socket,           // socket  
    uchar&       buffer[],        // buffer for reading data from socket  
    uint         buffer_maxlen,    // number of bytes to read  
    uint         timeout_ms       // reading timeout  
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed to [_LastError](#), the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

buffer

[out] Reference to the [uchar](#) type array the data is read in. Dynamic array size is increased by the number of read bytes. The array size cannot exceed [INT_MAX](#) (2147483647).

buffer_maxlen

[in] Number of bytes to read to the *buffer[]* array. Data not fitting into the array remain in the socket. They can be received by the next SocketRead call. *buffer_maxlen* cannot exceed [INT_MAX](#) (2147483647).

timeout_ms

[in] Data reading timeout in milliseconds. If data is not obtained within this time, attempts are stopped and the function returns -1.

Return Value

If successful, return the number of read bytes. In case of an error, -1 is returned.

Note

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

In case of a data reading error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written in [_LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

[SocketTimeouts](#), [MathSwap](#)

SocketSend

Write data to a socket.

```
int SocketSend(
    int          socket,           // socket
    const uchar& buffer[],        // data buffer
    uint         buffer_len       // buffer size
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [_LastError](#).

buffer

[in] Reference to the [uchar](#) type array with the data to be sent to the socket.

buffer_len

[in] 'buffer' array size.

Return Value

If successful, return the number of bytes written to a socket. In case of an error, -1 is returned.

Note

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

In case of a data writing error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written to [_LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

[SocketTimeouts](#), [MathSwap](#), [StringToCharArray](#)

SocketTlsHandshake

Initiate secure TLS (SSL) connection to a specified host via TLS Handshake protocol. During Handshake, a client and a server agree on connection parameters: applied protocol version and data encryption method.

```
bool SocketTlsHandshake (
    int          socket,           // socket
    const string host             // host address
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [_LastError](#).

host

[in] Address of a host a secure connection is established with.

Return Value

Returns true if successful, otherwise false.

Notes

Before a secure connection, the program should establish a standard TCP connection with the host using [SocketConnect](#).

If secure connection fails, the error 5274 (ERR_NETSOCKET_HANDSHAKE_FAILED) is written to [_LastError](#).

There is no need to call the function when [connecting](#) to the port 443. This is a standard TCP port used for secure TLS (SSL) connections.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

if(!resp.Length())
{
    Print("ERROR: No response from server");
    return(false);
}
//--- return the string
result=resp;
return(true);
}
```

SocketTlsCertificate

Get data on the certificate used to secure network connection.

```
bool SocketTlsCertificate(
    int          socket,           // socket
    string&      subject,         // certificate owner
    string&      issuer,          // certificate issuer
    string&      serial,          // certificate serial number
    string&      thumbprint,      // certificate print
    datetime&    expiration      // certificate expiration
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [_LastError](#).

subject

[in] Certificate owner name. Corresponds to the Subject field.

issuer

[in] Certificate issuer name. Corresponds to the Issuer field.

serial

[in] Certificate serial number. Corresponds to the SerialNumber field.

thumbprint

[in] Certificate print. Corresponds to the SHA-1 hash from the entire certificate file (all fields including the issuer signature).

expiration

[in] Certificate expiration date in the [datetime](#) format.

Return Value

Returns true if successful, otherwise false.

Note

Certificate data can be requested only after establishing a secure connection using [SocketTlsHandshake](#).

In case of a certificate obtaining error, the error 5275 (ERR_NETSOCKET_NO_CERTIFICATE) is written to [_LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

            //--- send GET request to the server
            if(HTTPSsend(socket,"GET / HTTP/1.1\r\nHost: www.mql5.com\r\nUser-Agent: MT5\
            {
                Print("GET request sent");
                //--- read the response

```

```
        if(!HTTPRecv(socket,1000))
            Print("Failed to get a response, error ",GetLastError());
    }
    else
        Print("Failed to send GET request, error ",GetLastError());
    }
    else
    {
        Print("Connection to ",Address,":",Port," failed, error ",GetLastError());
    }
    //--- close a socket after using
    SocketClose(socket);
    }
    else
        Print("Failed to create a socket, error ",GetLastError());
    }
    //+-----+
```

SocketTlsRead

Read data from secure TLS connection.

```
int SocketTlsRead(  
    int          socket,           // socket  
    uchar&       buffer[],        // buffer for reading data from socket  
    uint         buffer_maxlen    // number of bytes to read  
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed to [_LastError](#), the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

buffer

[out] Reference to the [uchar](#) type array the data is read in. Dynamic array size is increased by the number of read bytes. The array size cannot exceed [INT_MAX](#) (2147483647).

buffer_maxlen

[in] Number of bytes to read to the *buffer[]* array. Data not fitting into the array remain in the socket. They can be received by the next SocketTlsRead call. *buffer_maxlen* cannot exceed [INT_MAX](#) (2147483647).

Return Value

If successful, return the number of read bytes. In case of an error, -1 is returned.

Note

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

The function is executed till it receives the specified amount of data or the timeout is reached ([SocketTimeouts](#)).

In case of a data reading error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written in [_LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

SocketTlsReadAvailable

Read all available data from secure TLS connection.

```
int SocketTlsReadAvailable(
    int          socket,           // socket
    uchar&       buffer[],        // buffer for reading data from socket
    const uint   buffer_maxlen    // number of bytes to read
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed to [_LastError](#), the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is activated.

buffer

[out] Reference to the [uchar](#) type array the data is read in. Dynamic array size is increased by the number of read bytes. The array size cannot exceed [INT_MAX](#) (2147483647).

buffer_maxlen

[in] Number of bytes to read to the buffer[] array. Data not fitting into the array remain in the socket. They can be received by the next [SocketTlsReadAvailable](#) or [SocketTlsRead](#) call. *buffer_maxlen* cannot exceed [INT_MAX](#) (2147483647).

Return Value

If successful, return the number of read bytes. In case of an error, -1 is returned.

Note

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

In case of a data reading error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written in [_LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

```

SocketTlsSend

Send data via secure TLS connection.

```
int SocketTlsSend(
    int          socket,           // socket
    const uchar& buffer[],        // data buffer
    uint         buffer_len       // buffer size
);
```

Parameters

socket

[in] Socket handle returned by the [SocketCreate](#) function. When an incorrect handle is passed, the error 5270 (ERR_NETSOCKET_INVALIDHANDLE) is written to [_LastError](#).

buffer

[in] Reference to the [uchar](#) type array with the data to be sent.

buffer_len

[in] 'buffer' array size.

Return Value

If successful, return the number of bytes written to a socket. In case of an error, -1 is returned.

Note

If an error occurs on a system socket when executing the function, connection established via [SocketConnect](#) is discontinued.

In case of a data writing error, the error 5273 (ERR_NETSOCKET_IO_ERROR) is written to [_LastError](#).

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If calling from an indicator, [GetLastError\(\)](#) returns the error 4014 - "Function is not allowed for call".

Example:

```
//+-----+
//|                                     SocketTlsSend.mq5 |

            }
        }
    }
    while(GetTickCount64()<timeout_check && !IsStopped());

    return(false);
}

```

See also

[SocketTimeouts](#), [MathSwap](#), [StringToCharArray](#)

WebRequest

The function sends an HTTP request to a specified server. The function has two versions:

1. **Sending simple requests** of type "key=value" using the header Content-Type: application/x-www-form-urlencoded.

```
int WebRequest(  
    const string    method,           // HTTP method  
    const string    url,              // URL  
    const string    cookie,           // cookie  
    const string    referer,          // referer  
    int             timeout,           // timeout  
    const char      &data[],           // the array of the HTTP message body  
    int             data_size,         // data[] array size in bytes  
    char            &result[],         // an array containing server response data  
    string          &result_headers  // headers of server response  
);
```

2. **Sending a request of any type** specifying the custom set of headers for a more flexible interaction with various Web services.

```
int WebRequest(  
    const string    method,           // HTTP method  
    const string    url,              // URL  
    const string    headers,          // headers  
    int             timeout,           // timeout  
    const char      &data[],           // the array of the HTTP message body  
    char            &result[],         // an array containing server response data  
    string          &result_headers  // headers of server response  
);
```

Parameters

method

[in] HTTP method.

url

[in] URL.

headers

[in] Request headers of type "key: value", separated by a line break "\r\n".

cookie

[in] Cookie value.

referer

[in] Value of the Referer header of the HTTP request.

timeout

[in] Timeout in milliseconds.

data[]

[in] Data array of the HTTP message body.

data_size

[in] Size of the data[] array.

result[]

[out] An array containing server response data.

result_headers

[out] Server response headers.

Return Value

HTTP server response code or -1 for an error.

Note

To use the `WebRequest()` function, add the addresses of the required servers in the list of allowed URLs in the "Expert Advisors" tab of the "Options" window. Server port is automatically selected on the basis of the specified protocol - 80 for "http://" and 443 for "https://".

The `WebRequest()` function is synchronous, which means it breaks the program execution and waits for the response from the requested server. Since the delays in receiving a response can be large, the function is not available for calls from indicators, because indicators run in a common thread shared by all indicators and charts on one symbol. Indicator performance delay on one of the charts of a symbol may stop updating of all charts of the same symbol.

The function can be called only from Expert Advisors and scripts, as they run in their own execution threads. If you try to call the function from an indicator, [GetLastError\(\)](#) will return error 4014 - "Function is not allowed for call".

`WebRequest()` cannot be executed in the [Strategy Tester](#).

Example:

```
void OnStart()
{
    string cookie=NULL,headers;
    char post[],result[];
    string url="https://finance.yahoo.com";
    //--- To enable access to the server, you should add URL "https://finance.yahoo.com"
    //--- to the list of allowed URLs (Main Menu->Tools->Options, tab "Expert Advisors"):
    //--- Resetting the last error code
    ResetLastError();
    //--- Downloading a html page from Yahoo Finance
    int res=WebRequest("GET",url,cookie,NULL,500,post,0,result,headers);
    if(res==-1)
    {
        Print("Error in WebRequest. Error code =",GetLastError());
        //--- Perhaps the URL is not listed, display a message about the necessity to add
        MessageBox("Add the address '"+url+"' to the list of allowed URLs on tab 'Expert
    }
```

```
else
{
    if(res==200)
    {
        //--- Successful download
        PrintFormat("The file has been successfully downloaded, File size %d byte.",2
        //PrintFormat("Server headers: %s",headers);
        //--- Saving the data to a file
        int filehandle=FileOpen("url.htm",FILE_WRITE|FILE_BIN);
        if(filehandle!=INVALID_HANDLE)
        {
            //--- Saving the contents of the result[] array to a file
            FileWriteArray(filehandle,result,0,ArraySize(result));
            //--- Closing the file
            FileClose(filehandle);
        }
        else
            Print("Error in FileOpen. Error code =",GetLastError());
    }
    else
        PrintFormat("Downloading '%s' failed, error code %d",url,res);
}
}
```

SendFTP

Sends a file at the address, specified in the setting window of the "FTP" tab.

```
bool SendFTP(  
    string filename,           // file to be send by ftp  
    string ftp_path=NULL      // ftp catalog  
);
```

Parameters

filename

[in] Name of sent file.

ftp_path=NULL

[in] FTP catalog. If a directory is not specified, directory described in settings is used.

Return Value

In case of failure returns 'false'.

Note

Sent file must be located in the folder *terminal_directory\MQL5\files* or its subfolders. Sending isn't performed if FTP address and/or access password are not specified in settings.

SendFTP() function does not work in the [Strategy Tester](#).

Example:

```
//+-----+  
//|                                     SendFTP.mq5 |  
//|                                     Copyright 2024, MetaQuotes Ltd. |  
//|                                     https://www.mql5.com |  
//+-----+  
#property copyright "Copyright 2024, MetaQuotes Ltd."  
#property link      "https://www.mql5.com"  
#property version   "1.00"  
  
#define FILENAME "SomeFile.bin"  
#define PATH      NULL  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart(void)  
{  
    //--- check permission to send files to the FTP address in the terminal  
    if(!TerminalInfoInteger(TERMINAL_FTP_ENABLED))  
    {  
        Print("Error. The client terminal does not have permission to send messages to t  
        return;  
    }  
}
```

```
//--- send file
ResetLastError();
if(!SendFTP(FILENAME, PATH))
    Print("SendFTP() failed. Error ",GetLastError());
}
```

SendMail

Sends an email at the address specified in the settings window of the "Email" tab.

```
bool SendMail(  
    string subject,      // header  
    string some_text     // email text  
);
```

Parameters

subject

[in] Email header.

some_text

[in] Email body.

Return Value

true - if an email is put into the send queue, otherwise - false.

Note

Sending can be prohibited in settings, email address can be omitted as well. For the error information call [GetLastError\(\)](#).

SendMail() function does not work in the [Strategy Tester](#).

Example:

```
//+-----+  
//|                                     SendMail.mq5 |  
//|                                     Copyright 2024, MetaQuotes Ltd. |  
//|                                     https://www.mql5.com |  
//+-----+  
#property copyright "Copyright 2024, MetaQuotes Ltd."  
#property link      "https://www.mql5.com"  
#property version   "1.00"  
  
#define SUBJECT    "Test SendMail"  
#define TEXT        "Text for SendMail() function"  
  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart(void)  
{  
    //--- check permission to send email in the terminal  
    if(!TerminalInfoInteger(TERMINAL_EMAIL_ENABLED))  
    {  
        Print("Error. The client terminal does not have permission to send email message"  
        return;  
    }  
}
```

```
//--- send mail
ResetLastError();
if(!SendMail(SUBJECT, TEXT))
    Print("SendMail() failed. Error ",GetLastError());
}
```

SendNotification

Sends push notifications to the mobile terminals, whose MetaQuotes IDs are specified in the "Notifications" tab.

```
bool SendNotification(  
    string text           // Text of the notification  
);
```

Parameters

text

[in] The text of the notification. The message length should not exceed 255 characters.

Return Value

true if a notification has been successfully sent from the terminal; in case of failure returns false. When checking after a failed push of notification, [GetLastError \(\)](#) may return one of the following errors:

- 4515 - ERR_NOTIFICATION_SEND_FAILED,
- 4516 - ERR_NOTIFICATION_WRONG_PARAMETER,
- 4517 - ERR_NOTIFICATION_WRONG_SETTINGS,
- 4518 - ERR_NOTIFICATION_TOO_FREQUENT.

Note

Strict use restrictions are set for the SendNotification() function: no more than 2 calls per second and not more than 10 calls per minute. Monitoring the frequency of use is dynamic. The function can be disabled in case of the restriction violation.

SendNotification() function does not work in the [Strategy Tester](#).

Example:

```
//+-----+  
//|                                     SendNotification.mq5 |  
//|                                     Copyright 2024, MetaQuotes Ltd. |  
//|                                     https://www.mql5.com |  
//+-----+  
#property copyright "Copyright 2024, MetaQuotes Ltd."  
#property link      "https://www.mql5.com"  
#property version   "1.00"  
  
#define MESSAGE    "Test Message"  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart(void)  
{  
    //--- check permission to send notifications in the terminal  
    if(!TerminalInfoInteger(TERMINAL_NOTIFICATIONS_ENABLED))  
    {
```

```
        Print("Error. The client terminal does not have permission to send notifications");
        return;
    }
    ///--- send notification
    ResetLastError();
    if(!SendNotification(MESSAGE))
        Print("SendNotification() failed. Error ",GetLastError());
}
```

Global Variables of the Client Terminal

There is a group set of functions for working with global variables.

Global variables of the client terminal should not be mixed up with variables declared in the [global scope](#) of the mql5 program.

Global variables are kept in the client terminal for 4 weeks since the last access, then they will be deleted automatically. An access to a global variable is not only setting of a new value, but reading of the global variable value, as well.

Global variables of the client terminal are accessible simultaneously from all mql5 programs launched in the client terminal.

Function	Action
GlobalVariableCheck	Checks the existence of a global variable with the specified name
GlobalVariableTime	Returns time of the last accessing the global variable
GlobalVariableDel	Deletes a global variable
GlobalVariableGet	Returns the value of a global variable
GlobalVariableName	Returns the name of a global variable by its ordinal number in the list of global variables
GlobalVariableSet	Sets the new value to a global variable
GlobalVariablesFlush	Forcibly saves contents of all global variables to a disk
GlobalVariableTemp	Sets the new value to a global variable, that exists only in the current session of the terminal
GlobalVariableSetOnCondition	Sets the new value of the existing global variable by condition
GlobalVariablesDeleteAll	Deletes global variables with the specified prefix in their names
GlobalVariablesTotal	Returns the total number of global variables

GlobalVariableCheck

Checks the existence of a global variable with the specified name

```
bool GlobalVariableCheck(  
    string name    // Global variable name  
);
```

Parameters

name

[in] Global variable name.

Return Value

Returns true, if the global variable exists, otherwise returns false.

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.

See also

[GlobalVariableTime\(\)](#)

GlobalVariableTime

Returns the time when the global variable was last accessed.

```
datetime GlobalVariableTime(  
    string name    // name  
);
```

Parameters

name

[in] Name of the global variable.

Return Value

The function returns time of last accessing the specified global variable. Addressing a variable for its value, for example using the [GlobalVariableGet\(\)](#) and [GlobalVariableCheck\(\)](#) functions, also modifies the time of last access. In order to obtain [error](#) details, call the [GetLastError\(\)](#) function.

Note

Global variables exist in the client terminal during 4 weeks since they were called last. After that they are automatically deleted.

See also

[GlobalVariableCheck\(\)](#)

GlobalVariableDel

Deletes a global variable from the client terminal.

```
bool GlobalVariableDel(  
    string name    // Global variable name  
);
```

Parameters

name

[in] Global variable name.

Return Value

If successful, the function returns true, otherwise it returns false. To obtain an information about the [error](#) it is necessary to call the function [GetLastError\(\)](#).

Note

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.

GlobalVariableGet

Returns the value of an existing global variable of the client terminal. There are 2 variants of the function.

1. Immediately returns the value of the global variable.

```
double GlobalVariableGet(  
    string name      // Global variable name  
);
```

2. Returns true or false depending on the success of the function run. If successful, the global variable of the client terminal is placed in a variable passed by reference in the second parameter.

```
bool GlobalVariableGet(  
    string name,          // Global variable name  
    double& double_var    // This variable will contain the value of the global variable  
);
```

Parameters

name

[in] Global variable name.

double_var

[out] Target variable of the double type, which accepts the value stored in a the global variable of the client terminal.

Return Value

The value of the existing global variable or 0 in case of an [error](#). For more details about the error, call [GetLastError\(\)](#).

Note

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.

GlobalVariableName

Returns the name of a global variable by its ordinal number.

```
string GlobalVariableName(  
    int index    // Global variable number in the list of global variables  
);
```

Parameters

index

[in] Sequence number in the list of global variables. It should be greater than or equal to 0 and less than [GlobalVariablesTotal\(\)](#).

Return Value

Global variable name by its ordinal number in the list of global variables. For more details about the [error](#), call [GetLastError\(\)](#).

Note

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.

GlobalVariableSet

Sets a new value for a global variable. If the variable does not exist, the system creates a new global variable.

```
datetime GlobalVariableSet(  
    string  name,           // Global variable name  
    double  value           // Value to set  
);
```

Parameters

name

[in] Global variable name.

value

[in] The new numerical value.

Return Value

If successful, the function returns the last modification time, otherwise 0. For more details about the [error](#), call [GetLastError\(\)](#).

Note

A global variable name should not exceed 63 characters. Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.

GlobalVariablesFlush

Forcibly saves contents of all global variables to a disk.

```
void GlobalVariablesFlush();
```

Return Value

No return value.

Note

The terminal writes all the global variables when the work is over, but data can be lost at a sudden computer operation failure. This function allows independently controlling the process of saving global variables in case of contingency.

GlobalVariableTemp

The function attempts to create a temporary global variable. If the variable doesn't exist, the system creates a new temporary global variable.

```
bool GlobalVariableTemp(  
    string name    // Global variable name  
);
```

Parameters

name

[in] The name of a temporary global variable.

Return Value

If successful, the function returns true, otherwise - false. To get details about the [error](#), you should call the [GetLastError\(\)](#) function.

Note

Temporary global variables exist only while the client terminal is running; after the terminal shutdown they are automatically deleted. Note that during the execution of [GlobalVariablesFlush\(\)](#) temporary global variables are not written to a disk.

After a temporary global variable has been created, it can be accessed and modified the same as [global variable of the client terminal](#).

GlobalVariableSetOnCondition

Sets the new value of the existing global variable if the current value equals to the third parameter `check_value`. If there is no global variable, the function will generate an error `ERR_GLOBALVARIABLE_NOT_FOUND` (4501) and return false.

```
bool GlobalVariableSetOnCondition(  
    string  name,           // Global variable name  
    double  value,          // New value for variable if condition is true  
    double  check_value     // Check value condition  
);
```

Parameters

name

[in] The name of a global variable.

value

[in] New value.

check_value

[in] The value to check the current value of the global variable.

Return Value

If successful, the function returns true, otherwise it returns false. For details about the [error](#) call [GetLastError\(\)](#). If the current value of the global variable is different from `check_value`, the function returns false.

Note

Function provides atomic access to the global variable, so it can be used for providing of a mutex at interaction of several Expert Advisors working simultaneously within one client terminal.

GlobalVariablesDeleteAll

Deletes global variables of the client terminal.

```
int GlobalVariablesDeleteAll(  
    string    prefix_name=NULL,    // All global variables with names beginning with  
    datetime  limit_data=0        // All global variables that were changed before t  
);
```

Parameters

prefix_name=NULL

[in] Name prefix global variables to remove. If you specify a prefix NULL or empty string, then all variables that meet the data criterion will be deleted.

limit_data=0

[in] Date to select global variables by the time of their last modification. The function removes global variables, which were changed before this date. If the parameter is zero, then all variables that meet the first criterion (prefix) are deleted.

Return Value

The number of deleted variables.

Note

If both options are equal to zero (*prefix_name* = NULL and *limit_data* = 0), then function deletes all global variables of the terminal. If both parameters are specified, then it deletes global variables corresponding to both parameters.

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted.

GlobalVariablesTotal

Returns the total number of global variables of the client terminal.

```
int GlobalVariablesTotal();
```

Return Value

Number of global variables.

Note

Global variables exist in the client terminal during 4 weeks since their last use, then they are automatically deleted. Call of a global variable is not only setting a new value, but also reading the value of the global variable.

File Functions

This is a group of functions for working with files.

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means cannot be outside the file sandbox.

There are two directories (with subdirectories) in which working files can be located:

- terminal_data_folder\MQL5\FILES\ (in the terminal menu select to view "File" - "Open the data directory");
- the common folder for all the terminals installed on a computer - usually located in the directory C:\Documents and Settings\All Users\Application Data\MetaQuotes\Terminal\Common\Files.

There is a program method to obtain names of these catalogs using the [TerminalInfoString\(\)](#) function, using the [ENUM_TERMINAL_INFO_STRING](#) enumeration:

```
//--- Folder that stores the terminal data
string terminal_data_path=TerminalInfoString(TERMINAL_DATA_PATH);
//--- Common folder for all client terminals
string common_data_path=TerminalInfoString(TERMINAL_COMMONDATA_PATH);
```

Work with files from other directories is prohibited.

If the file is opened for writing using [FileOpen\(\)](#), all subfolders specified in the path will be created if there are no such ones.

File functions allow working with so-called "named pipes". To do this, simply call [FileOpen\(\)](#) function with appropriate parameters.

Function	Action
FileSelectDialog	Create a file or folder opening/creation dialog
FileFindFirst	Starts the search of files in a directory in accordance with the specified filter
FileFindNext	Continues the search started by the FileFindFirst() function
FileFindClose	Closes search handle
FileOpen	Opens a file with a specified name and flag
FileDelete	Deletes a specified file
FileFlush	Writes to a disk all data remaining in the input/output file buffer
FileGetInteger	Gets an integer property of a file
FileIsEnding	Defines the end of a file in the process of reading
FileIsLineEnding	Defines the end of a line in a text file in the process of reading
FileClose	Closes a previously opened file
FileIsExist	Checks the existence of a file

Function	Action
FileCopy	Copies the original file from a local or shared folder to another file
FileMove	Moves or renames a file
FileReadArray	Reads arrays of any type except for string from the file of the BIN type
FileReadBool	Reads from the file of the CSV type a string from the current position till a delimiter (or till the end of a text line) and converts the read string to a value of bool type
FileReadDatetime	Reads from the file of the CSV type a string of one of the formats: "YYYY.MM.DD HH:MM:SS", "YYYY.MM.DD" or "HH:MM:SS" - and converts it into a datetime value
FileReadDouble	Reads a double value from the current position of the file pointer
FileReadFloat	Reads a float value from the current position of the file pointer
FileReadInteger	Reads int, short or char value from the current position of the file pointer
FileReadLong	Reads a long type value from the current position of the file pointer
FileReadNumber	Reads from the file of the CSV type a string from the current position till a delimiter (or till the end of a text line) and converts the read string into double value
FileReadString	Reads a string from the current position of a file pointer from a file
FileReadStruct	Reads the contents from a binary file into a structure passed as a parameter, from the current position of the file pointer
FileSeek	Moves the position of the file pointer by a specified number of bytes relative to the specified position
FileSize	Returns the size of a corresponding open file
FileTell	Returns the current position of the file pointer of a corresponding open file
FileWrite	Writes data to a file of CSV or TXT type
FileWriteArray	Writes arrays of any type except for string into a file of BIN type
FileWriteDouble	Writes value of the double type from the current position of a file pointer into a binary file
FileWriteFloat	Writes value of the float type from the current position of a file pointer into a binary file
FileWriteInteger	Writes value of the int type from the current position of a file pointer into a binary file
FileWriteLong	Writes value of the long type from the current position of a file pointer into a binary file

Function	Action
FileWriteString	Writes the value of a string parameter into a BIN or TXT file starting from the current position of the file pointer
FileWriteStruct	Writes the contents of a structure passed as a parameter into a binary file, starting from the current position of the file pointer
FileLoad	Reads all data of a specified binary file into a passed array of numeric types or simple structures
FileSave	Writes to a binary file all elements of an array passed as a parameter
FolderCreate	Creates a folder in the Files directory
FolderDelete	Removes a selected directory. If the folder is not empty, then it can't be removed
FolderClean	Deletes all files in the specified folder

FileSelectDialog

Create a file or folder opening/creation dialog.

```
int FileSelectDialog(  
    string  caption,           // window header  
    string  initial_dir,      // initial directory  
    string  filter,           // extension filter  
    uint    flags,            // combination of flags  
    string& filenames[],      // array with file names  
    string  default_filename  // default file name  
);
```

Parameters

caption

[in] Dialog window header.

initial_dir

[in] Initial directory name relative to MQL5\Files, the contents of which is to be displayed in the dialog box. If the value is [NULL](#), MQL5\Files is displayed in the dialog.

filter

[in] Extension filter of the files to be displayed in the selection dialog window. Files of other formats are hidden.

flags

[in] [Combination of flags](#) defining the dialog window mode. The flags are defined as follows:

FSD_WRITE_FILE - file open dialog;

FSD_SELECT_FOLDER - allow selection of folders only;

FSD_ALLOW_MULTISELECT - allow selection of multiple files;

FSD_FILE_MUST_EXIST - selected files should exist;

FSD_COMMON_FOLDER - file is located in the common folder of all client terminals
\\Terminal\Common\Files.

filenames[]

[out] Array of strings the names of selected files/folders are placed to.

default_filename

[in] Default file/folder name. If specified, a name is automatically added to the open dialog and returned in the *filenames[]* array when testing.

Return Value

In case of a successful completion, the function returns the number of selected files whose names can be obtained in *filenames[]*. If a user closes the dialog without selecting a file, the function returns 0. In case of unsuccessful execution, a value less than 0 is returned. The error code can be obtained using [GetLastError\(\)](#).

Note

For reasons of security, working with files is strictly controlled in MQL5 language. Files used in file operations by means of MQL5 language cannot be located outside the file sandbox (namely, outside the MQL5\Files directory).

The *initial_dir* name is searched in the client terminal's directory in MQL5\Files (or testing_agent_directory\MQL5\Files in case of testing). If FSD_COMMON_FOLDER is set among the flags, the search for the initial directory is performed in the common folder of all client terminals \Terminal\Common\Files.

The *filter* parameter indicates valid files and should be set in the "<description 1>|<extension 1>|<description 2>|<extension 2>..." format, for example, "Text files (*.txt)|*.txt|All files (*.*)|*.*". The first extension "Text files (*.txt)|*.txt" is selected as a default file type.

If *filter*=NULL, the mask of file selection in the dialog window is "All Files (*.*)|*.*|"

If the *default_filename* parameter is set, calling [FileSelectDialog\(\)](#) returns 1, while the *default_filename* value itself is copied to the *filenames[]* array during the non-visualized testing.

The function cannot be used in custom indicators since calling [FileSelectDialog\(\)](#) suspends the [thread of execution](#) for the whole time while waiting for the user's response. Since all indicators for each symbol are executed in a single thread, such suspension makes the operation of all charts on all timeframes for this symbol impossible.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- get the names of text files for downloading from the common folder of the client
string filenames[];
if(FileSelectDialog("Select files to download", NULL,
                    "Text files (*.txt)|*.txt|All files (*.*)|*.*",
                    FSD_ALLOW_MULTISELECT|FSD_COMMON_FOLDER, filenames, "data.txt"))
{
//--- display the name of each selected file
int total=ArraySize(filenames);
for(int i=0; i<total; i++)
    Print(i, ": ", filenames[i]);
}
else
{
    Print("Files not selected");
}
//---
}
```

See also

[FileOpen](#), [FilesExist](#), [FileDelete](#), [FileMove](#), [FolderCreate](#), [FolderDelete](#), [FolderClean](#), [Flags of opening files](#)

FileFindFirst

The function starts the search of files or subdirectories in a directory in accordance with the specified filter.

```
long FileFindFirst(  
    const string    file_filter,           // String - search filter  
    string&         returned_filename,     // Name of the file or subdirectory found  
    int             common_flag=0         // Defines the search  
);
```

Parameters

file_filter

[in] Search filter. A subdirectory (or sequence of nested subdirectories) relative to the \Files directory, in which files should be searched for, can be specified in the filter.

returned_filename

[out] The returned parameter, where, in case of success, the name of the first found file or subdirectory is placed. Only the file name is returned (including the extension), the directories and subdirectories are not included no matter if they are specified or not in the search filter.

common_flag

[in] [Flag](#) determining the location of the file. If common_flag = FILE_COMMON, then the file is located in a shared folder for all client terminals \Terminal\Common\Files. Otherwise, the file is located in a local folder.

Return Value

Returns handle of the object searched, which should be used for further sorting of files and subdirectories by the [FileFindNext\(\)](#) function, or [INVALID_HANDLE](#) when there is no file and subdirectory corresponding to the filter (in the particular case - when the directory is empty). After searching, the handle must be closed using the [FileFindClose\(\)](#) function.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

Example:

```

//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- filter
input string InpFilter="Dir1\\*";
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    string file_name;
    string int_dir="";
    int i=1,pos=0,last_pos=-1;
//--- search for the last backslash
    while(!IsStopped())
    {
        pos=StringFind(InpFilter,"\\",pos+1);
        if(pos>=0)
            last_pos=pos;
        else
            break;
    }
//--- the filter contains the folder name
    if(last_pos>=0)
        int_dir=StringSubstr(InpFilter,0,last_pos+1);
//--- get the search handle in the root of the local folder
    long search_handle=FileFindFirst(InpFilter,file_name);
//--- check if the FileFindFirst() is executed successfully
    if(search_handle!=INVALID_HANDLE)
    {
        //--- in a loop, check if the passed strings are the names of files or directories
        do
        {
            ResetLastError();
            //--- if it's a file, the function returns true, and if it's a directory, it
            FileIsExist(int_dir+file_name);
            PrintFormat("%d : %s name = %s",i,GetLastError()==ERR_FILE_IS_DIRECTORY ? "D":
            i++;
        }
        while(FileFindNext(search_handle,file_name));
        //--- close the search handle
        FileFindClose(search_handle);
    }
    else
        Print("Files not found!");
}

```

See also

[FileFindNext](#), [FileFindClose](#)

FileFindNext

The function continues the search started by [FileFindFirst\(\)](#).

```
bool FileFindNext (
    long      search_handle,          // Search handle
    string&    returned_filename      // Name of the file or subdirectory found
);
```

Parameters

search_handle

[in] Search handle, retrieved by [FileFindFirst\(\)](#).

returned_filename

[out] The name of the next file or subdirectory found. Only the file name is returned (including the extension), the directories and subdirectories are not included no matter if they are specified or not in the search filter.

Return Value

If successful returns true, otherwise false.

Example:

```
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- filter
input string InpFilter="*";
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    string file_name;
    int i=1;
    //--- receive search handle in local folder's root
    long search_handle=FileFindFirst(InpFilter,file_name);
    //--- check if FileFindFirst() function executed successfully
    if(search_handle!=INVALID_HANDLE)
    {
        //--- check if the passed strings are file or directory names in the loop
        do
        {
            ResetLastError();
            //--- if this is a file, the function will return true, if it is a directory,
            FileIsExist(file_name);
            PrintFormat("%d : %s name = %s",i,GetLastError()==ERR_FILE_IS_DIRECTORY ? "D":
            i++;
        }
        while(FileFindNext(search_handle,file_name));
```

```
//--- close search handle
FileFindClose(search_handle);
}
else
    Print("Files not found!");
}
```

See also

[FileFindFirst](#), [FileFindClose](#)

FileFindClose

The function closes the search handle.

```
void FileFindClose(  
    long search_handle    // Search handle  
);
```

Parameters

search_handle

[in] Search handle, retrieved by [FileFindFirst\(\)](#).

Return Value

No value returned.

Note

Function must be called to free up system resources.

Example:

```
/*--- display the window of input parameters when launching the script  
#property script_show_inputs  
/*--- filter  
input string InpFilter="*";  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    string file_name;  
    int i=1;  
    /*--- receive search handle in local folder's root  
    long search_handle=FileFindFirst(InpFilter,file_name);  
    /*--- check if FileFindFirst() function executed successfully  
    if(search_handle!=INVALID_HANDLE)  
    {  
        /*--- check if the passed strings are file or directory names in the loop  
        do  
        {  
            ResetLastError();  
            /*--- if this is a file, the function will return true, if it is a directory,  
            FileIsExist(file_name);  
            PrintFormat("%d : %s name = %s",i,GetLastError()==5018 ? "Directory" : "File"  
            i++;  
        }  
        while(FileFindNext(search_handle,file_name));  
        /*--- close search handle  
        FileFindClose(search_handle);  
    }  
}
```

```
else  
    Print("Files not found!");  
}
```

See also

[FileFindFirst](#), [FileFindNext](#)

FileIsExist

Checks the existence of a file.

```
bool FileIsExist(  
    const string file_name,      // File name  
    int common_flag=0           // Search area  
);
```

Parameters

file_name

[in] The name of the file being checked

common_flag=0

[in] [Flag](#) determining the location of the file. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals `\Terminal\Common\Files`. Otherwise, the file is located in a local folder.

Return Value

Returns true, if the specified file exists.

Note

Checked file can turn out to be a subdirectory. In this case, `FileIsExist()` function will return false, while error 5018 will be logged in `_LastError` variable - "This is a directory, not a file" (see example for [FileFindFirst](#) function).

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If `common_flag = FILE_COMMON`, then the function looks for the file in a shared folder for all client terminals `\Terminal\Common\Files`, otherwise the function looks for a file in a local folder (`MQL5\Files` or `MQL5\Tester\Files` in the case of testing).

Example:

```
//--- show the window of input parameters when launching the script  
#property script_show_inputs  
//--- date for old files  
input datetime InpFilesDate=D'2013.01.01 00:00';  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    string file_name;      // variable for storing file names  
    string filter="*.txt"; // filter for searching the files  
    datetime create_date;  // file creation date  
    string files[];        // list of file names  
    int def_size=25;       // array size by default  
    int size=0;            // number of files
```

```
//--- allocate memory for the array
ArrayResize(files,def_size);
//--- receive the search handle in the local folder's root
long search_handle=FileFindFirst(filter,file_name);
//--- check if FileFindFirst() executed successfully
if(search_handle!=INVALID_HANDLE)
{
    //--- searching files in the loop
    do
    {
        files[size]=file_name;
        //--- increase the array size
        size++;
        if(size==def_size)
        {
            def_size+=25;
            ArrayResize(files,def_size);
        }
        //--- reset the error value
        ResetLastError();
        //--- receive the file creation date
        create_date=(datetime)FileGetInteger(file_name,FILE_CREATE_DATE,false);
        //--- check if the file is old
        if(create_date<InpFilesDate)
        {
            PrintFormat("%s file deleted!",file_name);
            //--- delete the old file
            FileDelete(file_name);
        }
    }
    while(FileFindNext(search_handle,file_name));
    //--- close the search handle
    FileFindClose(search_handle);
}
else
{
    Print("Files not found!");
    return;
}
//--- check what files have remained
PrintFormat("Results:");
for(int i=0;i<size;i++)
{
    if(FileIsExist(files[i]))
        PrintFormat("%s file exists!",files[i]);
    else
        PrintFormat("%s file deleted!",files[i]);
}
}
```

[FileFindFirst](#)

FileOpen

The function opens the file with the specified name and flag.

```
int FileOpen(  
    string file_name,           // File name  
    int open_flags,            // Combination of flags  
    short delimiter='\t',      // Delimiter  
    uint codepage=CP_ACP      // Code page  
);
```

Parameters

file_name

[in] The name of the file can contain subfolders. If the file is opened for writing, these subfolders will be created if there are no such ones.

open_flags

[in] [combination of flags](#) determining the operation mode for the file. The flags are defined as follows:

FILE_READ file is opened for reading

FILE_WRITE file is opened for writing

FILE_BIN binary read-write mode (no conversion from a string and to a string)

FILE_CSV file of csv type (all recorded items are converted to the strings of unicode or ansi type, and are separated by a delimiter)

FILE_TXT a simple text file (the same as csv, but the delimiter is not taken into account)

FILE_ANSI lines of ANSI type (single-byte symbols)

FILE_UNICODE lines of UNICODE type (double-byte characters)

FILE_SHARE_READ shared reading from several programs

FILE_SHARE_WRITE shared writing from several programs

FILE_COMMON location of the file in a shared folder for all client terminals
\\Terminal\\Common\\Files

delimiter='\t'

[in] value to be used as a separator in txt or csv-file. If the csv-file delimiter is not specified, it defaults to a tab. If the txt-file delimiter is not specified, then no separator is used. If the separator is clearly set to 0, then no separator is used.

codepage=CP_ACP

[in] The value of the code page. For the most-used [code pages](#) provide appropriate constants.

Return Value

If a file has been opened successfully, the function returns the file handle, which is then used to access the file data. In case of failure returns [INVALID_HANDLE](#).

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

Make sure to set the FILE_ANSI flag if the file should be read in a specific encoding (the codepage parameter with [a code page](#) value is specified). If there is no specified FILE_ANSI flag, the text file is read in Unicode without any conversion.

The file is opened in the folder of the client terminal in the subfolder MQL5\files (or testing_agent_directory\MQL5\files in case of testing). If FILE_COMMON is specified among flags, the file is opened in a shared folder for all MetaTrader 5 client terminals.

"Named pipes" can be opened according to the following rules:

- Pipe name is a string, which should have the following look: "\\servername\pipe\pipename", where servername - server name in the network, while pipename is a pipe name. If the pipes are used on the same computer, the server name can be omitted but a point should be inserted instead of it: "\\.\pipe\pipename". A client trying to connect the pipe should know its name.
- [FileFlush\(\)](#) and [FileSeek\(\)](#) should be called to the beginning of a file between sequential operations of reading from the pipe and writing to it.

A special symbol '\\' is used in shown strings. Therefore, '\\' should be doubled when writing a name in MQL5 application. It means that the above example should have the following look in the code: "\\.\servername\pipe\pipename".

More information about working with named pipes can be found in the article "[Communicating With MetaTrader 5 Using Named Pipes Without Using DLLs](#)".

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- incorrect file opening method
    string terminal_data_path=TerminalInfoString(TERMINAL_DATA_PATH);
    string filename=terminal_data_path+"\\MQL5\\Files\\"+"fractals.csv";
    int filehandle=FileOpen(filename,FILE_WRITE|FILE_CSV);
    if(filehandle<0)
    {
        Print("Failed to open the file by the absolute path ");
        Print("Error code ",GetLastError());
    }

//--- correct way of working in the "file sandbox"
    ResetLastError();
    filehandle=FileOpen("fractals.csv",FILE_WRITE|FILE_CSV);
    if(filehandle!=INVALID_HANDLE)
    {
        FileWrite(filehandle,TimeCurrent(),Symbol(), EnumToString(_Period));
        FileClose(filehandle);
        Print("FileOpen OK");
    }
    else Print("Operation FileOpen failed, error ",GetLastError());
//--- another example with the creation of an enclosed directory in MQL5\Files\
```

```
string subfolder="Research";
filehandle=FileOpen(subfolder+"\\fractals.txt",FILE_WRITE|FILE_CSV);
if(filehandle!=INVALID_HANDLE)
{
    FileWrite(filehandle,TimeCurrent(),Symbol(),EnumToString(_Period));
    FileClose(filehandle);
    Print("The file must be created in the folder "+terminal_data_path+"\\ "+subfolder);
}
else Print("File open failed, error ",GetLastError());
}
```

[Use of a Codepage](#), [FileFindFirst](#), [FolderCreate](#), [File opening flags](#)

FileClose

Close the file previously opened by [FileOpen\(\)](#).

```
void FileClose(  
    int file_handle    // File handle  
);
```

Parameters

file_handle

[in] File descriptor returned by FileOpen().

Return Value

No value returned.

Example:

```
//--- show the window of input parameters when launching the script  
#property script_show_inputs  
//--- input parameters  
input string InpFileName="file.txt";    // file name  
input string InpDirectoryName="Data";    // directory name  
input int    InpEncodingType=FILE_ANSI; // ANSI=32 or UNICODE=64  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    //--- print the path to the file we are going to use  
    PrintFormat("Working %s\\Files\\ folder",TerminalInfoString(TERMINAL_DATA_PATH));  
    //--- reset the error value  
    ResetLastError();  
    //--- open the file for reading (if the file does not exist, the error will occur)  
    int file_handle=FileOpen(InpDirectoryName+"\\ "+InpFileName,FILE_READ|FILE_TXT|InpEn  
    if(file_handle!=INVALID_HANDLE)  
    {  
        //--- print the file contents  
        while(!FileIsEnding(file_handle))  
            Print(FileReadString(file_handle));  
        //--- close the file  
        FileClose(file_handle);  
    }  
    else  
        PrintFormat("Error, code = %d",GetLastError());  
}
```

FileCopy

The function copies the original file from a local or shared folder to another file.

```
bool FileCopy(
    const string src_file_name,    // Name of a source file
    int         common_flag,      // Location
    const string dst_file_name,    // Name of the destination file
    int         mode_flags        // Access mode
);
```

Parameters

src_file_name

[in] File name to copy.

common_flag

[in] [Flag](#) determining the location of the file. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals `\Terminal\Common\Files`. Otherwise, the file is located in a local folder (for example, `common_flag=0`).

dst_file_name

[in] Result file name.

mode_flags

[in] [Access flags](#). The parameter can contain only 2 flags: `FILE_REWRITE` and/or `FILE_COMMON` - other flags are ignored. If the file already exists, and the `FILE_REWRITE` flag hasn't been specified, then the file will not be rewritten, and the function will return false.

Return Value

In case of failure the function returns false.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If the new file already exists, the copy will be made depending on the availability of the `FILE_REWRITE` flag in the `mode_flags` parameter.

Example:

```
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- input parameters
input string InpSrc="source.txt";      // source
input string InpDst="destination.txt"; // copy
input int    InpEncodingType=FILE_ANSI; // ANSI=32 or UNICODE=64
//+-----+
//| Script program start function |
//+-----+
void OnStart()
```

```

{
//--- display the source contents (it must exist)
if(!FileDisplay(InpSrc))
    return;
//--- check if the copy file already exists (may not be created)
if(!FileDisplay(InpDst))
{
    //--- the copy file does not exist, copying without FILE_REWRITE flag (correct c
    if(FileCopy(InpSrc,0,InpDst,0))
        Print("File is copied!");
    else
        Print("File is not copied!");
}
else
{
    //--- the copy file already exists, try to copy without FILE_REWRITE flag (inco
    if(FileCopy(InpSrc,0,InpDst,0))
        Print("File is copied!");
    else
        Print("File is not copied!");
    //--- InpDst file's contents remains the same
    FileDisplay(InpDst);
    //--- copy once more with FILE_REWRITE flag (correct copying if the file exists)
    if(FileCopy(InpSrc,0,InpDst,FILE_REWRITE))
        Print("File is copied!");
    else
        Print("File is not copied!");
}
//--- receive InpSrc file copy
FileDisplay(InpDst);
}
//+-----+
//| Read the file contents |
//+-----+
bool FileDisplay(const string file_name)
{
//--- reset the error value
ResetLastError();
//--- open the file
int file_handle=FileOpen(file_name,FILE_READ|FILE_TXT|InpEncodingType);
if(file_handle!=INVALID_HANDLE)
{
    //--- display the file contents in the loop
    Print("+-----+");
    PrintFormat("File name = %s",file_name);
    while(!FileIsEnding(file_handle))
        Print(FileReadString(file_handle));
    Print("+-----+");
    //--- close the file

```

```
        FileClose(file_handle);  
        return(true);  
    }  
    ///--- failed to open the file  
    PrintFormat("%s is not opened, error = %d",file_name,GetLastError());  
    return(false);  
}
```

FileDelete

Deletes the specified file in a local folder of the client terminal.

```
bool FileDelete(  
    const string file_name,      // File name to delete  
    int         common_flag=0    // Location of the file to delete  
);
```

Parameters

file_name

[in] File name.

common_flag=0

[in] [Flag](#) determining the file location. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals `\Terminal\Common\Files`. Otherwise, the file is located in a local folder.

Return Value

In case of failure the function returns false.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

Deletes the specified file from a local folder of the client terminal (`MQL5\Files` or `MQL5\Tester\Files` in case of testing). If `common_flag = FILE_COMMON`, then the function removes the file from the shared folder for all client terminals `\Terminal\Common\Files`.

Example:

```
//--- show the window of input parameters when launching the script  
#property script_show_inputs  
//--- date for old files  
input datetime InpFilesDate=D'2013.01.01 00:00';  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    string file_name;      // variable for storing file names  
    string filter="*.txt"; // filter for searching the files  
    datetime create_date;  // file creation date  
    string files[];        // list of file names  
    int def_size=25;       // array size by default  
    int size=0;            // number of files  
    //--- allocate memory for the array  
    ArrayResize(files,def_size);  
    //--- receive the search handle in the local folder's root  
    long search_handle=FileFindFirst(filter,file_name);
```

```
//--- check if FileFindFirst() executed successfully
if(search_handle!=INVALID_HANDLE)
{
    //--- searching files in the loop
    do
    {
        files[size]=file_name;
        //--- increase the array size
        size++;
        if(size==def_size)
        {
            def_size+=25;
            ArrayResize(files,def_size);
        }
        //--- reset the error value
        ResetLastError();
        //--- receive the file creation date
        create_date=(datetime)FileGetInteger(file_name,FILE_CREATE_DATE,false);
        //--- check if the file is old
        if(create_date<InpFilesDate)
        {
            PrintFormat("%s file deleted!",file_name);
            //--- delete the old file
            FileDelete(file_name);
        }
    }
    while(FileFindNext(search_handle,file_name));
    //--- close the search handle
    FileFindClose(search_handle);
}
else
{
    Print("Files not found!");
    return;
}
//--- check what files have remained
PrintFormat("Results:");
for(int i=0;i<size;i++)
{
    if(FileIsExist(files[i]))
        PrintFormat("%s file exists!",files[i]);
    else
        PrintFormat("%s file deleted!",files[i]);
}
}
```

FileMove

Moves a file from a local or shared folder to another folder.

```
bool FileMove(  
    const string src_file_name,    // File name for the move operation  
    int common_flag,              // Location  
    const string dst_file_name,    // Name of the destination file  
    int mode_flags                 // Access mode  
);
```

Parameters

src_file_name

[in] File name to move/rename.

common_flag

[in] [Flag](#) determining the location of the file. If `common_flag = FILE_COMMON`, then the file is located in a shared folder for all client terminals `\Terminal\Common\Files`. Otherwise, the file is located in a local folder (`common_flag=0`).

dst_file_name

[in] File name after operation

mode_flags

[in] [Access flags](#). The parameter can contain only 2 flags: `FILE_REWRITE` and/or `FILE_COMMON` - other flags are ignored. If the file already exists and the `FILE_REWRITE` flag isn't specified, the file will not be rewritten, and the function will return false.

Return Value

In case of failure the function returns false.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If the new file already exists, the copy will be made depending on the availability of the `FILE_REWRITE` flag in the `mode_flags` parameter.

Example:

```
//--- display the window of input parameters when launching the script  
#property script_show_inputs  
//--- input parameters  
input string InpSrcName="data.txt";  
input string InpDstName="newdata.txt";  
input string InpSrcDirectory="SomeFolder";  
input string InpDstDirectory="OtherFolder";  
//+-----+  
//| Script program start function |  
//+-----+
```

```

void OnStart()
{
    string local=TerminalInfoString(TERMINAL_DATA_PATH);
    string common=TerminalInfoString(TERMINAL_COMMONDATA_PATH);
    //-- receive file paths
    string src_path;
    string dst_path;
    StringConcatenate(src_path,InpSrcDirectory,"/",InpSrcName);
    StringConcatenate(dst_path,InpDstDirectory,"/",InpDstName);
    //-- check if the source file exists (if not - exit)
    if(FileIsExist(src_path))
        PrintFormat("%s file exists in the %s\\Files\\%s folder",InpSrcName,local,InpSrcName);
    else
    {
        PrintFormat("Error, %s source file not found",InpSrcName);
        return;
    }
    //-- check if the result file already exists
    if(FileIsExist(dst_path,FILE_COMMON))
    {
        PrintFormat("%s file exists in the %s\\Files\\%s folder",InpDstName,common,InpDstName);
        //-- file exists, moving should be performed with FILE_REWRITE flag
        ResetLastError();
        if(FileMove(src_path,0,dst_path,FILE_COMMON|FILE_REWRITE))
            PrintFormat("%s file moved",InpSrcName);
        else
            PrintFormat("Error! Code = %d",GetLastError());
    }
    else
    {
        PrintFormat("%s file does not exist in the %s\\Files\\%s folder",InpDstName,common,InpDstName);
        //-- the file does not exist, moving should be performed without FILE_REWRITE flag
        ResetLastError();
        if(FileMove(src_path,0,dst_path,FILE_COMMON))
            PrintFormat("%s file moved",InpSrcName);
        else
            PrintFormat("Error! Code = %d",GetLastError());
    }
    //-- the file is moved; let's check it out
    if(FileIsExist(dst_path,FILE_COMMON) && !FileIsExist(src_path,0))
        Print("Success!");
    else
        Print("Error!");
}

```

See also

[FileIsExist](#)

FileFlush

Writes to a disk all data remaining in the input/output file buffer.

```
void FileFlush(
    int file_handle    // File handle
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

No value returned.

Note

When writing to a file, the data may be actually found there only after some time. To save the data in the file instantly, use FileFlush() function. If the function is not used, part of the data that has not been stored in the disk yet, will be forcibly written there only when the file is closed using FileClose() function.

The function should be used when written data is of a certain value. It should be kept in mind that frequent function call may affect the program operation speed.

Function FileFlush () must be called between the operations of reading from a file and writing to it.

Example:

```
//--- show the window of input parameters when launching the script
#property script_show_inputs
//--- file name for writing
input string InpFileName="example.csv"; // file name
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- reset error value
    ResetLastError();
    //--- open the file
    int file_handle=FileOpen(InpFileName,FILE_READ|FILE_WRITE|FILE_CSV);
    if(file_handle!=INVALID_HANDLE)
    {
        //--- write data to the file
        for(int i=0;i<1000;i++)
        {
            //--- call write function
            FileWrite(file_handle,TimeCurrent(),SymbolInfoDouble(Symbol(),SYMBOL_BID),Sym
            //--- save data on the disk at each 128th iteration
            if((i & 127)==127)
```

```
    {
        //--- now, data will be located in the file and will not be lost in case of
        FileFlush(file_handle);
        PrintFormat("i = %d, OK",i);
    }
    //--- 0.01 second pause
    Sleep(10);
}
//--- close the file
FileClose(file_handle);
}
else
    PrintFormat("Error, code = %d", GetLastError());
}
```

See also[FileClose](#)

FileGetInteger

Gets an integer property of a file. There are two variants of the function.

1. Get a property by the handle of a file.

```
long FileGetInteger(  
    int file_handle, // File handle  
    ENUM_FILE_PROPERTY_INTEGER property_id // Property ID  
);
```

2. Get a property by the file name.

```
long FileGetInteger(  
    const string file_name, // File name  
    ENUM_FILE_PROPERTY_INTEGER property_id, // Property ID  
    bool common_folder=false // The file is viewed in a local  
); // or a common folder of all terminals
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

file_name

[in] File name.

property_id

[in] File property ID. The value can be one of the values of the [ENUM_FILE_PROPERTY_INTEGER](#) enumeration. If the second variant of the function is used, you can receive only the values of the [following properties](#): FILE_EXISTS, FILE_CREATE_DATE, FILE_MODIFY_DATE, FILE_ACCESS_DATE and FILE_SIZE.

common_folder=false

[in] Points to the file location. If the parameter is false, terminal data folder is viewed. Otherwise it is assumed that the file is in the shared folder of all terminals \Terminal\Common\Files ([FILE_COMMON](#)).

Return Value

The value of the property. In case of an error, -1 is returned. To get an error code use the [GetLastError\(\)](#) function.

If a folder is specified when getting properties by the name, the function will have error 5018 (ERR_MQL_FILE_IS_DIRECTORY) in any case, though the return value will be correct.

Note

The function always changes the error code. In case of successful completion the error code is reset to NULL.

Example:

```
//--- display the window of input parameters when launching the script
```

```

#property script_show_inputs
//--- input parameters
input string InpFileName="data.csv";
input string InpDirectoryName="SomeFolder";
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    string path=InpDirectoryName+"//"+InpFileName;
    long l=0;
//--- open the file
    ResetLastError();
    int handle=FileOpen(path,FILE_READ|FILE_CSV);
    if(handle!=INVALID_HANDLE)
    {
        //--- print all information about the file
        Print(InpFileName," file info:");
        FileInfo(handle,FILE_EXISTS,l,"bool");
        FileInfo(handle,FILE_CREATE_DATE,l,"date");
        FileInfo(handle,FILE_MODIFY_DATE,l,"date");
        FileInfo(handle,FILE_ACCESS_DATE,l,"date");
        FileInfo(handle,FILE_SIZE,l,"other");

[File Operations](#), [File Properties](#)

FileIsEnding

Defines the end of a file in the process of reading.

```
bool FileIsEnding(
    int file_handle    // File handle
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

The function returns true if the file end has been reached in the process of reading or moving of the file pointer.

Note

To define the end of the file, the function tries to read the next string from it. If the string does not exist, the function returns true, otherwise it returns false.

Example:

```
/*--- show the window of input parameters when launching the script
#property script_show_inputs
/*--- input parameters
input string InpFileName="file.txt";    // file name
input string InpDirectoryName="Data";    // directory name
input int    InpEncodingType=FILE_ANSI; // ANSI=32 or UNICODE=64
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    /*--- print the path to the file we are going to use
    PrintFormat("Working %s\\Files\\ folder",TerminalInfoString(TERMINAL_DATA_PATH));
    /*--- reset the error value
    ResetLastError();
    /*--- open the file for reading (if the file does not exist, the error will occur)
    int file_handle=FileOpen(InpDirectoryName+"\\\\"+InpFileName,FILE_READ|FILE_TXT|InpEn
    if(file_handle!=INVALID_HANDLE)
    {
        /*--- print the file contents
        while(!FileIsEnding(file_handle))
            Print(FileReadString(file_handle));
        /*--- close the file
        FileClose(file_handle);
    }
    else
        PrintFormat("Error, code = %d",GetLastError());
```

```
}
```

FileIsLineEnding

Defines the line end in a text file in the process of reading.

```
bool FileIsLineEnding(
    int file_handle    // File handle
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

Returns true if in the process of reading txt or csv-file reached the end of the line (the characters CR-LF).

Example (the file obtained during the execution of an example for [FileWriteString](#) function is used here)

}
```

See also[FileWriteString](#)

FileReadArray

Reads from a file of BIN type arrays of any type except string (may be an array of structures, not containing strings, and dynamic arrays).

```
uint FileReadArray(
    int    file_handle,           // File handle
    void&  array[],              // Array to record
    int    start=0,              // start array position to write
    int    count=WHOLE_ARRAY     // count to read
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

array[]

[out] An array where the data will be loaded.

start=0

[in] Start position to read from the array.

count=WHOLE_ARRAY

[in] Number of elements to read. By default, reads the entire array (count=[WHOLE_ARRAY](#)).

Return Value

Number of elements read.

Note

String array can be read only from the file of TXT type. If necessary, the function tries to increase the size of the array.

Example (the file obtained after execution of the example for [FileWriteArray](#) function is used here)

```
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- input parameters
input string InpFileName="data.bin";
input string InpDirectoryName="SomeFolder";
//+-----+
//| Structure for storing price data |
//+-----+
struct prices
{
    datetime    date; // date
    double      bid;  // bid price
    double      ask;  // ask price
};
//+-----+
//| Script program start function |
```

```
//+-----+
void OnStart()
{
//--- structure array
    prices arr[];
//--- file path
    string path=InpDirectoryName+"//"+InpFileName;
//--- open the file
    ResetLastError();
    int file_handle=FileOpen(path,FILE_READ|FILE_BIN);
    if(file_handle!=INVALID_HANDLE)
    {
        //--- read all data from the file to the array
        FileReadArray(file_handle,arr);
        //--- receive the array size
        int size=ArraySize(arr);
        //--- print data from the array
        for(int i=0;i<size;i++)
            Print("Date = ",arr[i].date," Bid = ",arr[i].bid," Ask = ",arr[i].ask);
        Print("Total data = ",size);
        //--- close the file
        FileClose(file_handle);
    }
    else
        Print("File open failed, error ",GetLastError());
}
```

See also

[Variables](#), [FileWriteArray](#)

FileReadBool

Reads from the file of CSV type string from the current position to a delimiter (or till the end of the text line) and converts the read string to a bool type value.

```
bool FileReadBool(
    int file_handle // File handle
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

Line read may be set to "true", "false" or the symbolic representation of integers "0" or "1". A nonzero value is converted to a logical true. The function returns the converted value.

Example (the file obtained after executing the example for [FileWrite](#) function is used here)

FileReadDatetime

Reads from the file of CSV type a string of one of the formats: "YYYY.MM.DD HH:MI:SS", "YYYY.MM.DD" or "HH:MI:SS" - and converts it into a value of datetime type.

```
datetime FileReadDatetime(
    int file_handle // File handle
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

The value of datetime type.

Example (the file obtained after executing the example for [FileWrite](#) function is used here)

FileReadDouble

Reads a double-precision floating point number (double) from the current position of the binary file.

```
double FileReadDouble(
    int file_handle // File handle
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

The value of double type.

Note

For more details about the error, call [GetLastError\(\)](#).

[Real types \(double, float\)](#), [FileReadDouble](#), [FileWriteFloat](#)

FileReadInteger

The function reads int, short or char value from the current position of the file pointer depending on the length specified in bytes.

```
int FileReadInteger(
    int file_handle,      // File handle
    int size=INT_VALUE    // Size of an integer in bytes
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

size=INT_VALUE

[in] Number of bytes (up to 4 inclusive) that should be read. The corresponding constants are provided: CHAR_VALUE = 1, SHORT_VALUE = 2 and INT_VALUE = 4, so the function can read the whole value of char, short or int type.

Return Value

A value of the int type. The result of this function must be explicitly cast to a target type, i.e. to the type of data that you need to read. Since a value of the int type is returned, it can be easily converted to any integer value. The file pointer is shifted by the number of bytes read.

Note

When reading less than 4 bytes, the received result is always positive. If one or two bytes are read, the sign of the number can be determined by explicit casting to type char (1 byte) or short (2 bytes). Getting the sign for a three-byte number is not trivial, since there is no corresponding [underlying type](#).

Example (the file obtained after executing the example for [FileWriteInteger](#) function is used here)

[Integer types](#), [FileReadInteger](#), [FileWriteLong](#)

FileReadNumber

The function reads from the CSV file a string from the current position till a separator (or till the end of a text string) and converts the read string to a value of double type.

```
double FileReadNumber(
    int file_handle // File handle
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

The value of double type.

Example (the file obtained during the execution of an example for [FileWriteString](#) function is used here)

```

}
```

See also[FileWriteString](#)

FileReadString

The function reads a string from the current position of a file pointer in a file.

```
string FileReadString(
    int file_handle,      // File handle
    int length=-1         // Length of the string
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

length=-1

[in] Number of characters to read.

Return Value

Line read (string).

Note

When reading from a bin-file. the length of a string to read must be specified. When reading from a txt-file the string length is not required, and the string will be read from the current position to the line feed character "\r\n". When reading from a csv-file, the string length isn't required also, the string will be read from the current position till the nearest delimiter or till the text string end character.

If the file is opened with FILE_ANSI [flag](#), then the line read is converted to Unicode.

Example (the file obtained after executing the example for [FileWriteInteger](#) function is used here)

```
//--- display the window of input parameters when launching the script
#property script_show_inputs
//--- parameters for data reading
input string InpFileName="Trend.bin"; // file name
input string InpDirectoryName="Data"; // directory name
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    //--- open the file
    ResetLastError();
    int file_handle=FileOpen(InpDirectoryName+"\\ "+InpFileName,FILE_READ|FILE_BIN|FILE_
    if(file_handle!=INVALID_HANDLE)
    {
        PrintFormat("%s file is available for reading",InpFileName);
        PrintFormat("File path: %s\\Files\\",TerminalInfoString(TERMINAL_DATA_PATH));
        //--- additional variables
        int str_size;
        string str;
```

```
//--- read data from the file
while(!FileIsEnding(file_handle))
{
    //--- find out how many symbols are used for writing the time
    str_size=FileReadInteger(file_handle,INT_VALUE);
    //--- read the string
    str=FileReadString(file_handle,str_size);
    //--- print the string
    PrintFormat(str);
}
//--- close the file
FileClose(file_handle);
PrintFormat("Data is read, %s file is closed",InpFileName);
}
else
    PrintFormat("Failed to open %s file, Error code = %d",InpFileName,GetLastError())
}
```

See also

[String Type](#), [Conversion Functions](#), [FileWriteInteger](#)

FileReadStruct

The function reads contents into a structure passed as a parameter from a binary-file, starting with the current position of the file pointer.

```
uint FileReadStruct(
    int          file_handle,          // file handle
    const void&  struct_object,       // target structure to which the contents are read
    int          size=-1               // structure size in bytes
);
```

Parameters

file_handle

[in] File descriptor of an open bin-file.

struct_object

[out] The object of this structure. The structure should not contain strings, [dynamic arrays](#) or [virtual functions](#).

size=-1

[in] Number of bytes that should be read. If size is not specified or the indicated value is greater than the size of the structure, the exact size of the specified structure is used.

Return Value

If successful the function returns the number of bytes read. File pointer is moved by the same number of bytes.

Example (the file obtained after using the example for [FileWriteStruct](#) function is used here)

[Structures and classes](#), [FileWriteStruct](#)

FileSeek

The function moves the position of the file pointer by a specified number of bytes relative to the specified position.

```
bool FileSeek(
    int          file_handle,    // File handle
    long         offset,        // In bytes
    ENUM_FILE_POSITION origin    // Position for reference
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

offset

[in] The shift in bytes (may take a negative value).

origin

[in] The starting point for the displacement. Can be one of values of [ENUM_FILE_POSITION](#).

Return Value

If successful the function returns true, otherwise false. To obtain information about the [error](#) call the [GetLastError\(\)](#) function.

Note

If the execution of the FileSeek() function results in a negative shift (going beyond the "level boundary" of the file), the file pointer will be set to the file beginning.

If a position is set beyond the "right boundary" of the file (larger than the file size), the next writing to the file will be performed not from the end of the file, but from the position set. In this case indefinite values will be written for the previous file end and the position set.

Example:

```

    }
    else
        break; // end of the file, exit
}
//--- define the actual size of the array
ArrayResize(arr,i);
}
```

FileSize

The function returns the file size in bytes.

```
ulong FileSize(  
    int file_handle    // File handle  
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

The value of type int.

Note

To obtain information about the [error](#) call [GetLastError\(\)](#).

Example:

```
///--- show the window of input parameters when launching the script  
#property script_show_inputs  
///--- input parameters  
input ulong InpThresholdSize=20;      // file threshold size in kilobytes  
input string InpBigFolderName="big";  // folder for large files  
input string InpSmallFolderName="small"; // folder for small files  
//+-----+  
//| Script program start function |  
//+-----+  
void OnStart()  
{  
    string file_name;    // variable for storing file names  
    string filter="*.csv"; // filter for searching the files  
    ulong file_size=0;   // file size in bytes  
    int size=0;          // number of files  
    ///--- print the path to the file we are going to work with  
    PrintFormat("Working in %s\\Files\\ folder",TerminalInfoString(TERMINAL_COMMONDATA_  
    ///--- receive the search handle in common folder's root of all terminals  
    long search_handle=FileFindFirst(filter,file_name,FILE_COMMON);  
    ///--- check if FileFindFirst() has been executed successfully  
    if(search_handle!=INVALID_HANDLE)  
    {  
        ///--- move files in the loop according to their size  
        do  
        {  
            ///--- open the file  
            ResetLastError();  
            int file_handle=FileOpen(file_name,FILE_READ|FILE_CSV|FILE_COMMON);  
            if(file_handle!=INVALID_HANDLE)
```

```
{
    //--- receive the file size
    file_size=FileSize(file_handle);
    //--- close the file
    FileClose(file_handle);
}
else
{
    PrintFormat("Failed to open %s file, Error code = %d",file_name,GetLastError());
    continue;
}
//--- print the file size
PrintFormat("Size of %s file is equal to %d bytes",file_name,file_size);
//--- define the path for moving the file
string path;
if(file_size>InpThresholdSize*1024)
    path=InpBigFolderName+"//"+file_name;
else
    path=InpSmallFolderName+"//"+file_name;
//--- move the file

}
while(FileFindNext(search_handle,file_name));
//--- close the search handle
FileFindClose(search_handle);
}
else
    Print("Files not found!");
}
```

FileTell

The file returns the current position of the file pointer of an open file.

```
ulong FileTell(  
    int file_handle    // File handle  
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

Return Value

Current position of the file descriptor in bytes from the beginning of the file.

Note

To obtain information about the [error](#) call [GetLastError\(\)](#).

Example:

```
//+-----+  
//|                                     Demo_FileTell.mq5 |

            ArrayResize(arr,def_size);
        }
    }
    else
        break; // end of the file, exit
}
//--- define the actual size of the array
ArrayResize(arr,i);
}
```

FileWrite

The function is intended for writing of data into a CSV file, delimiter being inserted automatically unless it is equal to 0. After writing into the file, the line end character "\r\n" will be added.

```
uint FileWrite(
    int file_handle, // File handle
    ...             // List of recorded parameters
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

...

[in] The list of parameters separated by commas, to write to the file. The number of written parameters can be up to 63.

Return Value

Number of bytes written.

Note

Numbers will be converted into a text at output (see the [Print\(\)](#) function). Data of the double type are output with the accuracy of 16 digits after the decimal point, and the data can be displayed either in traditional or in scientific format - depending on which format will be the most compact. The data of the float type are shown with 5 digits after the decimal point. To output real numbers with different precision or in a clearly specified format, use [DoubleToString\(\)](#).

Numbers of the bool type are displayed as "true" or "false" strings. Numbers of the datetime type are displayed as "YYYY.MM.DD HH:MI:SS".

Example:

```
//+-----+
//|                                     Demo_FileWrite.mq5 |
//|                                     Copyright 2013, MetaQuotes Software Corp. |

FileWriteArray

The function writes arrays of any type except for string to a BIN file (can be an array of structures not containing strings or dynamic arrays).

```
uint FileWriteArray(
    int          file_handle,      // File handle
    const void&  array[],          // Array
    int          start=0,          // Start index in the array
    int          count=WHOLE_ARRAY // Number of elements
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

array[]

[out] Array for recording.

start=0

[in] Initial index in the array (number of the first recorded element).

count=WHOLE_ARRAY

[in] Number of items to write ([WHOLE_ARRAY](#) means that all items starting with the number start until the end of the array will be written).

Return Value

Number of recorded items.

Note

String array can be recorded in a TXT file. In this case, strings are automatically ended by the line end characters "\r\n". Depending on the file type ANSI or UNICODE, strings are either converted to ansi-encoding or not.

Example:

```
//+-----+
//|                                     Demo_FileWriteArray.mq5 |

[Variables](#), [FileSeek](#)

FileWriteDouble

The function writes the value of a double parameter to a a bin-file, starting from the current position of the file pointer.

```
uint FileWriteDouble(
    int      file_handle,    // File handle
    double   value           // Value to write
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

value

[in] The value of double type.

Return Value

If successful the function returns the number of bytes written (in this case [sizeof](#)(double)=8). The file pointer is shifted by the same number of bytes.

Example:

```
//+-----+
//|                                     Demo_FileWriteDouble.mq5 |

[Real types \(double, float\)](#)

FileWriteFloat

The function writes the value of the float parameter to a bin-file, starting from the current position of the file pointer.

```
uint FileWriteFloat(
    int    file_handle,    // File handle
    float  value           // Value to be written
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

value

[in] The value of float type.

Return Value

If successful the function returns the number of bytes written (in this case [sizeof\(float\)](#)=4). The file pointer is shifted by the same number of bytes.

Example:

```
//+-----+
//|                                     Demo_FileWriteFloat.mq5 |

[Real types \(double, float\)](#), [FileWriteDouble](#)

FileWriteInteger

The function writes the value of the `int` parameter to a bin-file, starting from the current position of the file pointer.

```
uint FileWriteInteger(
    int file_handle,      // File handle
    int value,            // Value to be written
    int size=INT_VALUE    // Size in bytes
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

value

[in] Integer value.

size=INT_VALUE

[in] Number of bytes (up to 4 inclusive), that should be written. The corresponding constants are provided: `CHAR_VALUE=1`, `SHORT_VALUE=2` and `INT_VALUE=4`, so the function can write the integer value of `char`, `uchar`, `short`, `ushort`, `int`, or `uint` type.

Return Value

If successful the function returns the number of bytes written. The file pointer is shifted by the same number of bytes.

Example:

```
//+-----+

FileWriteLong

The function writes the value of the long-type parameter to a bin-file, starting from the current position of the file pointer.

```
uint FileWriteLong(
    int   file_handle,    // File handle
    long  value           // Value to be written
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

value

[in] Value of type long.

Return Value

If successful the function returns the number of bytes written (in this case [sizeof\(long\)](#)=8). The file pointer is shifted by the same number of bytes.

Example:

```
//+-----+
//|                                     Demo_FileWriteLong.mq5 |

[Integer types](#), [FileWriteInteger](#)

FileWriteString

The function writes the value of a string-type parameter into a BIN, CSV or TXT file starting from the current position of the file pointer. When writing to a CSV or TXT file: if there is a symbol in the string '\n' (LF) without previous character '\r' (CR), then before '\n' the missing '\r' is added.

```
uint FileWriteString(
    int          file_handle,    // File handle
    const string text_string,    // string to write
    int          length=-1       // number of symbols
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

text_string

[in] String.

length=-1

[in] The number of characters that you want to write. This option is needed for writing a string into a BIN file. If the size is not specified, then the entire string without the trailer 0 is written. If you specify a size smaller than the length of the string, then a part of the string without the trailer 0 is written. If you specify a size greater than the length of the string, the string is filled by the appropriate number of zeros. For files of CSV and TXT type, this parameter is ignored and the string is written entirely.

Return Value

If successful the function returns the number of bytes written. The file pointer is shifted by the same number of bytes.

Note

Note that when writing to a file opened by the FILE_UNICODE [flag](#) (or without a flag FILE_ANSI), then the number of bytes written will be twice as large as the number of string characters written. When recording to a file opened with the FILE_ANSI flag, the number of bytes written will coincide with the number of string characters written.

Example:

```

[String Type](#), [StringFormat](#)

FileWriteStruct

The function writes into a bin-file contents of a structure passed as a parameter, starting from the current position of the file pointer.

```
uint FileWriteStruct(
    int          file_handle,      // File handle
    const void&  struct_object,    // link to an object
    int          size=-1           // size to be written in bytes
);
```

Parameters

file_handle

[in] File descriptor returned by [FileOpen\(\)](#).

struct_object

[in] Reference to the object of this structure. The structure should not contain strings, [dynamic arrays](#) or [virtual functions](#).

size=-1

[in] Number of bytes that you want to record. If size is not specified or the specified number of bytes is greater than the size of the structure, the entire structure is written.

Return Value

If successful the function returns the number of bytes written. The file pointer is shifted by the same number of bytes.

Example:

[Structures and classes](#)

FileLoad

Reads all data of a specified binary file into a passed array of numeric types or simple structures. The function allows you to quickly read data of a known type into the appropriate array.

```
long FileLoad(
    const string file_name,           // File name
    void& buffer[],                  // An array of numeric types or simple structures
    int common_flag=0                // A file flag, is searched in <data_folder>\MQL5\
);
```

Parameters

file_name

[in] The name of the file from which data will be read.

buffer

[out] An array of numeric types or [simple structures](#).

common_flag=0

[in] [A file flag](#) indicating the operation mode. If the parameter is not specified, the file is searched in the subfolder MQL5\Files (or in <testing_agent_directory>\MQL5\Files in case of testing).

Return Value

The number of elements read or -1 in case of an error.

Note

The FileLoad() function reads from a file the number of bytes multiple of the array element size. Suppose the file size is 10 bytes, and the function reads data into an array of type double ([sizeof\(double\)=8](#)). In this case the function will read only 8 bytes, the remaining 2 bytes at the end of the file will be dropped, and the function FileLoad() will return 1 (1 element read).

Example:

```
//+-----+
//|                                     Demo_FileLoad.mq5 |

FileSave

Writes to a binary file all elements of an array passed as a parameter. The function allows you to quickly write arrays of numeric types or simple structures as one string.

```
bool FileSave(
    const string file_name,           // File name
    void& buffer[],                  // An array of numeric types or simple structures
    int common_flag=0                // A file flag, by default files are written to <
);
```

Parameters

file_name

[in] The name of the file, to the data array will be written.

buffer

[in] An array of numeric types or [simple structures](#).

common_flag=0

[in] [A file flag](#) indicating the operation mode. If the parameter is not specified, the file will be written to the subfolder MQL5\Files (or to <testing_agent_directory>\MQL5\Files in case of testing).

Return Value

In case of failure returns false.

Example:

```
//+-----+
//|                                     Demo_FileSave.mq5 |
//|                                     Copyright 2016, MetaQuotes Software Corp. |

FolderCreate

Creates a directory in the Files folder (depending on the common_flag value)

```
bool FolderCreate(
    string folder_name,      // line with the created folder name
    int common_flag=0       // action area
);
```

Parameters

folder_name

[in] Name of the directory to be created. Contains the relative path to the folder.

common_flag=0

[in] [Flag](#) defining the directory location. If common_flag=FILE_COMMON, the directory is located in the common folder of all client terminals \Terminal\Common\Files. Otherwise, the directory is in the local folder (MQL5\Files or MQL5\Tester\Files when testing).

Return Value

Returns true if successful, otherwise false.

Note

For reasons of security, working with files is strictly controlled in MQL5 language. Files used in file operations by means of MQL5 language cannot be located outside the file sandbox.

Example:

```
#property copyright "Copyright 2000-2024, MetaQuotes Ltd."
#property link      "https://www.mql5.com"
#property version   "1.00"
//--- description

    {
        ///--- display the full path for the created folder
        PrintFormat("Created the folder %s",working_folder+"\\ "+folder_path);
        ///--- reset the error code
        ResetLastError();
        ///--- successful execution
        return true;
    }
    else
        PrintFormat("Failed to create the folder %s. Error code %d",working_folder+folder_path,GetLastError());
    ///--- execution failed
    return false;
}

```

```
}
```

See also

[FileOpen\(\)](#), [FolderClean\(\)](#), [FileCopy\(\)](#)

FolderDelete

The function removes the specified directory. If the folder is not empty, then it can't be removed.

```
bool FolderDelete(
    string folder_name,      // String with the name of the folder to delete
    int common_flag=0       // Scope
);
```

Parameters

folder_name

[in] The name of the directory you want to delete. Contains the full path to the folder.

common_flag=0

[in] [Flag](#) determining the location of the directory. If `common_flag=FILE_COMMON`, then the directory is in the shared folder for all client terminals `\Terminal\Common\Files`. Otherwise, the directory is in a local folder (`MQL5\Files` or `MQL5\Tester\Files` in the case of testing).

Return Value

Returns true if successful, otherwise false.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

If the directory contains at least one file and/or subdirectory, then this directory can't be deleted, it must be cleared first. [FolderClean\(\)](#) is used to clear a folder of all its files or subfolders.

Example:

```

[FileOpen\(\)](#), [FolderClean\(\)](#), [FileMove\(\)](#)

FolderClean

The function deletes all files in a specified folder.

```
bool FolderClean(
    string folder_name,      // String with the name of the deleted folder
    int common_flag=0       // Scope
);
```

Parameters

folder_name

[in] The name of the directory where you want to delete all files. Contains the full path to the folder.

common_flag=0

[in] [Flag](#) determining the location of the directory. If common_flag = FILE_COMMON, then the directory is in the shared folder for all client terminals \Terminal\Common\Files. Otherwise, the directory is in a local folder(MQL5\Files or MQL5\Tester\Files in case of testing).

Return Value

Returns true if successful, otherwise false.

Note

For security reasons, work with files is strictly controlled in the MQL5 language. Files with which file operations are conducted using MQL5 means, cannot be outside the file sandbox.

This function should be used with caution, since all the files and all subdirectories are deleted irretrievably.

Custom Indicators

This is the group functions used in the creation of custom indicators. These functions can't be used when writing Expert Advisors and Scripts.

Function	Action
SetIndexBuffer	Binds the specified indicator buffer with one-dimensional dynamic array of the double type
IndicatorSetDouble	Sets the value of an indicator property of the double type
IndicatorSetInteger	Sets the value of an indicator property of the int type
IndicatorSetString	Sets the value of an indicator property of the string type
PlotIndexSetDouble	Sets the value of an indicator line property of the type double
PlotIndexSetInteger	Sets the value of an indicator line property of the int type
PlotIndexSetString	Sets the value of an indicator line property of the string type
PlotIndexGetInteger	Returns the value of an indicator line property of the integer type

[Indicator properties](#) can be set using the compiler directives or using functions. To better understand this, it is recommended that you study [indicator styles in examples](#).

All the necessary calculations of a custom indicator must be placed in the predetermined function [OnCalculate\(\)](#). If you use a short form of the OnCalculate() function call, like

```
int OnCalculate (const int rates_total, const int prev_calculated, const int begin, co
```

then the *rates_total* variable contains the value of the total number of elements of the price[] array, passed as an input parameter for calculating indicator values.

Parameter *prev_calculated* is the result of the execution of OnCalculate() at the previous call; it allows organizing a saving algorithm for calculating indicator values. For example, if the current value rates_total = 1000, prev_calculated = 999, then perhaps it's enough to make calculations only for one value of each indicator buffer.

If the information about the size of the input array price would have been unavailable, then it would lead to the necessity to make calculations for 1000 values of each indicator buffer. At the first call of OnCalculate() value prev_calculated = 0. If the price[] array has changed somehow, then in this case prev_calculated is also equal to 0.

The *begin* parameter shows the number of initial values of the price array, which don't contain data for calculation. For example, if values of Accelerator Oscillator (for which the first 37 values aren't calculated) were used as an input parameter, then begin = 37. For example, let's consider a simple indicator:

```
#property indicator_chart_window
#property indicator_buffers 1
#property indicator_plots 1
//---- plot Label1
#property indicator_label1 "Label1"
```

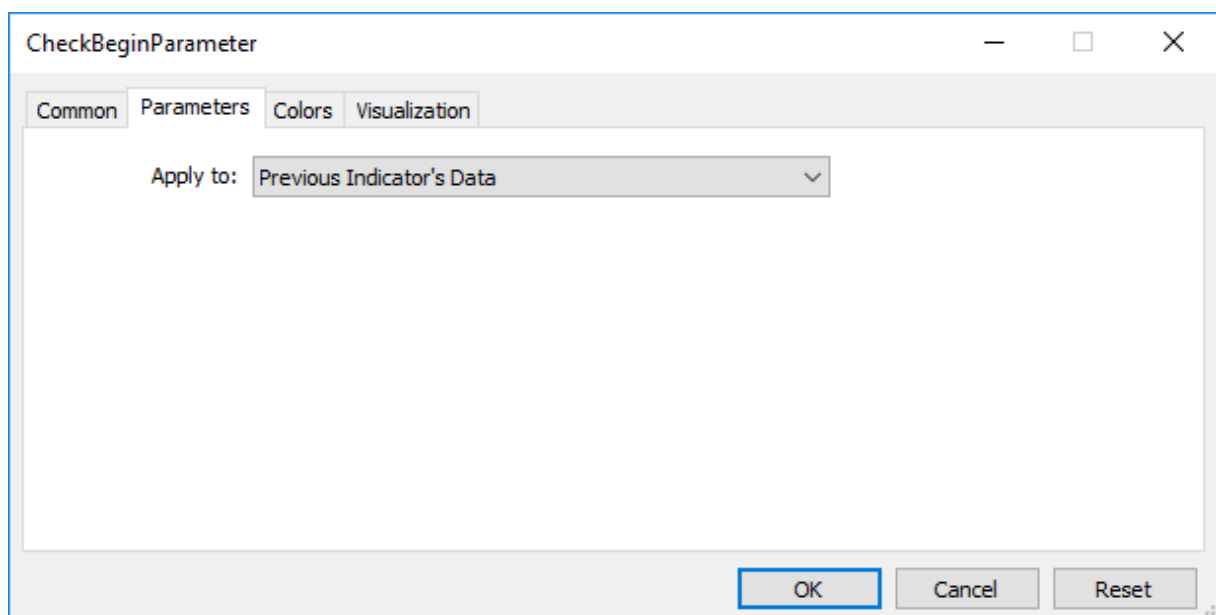

```

#property indicator_type1   DRAW_LINE
#property indicator_color1  clrRed
#property indicator_style1  STYLE_SOLID
#property indicator_width1  1
//--- indicator buffers
double                    Label1Buffer[];
//+-----+
//| Custom indicator initialization function |
//+-----+
void OnInit()
{
//--- indicator buffers mapping
    SetIndexBuffer(0,Label1Buffer,INDICATOR_DATA);
//---
}
//+-----+
//| Custom indicator iteration function |
//+-----+
int OnCalculate(const int rates_total,
               const int prev_calculated,
               const int begin,
               const double &price[])

{
//---
    Print("begin = ",begin,"  prev_calculated = ",prev_calculated,"  rates_total = ",rates_total);
//--- return value of prev_calculated for next call
    return(rates_total);
}

```

Drag it from the "Navigator" window to the window of the Accelerator Oscillator indicator and we indicate that calculations will be made based on the values of the previous indicator:

As a result, the first call of OnCalculate() the value of prev_calculated will be equal to zero, and in further calls it will be equal to the rates_total value (until the number of bars on the price chart increases).

The value of the begin parameter will be exactly equal to the number of initial bars, for which the values of the Accelerator indicator aren't calculated according to the logic of this indicator. If we look at the source code of the custom indicator Accelerator.mq5, we'll see the following lines in the [OnInit\(\)](#) function:

```
//--- sets first bar from which index will be drawn
PlotIndexSetInteger(0, PLOT_DRAW_BEGIN, 37);
```

Using the function [PlotIndexSetInteger\(0, PLOT_DRAW_BEGIN, empty_first_values\)](#), we set the number of non-existing first values in the zero indicator array of a custom indicator, which we don't need to accept for calculation (empty_first_values). Thus, we have mechanisms to:

1. set the number of initial values of an indicator, which shouldn't be used for calculations in another custom indicator;
2. get information on the number of first values to be ignored when you call another custom indicator, without going into the logic of its calculations.

Indicator Styles in Examples

The MetaTrader 5 Client Terminal includes 38 technical indicators that can be used in MQL5 programs using [appropriate functions](#). But the main advantage of the MQL5 language is the ability to create custom indicators, which can then be used in Expert Advisors or simply applied on price charts for the purpose of technical analysis.

The entire set of indicators can be derived from several base [drawing styles](#), known as plotting. Plotting denotes a way of displaying data, which the indicator calculates, stores and provides on request. There are seven such basic plotting types:

- 1. A line
- 2. A section (segment)
- 3. Histogram
- 4. Arrow (symbol)
- 5. A painted area (filled channel)
- 6. Bars
- 7. Japanese candlesticks

Each plotting requires one to five [arrays](#) of the [double](#) type, in which indicator values are stored. For the purpose of convenience, these arrays are associated with the indicator buffers. The number of buffers in an indicator must be declared in advance using [compiler directives](#), for example:

```
#property indicator_buffers 3 // Number of buffers
#property indicator_plots 2 // number of plots
```

The number of buffers in the indicator is always greater than or equal to the number of plots in the indicator.

Since each basic plotting type can have color variation or construction specifics, the actual number of plotting types in the MQL5 is 18:

Plotting	Descripti on	Value buffers	Color buffers
DRAW_NONE	Is not visually displayed in the chart, but the values of the corresponding buffer can be viewed in the Data Window	1	-

Plotting	Descripti on	Value buffers	Color buffers
DRAW_LINE	A line is plotted on the values of the corresponding buffer (empty values in the buffer are undesirable)	1	-
DRAW_SECTION	Is drawn as line segments between the values of the corresponding buffer (usually has a lot of empty values)	1	-
DRAW_HISTOGRAM	Is drawn as a histogram from the zero line to the values of the corresponding buffer (may have empty values)	1	-

Plotting	Descripti on	Value buffers	Color buffers
DRAW_HISTOGRAM2	Is drawn as a histogram based on two indicator buffers (may have empty values)	2	-
DRAW_ARROW	Is drawn as symbols (may have empty values)	1	-
DRAW_ZIGZAG	Similar to the style DRAW_SECTION , but unlike it, can plot vertical segments on one bar	2	-
DRAW_FILLING	Color fill between two lines. 2 values of the corresponding buffers are shown in the Data Window	2	-
DRAW_BARS	Is drawn as bars. 4 values	4	-

Plotting	Descripti on	Value buffers	Color buffers
	of the correspo nding buffers are shown in the Data Window		
DRAW_CANDLES	Drawn as Japanese candlesti cks. 4 values of the correspo nding buffers are shown in the Data Window	4	-
DRAW_COLOR_LINE	A line for which you can alternate colors on different bars or change its color at any time	1	1
DRAW_COLOR_SECTION	Similar to the style DRAW_S ECTION , but the color of each section can be set individua lly; color can also	1	1

Plotting	Descripti on	Value buffers	Color buffers
	be set dynamica lly		
DRAW_COLOR_HISTOGRAM	Similar to the style DRAW_H ISTOGRAM , but each strip may have a different color, you can set the color dynamica lly	1	1
DRAW_COLOR_HISTOGRAM2	Similar to the style DRAW_H ISTOGRAM2 , but each strip may have a different color, you can set the color dynamica lly	2	1
DRAW_COLOR_ARROW	Similar to the style DRAW_A RROW , but each symbol can have its color. Color can be	1	1

Plotting	Descripti on	Value buffers	Color buffers
	changed dynamica lly		
DRAW_COLOR_ZIGZAG	The DRAW_ZI GZAG style with the options of individual coloring of sections and dynamic color changing	2	1
DRAW_COLOR_BARS	The DRAW_B ARS style with the options of individual coloring of bars and dynamic color changing	4	1
DRAW_COLOR_CANDLES	The DRAW_C ANDLES style with the options of individual coloring of candlesti cks and dynamic color changing	4	1

The difference between an indicator buffer and an array

In each indicator, on its [global level](#), you should declare one or more arrays of the double type, which then must be used as an indicator buffer using the [SetIndexBuffer\(\)](#) function. To draw indicator plots, only the values of the indicator buffers are used, any other arrays cannot be used for this purpose. In addition, buffer values are displayed in the Data Window.

An indicator buffer should be [dynamic](#) and does not require [specification of the size](#) - the size of the array used as the indicator buffer is set by the terminal execution subsystem automatically.

After the array is bound to the indicator buffer, [the indexing direction](#) is set by default like in ordinary arrays, but you can use the [ArraySetAsSeries\(\)](#) function to change the way of access to the array elements. By default, the indicator buffer is used to store data used for plotting ([INDICATOR_DATA](#)).

If the calculation of indicator values requires holding intermediate calculations and storing the additional values for each bar, then such an array can be declared as a calculation buffer during binding ([INDICATOR_CALCULATIONS](#)). For the intermediate values, you can also use a regular array, but in this case, the programmer has to manage the size of the array.

Some plots allow setting a color for each bar. To store the information about color, color buffers are used ([INDICATOR_COLOR_INDEX](#)). The color is an integer type [color](#), but all indicator buffers must be of type [double](#). Values of color and auxiliary ([INDICATOR_CALCULATIONS](#)) buffers cannot be obtained by using [CopyBuffer\(\)](#).

The number of indicator buffers must be specified using the compiler directive [#property indicator_buffers](#) number_of_buffers:

```
#property indicator_buffers 3 // the indicator has 3 buffers
```

The maximum allowed number of buffers in one indicator is 512.

Relevance of Indicator Buffers and Plotting

Each plotting is based on one or more indicator buffers. So, for displaying simple candlesticks, four values are required - Open, High, Low and Close prices. Accordingly, to display an indicator in the form of candlesticks, it is necessary to declare 4 indicator buffers and 4 arrays of the double type for them. For example:

```
//--- The indicator has four indicator buffers
#property indicator_buffers 4
//--- The indicator has one plotting
#property indicator_plots 1
//--- Graphical plotting number 1 will appear as candlesticks
#property indicator_type1 DRAW_CANDLES
//--- Candlestick will be drawn in clrDodgerBlue
#property indicator_color1 clrDodgerBlue
//--- 4 arrays for the indicator buffers
double OBuffer[];
```

```
double HBuffer[];
double LBuffer[];
double CBuffer[];
```

Graphical plots automatically use indicator buffers in accordance with the plot number. Numbering of plots starts with 1, numbering of buffers starts with zero. If the first plotting requires 4 indicator buffers, then the first 4 indicator buffers will be used to draw it. These four buffers should be linked with the appropriate arrays with correct indexing using the [SetIndexBuffer\(\)](#) function.

```
//--- Binding arrays with indicator buffers
SetIndexBuffer(0,OBuffer,INDICATOR_DATA); // The first buffer corresponds to the
SetIndexBuffer(1,HBuffer,INDICATOR_DATA); // The second buffer corresponds to inde
SetIndexBuffer(2,LBuffer,INDICATOR_DATA); // The third buffer corresponds to inde
SetIndexBuffer(3,CBuffer,INDICATOR_DATA); // The fourth buffer corresponds to inde
```

The plotting candlesticks, the indicator will use just the first four buffers, because plotting of "candlesticks" was announced under the first number.

Change the example, and add plotting of a simple line - [DRAW_LINE](#). Now suppose that the line is numbered 1, and the candlesticks are number 2. The number of buffers and the number of plots has increased.

```
//--- The indicator has 5 indicator buffers
#property indicator_buffers 5
//--- The indicator has 2 plots
#property indicator_plots 2
//--- Plot 1 is a line
#property indicator_type1 DRAW_LINE
//--- The color of the line is clrDodgerRed
#property indicator_color1 clrDodgerRed
//--- Plot 2 is drawn as Japanese candlesticks
#property indicator_type2 DRAW_CANDLES
//--- The color of the candlesticks is clrDodgerBlue
#property indicator_color2 clrDodgerBlue
//--- 5 arrays for indicator buffers
double LineBuffer[];
double OBuffer[];
double HBuffer[];
double LBuffer[];
double CBuffer[];
```

The order of the plots has changed, and now the line comes first, followed by Japanese candlesticks. Therefore, the order of the buffers is appropriate - first we announce a buffer for the line with the zero index, and then four buffers for the candlesticks.

```
SetIndexBuffer(0,LineBuffer,INDICATOR_DATA); // The first buffer corresponds to in
//--- Binding arrays with indicator buffers for the candlesticks
SetIndexBuffer(1,OBuffer,INDICATOR_DATA); // The second buffer corresponds to
SetIndexBuffer(2,HBuffer,INDICATOR_DATA); // The third buffer corresponds to in
SetIndexBuffer(3,LBuffer,INDICATOR_DATA); // The fourth buffer corresponds to
```

```
SetIndexBuffer(4,CBuffer,INDICATOR_DATA); // The fifth buffer corresponds to i
```

The number of buffers and plots can be set only by using compiler directives, it is impossible to change these properties dynamically using functions.

Color Versions of Styles

As can be seen in the table, the styles are divided into two groups. The first group includes styles in whose name there is no word **COLOR**, we call these styles basic:

- DRAW_LINE
- DRAW_SECTION
- DRAW_HISTOGRAM
- DRAW_HISTOGRAM2
- DRAW_ARROW
- DRAW_ZIGZAG
- DRAW_FILLING
- DRAW_BARS
- DRAW_CANDLES

In the second group, the style names contain the word **COLOR**, let's call them color versions:

- DRAW_COLOR_LINE
- DRAW_COLOR_SECTION
- DRAW_COLOR_HISTOGRAM
- DRAW_COLOR_HISTOGRAM2
- DRAW_COLOR_ARROW
- DRAW_COLOR_ZIGZAG
- DRAW_COLOR_BARS
- DRAW_COLOR_CANDLES

All color versions of styles differ from the basic ones in that they allow specifying a color for each part of the plotting. The minimal part of plotting is a bar, so we can say that the color versions allow setting the color on each bar.

Exceptions are styles [DRAW_NONE](#) and [DRAW_FILLING](#), they do not have color versions.

To set the plotting color on each bar, an additional buffer for storing the color index has been added to the color version. These indices indicate the number of a color in a special array, which contains a predefined set of colors. The size of the array of colors is 64. This means that each color version of a style allows painting a plot in 64 different colors.

The set and the number of colors in the special array of colors can be set via a compiler directive `#property indicator_color`, where you can specify all the necessary colors separated by commas. For example, such an entry in an indicator:

```
//--- Define 8 colors for coloring candlesticks (they are stored in the special array)
#property indicator_color1 clrRed,clrBlue,clrGreen,clrYellow,clrMagenta,clrCyan,clrL
```

It states that for plotting 1, 8 colors are set, which will be placed in a special array. Further in the program we will not specify the color of the plotting, but only its index. If we want to set red color for the bar number *K*, the color index value from an array should be set in the color buffer of the indicator. The red color is specified first in the directive, it corresponds to the index number 0.

```
//--- set the candlestick color clrRed
col_buffer[buffer_index]=0;
```

The set of colors is not given once and for all, it can be changed dynamically using `PlotIndexSetInteger()`. Example:

```
//--- Set the color for each index as the property PLOT_LINE_COLOR
PlotIndexSetInteger(0, // The number of a graphical style
PLOT_LINE_COLOR, // Property identifier
plot_color_ind, // The index of the color, where we v
color_array[i]); // A new color
```

Properties of the indicator and plotting

For indicator plots, properties can be set by means of [compiler directives](#) and using the appropriate functions. Read more information about this in [Connection between Indicator Properties and Functions](#). Dynamic change of indicator properties using special functions allows creating more flexible custom indicators.

Start of Indicator Drawing on the Chart

In many cases, according to the conditions of the algorithm, it is impossible to start calculating the indicator values immediately with the current bar, since it is necessary to provide a minimum number of previous bars available in history. For example, many types of smoothing imply using an array of prices over the previous *N* bars, and on the basis of these values, the indicator value on the current bar is calculated.

In such cases, either there is no way to calculate the indicator values for the first *N* bars, or these values are not intended to be displayed on the chart and are only subsidiary for calculating further values. To avoid plotting of the indicator on the first *N* bars of the history, set the *N* value to the [PLOT_DRAW_BEGIN](#) property for the corresponding plot:

```
//--- Binding arrays with indicator buffers for the candlesticks
PlotIndexSetInteger(number_of_plot,PLOT_DRAW_BEGIN,N);
```

Here:

- `number_of_plot` - a value from zero to `indicator_plots-1` (numbering of plots starts with zero).
- *N* - the number of first bars in the history, on which the indicator should not be displayed on the chart.

DRAW_NONE

The DRAW_NONE style is designed for use in cases where it is necessary to calculate the values of a buffer and show them in the Data Window, but plotting on the chart is not required. To set up the accuracy use the expression `IndicatorSetInteger(INDICATOR_DIGITS,num_chars)` in the [OnInit\(\)](#) function:

```
int OnInit()
{
    //--- indicator buffers mapping
    SetIndexBuffer(0,InvisibleBuffer,INDICATOR_DATA);
    //--- Set the accuracy of values to be displayed in the Data Window
    IndicatorSetInteger(INDICATOR_DIGITS,0);
    //---
    return(INIT_SUCCEEDED);
}
```

The number of buffers required for plotting DRAW_NONE is 1.

An example of the indicator that shows the number of the bar on which the mouse currently hovers in the Data Window. The numbering corresponds to the timeseries, meaning the current unfinished bar has the zero index, and the oldest bar has the largest index.

Note that despite the fact that, for red color is set plotting #1, the indicator does not draw anything on the chart.

```

    ArraySetAsSeries(InvisibleBuffer,true);
    //--- Fill in each bar with its number
    for(int i=0;i<total;i++) InvisibleBuffer[i]=i;
}

```

DRAW_LINE

DRAW_LINE draws a line of the specified color by the values of the indicator buffer. The width, style and color of the line can be set using the [compiler directives](#) and dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The number of buffers required for plotting DRAW_LINE is 1.

An example of the indicator that draws a line using Close prices of bars. The line color, width and style change randomly every N=5 ticks.

Note that initially for `plot1` with DRAW_LINE the properties are set using the compiler directive `#property`, and then in the `OnCalculate()` function these three properties are set randomly. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

    size=ArraySize(styles);
    //--- Get the index to select a new style as the remainder of integer division
    int style_index=number%size;

```

```
//--- Set the color as the PLOT_LINE_COLOR property
    PlotIndexSetInteger(0,PLOT_LINE_STYLE,styles[style_index]);
//--- Write the line style
    comm=EnumToString(styles[style_index])+", "+comm;
//--- Show the information on the chart using a comment
    Comment(comm);
}
```

DRAW_SECTION

DRAW_SECTION draws sections of the specified color by the values of the indicator buffer. The width, color and style of the line can be specified like for the [DRAW_LINE](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

Sections are drawn from one non-empty value to another non-empty value of the indicator buffer, empty values are ignored. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property: For example, if the indicator should be drawn as a sequence of sections on non-zero values, then you need to set the zero value as an empty one:

```
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_SECTION,PLOT_EMPTY_VALUE,0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to the elements that should not be plotted.

The number of buffers required for plotting DRAW_SECTION is 1.

An example of the indicator that draws sections between the High and Low prices. The color, width and style of **all** sections change randomly every N ticks.

Note that initially for `plot1` with DRAW_SECTION the properties are set using the compiler directive [#property](#), and then in the [OnCalculate\(\)](#) function these three properties are set randomly. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

DRAW_HISTOGRAM

The DRAW_HISTOGRAM style draws a histogram as a sequence of columns of a specified color from zero to a specified value. Values are taken from the indicator buffer. The width, color and style of the column can be specified like for the [DRAW_LINE](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

Since a column from the zero level is drawn on each bar, DRAW_HISTOGRAM should better be used in a separate chart window. Most often this type of plotting is used to create indicators of the oscillator type, for example, [Bears Power](#) or [OsMA](#). For the empty non-displayable values the zero value should be specified.

The number of buffers required for plotting DRAW_HISTOGRAM is 1.

An example of the indicator that draws a sinusoid of a specified color based on the [MathSin\(\) function](#). The color, width and style of all histogram columns change randomly each N ticks. The bars parameter specifies the period of the sinusoid, that is after the specified number of bars the sinusoid will repeat the cycle.

Note that initially for plot1 with DRAW_HISTOGRAM the properties are set using the compiler directive [#property](#), and then in the [OnCalculate\(\)](#) function these three properties are set randomly. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

DRAW_HISTOGRAM2

The DRAW_HISTOGRAM2 style draws a histogram of a specified color - vertical segments using the values of two indicator buffers. The width, color and style of the segments can be specified like for the [DRAW_LINE](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

The DRAW_HISTOGRAM2 style can be used in a separate subwindow of a chart and in its main window. For empty values nothing is drawn, all the values in the indicator buffers need to be set explicitly. Buffers are not initialized with a zero value.

The number of buffers required for plotting DRAW_HISTOGRAM2 is 2.

An example of the indicator that plots a vertical segment of the specified color and width between the Open and Close prices of each bar. The color, width and style of **all** histogram columns change randomly each N ticks. During the start of the indicator, in the [OnInit\(\)](#) function, the number of the day of week for which the histogram will not be drawn - invisible_day - is set randomly. For this purpose an empty value is set [PLOT_EMPTY_VALUE](#)=0:

```
//--- Set an empty value
PlotIndexSetDouble(index_of_plot_DRAW_SECTION,PLOT_EMPTY_VALUE,0);
```

Note that initially for `plot1` with DRAW_HISTOGRAM2 the properties are set using the compiler directive `#property`, and then in the [OnCalculate\(\)](#) function these three properties are set randomly. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

    Comment(comm);
}

```

DRAW_ARROW

The DRAW_ARROW style draws arrows of the specified color (symbols of the set [Wingdings](#)) based on the value of the indicator buffer. The width and color of the symbols can be specified like for the [DRAW_LINE](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows changing the look of an indicator based on the current situation.

The symbol code is set using the [PLOT_ARROW](#) property.

```
//--- Define the symbol code from the Wingdings font to draw in PLOT_ARROW
PlotIndexSetInteger(0,PLOT_ARROW,code);
```

The default value of PLOT_ARROW=159 (a circle).

Each arrow is actually a symbol that has the height and the anchor point, and can cover some important information on a chart (for example, the closing price at the bar). Therefore, we can additionally specify the vertical shift in pixels, which does not depend on the scale of the chart. The arrows will be shifted down by the specified number of pixels, although the values of the indicator will remain the same:

```
//--- Set the vertical shift of arrows in pixels
PlotIndexSetInteger(0,PLOT_ARROW_SHIFT,shift);
```

A negative value of PLOT_ARROW_SHIFT means the shift of arrows upwards, a positive values shifts the arrow down.

The DRAW_ARROW style can be used in a separate subwindow of a chart and in its main window. Empty values are not drawn and do not appear in the "Data Window", all the values in the indicator buffers should be set explicitly. Buffers are not initialized with a zero value.

```
//--- Set an empty value
PlotIndexSetDouble(index_of_plot_DRAW_ARROW,PLOT_EMPTY_VALUE,0);
```

The number of buffers required for plotting DRAW_ARROW is 1.

An example of the indicator, which draws arrows on each bar with the close price higher than the close price of the previous bar. The color, width, shift and symbol code of all arrows are changed randomly every N ticks.

In the example, for `plot1` with the `DRAW_ARROW` style, the properties, color and size are specified using the compiler directive `#property`, and then in the `OnCalculate()` function the properties are set randomly. The `N` parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

DRAW_ZIGZAG

The DRAW_ZIGZAG style draws segments of a specified color based on the values of two indicator buffers. This style is very similar to [DRAW_SECTION](#), but unlike the latter, it allows drawing vertical segments within one bar, if values of both indicator buffers are set for this bar. The segments are plotted from a value in the first buffer to a value in the second indicator buffer. None of the buffers can contain only empty values, since in this case nothing is plotted.

The width, color and style of the line can be specified like for the [DRAW_SECTION](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

Sections are drawn from a non-empty value of one buffer to a non-empty value of another indicator buffer. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property:

```
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_ZIGZAG,PLOT_EMPTY_VALUE,0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of buffers required for plotting DRAW_ZIGZAG is 2.

An example of the indicator that plots a saw based on the High and Low prices. The color, width and style of the zigzag lines change randomly every N ticks.

Note that initially for `plot1` with DRAW_ZIGZAG the properties are set using the compiler directive [#property](#), and then in the [OnCalculate\(\)](#) function these properties are set randomly. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

}
```

DRAW_FILLING

The DRAW_FILLING style plots a colored area between the values of two indicator buffers. In fact, this style draws two lines and fills the space between them with one of two specified colors. It is used for creating indicators that draw channels. None of the buffers can contain only empty values, since in this case nothing is plotted.

You can set two fill colors:

- the first color is used for the areas where values in the first buffer are greater than the values in the second indicator buffer;
- the second color is used for the areas where values in the second buffer are greater than the values in the first indicator buffer.

The fill color can be set using the [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is calculated for all bars, for which the values of the both indicator buffers are equal neither to 0 nor to the empty value. To specify what value should be considered as "empty", set this value in [PLOT_EMPTY_VALUE](#) property:

```
#define INDICATOR_EMPTY_VALUE -1.0
...
//--- INDICATOR_EMPTY_VALUE (empty value) will not participate in calculation of
PlotIndexSetDouble (DRAW_FILLING_creation_index,PLOT_EMPTY_VALUE,INDICATOR_EMPTY_V
```

Drawing on the bars that do not participate in the indicator calculation will depend on the values in the indicator buffers:

- Bars, for which the values of both indicator buffers are equal to 0, do not participate in drawing the indicator. It means that the area with zero values is not filled out.

- Bars, for which the values of the indicator buffers are equal to the "empty value", participate in drawing the indicator. The area with empty values will be filled out so that to connect the areas with significant values.

It should be noted that if the "empty value" is equal to zero, the bars that do not participate in the indicator calculation are also filled out.

The number of buffers required for plotting DRAW_FILLING is 2.

An example of the indicator that draws a channel between two MAs with different averaging periods in a separate window. The change of the colors at the crossing of moving averages visually shows the change of the upward and downward trends. The colors change randomly every N ticks. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Note that initially for `plot1` with `DRAW_FILLING` the properties are set using the compiler directive `#property`, and then in the `OnCalculate()` function new colors are set randomly.

//--- Show the information on the chart using a comment
Comment(comm);
}
```

DRAW_BARS

The DRAW_BARS style draws bars on the values of four indicator buffers, which contain the Open, High, Low and Close prices. It is used for creating custom indicators as bars, including those in a separate subwindow of a chart and on other financial instruments.

The color of bars can be set using the [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of **all** four indicator buffers are set. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property:

```
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_BARS,PLOT_EMPTY_VALUE,0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of required buffers for plotting DRAW_BARS is 4. All buffers for the plotting should go one after the other in the given order: Open, High, Low and Close. None of the buffers can contain only empty values, since in this case nothing is plotted.

An example of the indicator that draws bars on a selected financial instrument in a separate window. The color of bars changes randomly every N ticks. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Please note that for `plot1` with the DRAW_BARS style, the color is set using the compiler directive [#property](#), and then in the [OnCalculate\(\)](#) function the color is set randomly from an earlier prepared list.

DRAW_CANDLES

The DRAW_CANDLES style draws candlesticks on the values of four indicator buffers, which contain the Open, High, Low and Close prices. It is used for creating custom indicators as a sequence of candlesticks, including those in a separate subwindow of a chart and on other financial instruments.

The color of candlesticks can be set using the [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of **all** four indicator buffers are set. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property:

```
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_CANDLES,PLOT_EMPTY_VALUE,0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of required buffers for plotting DRAW_CANDLES is 4. All buffers for the plotting should go one after the other in the given order: Open, High, Low and Close. None of the buffers can contain only empty values, since in this case nothing is plotted.

You can set up to three colors for the DRAW_CANDLES style affecting the candle look. If only one color is set, it is applied to all candles on a chart.

```
//--- identical candles with a single color applied to them
#property indicator_label1 "One color candles"
#property indicator_type1 DRAW_CANDLES
//--- only one color is specified, therefore all candles are of the same color
#property indicator_color1 clrGreen
```

If two comma-separated colors are specified, the first one is applied to candle outlines, while the second one is applied to the body.

```
//--- different colors for candles and wicks
#property indicator_label1 "Two color candles"
#property indicator_type1 DRAW_CANDLES
//--- green is applied to wicks and outlines, while white is applied to the body
#property indicator_color1 clrGreen,clrWhite
```

Specify three comma-separated colors so that rising and falling candles are displayed differently. In that case, the first color is applied to the candle outlines, while the second and third ones - to bullish and bearish candles.

```
//--- different colors for candles and wicks
#property indicator_label1 "One color candles"
#property indicator_type1 DRAW_CANDLES
//--- wicks and outlines are green, bullish candle body is white, while bearish candle
#property indicator_color1 clrGreen,clrWhite,clrRed
```

Thus, the DRAW_CANDLES style allows you to create custom candle coloring options. Besides, all colors can be changed dynamically during the indicator operation using the PlotIndexSetInteger function

(composition_index_DRAW_CANDLES, PLOT_LINE_COLOR, modifier_index, color), where modifier_index may have the following values:

- 0 - colors of outlines and wicks
- 1- bullish candle body color
- 2 - bearish candle body color

```
//--- set the color of outlines and wicks
PlotIndexSetInteger(0,PLOT_LINE_COLOR,0,clrBlue);
//--- set the bullish body color
PlotIndexSetInteger(0,PLOT_LINE_COLOR,1,clrGreen);
//--- set the bearish body color
PlotIndexSetInteger(0,PLOT_LINE_COLOR,2,clrRed);
```

An example of the indicator that draws candlesticks for a selected financial instrument in a separate window. The color of candlesticks changes randomly every N ticks. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Please note that for plot1, the color is set using the compiler directive [#property](#), and then in the [OnCalculate\(\)](#) function the color is set randomly from an earlier prepared list.

```

DRAW_COLOR_LINE

The DRAW_COLOR_LINE value is a colored variant of the [DRAW_LINE](#) style; it also draws a line using the values of the indicator buffer. But this style, like all color styles with the word **COLOR** in their title has an additional special indicator buffer that stores the color index (number) from a specially set array of colors. Thus, the color of each line segment can be defined by specifying the color index of the index to draw the line at this bar.

The width, style and colors of lines can be set using the [compiler directives](#) and dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The number of buffers required for plotting DRAW_COLOR_LINE is 2.

- one buffer to store the indicator values used for drawing a line;
- one buffer to store the index of the color of the line on each bar.

Colors can be specified by the compiler directive `#property indicator_color1` separated by a comma. The number of colors cannot exceed 64.

```
//--- Define 5 colors for coloring each bar (they are stored in the special array)
#property indicator_color1 clrRed,clrBlue,clrGreen,clrOrange,clrDeepPink // (Up to 64)
```

An example of the indicator that draws a line using Close prices of bars. The line width and style change randomly every N=5 ticks.

The colors of the line segments also change randomly in the custom function ChangeColors().

```
//+-----+
//| Changes the color of line segments |
//+-----+
void ChangeColors(color &cols[],int plot_colors)
```

```

{
//--- The number of colors
    int size=ArraySize(cols);
//---
    string comm=ChartGetString(0,CHART_COMMENT)+"\r\n\r\n";

//--- For each color index define a new color randomly
    for(int plot_color_ind=0;plot_color_ind<plot_colors;plot_color_ind++)
    {
        //--- Get a random value
        int number=MathRand();
        //--- Get an index in the col[] array as a remainder of the integer division
        int i=number%size;
        //--- Set the color for each index as the property PLOT_LINE_COLOR
        PlotIndexSetInteger(0,                // The number of a graphical style
                           PLOT_LINE_COLOR,  // Property identifier
                           plot_color_ind,    // The index of the color, where we want to set
                           cols[i]);          // A new color

        //--- Write the colors
        comm=comm+StringFormat("LineColorIndex[%d]=%s \r\n",plot_color_ind,ColorToString(cols[i]));
        ChartSetString(0,CHART_COMMENT,comm);
    }
//---
}

```

The example shows the feature of the "color" versions of indicators - to change the color of a line segment, you do not need to change values in the ColorLineColors[] buffer (which contains the color indexes). All you need to do is set new colors in a special array. This allows you to quickly change the color once for the entire plotting, changing only a small array of colors using the [PlotIndexSetInteger\(\)](#) function.

Note that initially for `plot1` with `DRAW_COLOR_LINE` the properties are set using the compiler directive `#property`, and then in the [OnCalculate\(\)](#) function these three properties are set randomly.

The N and Length (the length of color segments in bars) parameters are set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

DRAW_COLOR_SECTION

The DRAW_COLOR_SECTION style is a color version of [DRAW_SECTION](#), but unlike the latter, it allows drawing sections of different colors. The DRAW_COLOR_SECTION style, like all color styles with the word **COLOR** in their title, contains an additional special indicator buffer that stores the color index (number) from a specially set array of colors. Thus, the color of each section can be defined by specifying the color index of the index of the bar that corresponds to the section end.

The width, color and style of the sections can be specified like for the [DRAW_SECTION](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

Sections are drawn from one non-empty value to another non-empty value of the indicator buffer, empty values are ignored. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property: For example, if the indicator should be drawn as a sequence of sections on non-zero values, then you need to set the zero value as an empty one:

```
//--- The 0 (empty) value will not participate in drawing  
PlotIndexSetDouble(index_of_plot_DRAW_COLOR_SECTION, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to the elements that should not be plotted.

The number of buffers required for plotting DRAW_COLOR_SECTION is 2.

- one buffer to store the indicator values used for drawing a line;
- one buffer to store the color index, which is used to draw the section (it makes sense to set only non-empty values).

Colors can be specified by the compiler directive [#property indicator_color1](#) separated by a comma. The number of colors cannot exceed 64.

An example of the indicator that draws colored sections each 5 bars long, using the High price values. The color, width and style of sections change randomly every N ticks.

Note that initially for `plot1` with `DRAW_COLOR_SECTION` 8 colors are set using the compiler directive `#property`. Then in the `OnCalculate()` function, colors are set randomly from the array of colors `colors[]`.

The `N` parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

DRAW_COLOR_HISTOGRAM

The DRAW_COLOR_HISTOGRAM style draws a histogram as a sequence of colored columns from zero to a specified value. Values are taken from the indicator buffer. Each column can have its own color from a predefined set of colors.

The width, color and style of the histogram can be specified like for the [DRAW_HISTOGRAM](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

Since a column from the zero level is drawn on each bar, DRAW_COLOR_HISTOGRAM should better be used in a separate chart window. Most often this type of plotting is used to create indicators of the oscillator type, for example, [Awesome Oscillator](#) or [Market Facilitation Index](#). For the empty non-displayable values the zero value should be specified.

The number of buffers required for plotting DRAW_COLOR_HISTOGRAM is 2.

- one buffer for storing a non-zero value of the vertical segment on each bar, the second end of the segment is always on the zero line of the indicator;
- one buffer to store the color index, which is used to draw the section (it makes sense to set only non-empty values).

Colors can be specified using the compiler directive #property indicator_color1 separated by a comma. The number of colors cannot exceed 64.

An example of the indicator that draws a sinusoid of a specified color based on the [MathSin\(\) function](#). The color, width and style of all histogram columns change randomly each N ticks. The bars parameter specifies the period of the sinusoid, that is after the specified number of bars the sinusoid will repeat the cycle.

Please note that for `plot1` with the DRAW_COLOR_HISTOGRAM style, 5 colors are set using the compiler directive `#property`, and then in the [OnCalculate\(\)](#) function the colors are selected randomly

from the 14 colors stored in the colors[] array. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

DRAW_COLOR_HISTOGRAM2

The DRAW_COLOR_HISTOGRAM2 style draws a histogram of a specified color - vertical segments using the values of two indicator buffers. But unlike the one-color DRAW_HISTOGRAM2, in this style each column of the histogram can have its own color from a predefined set. The values of all the segments are taken from the indicator buffer.

The width, style and color of the histogram can be specified like for the [DRAW_HISTOGRAM2](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows changing the look of the histogram based on the current situation.

The DRAW_COLOR_HISTOGRAM2 style can be used in a separate subwindow of a chart and in its main window. For empty values nothing is drawn, all the values in the indicator buffers need to be set explicitly. Buffers are not initialized with empty values.

The number of buffers required for plotting DRAW_COLOR_HISTOGRAM2 is 3:

- two buffers to store the upper and lower end of the vertical segment on each bar;
- one buffer to store the color index, which is used to draw the segment (it makes sense to set only non-empty values).

An example of the indicator that draws a histogram of a specified color between the High and Low prices. For each day of week, the histogram lines have a different color. The color of the day, width and style of the histogram change randomly each N ticks.

Please note that for `plot1` with the DRAW_COLOR_HISTOGRAM2 style, 5 colors are set using the compiler directive `#property`, and then in the [OnCalculate\(\)](#) function the colors are selected randomly from the 14 colors stored in the `colors[]` array.

The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

```

DRAW_COLOR_ARROW

The DRAW_COLOR_ARROW style draws colored arrows (symbols of the set [Wingdings](#)) based on the value of the indicator buffer. In contrast to DRAW_ARROW, in this style it is possible to set a color from a predefined set of colors specified by the [indicator_color1](#) property for each symbol.

The width and color of the symbols can be specified like for the [DRAW_ARROW](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows changing the look of an indicator based on the current situation.

The symbol code is set using the [PLOT_ARROW](#) property.

```
//--- Define the symbol code from the Wingdings font to draw in PLOT_ARROW
PlotIndexSetInteger(0,PLOT_ARROW,code);
```

The default value of PLOT_ARROW=159 (a circle).

Each arrow is actually a symbol that has the height and the anchor point, and can cover some important information on a chart (for example, the closing price at the bar). Therefore, we can additionally specify the vertical shift in pixels, which does not depend on the scale of the chart. The arrows will be shifted down by the specified number of pixels, although the values of the indicator will remain the same:

```
//--- Set the vertical shift of arrows in pixels
PlotIndexSetInteger(0,PLOT_ARROW_SHIFT,shift);
```

A negative value of PLOT_ARROW_SHIFT means the shift of arrows upwards, a positive values shifts the arrow down.

The DRAW_COLOR_ARROW style can be used in a separate subwindow of a chart and in its main window. Empty values are not drawn and do not appear in the "Data Window", all the values in the indicator buffers should be set explicitly. Buffers are not initialized with a zero value.

```
//--- Set an empty value
PlotIndexSetDouble(DRAW_COLOR_ARROW_plot_index,PLOT_EMPTY_VALUE,0);
```

The number of buffers required for plotting DRAW_COLOR_ARROW is 2.

- a buffer to store the value of the price which is used to draw the symbol (plus a shift in pixels, given in the PLOT_ARROW_SHIFT property);
- a buffer to store the color index, which is used to draw an arrow (it makes sense to set only non-empty values).

An example of the indicator, which draws arrows on each bar with the close price higher than the close price of the previous bar. The width, shift and symbol code of **all** arrows are changed randomly every N ticks. The color of the symbol depends on the number of the bar on which it is drawn.

In the example, for `plot1` with the `DRAW_COLOR_ARROW` style, the properties, color and size are specified using the compiler directive `#property`, and then in the `OnCalculate()` function the properties are set randomly. The `N` parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Please note that initially 8 colors are set using the compiler directive `#property`, and then in the `OnCalculate()` function, the color is set randomly from the 14 colors that are stored in the `colors[]` array.

DRAW_COLOR_ZIGZAG

The `DRAW_COLOR_ZIGZAG` style draws segments of different colors, using the values of two indicator buffers. This style is a colored version of [DRAW_ZIGZAG](#), i.e. allows specifying for each segment an individual color from the predefined set of colors. The segments are plotted from a value in the first buffer to a value in the second indicator buffer. None of the buffers can contain only empty values, since in this case nothing is plotted.

The width, color and style of the line can be specified like for the [DRAW_ZIGZAG](#) style - using [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

Sections are drawn from a non-empty value of one buffer to a non-empty value of another indicator buffer. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property:

```
//--- The 0 (empty) value will not participate in drawing
PlotIndexSetDouble(index_of_plot_DRAW_COLOR_ZIGZAG, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the of the indicator buffers, set an empty value in a buffer to skip bars.

The number of buffers required for plotting `DRAW_COLOR_ZIGZAG` is 3:

- two buffers to store the values of ends of the zigzag sections;
- one buffer to store the color index, which is used to draw the section (it makes sense to set only non-empty values).

An example of the indicator that plots a saw based on the High and Low prices. The color, width and style of the zigzag lines change randomly every N ticks.

Please note that for **plot1** with the `DRAW_COLOR_ZIGZAG` style, 8 colors are set using the compiler directive `#property`, and then in the `OnCalculate()` function the color is selected randomly from the 14 colors stored in the `colors[]` array.

The `N` parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

DRAW_COLOR_BARS

The DRAW_COLOR_BARS style draws bars on the values of four indicator buffers, which contain the Open, High, Low and Close prices. This style is an advanced version of [DRAW_BARS](#) and allows specifying for each bar an individual color from the predefined set of colors. It used for creating custom indicators as bars, including those in a separate subwindow of a chart and on other financial instruments.

The color of bars can be set using the [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of all four indicator buffers are set. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property:

```
//--- The 0 (empty) value will not participate in drawing  
PlotIndexSetDouble(index_of_plot_DRAW_COLOR_BARS,PLOT_EMPTY_VALUE,0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of buffers required for plotting DRAW_COLOR_BARS is 5:

- four buffer to store the values of Open, High, Low and Close;
- one buffer to store the color index, which is used to draw a bar (it makes sense to set it only for the bars that will be drawn).

All buffers for the plotting should go one after the other in the given order: Open, High, Low, Close and the color buffer. None of the price buffers can contain only null values, since in this case nothing is plotted.

An example of the indicator that draws bars on a selected financial instrument in a separate window. The color of bars changes randomly every N ticks. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Please note that for `plot1` with the `DRAW_COLOR_BARS` style, 8 colors are set using the compiler directive `#property`, and then in the `OnCalculate()` function the color is selected randomly from the 14 colors stored in the `colors[]` array.

```

DRAW_COLOR_CANDLES

The DRAW_COLOR_CANDLES style, like [DRAW_CANDLES](#), draws candlesticks using the values of four indicator buffers, which contain Open, High, Low and Close prices. In addition, it allows specifying a color for each candlestick from a given set. For this purpose, the style has a special color buffer that stores color indexes for each bar. It used for creating custom indicators as a sequence of candlesticks, including those in a separate subwindow of a chart and on other financial instruments.

The number of colors of candlesticks can be set using the [compiler directives](#) or dynamically using the [PlotIndexSetInteger\(\)](#) function. Dynamic changes of the plotting properties allows "to enliven" indicators, so that their appearance changes depending on the current situation.

The indicator is drawn only to those bars, for which non-empty values of four price buffers of the indicator are set. To specify what value should be considered as "empty", set this value in the [PLOT_EMPTY_VALUE](#) property:

```
//--- The 0 (empty) value will not participate in drawing  
PlotIndexSetDouble(index_of_plot_DRAW_COLOR_CANDLES, PLOT_EMPTY_VALUE, 0);
```

Always explicitly fill in the values of the indicator buffers, set an empty value in a buffer to skip bars.

The number of required buffers for plotting DRAW_COLOR_CANDLES is 5:

- four buffer to store the values of Open, High, Low and Close;
- one buffer to store the color index, which is used to draw a candlestick (it makes sense to set it only for the candlesticks that will be drawn).

All buffers for the plotting should go one after the other in the given order: Open, High, Low, Close and the color buffer. None of the price buffers can contain only empty values, since in this case nothing is plotted.

An example of the indicator that draws candlesticks for a selected financial instrument in a separate window. The color of candlesticks changes randomly every N ticks. The N parameter is set in [external parameters](#) of the indicator for the possibility of manual configuration (the Parameters tab in the indicator's Properties window).

Please note that for `plot1`, the color is set using the compiler directive `#property`, and then in the `OnCalculate()` function the color is set randomly from an earlier prepared list.

Connection between Indicator Properties and Corresponding Functions

Every custom indicator has numerous [properties](#), some of which are obligatory and are always positioned at the beginning of description. They are the following properties:

- indication of a window to plot the indicator - `indicator_separate_window` or `indicator_chart_window`;
- number of indicator buffers - `indicator_buffers`;
- number of plots of the indicator - `indicator_plots`.

Also there are other properties that can be set both through [preprocessor](#) directives and through functions intended for custom indicator creation. These properties and corresponding functions are described in the following table.

Directives for properties of indicator subwindow	Functions of IndicatorSet...() type	Description of the adjusted property of the subwindow
<code>indicator_height</code>	IndicatorSetInteger (INDICATOR_INDICATOR_HEIGHT , nHeight)	The fixed value of the subwindow height
<code>indicator_minimum</code>	IndicatorSetDouble (INDICATOR_MINIMUM , dMaxValue)	Minimal value of the vertical axis
<code>indicator_maximum</code>	IndicatorSetDouble (INDICATOR_MAXIMUM , dMinValue)	Maximal value of the vertical axis
<code>indicator_levelN</code>	IndicatorSetDouble (INDICATOR_LEVELVALUE , N-1, nLevelValue)	Vertical axis value for N level
no preprocessor directive	IndicatorSetString (INDICATOR_LEVELTEXT , N-1, sLevelName)	Name of a displayed level
<code>indicator_levelcolor</code>	IndicatorSetInteger (INDICATOR_LEVELCOLOR , N-1, nLevelColor)	Color of N level
<code>indicator_levelwidth</code>	IndicatorSetInteger (INDICATOR_LEVELWIDTH , N-1, nLevelWidth)	Line width for N level
<code>indicator_levelstyle</code>	IndicatorSetInteger (INDICATOR_LEVELSTYLE , N-1, nLevelStyle)	Line style for N level
Directives for plotting properties	Functions of PlotIndexSet...() type	Description of the adjusted property of a plot
<code>indicator_labelN</code>	PlotIndexSetString (N-1, PLOT_LABEL , sLabel)	Short name of the number N plot. It is displayed in

Directives for properties of indicator subwindow	Functions of IndicatorSet...() type	Description of the adjusted property of the subwindow
		DataWindow and in the pop-up tooltip when pointing the mouse cursor over it
indicator_colorN	PlotIndexSetInteger (N-1, PLOT_LINE_COLOR , nColor)	Line color for N plot
indicator_styleN	PlotIndexSetInteger (N-1, PLOT_LINE_STYLE , nType)	Line style for N plot
indicator_typeN	PlotIndexSetInteger (N-1, PLOT_DRAW_TYPE , nType)	Line type for N plot
indicator_widthN	PlotIndexSetInteger (N-1, PLOT_LINE_WIDTH , nWidth)	Line width for N plot
Common indicator properties	Functions of IndicatorSet...() type	Description
no preprocessor directive	IndicatorSetString (INDICATOR_SHORTNAME , sShortName)	Sets the convenient short name of the indicator that will be displayed in the list of indicators (opened in the terminal by pressing Ctrl+I).
no preprocessor directive	IndicatorSetInteger (INDICATOR_DIGITS , nDigits)	Sets required accuracy of display of indicator values - number of decimal places
no preprocessor directive	IndicatorSetInteger (INDICATOR_LEVELS , nLevels)	Sets number of levels in the indicator window
indicator_applied_price	No function, the property can be set only by the preprocessor directive.	Default price type used for the indicator calculation. It is specified when necessary, only if OnCalculate() of the first type is used. The property value can also be set from the dialog of indicator properties in the "Parameters" tab - "Apply to" .

It should be noted that numeration of levels and plots in preprocessor terms starts with one, while numeration of the same properties at using functions starts with zero, i.e. the indicated value must be by 1 less than that indicated for #property.

There are several directives, for which there are no corresponding functions:

Directive	Description
indicator_chart_window	Indicator is displayed in the main window

Directive	Description
indicator_separate_window	Indicator is displayed in a separate subwindow
indicator_buffers	Number of required indicator buffers
indicator_plots	Number of plots in the indicator

SetIndexBuffer

The function binds a specified indicator buffer with one-dimensional dynamic array of the [double](#) type.

```
bool SetIndexBuffer(
    int          index,          // buffer index
    double       buffer[],       // array
    ENUM_INDEXBUFFER_TYPE data_type // what will be stored
);
```

Parameters

index

[in] Number of the indicator buffer. The numbering starts with 0. The number must be less than the value declared in [#property indicator_buffers](#).

buffer[]

[in] An array declared in the custom indicator program.

data_type

[in] Type of data stored in the indicator array. By default it is [INDICATOR_DATA](#) (values of the calculated indicator). It may also take the value of [INDICATOR_COLOR_INDEX](#); in this case this buffer is used for storing color indexes for the previous indicator buffer. You can specify up to 64 [colors](#) in the [#property indicator_colorN](#) line. The [INDICATOR_CALCULATIONS](#) value means that the buffer is used in intermediate calculations of the indicator and is not intended for drawing.

Return Value

If successful, returns [true](#), otherwise - [false](#).

Note

After binding, the dynamic array `buffer[]` will be indexed as in common arrays, even if the indexing of [timeseries](#) is pre-installed for the bound array. If you want to change the order of access to elements of the indicator array, use the [ArraySetAsSeries\(\)](#) function **after binding the array using the `SetIndexBuffer()` function**. Please note that you can't change the size for dynamic arrays set as indicator buffers by the function [SetIndexBuffer\(\)](#). For indicator buffers, all operations of size changes are performed by the executing sub-system of the terminal.

Example:

```

[Custom Indicator Properties](#), [Access to timeseries and indicators](#)

IndicatorSetDouble

The function sets the value of the corresponding indicator property. Indicator property must be of the double type. There are two variants of the function.

Call with specifying the property identifier.

```
bool IndicatorSetDouble(
    int    prop_id,           // identifier
    double prop_value        // value to be set
);
```

Call with specifying the property identifier and modifier.

```
bool IndicatorSetDouble(
    int    prop_id,           // identifier
    int    prop_modifier,    // modifier
    double prop_value        // value to be set
)
```

Parameters

prop_id

[in] Identifier of the indicator property. The value can be one of the values of the [ENUM_CUSTOMIND_PROPERTY_DOUBLE](#) enumeration.

prop_modifier

[in] Modifier of the specified property. Only level properties require a modifier. Numbering of levels starts from 0. It means that in order to set property for the second level you need to specify 1 (1 less than when using [compiler directive](#)).

prop_value

[in] Value of property.

Return Value

In case of successful execution, returns true, otherwise - false.

Note

Numbering of properties (modifiers) starts from 1 (one) when using the #property directive, while the function uses numbering from 0 (zero). In case the level number is set incorrectly, [indicator display](#) can differ from the intended one.

For example, the first level value for the indicator in a separate subwindow can be set in two ways:

- property indicator_level1 50 - the value of 1 is used for specifying the level number,
- IndicatorSetDouble(INDICATOR_LEVELVALUE, 0, 50) - 0 is used for specifying the first level.

Example: indicator that turns upside down the maximum and minimum values of the indicator window and values of levels on which the horizontal lines are placed.

```
#property indicator_separate_window
//--- set the maximum and minimum values for the indicator window
#property indicator_minimum 0
#property indicator_maximum 100
//--- display three horizontal levels in a separate indicator window
#property indicator_level1 25
#property indicator_level2 50
#property indicator_level3 75
//--- set thickness of horizontal levels
#property indicator_levelwidth 1
//--- set style of horizontal levels
#property indicator_levelstyle STYLE_DOT
//+-----+
//| Custom indicator initialization function |
//+-----+
int OnInit()
{
//--- set descriptions of horizontal levels
IndicatorSetString(INDICATOR_LEVELTEXT,0,"First Level (index 0)");
IndicatorSetString(INDICATOR_LEVELTEXT,1,"Second Level (index 1)");
IndicatorSetString(INDICATOR_LEVELTEXT,2,"Third Level (index 2)");
//--- set the short name for indicator
IndicatorSetString(INDICATOR_SHORTNAME,"IndicatorSetDouble() Demo");
//--- set color for each level
IndicatorSetInteger(INDICATOR_LEVELCOLOR,0,clrBlue);
IndicatorSetInteger(INDICATOR_LEVELCOLOR,1,clrGreen);
IndicatorSetInteger(INDICATOR_LEVELCOLOR,2,clrRed);
```

```

//---
    return(INIT_SUCCEEDED);
}
//+-----+
//| Custom indicator iteration function |
//+-----+

int OnCalculate(const int rates_total,

IndicatorSetInteger

The function sets the value of the corresponding indicator property. Indicator property must be of the int or color type. There are two variants of the function.

Call with specifying the property identifier.

```
bool IndicatorSetInteger(  
    int prop_id,           // identifier  
    int prop_value         // value to be set  
);
```

Call with specifying the property identifier and modifier.

```
bool IndicatorSetInteger(  
    int prop_id,           // identifier  
    int prop_modifier,     // modifier  
    int prop_value         // value to be set  
);
```

Parameters

prop_id

[in] Identifier of the indicator property. The value can be one of the values of the [ENUM_CUSTOMIND_PROPERTY_INTEGER](#) enumeration.

prop_modifier

[in] Modifier of the specified property. Only level properties require a modifier.

prop_value

[in] Value of property.

Return Value

In case of successful execution, returns true, otherwise - false.

Note

Numbering of properties (modifiers) starts from 1 (one) when using the #property directive, while the function uses numbering from 0 (zero). In case the level number is set incorrectly, [indicator display](#) can differ from the intended one.

For example, in order to set thickness of the first horizontal line use zeroth index:

- IndicatorSetInteger(INDICATOR_LEVELWIDTH, 0, 5) - index 0 is used to set thickness of the first level.

Example: indicator that sets color, style and thickness of the indicator horizontal lines.

```
#property indicator_separate_window
#property indicator_minimum 0
#property indicator_maximum 100
//--- display three horizontal levels in a separate indicator window
#property indicator_level1 20
#property indicator_level2 50
#property indicator_level3 80
//--- set thickness of horizontal levels
#property indicator_levelwidth 5
//--- set color of horizontal levels

IndicatorSetString

The function sets the value of the corresponding indicator property. Indicator property must be of the string type. There are two variants of the function.

Call with specifying the property identifier.

```
bool IndicatorSetString(  
    int     prop_id,           // identifier  
    string  prop_value        // value to be set  
);
```

Call with specifying the property identifier and modifier.

```
bool IndicatorSetString(  
    int     prop_id,           // identifier  
    int     prop_modifier,     // modifier  
    string  prop_value        // value to be set  
);
```

Parameters

prop_id

[in] Identifier of the indicator property. The value can be one of the values of the [ENUM_CUSTOMIND_PROPERTY_STRING](#) enumeration.

prop_modifier

[in] Modifier of the specified property. Only level properties require a modifier.

prop_value

[in] Value of property.

Return Value

In case of successful execution, returns true, otherwise - false.

Note

Numbering of properties (modifiers) starts from 1 (one) when using the #property directive, while the function uses numbering from 0 (zero). In case the level number is set incorrectly, [indicator display](#) can differ from the intended one.

For example, in order to set description of the first horizontal line use zeroth index:

- `IndicatorSetString(INDICATOR_LEVELTEXT, 0, "First Level")` - index 0 is used to set text description of the first level.

Example: indicator that sets text labels to the indicator horizontal lines.

```
#property indicator_separate_window
#property indicator_minimum 0
#property indicator_maximum 100
//--- display three horizontal levels in a separate indicator window
#property indicator_level1 30
#property indicator_level2 50
#property indicator_level3 70
//--- set color of horizontal levels
#property indicator_levelcolor clrRed
//--- set style of horizontal levels
#property indicator_levelstyle STYLE_SOLID
//+-----+
//| Custom indicator initialization function |
//+-----+
int OnInit()

[Custom Indicator Properties](#), [Program Properties \(#property\)](#)

PlotIndexSetDouble

The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the double type.

```
bool PlotIndexSetDouble(  
    int     plot_index,    // plotting style index  
    int     prop_id,       // property identifier  
    double  prop_value     // value to be set  
);
```

Parameters

plot_index

[in] Index of the [graphical plotting](#)

prop_id

[in] The value can be one of the values of the [ENUM_PLOT_PROPERTY_DOUBLE](#) enumeration.

prop_value

[in] The value of the property.

Return Value

If successful, returns [true](#), otherwise [false](#).

PlotIndexSetInteger

The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the int, char, bool or color type. There are 2 variants of the function.

Call indicating identifier of the property.

```
bool PlotIndexSetInteger(  
    int plot_index,      // plotting style index  
    int prop_id,         // property identifier  
    int prop_value       // value to be set  
);
```

Call indicating the identifier and modifier of the property.

```
bool PlotIndexSetInteger(  
    int plot_index,      // plotting style index  
    int prop_id,         // property identifier  
    int prop_modifier,   // property modifier  
    int prop_value       // value to be set  
);
```

Parameters

plot_index

[in] Index of the [graphical plotting](#)

prop_id

[in] The value can be one of the values of the [ENUM_PLOT_PROPERTY_INTEGER](#) enumeration.

prop_modifier

[in] Modifier of the specified property. Only color index properties require a modifier.

prop_value

[in] The value of the property.

Return Value

If successful, returns [true](#), otherwise [false](#).

Example: an indicator that draws a three-color line. The color scheme changes every 5 ticks.

```
#property indicator_chart_window
#property indicator_buffers 2
#property indicator_plots 1
//---- plot ColorLine
#property indicator_label1 "ColorLine"
#property indicator_type1 DRAW_COLOR_LINE
#property indicator_color1 clrRed,clrGreen,clrBlue

//+-----+

```

PlotIndexSetString

The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the string type.

```
bool PlotIndexSetString(  
    int     plot_index,    // plotting style index  
    int     prop_id,       // property identifier  
    string  prop_value     // value to be set  
);
```

Parameters

plot_index

[in] Index of [graphical plot](#)

prop_id

[in] The value can be one of the values of the [ENUM_PLOT_PROPERTY_STRING](#) enumeration.

prop_value

[in] The value of the property.

Return Value

If successful, returns [true](#), otherwise [false](#).

PlotIndexGetInteger

The function sets the value of the corresponding property of the corresponding indicator line. The indicator property must be of the int, color, bool or char type. There are 2 variants of the function.

Call indicating identifier of the property.

```
int PlotIndexGetInteger(  
    int plot_index,      // plotting style index  
    int prop_id,         // property identifier  
);
```

Call indicating the identifier and modifier of the property.

```
int PlotIndexGetInteger(  
    int plot_index,      // plotting index  
    int prop_id,         // property identifier  
    int prop_modifier    // property modifier  
)
```

Parameters

plot_index

[in] Index of the [graphical plotting](#)

prop_id

[in] The value can be one of the values of the [ENUM_PLOT_PROPERTY_INTEGER](#) enumeration.

prop_modifier

[in] Modifier of the specified property. Only color index properties require a modifier.

Note

Function is designed to extract the settings of drawing of the appropriate indicator line. The function works in tandem with the function [PlotIndexSetInteger](#) to copy the drawing properties of one line to another.

Example: an indicator that colors candles depending on the day of the week. Colors for each day are set in a programmatically.

```
#property indicator_separate_window
#property indicator_buffers 5
#property indicator_plots 1
//---- plot ColorCandles
#property indicator_label1 "ColorCandles"
#property indicator_type1 DRAW_COLOR_CANDLES
#property indicator_style1 STYLE_SOLID
#property indicator_width1 1
//--- indicator buffers
double      OpenBuffer[];
double      HighBuffer[];
double      LowBuffer[];
double      CloseBuffer[];
double      ColorCandlesColors[];
color       ColorOfDay[6]={CLR_NONE,clrMediumSlateBlue,
                           clrDarkGoldenrod,clrForestGreen,clrBlueViolet,clrRed};

//+-----+
//| Custom indicator initialization function |
//+-----+
void OnInit()
{
//--- indicator buffers mapping
SetIndexBuffer(0,OpenBuffer,INDICATOR_DATA);
SetIndexBuffer(1,HighBuffer,INDICATOR_DATA);
SetIndexBuffer(2,LowBuffer,INDICATOR_DATA);
SetIndexBuffer(3,CloseBuffer,INDICATOR_DATA);
SetIndexBuffer(4,ColorCandlesColors,INDICATOR_COLOR_INDEX);
//--- set number of colors in color buffer
```

```

    PlotIndexSetInteger(0,PLOT_COLOR_INDEXES,6);
//--- set colors for color buffer
    for(int i=1;i<6;i++)
        PlotIndexSetInteger(0,PLOT_LINE_COLOR,i,ColorOfDay[i]);
//--- set accuracy
    IndicatorSetInteger(INDICATOR_DIGITS,_Digits);
    printf("We have %u colors of days",PlotIndexGetInteger(0,PLOT_COLOR_INDEXES));
//---
    }
//+-----+
//| Custom indicator iteration function |
//+-----+
int OnCalculate(const int rates_total,
               const int prev_calculated,
               const datetime &time[],
               const double &open[],
               const double &high[],
               const double &low[],
               const double &close[],
               const long &tick_volume[],
               const long &volume[],
               const int &spread[])
{
//---
    int i;
    MqlDateTime t;
//----
    if(prev_calculated==0) i=0;
    else i=prev_calculated-1;
//----
    while(i<rates_total)
    {
        OpenBuffer[i]=open[i];
        HighBuffer[i]=high[i];
        LowBuffer[i]=low[i];
        CloseBuffer[i]=close[i];
        //--- set color for every candle
        TimeToStruct(time[i],t);
        ColorCandlesColors[i]=t.day_of_week;
        //---
        i++;
    }
//--- return value of prev_calculated for next call
    return(rates_total);
}
//+-----+

```

Object Functions

This is the group of functions intended for working with graphic objects relating to any specified chart.

The functions defining the properties of graphical objects, as well as [ObjectCreate\(\)](#) and [ObjectMove\(\)](#) operations for creating and moving objects along the chart are actually used for sending commands to the chart. If these functions are executed successfully, the command is included in the common queue of the chart events. Visual changes in the properties of graphical objects are implemented when handling the queue of the chart events.

Thus, do not expect an immediate visual update of graphical objects after calling these functions. Generally, the graphical objects on the chart are updated automatically by the terminal following the change events - a new quote arrival, resizing the chart window, etc. Use [ChartRedraw\(\)](#) function to forcefully update the graphical objects.

Function	Action
ObjectCreate	Creates an object of the specified type in a specified chart
ObjectName	Returns the name of an object of the corresponding type in the specified chart (specified chart subwindow)
ObjectDelete	Removes the object with the specified name from the specified chart (from the specified chart subwindow)
ObjectsDeleteAll	Removes all objects of the specified type from the specified chart (from the specified chart subwindow)
ObjectFind	Searches for an object with the specified ID by the name
ObjectGetTimeByValue	Returns the time value for the specified object price value
ObjectGetValueByTime	Returns the price value of an object for the specified time
ObjectMove	Changes the coordinates of the specified object anchor point
ObjectsTotal	Returns the number of objects of the specified type in the specified chart (specified chart subwindow)
ObjectGetDouble	Returns the double value of the corresponding object property
ObjectGetInteger	Returns the integer value of the corresponding object property
ObjectGetString	Returns the string value of the corresponding object property
ObjectSetDouble	Sets the value of the corresponding object property
ObjectSetInteger	Sets the value of the corresponding object property
ObjectSetString	Sets the value of the corresponding object property
TextSetFont	Sets the font for displaying the text using drawing methods (Arial 20 used by default)
TextOut	Transfers the text to the custom array (buffer) designed for creation of a graphical resource

Function	Action
TextGetSize	Returns the string's width and height at the current font settings

Every graphical object should have a name unique within one [chart](#), including its subwindows. Changing of a name of a graphic object generates two events: event of deletion of an object with the old name, and event of creation of an object with a new name.

After an object is created or an [object property](#) is modified it is recommended to call the [ChartRedraw\(\)](#) function, which commands the client terminal to forcibly draw a chart (and all [visible](#) objects in it).

ObjectCreate

The function creates an object with the specified name, type, and the initial coordinates in the specified chart subwindow. During creation up to 30 coordinates can be specified.

```
bool  ObjectCreate(
    long      chart_id,      // chart identifier
    string    name,         // object name
    ENUM_OBJECT type,       // object type
    sub_window nwin,        // window index
    datetime  time1,        // time of the first anchor point
    double    price1,       // price of the first anchor point
    ...
    datetime  timeN=0,      // time of the N-th anchor point
    double    priceN=0,     // price of the N-th anchor point
    ...
    datetime  time30=0,     // time of the 30th anchor point
    double    price30=0     // price of the 30th anchor point
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object. The name must be unique within a chart, including its subwindows.

type

[in] Object type. The value can be one of the values of the [ENUM_OBJECT](#) enumeration.

sub_window

[in] Number of the chart subwindow. 0 means the main chart window. The specified subwindow must exist, otherwise the function returns false.

time1

[in] The time coordinate of the first anchor.

price1

[in] The price coordinate of the first anchor point.

timeN=0

[in] The time coordinate of the N-th anchor point.

priceN=0

[in] The price coordinate of the N-th anchor point.

time30=0

[in] The time coordinate of the thirtieth anchor point.

price30=0

[in] The price coordinate of the thirtieth anchor point.

Return Value

The function returns true if the command has been successfully added to the queue of the specified chart, or false otherwise. If an object has already been created, an attempt is made to change its coordinates.

Note

An asynchronous call is always used for `ObjectCreate()`, that is why the function only returns the results of adding the command to a chart queue. In this case, true only means that the command has been successfully enqueued, but the result of its execution is unknown.

To check the command execution result, you can use the [ObjectFind\(\)](#) function or any other function that requests object properties, such as `ObjectGetXXX`. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result (due to the synchronous call), and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

An object name should not exceed 63 characters.

The numbering of the chart subwindows (if there are subwindows with indicators in the chart) starts with 1. The main chart window of the chart is and always has index 0.

The large number of anchor points (up to 30) is implemented for future use. At the same time, the limit of 30 possible anchor points for graphical objects is determined by the limit on the number of parameters (not more than 64) that can be used when calling a function.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the [OnChartEvent\(\)](#) function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.

There is a certain number of anchor points that must be specified when creating each [object type](#):

ID	Description	Anchor Points
OBJ_VLINE	Vertical Line	One anchor point. Actually only the time coordinate is used.
OBJ_HLINE	Horizontal Line	One anchor point. Actually only the price coordinate is used.
OBJ_TREND	Trend Line	Two anchor points.
OBJ_TRENDBYANGLE	Trend Line By Angle	Two anchor points.
OBJ_CYCLES	Cycle Lines	Two anchor points.
OBJ_ARROWED_LINE	Arrowed Line	Two anchor points.
OBJ_CHANNEL	Equidistant Channel	Three anchor points.
OBJ_STDDEVCHANNEL	Standard Deviation Channel	Two anchor points.
OBJ_REGRESSION	Linear Regression Channel	Two anchor points.

ID	Description	Anchor Points
<u>OBJ_PITCHFORK</u>	Andrews' Pitchfork	Three anchor points.
<u>OBJ_GANNLINE</u>	Gann Line	Two anchor points.
<u>OBJ_GANNFAN</u>	Gann Fan	Two anchor points.
<u>OBJ_GANNGRID</u>	Gann Grid	Two anchor points.
<u>OBJ_FIBO</u>	Fibonacci Retracement	Two anchor points.
<u>OBJ_FIBOTIMES</u>	Fibonacci Time Zones	Two anchor points.
<u>OBJ_FIBOFAN</u>	Fibonacci Fan	Two anchor points.
<u>OBJ_FIBOARC</u>	Fibonacci Arcs	Two anchor points.
<u>OBJ_FIBOCHANNEL</u>	Fibonacci Channel	Three anchor points.
<u>OBJ_EXPANSION</u>	Fibonacci Expansion	Three anchor points.
<u>OBJ_ELLIOTWAVE5</u>	Elliott Motive Wave	Five anchor points.
<u>OBJ_ELLIOTWAVE3</u>	Elliott Correction Wave	Three anchor points.
<u>OBJ_RECTANGLE</u>	Rectangle	Two anchor points.
<u>OBJ_TRIANGLE</u>	Triangle	Three anchor points.
<u>OBJ_ELLIPSE</u>	Ellipse	Three anchor points.
<u>OBJ_ARROW_THUMB_UP</u>	Thumbs Up	One anchor point.
<u>OBJ_ARROW_THUMB_DOWN</u>	Thumbs Down	One anchor point.
<u>OBJ_ARROW_UP</u>	Arrow Up	One anchor point.
<u>OBJ_ARROW_DOWN</u>	Arrow Down	One anchor point.
<u>OBJ_ARROW_STOP</u>	Stop Sign	One anchor point.
<u>OBJ_ARROW_CHECK</u>	Check Sign	One anchor point.
<u>OBJ_ARROW_LEFT_PRICE</u>	Left Price Label	One anchor point.
<u>OBJ_ARROW_RIGHT_PRICE</u>	Right Price Label	One anchor point.
<u>OBJ_ARROW_BUY</u>	Buy Sign	One anchor point.
<u>OBJ_ARROW_SELL</u>	Sell Sign	One anchor point.
<u>OBJ_ARROW</u>	Arrow	One anchor point.
<u>OBJ_TEXT</u>	Text	One anchor point.
<u>OBJ_LABEL</u>	Label	Position is set using the <u>OBJPROP_XDISTANCE</u> and <u>OBJPROP_YDISTANCE</u> properties.

ID	Description	Anchor Points
<u>OBJ_BUTTON</u>	Button	Position is set using the <u>OBJPROP_XDISTANCE</u> and <u>OBJPROP_YDISTANCE</u> properties.
<u>OBJ_CHART</u>	Chart	Position is set using the <u>OBJPROP_XDISTANCE</u> and <u>OBJPROP_YDISTANCE</u> properties.
<u>OBJ_BITMAP</u>	Bitmap	One anchor point.
<u>OBJ_BITMAP_LABEL</u>	Bitmap Label	Position is set using the <u>OBJPROP_XDISTANCE</u> and <u>OBJPROP_YDISTANCE</u> properties.
<u>OBJ_EDIT</u>	Edit	Position is set using the <u>OBJPROP_XDISTANCE</u> and <u>OBJPROP_YDISTANCE</u> properties.
<u>OBJ_EVENT</u>	The "Event" object corresponding to an event in the economic calendar	One anchor point. Actually only the time coordinate is used.
<u>OBJ_RECTANGLE_LABEL</u>	The "Rectangle label" object for creating and designing the custom graphical interface.	Position is set using the <u>OBJPROP_XDISTANCE</u> and <u>OBJPROP_YDISTANCE</u> properties.

ObjectName

The function returns the name of the corresponding object in the specified chart, in the specified subwindow, of the specified type.

```
string ObjectName(  
    long  chart_id,           // chart identifier  
    int   pos,               // number in the list of objects  
    int   sub_window=-1,     // window index  
    int   type=-1            // object type  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

pos

[in] Ordinal number of the object according to the specified filter by the number and type of the subwindow.

sub_window=-1

[in] Number of the chart subwindow. 0 means the main chart window, -1 means all the subwindows of the chart, including the main window.

type=-1

[in] Type of the object. The value can be one of the values of the [ENUM_OBJECT](#) enumeration. -1 means all types.

Return Value

Name of the object is returned in case of success.

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the [OnChartEvent\(\)](#) function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.

ObjectDelete

The function removes the object with the specified name from the specified chart.

```
bool ObjectDelete(  
    long    chart_id,    // chart identifier  
    string  name         // object name  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of object to be deleted.

Return Value

The function returns true if the command has been successfully added to the queue of the specified chart, or false otherwise.

Note

An asynchronous call is always used for `ObjectDelete()`, that is why the function only returns the results of adding the command to a chart queue. In this case, true only means that the command has been successfully enqueued, but the result of its execution is unknown.

To check the command execution result, you can use the [ObjectFind\(\)](#) function or any other function that requests object properties, such as `ObjectGetXXX`. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result (due to the synchronous call), and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the [OnChartEvent\(\)](#) function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.

ObjectsDeleteAll

Removes all objects from the specified chart, specified chart subwindow, of the specified type.

```
int ObjectsDeleteAll(  
    long   chart_id,           // chart identifier  
    int    sub_window=-1,     // window index  
    int    type=-1            // object type  
);
```

Removes all objects of the specified type using prefix in object names.

```
int ObjectsDeleteAll(  
    long      chart_id,       // chart ID  
    const string prefix,     // prefix in object name  
    int       sub_window=-1,  // window index  
    int       object_type=-1  // object type  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

prefix

[in] Prefix in object names. All objects whose names start with this set of characters will be removed from chart. You can specify prefix as 'name' or 'name*' - both variants will work the same. If an empty string is specified as the prefix, objects with all possible names will be removed.

sub_window=-1

[in] Number of the chart subwindow. 0 means the main chart window, -1 means all the subwindows of the chart, including the main window.

type=-1

[in] Type of the object. The value can be one of the values of the [ENUM_OBJECT](#) enumeration. -1 means all types.

Return Value

Returns the number of deleted objects. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

ObjectFind

The function searches for an object with the specified name in the chart with the specified ID.

```
int ObjectFind(  
    long    chart_id,    // chart identifier  
    string  name         // object name  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] The name of the searched object.

Return Value

If successful the function returns the number of the subwindow (0 means the main window of the chart), in which the object is found. If the object is not found, the function returns a negative number. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the [OnChartEvent\(\)](#) function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.

ObjectGetTimeByValue

The function returns the time value for the specified price value of the specified object.

```
datetime ObjectGetTimeByValue(  
    long    chart_id,      // chart identifier  
    string  name,          // object name  
    double  value,         // Price  
    int     line_id        // Line number  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

value

[in] Price value.

line_id

[in] Line identifier.

Return Value

The time value for the specified price value of the specified object.

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

An object can have several values in one price coordinate, therefore it is necessary to specify the line number. This function applies only to the following objects:

- Trendline (OBJ_TREND)
- Trendline by angle (OBJ_TRENDBYANGLE)
- Gann line (OBJ_GANNLIN)
- Equidistant channel (OBJ_CHANNEL) - 2 lines
- Linear regression channel (OBJ_REGRESSION) - 3 lines
- Standard deviation channel (OBJ_STDDEVCHANNEL) - 3 lines
- Arrowed line (OBJ_ARROWED_LINE)

See also

[Object Types](#)

ObjectGetValueByTime

The function returns the price value for the specified time value of the specified object.

```
double ObjectGetValueByTime(  
    long      chart_id,      // chart identifier  
    string     name,         // object name  
    datetime   time,         // Time  
    int        line_id       // Line number  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

time

[in] Time value.

line_id

[in] Line ID.

Return Value

The price value for the specified time value of the specified object.

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

An object can have several values in one price coordinate, therefore it is necessary to specify the line number. This function applies only to the following objects:

- Trendline (OBJ_TREND)
- Trendline by angle (OBJ_TRENDBYANGLE)
- Gann line (OBJ_GANNLIN)
- Equidistant channel (OBJ_CHANNEL) - 2 lines
- Linear regression channel (OBJ_REGRESSION) - 3 lines
- Standard deviation channel (OBJ_STDDEVCHANNEL) - 3 lines
- Arrowed line (OBJ_ARROWED_LINE)

See also

[Object Types](#)

ObjectMove

The function changes coordinates of the specified anchor point of the object.

```
bool ObjectMove(  
    long      chart_id,      // chart identifier  
    string     name,         // object name  
    int        point_index,   // anchor point number  
    datetime   time,         // Time  
    double     price          // Price  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

point_index

[in] Index of the anchor point. The number of anchor points depends on the type of object.

time

[in] Time coordinate of the selected anchor point.

price

[in] Price coordinate of the selected anchor point.

Return Value

The function returns true if the command has been successfully added to the queue of the specified chart, or false otherwise.

Note

An asynchronous call is always used for ObjectMove(), that is why the function only returns the results of adding the command to a chart queue. In this case, true only means that the command has been successfully enqueued, but the result of its execution is unknown.

To check the command execution result, you can use a function that requests object properties, such as ObjectGetXXX. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result (due to the synchronous call), and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

ObjectsTotal

The function returns the number of objects in the specified chart, specified subwindow, of the specified type.

```
int ObjectsTotal(  
    long  chart_id,           // chart identifier  
    int   sub_window=-1,     // window index  
    int   type=-1            // object type  
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

sub_window=-1

[in] Number of the chart subwindow. 0 means the main chart window, -1 means all the subwindows of the chart, including the main window.

type=-1

[in] Type of the object. The value can be one of the values of the [ENUM_OBJECT](#) enumeration. -1 means all types.

Return Value

The number of objects.

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

ObjectSetDouble

The function sets the value of the corresponding object property. The object property must be of the [double](#) type. There are 2 variants of the function.

Setting property value, without modifier

```
bool ObjectSetDouble(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id, // property
    double        prop_value    // value
);
```

Setting a property value indicating the modifier

```
bool ObjectSetDouble(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id, // property
    int          prop_modifier, // modifier
    double        prop_value    // value
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

prop_id

[in] ID of the object property. The value can be one of the values of the [ENUM_OBJECT_PROPERTY_DOUBLE](#) enumeration.

prop_modifier

[in] Modifier of the specified property. It denotes the number of the level in [Fibonacci tools](#) and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

prop_value

[in] The value of the property.

Return Value

The function returns true only if the command to change properties of a graphical object has been sent to a chart successfully. Otherwise it returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses an asynchronous call, which means that the function does not wait for the execution of the command that has been added to the queue of the specified chart. Instead, it immediately returns control.

To check the command execution result, you can use a function that requests the specified object property. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result, and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

Example of creating a Fibonacci object and adding a new level in it

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- auxiliary arrays
    double high[],low[],price1,price2;
    datetime time[],time1,time2;
//--- Copy the open prices - 100 latest bars are enough
    int copied=CopyHigh(Symbol(),0,0,100,high);
    if(copied<=0)
    {
        Print("Failed to copy the values of the High price series");
        return;
    }
//--- Copy the close price - 100 latest bars are enough
    copied=CopyLow(Symbol(),0,0,100,low);
    if(copied<=0)
    {
        Print("Failed to copy the values of the Low price series");
        return;
    }
//--- Copy the open time for the last 100 bars
    copied=CopyTime(Symbol(),0,0,100,time);
    if(copied<=0)
    {
        Print("Failed to copy the values of the price series of Time");
        return;
    }
//--- Organize access to the copied data as to timeseries - backwards
    ArraySetAsSeries(high,true);
    ArraySetAsSeries(low,true);
    ArraySetAsSeries(time,true);

//--- Coordinates of the first anchor point of the Fibo object

[Object Types](#), [Object Properties](#)

ObjectSetInteger

The function sets the value of the corresponding object property. The object property must be of the [datetime](#), [int](#), [color](#), [bool](#) or [char](#) type. There are 2 variants of the function.

Setting property value, without modifier

```
bool ObjectSetInteger(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_INTEGER prop_id, // property
    long          prop_value    // value
);
```

Setting a property value indicating the modifier

```
bool ObjectSetInteger(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_INTEGER prop_id, // property
    int           prop_modifier, // modifier
    long          prop_value    // value
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

prop_id

[in] ID of the object property. The value can be one of the values of the [ENUM_OBJECT_PROPERTY_INTEGER](#) enumeration.

prop_modifier

[in] Modifier of the specified property. It denotes the number of the level in [Fibonacci tools](#) and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

prop_value

[in] The value of the property.

Return Value

The function returns true only if the command to change properties of a graphical object has been sent to a chart successfully. Otherwise it returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses an asynchronous call, which means that the function does not wait for the execution of the command that has been added to the queue of the specified chart. Instead, it immediately returns control.

To check the command execution result, you can use a function that requests the specified object property. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result, and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

[Object Types](#), [Object Properties](#)

ObjectSetString

The function sets the value of the corresponding object property. The object property must be of the [string](#) type. There are 2 variants of the function.

Setting property value, without modifier

```
bool ObjectSetString(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_STRING prop_id, // property
    string        prop_value    // value
);
```

Setting a property value indicating the modifier

```
bool ObjectSetString(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_STRING prop_id, // property
    int          prop_modifier, // modifier
    string        prop_value    // value
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

prop_id

[in] ID of the object property. The value can be one of the values of the [ENUM_OBJECT_PROPERTY_STRING](#) enumeration.

prop_modifier

[in] Modifier of the specified property. It denotes the number of the level in [Fibonacci tools](#) and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

prop_value

[in] The value of the property.

Return Value

The function returns true only if the command to change properties of a graphical object has been sent to a chart successfully. Otherwise it returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses an asynchronous call, which means that the function does not wait for the execution of the command that has been added to the queue of the specified chart. Instead, it immediately returns control.

To check the command execution result, you can use a function that requests the specified object property. However, you should keep in mind that such functions are added to the end of the queue of that chart, and they wait for the execution result, and can therefore be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the [OnChartEvent\(\)](#) function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.

ObjectGetDouble

The function returns the value of the corresponding object property. The object property must be of the [double](#) type. There are 2 variants of the function.

1. Immediately returns the property value.

```
double ObjectGetDouble(
    long          chart_id,          // chart identifier
    string        name,              // object name
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id, // property identifier
    int          prop_modifier=0    // property modifier, if required
);
```

2. Returns true or false, depending on the success of the function. If successful, the property value is placed to a receiving variable passed by reference by the last parameter.

```
bool ObjectGetDouble(
    long          chart_id,          // chart identifier
    string        name,              // object name
    ENUM_OBJECT_PROPERTY_DOUBLE prop_id, // property identifier
    int          prop_modifier,      // property modifier
    double&       double_var         // here we accept the property value
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

prop_id

[in] ID of the object property. The value can be one of the values of the [ENUM_OBJECT_PROPERTY_DOUBLE](#) enumeration.

prop_modifier

[in] Modifier of the specified property. For the first variant, the default modifier value is equal to 0. Most properties do not require a modifier. It denotes the number of the level in [Fibonacci tools](#) and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

double_var

[out] Variable of the double type that received the value of the requested property.

Return Value

Value of the double type for the first calling variant.

For the second variant the function returns true, if this property is maintained and the value has been placed into the double_var variable, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

ObjectGetInteger

The function returns the value of the corresponding object property. The object property must be of the [datetime](#), [int](#), [color](#), [bool](#) or [char](#) type. There are 2 variants of the function.

1. Immediately returns the property value.

```
long ObjectGetInteger(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_INTEGER prop_id, // property identifier
    int          prop_modifier=0 // property modifier, if required
);
```

2. Returns true or false, depending on the success of the function. If successful, the property value is placed to a receiving variable passed by reference by the last parameter.

```
bool ObjectGetInteger(
    long          chart_id,      // chart identifier
    string        name,         // object name
    ENUM_OBJECT_PROPERTY_INTEGER prop_id, // property identifier
    int          prop_modifier, // property modifier
    long&         long_var      // here we accept the property value
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

prop_id

[in] ID of the object property. The value can be one of the values of the [ENUM_OBJECT_PROPERTY_INTEGER](#) enumeration.

prop_modifier

[in] Modifier of the specified property. For the first variant, the default modifier value is equal to 0. Most properties do not require a modifier. It denotes the number of the level in [Fibonacci tools](#) and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

long_var

[out] Variable of the long type that receives the value of the requested property.

Return Value

The long value for the first calling variant.

For the second variant the function returns true, if this property is maintained and the value has been placed into the long_var variable, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

ObjectGetString

The function returns the value of the corresponding object property. The object property must be of the [string](#) type. There are 2 variants of the function.

1. Immediately returns the property value.

```
string ObjectGetString(
    long          chart_id,          // chart identifier
    string        name,              // object name
    ENUM_OBJECT_PROPERTY_STRING prop_id, // property identifier
    int          prop_modifier=0    // property modifier, if required
);
```

2. Returns true or false, depending on the success of the function. If successful, the property value is placed to a receiving variable passed by reference by the last parameter.

```
bool ObjectGetString(
    long          chart_id,          // chart identifier
    string        name,              // object name
    ENUM_OBJECT_PROPERTY_STRING prop_id, // property identifier
    int          prop_modifier,      // property modifier
    string&       string_var         // here we accept the property value
);
```

Parameters

chart_id

[in] Chart identifier. 0 means the current chart.

name

[in] Name of the object.

prop_id

[in] ID of the object property. The value can be one of the values of the [ENUM_OBJECT_PROPERTY_STRING](#) enumeration.

prop_modifier

[in] Modifier of the specified property. For the first variant, the default modifier value is equal to 0. Most properties do not require a modifier. It denotes the number of the level in [Fibonacci tools](#) and in the graphical object Andrew's pitchfork. The numeration of levels starts from zero.

string_var

[out] Variable of the string type that receives the value of the requested properties.

Return Value

String value for the first version of the call.

For the second version of the call returns true, if this property is maintained and the value has been placed into the *string_var* variable, otherwise returns false. To read more about the [error](#) call [GetLastError\(\)](#).

Note

The function uses a synchronous call, which means that the function waits for the execution of all commands that have been enqueued for this chart prior to its call, that is why this function can be time consuming. This feature should be taken into account when working with a large number of objects on a chart.

When an object is renamed, two events are formed simultaneously. These events can be handled in an Expert Advisor or indicator by the [OnChartEvent\(\)](#) function:

- an event of deletion of an object with the old name;
- an event of creation of an object with a new name.

TextSetFont

The function sets the font for displaying the text using drawing methods and returns the result of that operation. Arial font with the size -120 (12 pt) is used by default.

```
bool TextSetFont(  
    const string name,           // font name or path to font file on the disk  
    int size,                   // font size  
    uint flags,                 // combination of flags  
    int orientation=0           // text slope angle  
);
```

Parameters

name

[in] Font name in the system or the name of the resource containing the font or the path to font file on the disk.

size

[in] The font size that can be set using positive and negative values. In case of positive values, the size of a displayed text does not depend on the operating system's font size settings. In case of negative values, the value is set in tenths of a point and the text size depends on the operating system settings ("standard scale" or "large scale"). See the Note below for more information about the differences between the modes.

flags

[in] Combination of [flags](#) describing font style.

orientation

[in] Text's horizontal inclination to X axis, the unit of measurement is 0.1 degrees. It means that *orientation=450* stands for inclination equal to 45 degrees.

Return Value

Returns true if the current font is successfully installed, otherwise false. Possible code errors:

- `ERR_INVALID_PARAMETER(4003)` - *name* presents NULL or "" (empty string),
- `ERR_INTERNAL_ERROR(4001)` - operating system error (for example, an attempt to create a non-existent font).

Note

If "::" is used in font name, the font is downloaded from [EX5 resource](#). If *name* font name is specified with an extension, the font is downloaded from the file, if the path starts from "\" or "/", the file is searched relative to MQL5 directory. Otherwise, it is searched relative to the path of EX5 file which called `TextSetFont()` function.

The font size is set using positive or negative values. This fact defines the dependence of the text size from the operating system settings (size scale).

- If the size is specified using a positive number, this size is transformed into physical measurement units of a device (pixels) when changing a logical font into a physical one, and this size corresponds to the height of the symbol glyphs picked from the available fonts. This case is not recommended when the texts displayed by [TextOut\(\)](#) function and the ones displayed by [OBJ_LABEL](#) ("Label") graphical object are to be used together on the chart.

- If the size is specified using a negative number, this number is supposed to be set in tenths of a logical point and is divided by 10 (for example, -350 is equal to 35 logical points). An obtained value is then transformed into physical measurement units of a device (pixels) and corresponds to the absolute value of the height of a symbol picked from the available fonts. Multiply the font size specified in the object properties by -10 to make the size of a text on the screen similar to the one in [OBJ_LABEL](#) object.

The flags can be used as the combination of style flags with one of the flags specifying the font width. Flag names are shown below.

Flags for specifying font style

Flag	Description
FONT_ITALIC	Italic
FONT_UNDERLINE	Underline
FONT_STRIKEOUT	Strikeout

Flags for specifying font width

Flag
FW_DONTCARE
FW_THIN
FW_EXTRALIGHT
FW_ULTRALIGHT
FW_LIGHT
FW_NORMAL
FW_REGULAR
FW_MEDIUM
FW_SEMIBOLD
FW_DEMIBOLD
FW_BOLD
FW_EXTRABOLD
FW_ULTRABOLD
FW_HEAVY
FW_BLACK

[Resources](#), [ResourceCreate\(\)](#), [ResourceSave\(\)](#), [TextOut\(\)](#)

TextOut

The function displays a text in a custom array (buffer) and returns the result of that operation. The array is designed to create the graphical [resource](#).

```
bool TextOut(
    const string      text,           // displayed text
    int               x,              // X coordinate
    int               y,              // Y coordinate
    uint              anchor,         // anchor type
    uint              &data[],        // output buffer
    uint              width,          // buffer width in pixels
    uint              height,         // buffer height in pixels
    uint              color,          // text color
    ENUM_COLOR_FORMAT color_format    // color format for output
);
```

Parameters

text

[in] Displayed text that will be written to the buffer. Only one-lined text is displayed.

x

[in] X coordinate of the anchor point of the displayed text.

y

[in] Y coordinate of the anchor point of the displayed text.

anchor

[in] The value out of the 9 pre-defined methods of the displayed text's anchor point location. The value is set by a combination of two flags - flags of horizontal and vertical text align. Flag names are listed in the Note below.

data[]

[in] Buffer, in which text is displayed. The buffer is used to create the graphical [resource](#).

width

[in] Buffer width in pixels.

height

[in] Buffer height in pixels.

color

[in] Text color.

color_format

[in] Color format is set by [ENUM_COLOR_FORMAT](#) enumeration value.

Return Value

Returns true if successful, otherwise false.

Note

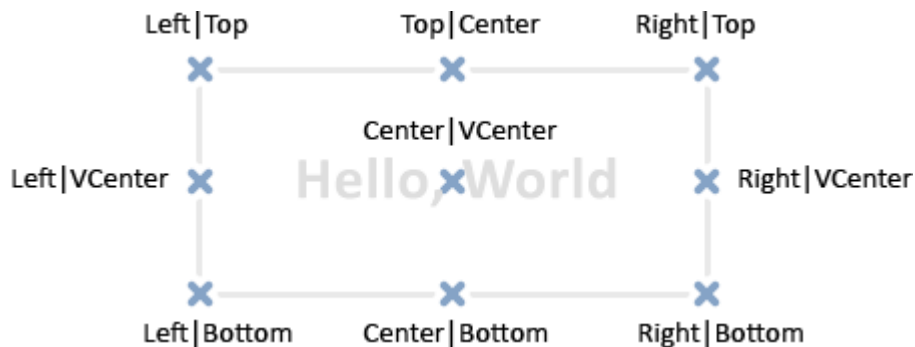

Anchor point specified by *anchor* is a combination of two flags of horizontal and vertical text align. Horizontal text align flags:

- TA_LEFT - anchor point on the left side of the bounding box
- TA_CENTER - horizontal anchor point is located at the center of the bounding box
- TA_RIGHT - anchor point on the right side of the bounding box

Vertical text align flags:

- TA_TOP - anchor point at the upper side of the bounding box
- TA_VCENTER - vertical anchor point is located at the center of the bounding box
- TA_BOTTOM - anchor point at the lower side of the bounding box

Possible combinations of flags and specified anchor points are shown in the image.

Example:

```
//--- width and height of the canvas (used for drawing)
#define IMG_WIDTH 200
#define IMG_HEIGHT 200
//--- display the parameter window before launching the script
#property script_show_inputs
//--- enable to set color format
input ENUM_COLOR_FORMAT clr_format=COLOR_FORMAT_XRGB_NOALPHA;
//--- drawing array (buffer)
uint ExtImg[IMG_WIDTH*IMG_HEIGHT];
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
//--- create OBJ_BITMAP_LABEL object for drawing

TextGetSize

The function returns the line width and height at the current [font settings](#).

```
bool TextGetSize(  
    const string      text,           // text string  
    uint&             width,          // buffer width in pixels  
    uint&             height         // buffer height in pixels  
);
```

Parameters

text

[in] String, for which length and width should be obtained.

width

[out] Input parameter for receiving width.

height

[out] Input parameter for receiving height.

Return Value

Returns true if successful, otherwise false. Possible code errors:

- `ERR_INTERNAL_ERROR(4001)` - operating system error.

Technical Indicator Functions

All functions like `iMA`, `iAC`, `iMACD`, `ilchimoku` etc. create a copy of the corresponding technical indicator in the global cache of the client terminal. If a copy of the indicator with such parameters already exists, the new copy is not created, and the counter of references to the existing copy increases.

These functions return the handle of the appropriate copy of the indicator. Further, using this handle, you can receive data calculated by the corresponding indicator. The corresponding buffer data (technical indicators contain calculated data in their internal buffers, which can vary from 1 to 5, depending on the indicator) can be copied to a mql5-program using the [CopyBuffer\(\)](#) function.

You can't refer to the indicator data right after it has been created, because calculation of indicator values requires some time, so it's better to create indicator handles in `OnInit()`. Function [iCustom\(\)](#) creates the corresponding custom indicator, and returns its handle in case it is successfully create. Custom indicators can contain up to 512 indicator buffers, the contents of which can also be obtained by the [CopyBuffer\(\)](#) function, using the obtained handle.

There is a universal method for creating any technical indicator using the [IndicatorCreate\(\)](#) function. This function accepts the following data as input parameters:

- symbol name;
- timeframe;
- type of the indicator to create;
- number of input parameters of the indicator;
- an array of [MqlParam](#) type containing all the necessary input parameters.

The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note. Repeated call of the indicator function with the same parameters within one mql5-program does not lead to a multiple increase of the reference counter; the counter will be increased only once by 1. However, it's recommended to get the indicators handles in function [OnInit\(\)](#) or in the class constructor, and further use these handles in other functions. The reference counter decreases when a mql5-program is deinitialized.

All indicator functions have at least 2 parameters - symbol and period. The [NULL](#) value of the symbol means the current symbol, the 0 value of the period means the current [timeframe](#).

Function	Returns the handle of the indicator:
iAC	Accelerator Oscillator
iAD	Accumulation/Distribution
iADX	Average Directional Index
iADXWilder	Average Directional Index by Welles Wilder
iAlligator	Alligator
iAMA	Adaptive Moving Average

Function	Returns the handle of the indicator:
<u>iAO</u>	Awesome Oscillator
<u>iATR</u>	Average True Range
<u>iBearsPower</u>	Bears Power
<u>iBands</u>	Bollinger Bands®
<u>iBullsPower</u>	Bulls Power
<u>iCCI</u>	Commodity Channel Index
<u>iChaikin</u>	Chaikin Oscillator
<u>iCustom</u>	Custom indicator
<u>iDEMA</u>	Double Exponential Moving Average
<u>iDeMarker</u>	DeMarker
<u>iEnvelopes</u>	Envelopes
<u>iForce</u>	Force Index
<u>iFractals</u>	Fractals
<u>iFrAMA</u>	Fractal Adaptive Moving Average
<u>iGator</u>	Gator Oscillator
<u>iIchimoku</u>	Ichimoku Kinko Hyo
<u>iBWMFI</u>	Market Facilitation Index by Bill Williams
<u>iMomentum</u>	Momentum
<u>iMFI</u>	Money Flow Index
<u>iMA</u>	Moving Average
<u>iOsMA</u>	Moving Average of Oscillator (MACD histogram)
<u>iMACD</u>	Moving Averages Convergence-Divergence
<u>iOBV</u>	On Balance Volume
<u>iSAR</u>	Parabolic Stop And Reverse System
<u>iRSI</u>	Relative Strength Index
<u>iRVI</u>	Relative Vigor Index
<u>iStdDev</u>	Standard Deviation
<u>iStochastic</u>	Stochastic Oscillator
<u>iTEMA</u>	Triple Exponential Moving Average
<u>iTriX</u>	Triple Exponential Moving Averages Oscillator

Function	Returns the handle of the indicator:
iWPR	Williams' Percent Range
iVIDyA	Variable Index Dynamic Average
iVolumes	Volumes

iAC

The function creates Accelerator Oscillator in a global cache of the client terminal and returns its handle. It has only one buffer.

```
int iAC(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period   // period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) enumeration values, 0 means the current timeframe.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

iAD

The function returns the handle of the Accumulation/Distribution indicator. It has only one buffer.

```
int iAD(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) enumeration values, 0 means the current timeframe.

applied_volume

[in] The volume used. Can be any of [ENUM_APPLIED_VOLUME](#) values.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

iADX

The function returns the handle of the Average Directional Movement Index indicator.

```
int iADX(
    string      symbol,          // symbol name
    ENUM_TIMEFRAMES period,      // period
    int         adx_period       // averaging period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

adx_period

[in] Period to calculate the index.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - MAIN_LINE, 1 - PLUSDI_LINE, 2 - MINUSDI_LINE.

```

iADXWilder

The function returns the handle of Average Directional Movement Index by Welles Wilder.

```
int iADXWilder(
    string      symbol,          // symbol name
    ENUM_TIMEFRAMES period,      // period
    int         adx_period       // averaging period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

adx_period

[in] Period to calculate the index.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - MAIN_LINE, 1 - PLUSDI_LINE, 2 - MINUSDI_LINE.

```

iAlligator

The function returns the handle of the Alligator indicator.

```
int iAlligator(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             jaw_period,      // period for the calculation of jaws
    int             jaw_shift,       // horizontal shift of jaws
    int             teeth_period,    // period for the calculation of teeth
    int             teeth_shift,     // horizontal shift of teeth
    int             lips_period,     // period for the calculation of lips
    int             lips_shift,      // horizontal shift of lips
    ENUM_MA_METHOD  ma_method,       // type of smoothing
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

jaw_period

[in] Averaging period for the blue line (Alligator's Jaw)

jaw_shift

[in] The shift of the blue line relative to the price chart.

teeth_period

[in] Averaging period for the red line (Alligator's Teeth).

teeth_shift

[in] The shift of the red line relative to the price chart.

lips_period

[in] Averaging period for the green line (Alligator's lips).

lips_shift

[in] The shift of the green line relative to the price chart.

ma_method

[in] The method of averaging. Can be any of the [ENUM_MA_METHOD](#) values.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - GATORJAW_LINE, 1 - GATORTEETH_LINE, 2 - GATORLIPS_LINE.

```

iAMA

The function returns the handle of the Adaptive Moving Average indicator. It has only one buffer.

```
int iAMA(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ama_period,       // average period for AMA
    int             fast_ma_period,   // fast MA period
    int             slow_ma_period,   // slow MA period
    int             ama_shift,        // horizontal shift of the indicator
    ENUM_APPLIED_PRICE applied_price // type of the price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ama_period

[in] The calculation period, on which the efficiency coefficient is calculated.

fast_ma_period

[in] Fast period for the smoothing coefficient calculation for a rapid market.

slow_ma_period

[in] Slow period for the smoothing coefficient calculation in the absence of trend.

ama_shift

[in] Shift of the indicator relative to the price chart.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iAO

The function returns the handle of the Awesome Oscillator indicator. It has only one buffer.

```
int iAO(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period    // period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

iATR

The function returns the handle of the Average True Range indicator. It has only one buffer.

```
int iATR(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period,  // period
    int         ma_period    // averaging period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] The value of the averaging period for the indicator calculation.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

```

iBands

The function returns the handle of the Bollinger Bands® indicator.

```
int iBands(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             bands_period,     // period for average line calculation
    int             bands_shift,      // horizontal shift of the indicator
    double          deviation,        // number of standard deviations
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

bands_period

[in] The averaging period of the main line of the indicator.

bands_shift

[in] The shift the indicator relative to the price chart.

deviation

[in] Deviation from the main line.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - BASE_LINE, 1 - UPPER_BAND, 2 - LOWER_BAND

iBullsPower

The function returns the handle of the Bulls Power indicator. It has only one buffer.

```
int iBullsPower(
    string      symbol,           // symbol name
    ENUM_TIMEFRAMES period,      // period
    int         ma_period,       // averaging period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] The averaging period for the indicator calculation.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

iCCI

The function returns the handle of the Commodity Channel Index indicator. It has only one buffer.

```
int iCCI(
    string      symbol,           // symbol name
    ENUM_TIMEFRAMES period,       // period
    int         ma_period,        // averaging period
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] The averaging period for the indicator calculation.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iChaikin

The function returns the handle of the Chaikin Oscillator indicator. It has only one buffer.

```
int iChaikin(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             fast_ma_period,  // fast period
    int             slow_ma_period,  // slow period
    ENUM_MA_METHOD  ma_method,       // smoothing type
    ENUM_APPLIED_VOLUME applied_volume // type of volume
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

fast_ma_period

[in] Fast averaging period for calculations.

slow_ma_period

[in] Slow averaging period for calculations.

ma_method

[in] Smoothing type. Can be one of the averaging constants of [ENUM_MA_METHOD](#).

applied_volume

[in] The volume used. Can be one of the constants of [ENUM_APPLIED_VOLUME](#).

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

```

```

iCustom

The function returns the handle of a specified custom indicator.

```
int iCustom(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period,  // period
    string      name         // folder/custom_indicator_name
    ...         // list of indicator input parameters
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

name

[in] Custom indicator name. If the name starts with the reverse slash '\', the EX5 indicator file is searched for relative to the MQL5 root directory. So, for a call of [iCustom](#)(Symbol(), Period(), "\FirstIndicator"...), the indicator will be loaded as MQL5\FirstIndicator.ex5. If the file is not found at this path, error 4802 (ERR_INDICATOR_CANNOT_CREATE) is returned.

If the path does not start with '\', the indicator is searched and downloaded as follows:

- First, the indicator EX5 file is searched for in the folder where the EX5 file of the calling program is located. For example, the CrossMA.EX5 EA is located in MQL5\Experts\MyExperts and contains the [iCustom](#) call (Symbol(), Period(), "SecondIndicator"...). In this case, the indicator is searched for in MQL5\Experts\MyExperts\SecondIndicator.ex5.
- If the indicator is not found in the same directory, the search is performed relative to the MQL5\Indicators indicator root directory. In other words, the search for the MQL5\Indicators\SecondIndicator.ex5 file is performed. If the indicator is still not found, the function returns [INVALID_HANDLE](#) and the error 4802 (ERR_INDICATOR_CANNOT_CREATE) is triggered.

If the path to the indicator is set in the subdirectory (for example, MyIndicators\ThirdIndicator), the search is first performed in the calling program folder (the EA is located in MQL5\Experts\MyExperts) in MQL5\Experts\MyExperts\MyIndicators\ThirdIndicator.ex5. If unsuccessful, the search for the MQL5\Indicators\MyIndicators\ThirdIndicator.ex5 file is performed. Make sure to use the double reverse slash '\\' as a separator in the path, for example [iCustom](#)(Symbol(), Period(), "MyIndicators\\ThirdIndicator"...)

...

[in] [input-parameters](#) of a custom indicator, separated by commas. Type and order of parameters must match. If there is no parameters specified, then [default values](#) will be used.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

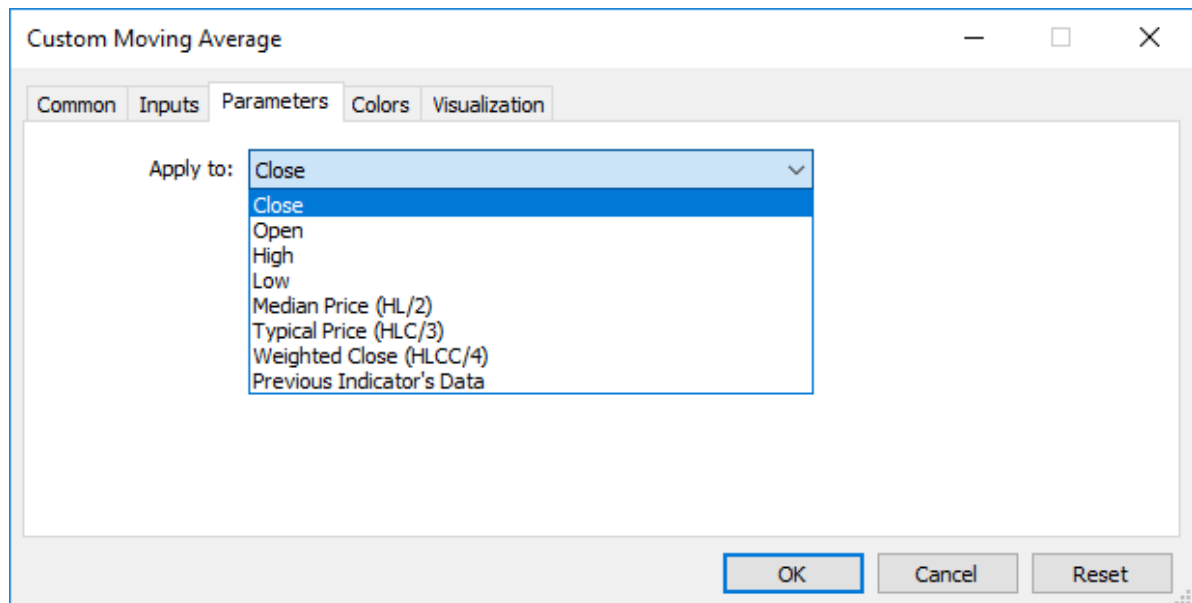

Note

A custom indicator must be compiled (with extension EX5) and located in the directory MQL5/Indicators of the client terminal or its subdirectory.

Indicators that require testing are defined automatically from the call of the [iCustom\(\)](#) function, if the corresponding parameter is set through a [constant string](#). For all other cases (use of the [IndicatorCreate\(\)](#) function or use of a non-constant string in the parameter that sets the indicator name) the property [#property tester_indicator](#) is required:

```
#property tester_indicator "indicator_name.ex5"
```

If [the first call form](#) is used in the indicator, then at the custom indicator start you can additionally indicate data for calculation in its "Parameters" tab. If the "Apply to" parameter is not selected explicitly, the default calculation is based on the values of "Close" prices.

When you call a custom indicator from mql5-program, the `Applied_Price` parameter or a handle of another indicator should be passed last, after all input variables of the custom indicator.

//--- return value of prev_calculated for next call

```

```
    return(rates_total);  
}  
//+-----+
```

iDEMA

The function returns the handle of the Double Exponential Moving Average indicator. It has only one buffer.

```
int iDEMA(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // averaging period
    int             ma_shift,         // horizontal shift
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period (bars count) for calculations.

ma_shift

[in] Shift of the indicator relative to the price chart.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iDeMarker

The function returns the handle of the DeMarker indicator. It has only one buffer.

```
int iDeMarker(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period,  // period
    int         ma_period    // averaging period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period (bars count) for calculations.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

iEnvelopes

The function returns the handle of the Envelopes indicator.

```
int iEnvelopes(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // period for the average line calculation
    int             ma_shift,         // horizontal shift of the indicator
    ENUM_MA_METHOD  ma_method,        // type of smoothing
    ENUM_APPLIED_PRICE applied_price, // type of price or handle
    double          deviation         // deviation of boundaries from the midline
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period for the main line.

ma_shift

[in] The shift of the indicator relative to the price chart.

ma_method

[in] Smoothing type. Can be one of the values of [ENUM_MA_METHOD](#).

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

deviation

[in] The deviation from the main line (in percents).

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers: 0 - UPPER_LINE, 1 - LOWER_LINE.

```

iForce

The function returns the handle of the Force Index indicator. It has only one buffer.

```
int iForce(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // averaging period
    ENUM_MA_METHOD  ma_method,        // smoothing type
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period for the indicator calculations.

ma_method

[in] Smoothing type. Can be one of the values of [ENUM_MA_METHOD](#).

applied_volume

[in] The volume used. Can be one of the values of [ENUM_APPLIED_VOLUME](#).

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iFractals

The function returns the handle of the Fractals indicator.

```
int iFractals(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period   // period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - UPPER_LINE, 1 - LOWER_LINE.

iFrAMA

The function returns the handle of the Fractal Adaptive Moving Average indicator. It has only one buffer.

```
int iFrAMA(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // averaging period
    int             ma_shift,         // horizontal shift on the chart
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Period (bars count) for the indicator calculations.

ma_shift

[in] Shift of the indicator in the price chart.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

iGator

The function returns the handle of the Gator indicator. The Oscillator shows the difference between the blue and red lines of Alligator (upper histogram) and difference between red and green lines (lower histogram).

```
int iGator(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             jaw_period,      // period for the calculation of the jaws
    int             jaw_shift,       // jaws horizontal shift
    int             teeth_period,    // period for the calculation of the teeth
    int             teeth_shift,     // teeth horizontal shift
    int             lips_period,     // period for the calculation of the lips
    int             lips_shift,      // lips horizontal shift
    ENUM_MA_METHOD  ma_method,       // type of smoothing
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

jaw_period

[in] Averaging period for the blue line (Alligator's Jaw).

jaw_shift

[in] The shift of the blue line relative to the price chart. It isn't directly connected with the visual shift of the indicator histogram.

teeth_period

[in] Averaging period for the red line (Alligator's Teeth).

teeth_shift

[in] The shift of the red line relative to the price chart. It isn't directly connected with the visual shift of the indicator histogram.

lips_period

[in] Averaging period for the green line (Alligator's lips).

lips_shift

[in] The shift of the green line relative to the price charts. It isn't directly connected with the visual shift of the indicator histogram.

ma_method

[in] Smoothing type. Can be one of the values of [ENUM_MA_METHOD](#).

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

Buffer numbers: 0 - UPPER_HISTOGRAM, 1 - color buffer of the upper histogram, 2 - LOWER_HISTOGRAM, 3 - color buffer of the lower histogram.

```

ilchimoku

The function returns the handle of the Ichimoku Kinko Hyo indicator.

```
int iIchimoku(
    string      symbol,           // symbol name
    ENUM_TIMEFRAMES period,      // period
    int         tenkan_sen,       // period of Tenkan-sen
    int         kijun_sen,        // period of Kijun-sen
    int         senkou_span_b     // period of Senkou Span B
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

tenkan_sen

[in] Averaging period for Tenkan Sen.

kijun_sen

[in] Averaging period for Kijun Sen.

senkou_span_b

[in] Averaging period for Senkou Span B.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers: 0 - TENKANSEN_LINE, 1 - KIJUNSEN_LINE, 2 - SENKOUSPANA_LINE, 3 - SENKOUSPANB_LINE, 4 - CHIKOUPSPAN_LINE.

iBWMFI

The function returns the handle of the Market Facilitation Index indicator. It has only one buffer.

```
int iBWMFI(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

applied_volume

[in] The volume used. Can be one of the constants of [ENUM_APPLIED_VOLUME](#).

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

iMomentum

The function returns the handle of the Momentum indicator. It has only one buffer.

```
int iMomentum(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             mom_period,      // averaging period
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

mom_period

[in] Averaging period (bars count) for the calculation of the price change.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

iMFI

The function returns the handle of the Money Flow Index indicator.

```
int iMFI(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // averaging period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period (bars count) for the calculation.

applied_volume

[in] The volume used. Can be any of the [ENUM_APPLIED_VOLUME](#) values.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iMA

The function returns the handle of the Moving Average indicator. It has only one buffer.

```
int iMA(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // averaging period
    int             ma_shift,         // horizontal shift
    ENUM_MA_METHOD  ma_method,        // smoothing type
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period for the calculation of the moving average.

ma_shift

[in] Shift of the indicator relative to the price chart.

ma_method

[in] Smoothing type. Can be one of the [ENUM_MA_METHOD](#) values.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iOsMA

The function returns the handle of the Moving Average of Oscillator indicator. The OsMA oscillator shows the difference between values of MACD and its signal line. It has only one buffer.

```
int iOsMA(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             fast_ema_period, // period for Fast Moving Average
    int             slow_ema_period, // period for Slow Moving Average
    int             signal_period,   // averaging period for their difference
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

fast_ema_period

[in] Period for Fast Moving Average calculation.

slow_ema_period

[in] Period for Slow Moving Average calculation.

signal_period

[in] Averaging period for signal line calculation.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

In some systems this oscillator is also known as MACD histogram.

```

iMACD

The function returns the handle of the Moving Averages Convergence/Divergence indicator. In systems where OsMA is called MACD Histogram, this indicator is shown as two lines. In the client terminal the Moving Averages Convergence/Divergence looks like a histogram.

```
int iMACD(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             fast_ema_period,  // period for Fast average calculation
    int             slow_ema_period,  // period for Slow average calculation
    int             signal_period,    // period for their difference averaging
    ENUM_APPLIED_PRICE applied_price  // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

fast_ema_period

[in] Period for Fast Moving Average calculation.

slow_ema_period

[in] Period for Slow Moving Average calculation.

signal_period

[in] Period for Signal line calculation.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - MAIN_LINE, 1 - SIGNAL_LINE.

iOBV

The function returns the handle of the On Balance Volume indicator. It has only one buffer.

```
int iOBV(
    string          symbol,           // symbol name
    ENUM_TIMEFRAMES period,          // period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

applied_volume

[in] The volume used. Can be any of the [ENUM_APPLIED_VOLUME](#) values.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

```
//+-----+
//|                                     Demo_iOBV.mq5 |

iSAR

The function returns the handle of the Parabolic Stop and Reverse system indicator. It has only one buffer.

```
int iSAR(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period,  // period
    double      step,        // price increment step - acceleration factor
    double      maximum      // maximum value of step
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

step

[in] The step of price increment, usually 0.02.

maximum

[in] The maximum step, usually 0.2.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

iRSI

The function returns the handle of the Relative Strength Index indicator. It has only one buffer.

```
int iRSI(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,         // period
    int             ma_period,       // averaging period
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period for the RSI calculation.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

```

iRVI

The function returns the handle of the Relative Vigor Index indicator.

```
int iRVI(
    string      symbol,      // symbol name
    ENUM_TIMEFRAMES period,  // period
    int         ma_period    // averaging period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period for the RVI calculation.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers are the following: 0 - MAIN_LINE, 1 - SIGNAL_LINE.

iStdDev

The function returns the handle of the Standard Deviation indicator. It has only one buffer.

```
int iStdDev(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,       // averaging period
    int             ma_shift,        // horizontal shift
    ENUM_MA_METHOD  ma_method,       // smoothing type
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period for the indicator calculations.

ma_shift

[in] Shift of the indicator relative to the price chart.

ma_method

[in] Type of averaging. Can be any of the [ENUM_MA_METHOD](#) values.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iStochastic

The function returns the handle of the Stochastic Oscillator indicator.

```
int iStochastic(
    string      symbol,           // symbol name
    ENUM_TIMEFRAMES period,      // period
    int         Kperiod,         // K-period (number of bars for calculations)
    int         Dperiod,         // D-period (period of first smoothing)
    int         slowing,         // final smoothing
    ENUM_MA_METHOD ma_method,    // type of smoothing
    ENUM_STO_PRICE price_field   // stochastic calculation method
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

Kperiod

[in] Averaging period (bars count) for the %K line calculation.

Dperiod

[in] Averaging period (bars count) for the %D line calculation.

slowing

[in] Slowing value.

ma_method

[in] Type of averaging. Can be any of the [ENUM_MA_METHOD](#) values.

price_field

[in] Parameter of price selection for calculations. Can be one of the [ENUM_STO_PRICE](#) values.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Note

The buffer numbers: 0 - MAIN_LINE, 1 - SIGNAL_LINE.

Example:

```

```

iTEMA

The function returns the handle of the Triple Exponential Moving Average indicator. It has only one buffer.

```
int iTEMA(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // averaging period
    int             ma_shift,         // horizontal shift of indicator
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period (bars count) for calculation.

ma_shift

[in] Shift of indicator relative to the price chart.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iTriX

The function returns the handle of the Triple Exponential Moving Averages Oscillator indicator. It has only one buffer.

```
int iTriX(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             ma_period,        // averaging period
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

ma_period

[in] Averaging period (bars count) for calculations.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

```

iWPR

The function returns the handle of the Larry Williams' Percent Range indicator. It has only one buffer.

```
int iWPR(
    string      symbol,           // symbol name
    ENUM_TIMEFRAMES period,      // period
    int         calc_period      // averaging period
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

calc_period

[in] Period (bars count) for the indicator calculation.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

iVIDyA

The function returns the handle of the Variable Index Dynamic Average indicator. It has only one buffer.

```
int iVIDyA(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    int             cmo_period,      // period for Chande Momentum
    int             ema_period,      // EMA smoothing period
    int             ma_shift,        // horizontal shift on the price chart
    ENUM_APPLIED_PRICE applied_price // type of price or handle
);
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

cmo_period

[in] Period (bars count) for the Chande Momentum Oscillator calculation.

ema_period

[in] EMA period (bars count) for smoothing factor calculation.

ma_shift

[in] Shift of the indicator relative to the price chart.

applied_price

[in] The price used. Can be any of the price constants [ENUM_APPLIED_PRICE](#) or a handle of another indicator.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

void OnDeinit(const int reason)
{
    if(handle!=INVALID_HANDLE)
        IndicatorRelease(handle);
//--- clear the chart after deleting the indicator
    Comment("");
}

```

iVolumes

The function returns the handle of the Volumes indicator. It has an only one buffer.

```
int iVolumes(
    string          symbol,          // symbol name
    ENUM_TIMEFRAMES period,          // period
    ENUM_APPLIED_VOLUME applied_volume // volume type for calculation
)
```

Parameters

symbol

[in] The symbol name of the security, the data of which should be used to calculate the indicator. The [NULL](#) value means the current symbol.

period

[in] The value of the period can be one of the [ENUM_TIMEFRAMES](#) values, 0 means the current timeframe.

applied_volume

[in] The volume used. Can be any of the [ENUM_APPLIED_VOLUME](#) values.

Return Value

Returns the handle of a specified technical indicator, in case of failure returns [INVALID_HANDLE](#). The computer memory can be freed from an indicator that is no more utilized, using the [IndicatorRelease\(\)](#) function, to which the indicator handle is passed.

Example:

```

Working with Optimization Results

Functions for organizing custom processing of the optimization results in the strategy tester. They can be called during optimization in testing agents, as well as locally in Expert Advisors and scripts.

When you run an Expert Advisor in the strategy tester, you can create your own data array based on the simple types or [simple structures](#) (they do not contain strings, class objects or objects of dynamic arrays). This data set can be saved using the [FrameAdd\(\)](#) function in a special structure called a frame. During the optimization of an Expert Advisor, each agent can send a series of frames to the terminal. All the received frames are written in the *.MQD file named as the Expert Advisor in the terminal_directory\MQL5\Files\Tester folder. They are written in the order they are received from the agents. Receipt of a frame in the client terminal from a testing agent generates the [TesterPass](#) event.

Frames can be stored in the computer memory and in a file with the specified name. The MQL5 language sets no limitations on the number of frames.

Memory and disk space limits in MQL5 Cloud Network

The following limitation applies to optimizations run in the [MQL5 Cloud Network](#): the Expert Advisor must not write to disk more than 4GB of information or use more than 4GB of RAM. If the limit is exceeded, the network agent will not be able to complete the calculation correctly, and you will not receive the result. However, you will be charged for all the time spent on the calculations.

If you need to get information from each optimization pass, [send frames](#) without writing to disk. To avoid using [file operations](#) in Expert Advisors during calculations in the MQL5 Cloud Network, you can use the following check:

```
int handle=INVALID_HANDLE;
bool file_operations_allowed=true;
if(MQLInfoInteger(MQL_OPTIMIZATION) || MQLInfoInteger(MQL_FORWARD))
    file_operations_allowed=false;

if(file_operations_allowed)
{
    ...
    handle=FileOpen(...);
    ...
}
```

Function	Action
FrameFirst	Moves a pointer of frame reading to the beginning and resets the previously set filter
FrameFilter	Sets the frame reading filter and moves the pointer to the beginning
FrameNext	Reads a frame and moves the pointer to the next one
FrameInputs	Receives input parameters , on which the frame is formed
FrameAdd	Adds a frame with data

Function	Action
ParameterGetRange	Receives data on the values range and the change step for an input variable when optimizing an Expert Advisor in the Strategy Tester
ParameterSetRange	Specifies the use of input variable when optimizing an Expert Advisor in the Strategy Tester: value, change step, initial and final values

See also

[Testing Statistics](#), [Properties of a Running MQL5 Program](#)

FrameFirst

Moves a pointer of frame reading to the beginning and resets a set filter.

```
bool FrameFirst();
```

Return Value

Returns true if successful, otherwise false. To get information about the error, call the [GetLastError\(\)](#) function.

FrameFilter

Sets the frame reading filter and moves the pointer to the beginning.

```
bool FrameFilter(  
    const string name,           // Public name/label  
    long id                     // Public ID  
);
```

Return Value

Returns true if successful, otherwise false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

If an empty string is passed as the first parameter, the filter will work only with a numeric parameter, i.e. only frames with the specified id will be viewed. If the value of the second parameter is [ULONG_MAX](#), only a text filter works.

Call of [FrameFilter\("", ULONG_MAX\)](#) is equivalent to calling [FrameFirst\(\)](#), i.e. equal to not using any filter.

FrameNext

Reads a frame and moves the pointer to the next one. There are two variants of the function.

1. Calling to receive one numeric value

```
bool FrameNext(  
    ulong& pass,      // The number of a pass in the optimization, during which the  
    string& name,     // Public name/label  
    long& id,         // Public ID  
    double& value     // Value  
);
```

2. Calling to receive all the data of a frame

```
bool FrameNext(  
    ulong& pass,      // The number of a pass in the optimization, during which the  
    string& name,     // Public name/label  
    long& id,         // Public ID  
    double& value,    // Value  
    void& data[]      // Array of any type  
);
```

Parameters

pass

[out] The number of a pass during optimization in the strategy tester.

name

[out] The name of the identifier.

id

[out] The value of the identifier.

value

[out] A single numeric value.

data

[out] An array of any type.

Return Value

Returns true if successful, otherwise false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

In the second version of the call, you must correctly handle the received data in the *data[]* array.

FrameInputs

Receives [input parameters](#), on which the frame with the specified pass number is formed.

```
bool FrameInputs(  
    ulong    pass,                // The number of a pass in the optimization  
    string&   parameters[],       // An array of strings of form "parameterN=valueN"  
    uint&     parameters_count    // The total number of parameters  
);
```

Parameters

pass

[in] The number of a pass during optimization in the strategy tester.

parameters

[out] A string array with the description of names and parameter values

parameters_count

[out] The number of elements in the array *parameters[]*.

Return Value

Returns true if successful, otherwise false. To get information about the error, call the [GetLastError\(\)](#) function.

Note

Having obtained the number of strings *parameters_count* in the *parameters[]* array, you can organize a loop to go through all records. This will help you find the values of input parameters of an Expert Advisor for the specified pass number.

FrameAdd

Adds a frame with data. There are two variants of the function.

1. Adding data from a file

```
bool FrameAdd(  
    const string name,      // Public name/label  
    long id,               // Public ID  
    double value,          // Value  
    const string filename  // Name of a data file  
);
```

2. Adding data from an array of any type

```
bool FrameAdd(  
    const string name,      // Public name/label  
    long id,               // Public ID  
    double value,          // Value  
    const void& data[]      // Array of any type  
);
```

Parameters

name

[in] Public frame label. It can be used for a filter in the [FrameFilter\(\)](#) function.

id

[in] A public identifier of the frame. It can be used for a filter in the [FrameFilter\(\)](#) function.

value

[in] A numeric value to write into the frame. It is used to transmit a single pass result like in the [OnTester\(\)](#) function.

filename

[in] The name of the file that contains data to add to the frame. The file must be located in the folder MQL5/Files.

data

[in] An array of any type to write into the frame. Passed by reference.

Return Value

Returns true if successful, otherwise false. To get information about the error, call the [GetLastError\(\)](#) function.

ParameterGetRange

Receives data on the values range and the change step for an [input variable](#) when optimizing an Expert Advisor in the Strategy Tester. There are 2 variants of the function.

1. Receiving data for the integer type input parameter

```
bool ParameterGetRange(  
    const string name,           // parameter (input variable) name  
    bool& enable,               // parameter optimization enabled  
    long& value,                // parameter value  
    long& start,                // initial value  
    long& step,                 // change step  
    long& stop                  // final value  
);
```

2. Receiving data for the real type input parameter

```
bool ParameterGetRange(  
    const string name,           // parameter (input variable) name  
    bool& enable,               // parameter optimization enabled  
    double& value,              // parameter value  
    double& start,              // initial value  
    double& step,               // change step  
    double& stop                // final value  
);
```

Parameters

name

[in] [input variable](#) ID. These variables are external parameters of an application. Their values can be specified when launching on a chart or during a single test.

enable

[out] Flag that this parameter can be used to enumerate the values during the optimization in the Strategy Tester.

value

[out] Parameter value.

start

[out] Initial parameter value during the optimization.

step

[out] Parameter change step when enumerating its values.

stop

[out] Final parameter value during the optimization.

Return Value

Returns true if successful, otherwise false. For information about the error, use the [GetLastError\(\)](#) function.

Note

The function can be called only from [OnTesterInit\(\)](#), [OnTesterPass\(\)](#) and [OnTesterDeinit\(\)](#) handlers. It has been introduced to receive Expert Advisor input parameters' values and variation ranges during the optimization in the Strategy Tester.

When called in [OnTesterInit\(\)](#), the obtained data can be used to redefine the rules for enumeration of any [input variable](#) using [ParameterSetRange\(\)](#) function. Therefore, new Start, Stop and Step values can be set and the input parameter can even be completely excluded from optimization regardless of the Strategy Tester settings. This allows you to manage the area of the input parameters during the optimization by excluding some parameters from the optimization depending on the Expert Advisor's key parameters' values.

Example:

```
#property description "Expert Advisor for ParameterGetRange() function demonstration."
#property description "Should be launched in the optimization mode of the Strategy Tester"

//--- input parameters
input int          Input1=1;
input double       Input2=2.0;
input bool         Input3=false;
input ENUM_DAY_OF_WEEK Input4=SUNDAY;

//+-----+
//| Expert initialization function |
//+-----+

int OnInit()
{
    //--- Expert Advisor is designed for operation only in the Strategy Tester
    if(!MQL5InfoInteger(MQL5_OPTIMIZATION))
    {
        MessageBox("Should be launched in the optimization mode of the Strategy Tester!");
        //--- finish the Expert Advisor operation in advance and remove from the chart
        return(INIT_FAILED);
    }

    //--- successful completion of initialization
    return(INIT_SUCCEEDED);
}

//+-----+
//| TesterInit function |
//+-----+

void OnTesterInit()
{
    //--- example for long type input parameter
    string name="Input1";
    bool enable;
    long par1,par1_start,par1_step,par1_stop;
    ParameterGetRange(name,enable,par1,par1_start,par1_step,par1_stop);
}
```

```

Print("First parameter");
PrintFormat("%s=%d  enable=%s  from %d to %d with step=%d",
            name,par1,(string)enable,par1_start,par1_stop,par1_step);
//--- example for double type input parameter
name="Input2";
double par2,par2_start,par2_step,par2_stop;
ParameterGetRange(name,enable,par2,par2_start,par2_step,par2_stop);
Print("Second parameter");
PrintFormat("%s=%G  enable=%s  from %G to %G with step=%G",
            name,par2,(string)enable,par2_start,par2_stop,par2_step);

//--- example for bool type input parameter
name="Input3";
long par3,par3_start,par3_step,par3_stop;
ParameterGetRange(name,enable,par3,par3_start,par3_step,par3_stop);
Print("Third parameter");
PrintFormat("%s=%s  enable=%s  from %s to %s",
            name,(string)par3,(string)enable,
            (string)par3_start,(string)par3_stop);

//--- example for enumeration type input parameter
name="Input4";
long par4,par4_start,par4_step,par4_stop;
ParameterGetRange(name,enable,par4,par4_start,par4_step,par4_stop);
Print("Fourth parameter");
PrintFormat("%s=%s  enable=%s  from %s to %s",
            name,EnumToString((ENUM_DAY_OF_WEEK)par4),(string)enable,
            EnumToString((ENUM_DAY_OF_WEEK)par4_start),
            EnumToString((ENUM_DAY_OF_WEEK)par4_stop));
}
//+-----+
//| TesterDeinit function |
//+-----+
void OnTesterDeinit()
{
//--- this message will be shown after optimization is complete
Print(__FUNCTION__," Optimization completed");
}

```

ParameterSetRange

Specifies the use of [input variable](#) when optimizing an Expert Advisor in the Strategy Tester: value, change step, initial and final values. There are 2 variants of the function.

1. Specifying the values for the integer type input parameter

```
bool ParameterSetRange(  
    const string name,          // parameter (input variable) name  
    bool enable,               // parameter optimization enabled  
    long value,                // parameter value  
    long start,                // initial value  
    long step,                 // change step  
    long stop                  // final value  
);
```

2. Specifying the values for the real type input parameter

```
bool ParameterSetRange(  
    const string name,          // parameter (input variable) name  
    bool enable,               // parameter optimization enabled  
    double value,              // parameter value  
    double start,              // initial value  
    double step,               // change step  
    double stop                 // final value  
);
```

Parameters

name

[in] [input or sinput](#) variable ID. These variables are external parameters of an application. Their values can be specified when launching the program.

enable

[in] Enable this parameter to enumerate the values during the optimization in the Strategy Tester.

value

[in] Parameter value.

start

[in] Initial parameter value during the optimization.

step

[in] Parameter change step when enumerating its values.

stop

[in] Final parameter value during the optimization.

Return Value

Returns true if successful, otherwise false. For information about the error, use the [GetLastError\(\)](#) function.

Note

The function can be called only from [OnTesterInit\(\)](#) handler when launching optimization from the Strategy Tester. It is designed for specifying the parameter's range and change step. The parameter can be completely excluded from optimization regardless of the Strategy Tester settings. It also allows using the variables declared with `sinput` modifier in the optimization process.

`ParameterSetRange()` function allows you to manage an Expert Advisor optimization in the Strategy Tester depending on its key parameters' values by including or excluding required input parameters from the optimization and setting the required range and the change step.

Event Functions

This group contains functions for working with custom events and timer events. Besides this group, there are special functions for handling [predefined events](#).

Function	Action
EventSetMillisecondTimer	Launches event generator of the high-resolution timer with a period less than 1 second for the current chart
EventSetTimer	Starts the timer event generator with the specified periodicity for the current chart
EventKillTimer	Stops the generation of events by the timer in the current chart
EventChartCustom	Generates a custom event for the specified chart

See also

[Types of Chart Events](#)

EventSetMillisecondTimer

The function indicates to the client terminal that [timer](#) events should be generated at intervals less than one second for this Expert Advisor or indicator.

```
bool EventSetMillisecondTimer(  
    int milliseconds // number of milliseconds  
);
```

Parameters

milliseconds

[in] Number of milliseconds defining the frequency of timer events.

Return Value

In case of successful execution, returns true, otherwise - false. To receive an [error](#) code, [GetLastError\(\)](#) function should be called.

Note

This feature is designed for the cases when high-resolution timer is required. In other words, timer events should be received more frequently than once per second. If a conventional timer with the period of more than one second is enough for you, use [EventSetTimer\(\)](#).

In general, when the timer period is reduced, the testing time is increased, as the handler of timer events is called more often. When working in real-time mode, timer events are generated no more than 1 time in 10-16 milliseconds due to hardware limitations.

Usually, this function should be called from [OnInit\(\)](#) function or in class [constructor](#). To handle events coming from the timer, an Expert Advisor or an indicator should have [OnTimer\(\)](#) function.

Each Expert Advisor and each indicator work with its own timer receiving events solely from this timer. During mql5 application shutdown, the timer is forcibly destroyed in case it has been created but has not been disabled by [EventKillTimer\(\)](#) function.

Only one timer can be launched for each program. Each mql5 application and chart have their own queue of events where all newly arrived events are placed. If the queue already contains [Timer](#) event or this event is in the processing stage, then the new Timer event is not added to mql5 application queue.

EventSetTimer

The function indicates to the client terminal, that for this indicator or Expert Advisor, events from the [timer](#) must be generated with the specified periodicity.

```
bool EventSetTimer(  
    int seconds // number of seconds  
);
```

Parameters

seconds

[in] Number of seconds that determine the frequency of the timer event occurrence.

Return Value

In case of success returns true, otherwise false. In order to get an [error code](#), the [GetLastError\(\)](#) function should be called.

Note

Normally, this function must be called from the [OnInit\(\)](#) function or from a class [constructor](#). In order to handle events coming from the timer, the Expert Advisor must have the [OnTimer\(\)](#) function.

Every Expert Advisor, as well as every indicator works with its own timer and receives events only from it. As soon as a mql5 program stops operating, the timer is destroyed forcibly if it was created but hasn't been disabled by the [EventKillTimer\(\)](#) function.

For each program no more than one timer can be run. Each mql5 program and each chart has its own queue of events, in which all the newly received events are placed. If the [Timer](#) event is present in the queue or is being processed, the new Timer event will not be placed in the queue of the mql5 program.

EventKillTimer

Specifies the client terminal that is necessary to stop the generation of events from [Timer](#).

```
void EventKillTimer();
```

Return Value

No return value.

Note

Typically, this function must be called from a function [OnDeinit\(\)](#), if the [EventSetTimer\(\)](#) function has been called from [OnInit\(\)](#). This function can also be called from the class destructor, if the [EventSetTimer\(\)](#) function has been called in the [constructor](#) of this class.

Every Expert Advisor, as well as every indicator works with its own timer and receives events only from it. As soon as a mql5 program stops operating, the timer is destroyed forcibly if it was created but hasn't been disabled by the [EventKillTimer\(\)](#) function

EventChartCustom

The function generates a custom event for the specified chart.

```
bool EventChartCustom(
    long    chart_id,           // identifier of the event receiving chart
    ushort  custom_event_id,    // event identifier
    long    lparam,            // parameter of type long
    double  dparam,            // parameter of type double
    string  sparam             // string parameter of the event
);
```

Parameters

- chart_id*
[in] Chart identifier. 0 means the current chart.
- custom_event_id*
[in] ID of the user events. This identifier is automatically added to the value [CHARTEVENT_CUSTOM](#) and converted to the integer type.
- lparam*
[in] Event parameter of the long type passed to the [OnChartEvent](#) function.
- dparam*
[in] Event parameter of the double type passed to the [OnChartEvent](#) function.
- sparam*
[in] Event parameter of the string type passed to the [OnChartEvent](#) function. If the string is longer than 63 characters, it is truncated.

Return Value

Returns true if a custom event has been successfully placed in the events queue of the chart that receives the events. In case of failure, it returns false. Use [GetLastError\(\)](#) to get an error code.

Note

An Expert Advisor or indicator attached to the specified chart handles the event using the function [OnChartEvent](#)(int event_id, long& lparam, double& dparam, string& sparam).

For each type of event, the input parameters of the OnChartEvent() function have definite values that are required for the processing of this event. The events and values passed through this parameters are listed in the below table.

Event	Value of the id parameter	Value of the lparam parameter	Value of the dparam parameter	Value of the sparam parameter
Event of a keystroke	CHARTEVENT_KEYDOWN	code of a pressed key	Repeat count (the number of times the keystroke is	The string value of a bit mask describing the

Event	Value of the id parameter	Value of the lparam parameter	Value of the dparam parameter	Value of the sparam parameter
			repeated as a result of the user holding down the key)	status of keyboard buttons
Mouse event (if property CHART_EVENT_MOUSE_MOVE =true is set for the chart)	CHARTEVENT_MOUSE_MOVE	the X coordinate	the Y coordinate	The string value of a bit mask describing the status of mouse buttons
Event of graphical object creation (if CHART_EVENT_OBJECT_CREATE =true is set for the chart)	CHARTEVENT_OBJECT_CREATE	—	—	Name of the created graphical object
Event of change of an object property via the properties dialog	CHARTEVENT_OBJECT_CHANGE	—	—	Name of the modified graphical object
Event of graphical object deletion (if CHART_EVENT_OBJECT_DELETE =true is set for the chart)	CHARTEVENT_OBJECT_DELETE	—	—	Name of the deleted graphical object
Event of a mouse click on the chart	CHARTEVENT_CLICK	the X coordinate	the Y coordinate	—
Event of a mouse click in a graphical object belonging to the chart	CHARTEVENT_OBJECT_CLICK	the X coordinate	the Y coordinate	Name of the graphical object, on which the event occurred
Event of a graphical object dragging using the mouse	CHARTEVENT_OBJECT_DRAG	—	—	Name of the moved graphical object
Event of the finished text	CHARTEVENT_OBJECT_ENDEDIT	—	—	Name of the LabelEdit

Event	Value of the id parameter	Value of the lparam parameter	Value of the dparam parameter	Value of the sparam parameter
editing in the entry box of the LabelEdit graphical object				graphical object, in which text editing has completed
Event of changes on a chart	CHARTEVENT_CHART_CHANGE	—	—	—
ID of the user event under the N number	CHARTEVENT_CUSTOM+N	Value set by the EventChartCustom() function	Value set by the EventChartCustom() function	Value set by the EventChartCustom() function

Working with OpenCL

[OpenCL](#) programs are used for performing computations on video cards that support OpenCL 1.1 or higher. Modern video cards contain hundreds of small specialized processors that can simultaneously perform simple mathematical operations with incoming data streams. The OpenCL language organizes parallel computing and provides greater speed for a certain class of tasks.

In some graphic cards working with the [double](#) type numbers is disabled by default. This can lead to compilation error 5105. To enable support for the double type numbers, please add the following directive to your OpenCL program: [#pragma OPENCL_EXTENSION cl_khr_fp64 : enable](#). However if a graphic card doesn't support double, enabling this directive won't be of help.

It is recommended to write the source code for OpenCL in separate CL files, which can later be included in the MQL5 program using the [resource variables](#).

Handling errors in OpenCL programs

To get information about the last error in an OpenCL program, use the [CLGetInfoInteger](#) and [CLGetInfoString](#) functions that allow getting the error code and text description.

OpenCL last error code: To get the latest OpenCL error, call [CLGetInfoInteger](#), while the *handle* parameter is ignored (can be set to zero). Description of errors: https://registry.khronos.org/OpenCL/specs/3.0-unified/html/OpenCL_API.html#CL_SUCCESS.

For an unknown error code, the "unknown OpenCL error N" string is returned where N is an error code. Example:

```
//--- the first 'handle' parameter is ignored when getting the last error code
int code= (int)CLGetInfoInteger(0,CL_LAST_ERROR);
```

Text description of the OpenCL error: To get the latest OpenCL error, call [CLGetInfoString](#). The error code should be passed as the *handle* parameter.

Description of errors: https://registry.khronos.org/OpenCL/specs/3.0-unified/html/OpenCL_API.html#CL_SUCCESS. If CL_LAST_ERROR is passed instead of the error code, then the function returns the description of the last error. For example:

```
//--- get the code of the last OpenCL error
int code= (int)CLGetInfoInteger(0,CL_LAST_ERROR);
string desc; // to get an error text description

//--- use the error code to get an error text description
if(!CLGetInfoString(code,CL_ERROR_DESCRIPTION,desc))
    desc="cannot get OpenCL error description,"+ (string)GetLastError();
Print(desc);

//--- in order to get the description of the last OpenCL error without getting the code
if(!CLGetInfoString(CL_LAST_ERROR,CL_ERROR_DESCRIPTION,desc))
    desc="cannot get OpenCL error description,"+ (string)GetLastError();
Print(desc);;
```

So far, the name of the internal enumeration is given as an error description. You can find its decoding here: https://registry.khronos.org/OpenCL/specs/3.0-unified/html/OpenCL_API.html#CL_SUCCESS. For example, the CL_INVALID_KERNEL_ARGS value means "Returned when enqueueing a kernel when some kernel arguments have not been set or are invalid."

Functions for running programs in OpenCL:

Function	Action
CLHandleType	Returns the type of an OpenCL handle as a value of the ENUM_OPENCL_HANDLE_TYPE enumeration
CLGetInfoInteger	Returns the value of an integer property for an OpenCL object or device
CLContextCreate	Creates an OpenCL context
CLContextFree	Removes an OpenCL context
CLGetDeviceInfo	Receives device property from OpenCL driver
CLProgramCreate	Creates an OpenCL program from a source code
CLProgramFree	Removes an OpenCL program
CLKernelCreate	Creates an OpenCL start function
CLKernelFree	Removes an OpenCL start function
CLSetKernelArg	Sets a parameter for the OpenCL function
CLSetKernelArgMem	Sets an OpenCL buffer as a parameter of the OpenCL function
CLSetKernelArgMemLocal	Sets the local buffer as an argument of the kernel function
CLBufferCreate	Creates an OpenCL buffer
CLBufferFree	Deletes an OpenCL buffer
CLBufferWrite	Writes an array into an OpenCL buffer
CLBufferRead	Reads an OpenCL buffer into an array
CLExecute	Runs an OpenCL program
CLExecutionStatus	Returns the OpenCL program execution status

[OpenCL](#), [Resources](#)

CLHandleType

Returns the type of an OpenCL handle as a value of the `ENUM_OPENCL_HANDLE_TYPE` enumeration.

```
ENUM_OPENCL_HANDLE_TYPE CLHandleType(  
    int handle    // Handle of an OpenCL object  
);
```

Parameters

handle
[in] A handle to an OpenCL object: a context, a kernel or an OpenCL program.

Return Value

The type of the OpenCL handle as a value of the [ENUM_OPENCL_HANDLE_TYPE](#) enumeration.

ENUM_OPENCL_HANDLE_TYPE

Identifier	Description
OPENCL_INVALID	Incorrect handle
OPENCL_CONTEXT	A handle of the OpenCL context
OPENCL_PROGRAM	A handle of the OpenCL program
OPENCL_KERNEL	A handle of the OpenCL kernel
OPENCL_BUFFER	A handle of the OpenCL buffer

CLGetInfoInteger

Returns the value of an integer property for an OpenCL object or device.

```
long CLGetInfoInteger(  
    int handle, // The handle of the OpenCL object or the number of the OpenCL device  
    ENUM_OPENCL_PROPERTY_INTEGER prop // Requested property  
);
```

Parameters

- handle*
- [in] A handle to the OpenCL object or number of the OpenCL device. Numbering of OpenCL devices starts with zero.
- prop*
- [in] The type of a requested property from the [ENUM_OPENCL_PROPERTY_INTEGER](#) enumeration, the value of which you want to obtain.

Return Value

The value of the property if successful or -1 in case of an error. For information about the error, use the [GetLastError\(\)](#) function.

ENUM_OPENCL_PROPERTY_INTEGER

Identifier	Description	Type
CL_DEVICE_COUNT	The number of devices with OpenCL support. This property does not require specification of the first parameter, i.e. you can pass a zero value for the <i>handle</i> parameter.	int
CL_DEVICE_TYPE	Type of device	ENUM_CL_DEVICE_TYPE
CL_DEVICE_VENDOR_ID	Unique vendor identifier	uint
CL_DEVICE_MAX_COMPUTE_UNITS	Number of parallel calculated tasks in OpenCL device. One working group solves one computational task. The lowest value is 1	uint
CL_DEVICE_MAX_CLOCK_FREQUENCY	Highest set frequency of the device in MHz.	uint
CL_DEVICE_GLOBAL_MEM_SIZE	Size of the global memory of the device in bytes	ulong
CL_DEVICE_LOCAL_MEM_SIZE	Size of the processed data (scene) local memory in bytes	uint

Identifier	Description	Type
CL_BUFFER_SIZE	Actual size of the OpenCL buffer in bytes	ulong
CL_DEVICE_MAX_WORK_GROUP_SIZE	The total number of the local working groups available for an OpenCL device.	ulong
CL_KERNEL_WORK_GROUP_SIZE	The total number of the local working groups available for an OpenCL program.	ulong
CL_KERNEL_LOCAL_MEM_SIZE	Size of the local memory (in bytes) used by an OpenCL program for solving all parallel tasks in a group. Use CL_DEVICE_LOCAL_MEM_SIZE to receive the maximum available value	ulong
CL_KERNEL_PRIVATE_MEM_SIZE	The minimum size of the private memory (in bytes) used by each task in the OpenCL program kernel.	ulong
CL_LAST_ERROR	The value of the last OpenCL error	int

The `ENUM_CL_DEVICE_TYPE` enumeration contains possible types of devices supporting OpenCL. You can receive the type of device by its number or the handle of the OpenCL object by calling `CLGetInfoInteger(handle_or_deviceN, CL_DEVICE_TYPE)`.

ENUM_CL_DEVICE_TYPE

Identifier	Description
CL_DEVICE_ACCELERATOR	Dedicated OpenCL accelerators (for example, the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.
CL_DEVICE_CPU	An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.
CL_DEVICE_GPU	An OpenCL device that is a GPU.
CL_DEVICE_DEFAULT	The default OpenCL device in the system. The default device cannot be a CL_DEVICE_TYPE_CUSTOM device.

Identifier	Description
CL_DEVICE_CUSTOM	Dedicated accelerators that do not support programs written in OpenCL C.

Example:

```
void OnStart()
{
    int cl_ctx;
    ///--- initialize OpenCL context
    if ((cl_ctx=CLContextCreate(CL_USE_GPU_ONLY))==INVALID_HANDLE)
    {
        Print("OpenCL not found");
        return;
    }
    ///--- Display general information about OpenCL device
    Print("OpenCL type: ",EnumToString((ENUM_CL_DEVICE_TYPE)CLGetInfoInteger(cl_ctx,CL_DEVICE_TYPE)));
    Print("OpenCL vendor ID: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_VENDOR_ID));
    Print("OpenCL units: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_MAX_COMPUTE_UNITS));
    Print("OpenCL freq: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_MAX_CLOCK_FREQUENCY)," MHz");
    Print("OpenCL global mem: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_GLOBAL_MEM_SIZE)," bytes");
    Print("OpenCL local mem: ",CLGetInfoInteger(cl_ctx,CL_DEVICE_LOCAL_MEM_SIZE)," bytes");
    ///--- free OpenCL context
    CLContextFree(cl_ctx);
}
```

CLGetInfoString

Returns string value of a property for OpenCL object or device.

```
bool CLGetInfoString(  
    int handle, // OpenCL object handle or OpenCL device number  
    ENUM_OPENCL_PROPERTY_STRING prop, // requested property  
    string& value // referenced string  
);
```

Parameters

- handle*
- [in] OpenCL object handle or OpenCL device number. The numbering of OpenCL devices starts with zero.
- prop*
- [in] Type of requested property from [ENUM_OPENCL_PROPERTY_STRING](#) enumeration, the value of which should be obtained.
- value*
- [out] String for receiving the property value.

Return Value

true if successful, otherwise false. For information about the error, use the [GetLastError\(\)](#) function.

ENUM_OPENCL_PROPERTY_STRING

Identifier	Description
CL_PLATFORM_PROFILE	CL_PLATFORM_PROFILE - OpenCL Profile. Profile name may be one of the following values: <ul style="list-style-type: none">FULL_PROFILE - implementation supports OpenCL (functionality is defined as the part of the kernel specification without requiring additional extensions for OpenCL support);EMBEDDED_PROFILE - implementation supports OpenCL as a supplement. Amended profile is defined as a subset for each OpenCL version.
CL_PLATFORM_VERSION	OpenCL version
CL_PLATFORM_VENDOR	Platform vendor name
CL_PLATFORM_EXTENSIONS	List of extensions supported by the platform. Extension names should be supported by all devices related to this platform
CL_DEVICE_NAME	Device name
CL_DEVICE_VENDOR	Vendor name

Identifier	Description
CL_DRIVER_VERSION	OpenCL driver version in major_number.minor_number format
CL_DEVICE_PROFILE	OpenCL device profile. Profile name may be one of the following values: <ul style="list-style-type: none">FULL_PROFILE - implementation supports OpenCL (functionality is defined as the part of the kernel specification without requiring additional extensions for OpenCL support);EMBEDDED_PROFILE - implementation supports OpenCL as a supplement. Amended profile is defined as a subset for each OpenCL version.
CL_DEVICE_VERSION	OpenCL version in "OpenCL<space><major_version.minor_version><space><vendor-specific information>" format
CL_DEVICE_EXTENSIONS	List of extensions supported by the device. The list may contain extensions supported by the vendor, as well as one or more approved names: cl_khr_int64_base_atomics cl_khr_int64_extended_atomics cl_khr_fp16 cl_khr_gl_sharing cl_khr_gl_event cl_khr_d3d10_sharing cl_khr_dx9_media_sharing cl_khr_d3d11_sharing
CL_DEVICE_BUILT_IN_KERNELS	The list of supported kernels separated by ";".
CL_DEVICE_OPENCL_C_VERSION	The maximum version supported by the compiler for this device. Version format: "OpenCL<space>C<space><major_version.minor_version><space><vendor-specific information> "
CL_ERROR_DESCRIPTION	Text description of an OpenCL error

Example:

```
void OnStart()
{
    int cl_ctx;
    string str;
    //--- initialize OpenCL context
    if((cl_ctx=CLContextCreate(CL_USE_GPU_ONLY))==INVALID_HANDLE)
    {
        Print("OpenCL not found");
        return;
    }
}
```

```

//--- Display information about the platform
if (CLGetInfoString(cl_ctx, CL_PLATFORM_NAME, str))
    Print("OpenCL platform name: ", str);
if (CLGetInfoString(cl_ctx, CL_PLATFORM_VENDOR, str))
    Print("OpenCL platform vendor: ", str);
if (CLGetInfoString(cl_ctx, CL_PLATFORM_VERSION, str))
    Print("OpenCL platform ver: ", str);
if (CLGetInfoString(cl_ctx, CL_PLATFORM_PROFILE, str))
    Print("OpenCL platform profile: ", str);
if (CLGetInfoString(cl_ctx, CL_PLATFORM_EXTENSIONS, str))
    Print("OpenCL platform ext: ", str);
//--- Display information about the device
if (CLGetInfoString(cl_ctx, CL_DEVICE_NAME, str))
    Print("OpenCL device name: ", str);
if (CLGetInfoString(cl_ctx, CL_DEVICE_PROFILE, str))
    Print("OpenCL device profile: ", str);
if (CLGetInfoString(cl_ctx, CL_DEVICE_BUILT_IN_KERNELS, str))
    Print("OpenCL device kernels: ", str);
if (CLGetInfoString(cl_ctx, CL_DEVICE_EXTENSIONS, str))
    Print("OpenCL device ext: ", str);
if (CLGetInfoString(cl_ctx, CL_DEVICE_VENDOR, str))
    Print("OpenCL device vendor: ", str);
if (CLGetInfoString(cl_ctx, CL_DEVICE_VERSION, str))
    Print("OpenCL device ver: ", str);
if (CLGetInfoString(cl_ctx, CL_DEVICE_OPENCL_C_VERSION, str))
    Print("OpenCL open c ver: ", str);
//--- Display general information about the OpenCL device
Print("OpenCL type: ", EnumToString((ENUM_CL_DEVICE_TYPE)CLGetInfoInteger(cl_ctx, CL_
Print("OpenCL vendor ID: ", CLGetInfoInteger(cl_ctx, CL_DEVICE_VENDOR_ID));
Print("OpenCL units: ", CLGetInfoInteger(cl_ctx, CL_DEVICE_MAX_COMPUTE_UNITS));
Print("OpenCL freq: ", CLGetInfoInteger(cl_ctx, CL_DEVICE_MAX_CLOCK_FREQUENCY));
Print("OpenCL global mem: ", CLGetInfoInteger(cl_ctx, CL_DEVICE_GLOBAL_MEM_SIZE));
Print("OpenCL local mem: ", CLGetInfoInteger(cl_ctx, CL_DEVICE_LOCAL_MEM_SIZE));
//--- free OpenCL context
CLContextFree(cl_ctx);
}

```

CLContextCreate

Creates an OpenCL context and returns its handle.

```
int CLContextCreate(  
    int device=CL_USE_ANY    // Serial number of the OpenCL device or macro  
);
```

Parameter

device

[in] The ordinal number of the OpenCL-device in the system. Instead of a specific number, you can specify one of the following values:

- CL_USE_ANY - any available device with OpenCL support is allowed;
- CL_USE_CPU_ONLY - only OpenCL emulation on CPU is allowed;
- CL_USE_GPU_ONLY - OpenCL emulation is prohibited and only specialized devices with OpenCL support (video cards) can be used;
- CL_USE_GPU_DOUBLE_ONLY - only the GPUs that support type [double](#) are allowed.

Return Value

A handle to the OpenCL context if successful, otherwise -1. For information about the error, use the [GetLastError\(\)](#) function.

CLContextFree

Removes an OpenCL context.

```
void CLContextFree(  
    int context    // Handle to an OpenCL context  
);
```

Parameters

context

[in] Handle of the OpenCL context.

Return Value

None. In the case of an internal error the value of [_LastError](#) changes. For information about the error, use the [GetLastError\(\)](#) function.

CLGetDeviceInfo

The function receives device property from OpenCL driver.

```
bool CLGetDeviceInfo(  
    int      handle,           // OpenCL device handle  
    int      property_id,      // requested property ID  
    uchar&   data[],          // array for receiving data  
    uint&    size              // shift in the array elements, default value is 0  
);
```

Parameters

- handle*
[in] OpenCL device index or OpenCL handle created by [CLContextCreate\(\)](#) function.
- property_id*
[in] ID of the OpenCL device property that should be received. The values can be of one of the predetermined ones listed in the [table below](#).
- data[]*
[out] The array for receiving data on the requested property.
- size*
[out] Size of the received data in the array *data[]*.

Return Value

true if successful, otherwise false. For information about the error, use the [GetLastError\(\)](#) function.

Note

For one-dimensional arrays, the number of the element, from which data reading for OpenCL buffer starts, is calculated considering [AS_SERIES](#) flag.

The list of available IDs of OpenCL device properties

Exact description of the property and its functions can be found at [the official OpenCL web site](#).

Identifier	Value

CLProgramCreate

Creates an OpenCL program from a source code.

```
int CLProgramCreate(
    int          context,    // Handle to an OpenCL context
    const string source      // Source code
);
```

An overloaded function version creates an OpenCL program and writes compiler messages into the passed string.

```
int CLProgramCreate(
    int          context,    // Handle to an OpenCL context
    const string source,    // Source code
    string       &build_log // A string for receiving the compilation log
);
```

Parameters

context

[in] Handle of the OpenCL context.

source

[in] String with the source code of the OpenCL program.

&build_log

[in] A string for receiving the OpenCL compiler messages.

Return Value

A handle to an OpenCL object if successful. In case of error -1 is returned. For information about the error, use the [GetLastError\(\)](#) function.

Note

At the moment, the following error codes are used:

- `ERR_OPENCL_INVALID_HANDLE` - invalid handle to the context OpenCL.
- `ERR_INVALID_PARAMETER` - invalid string parameter.
- `ERR_NOT_ENOUGH_MEMORY` - not enough memory to complete operation.
- `ERR_OPENCL_PROGRAM_CREATE` - internal error of OpenCL or compilation error.

In some graphic cards working with the [double](#) type numbers is disabled by default. This can lead to compilation error 5105. To enable support for the double type numbers, please add the following directive to your OpenCL program: `#pragma OPENCL EXTENSION cl_khr_fp64 : enable`. However if a graphic card doesn't support double, enabling this directive won't be of help.

Example:

```
//+-----+
//| OpenCL kernel                                     |
//+-----+
const string
```

```

cl_src=
    //--- by default some GPU doesn't support doubles
    //--- cl_khr_fp64 directive is used to enable work with doubles
    "#pragma OPENCL EXTENSION cl_khr_fp64 : enable      \r\n"
    //--- OpenCL kernel function
    "__kernel void Test_GPU(__global double *data,      \r\n"
    "                        const   int N,              \r\n"
    "                        const   int total_arrays)   \r\n"
    "    {                                              \r\n"
    "        uint kernel_index=get_global_id(0);        \r\n"
    "        if (kernel_index>total_arrays) return;      \r\n"
    "        uint local_start_offset=kernel_index*N;    \r\n"
    "        for(int i=0; i<N; i++)                      \r\n"
    "        {                                          \r\n"
    "            data[i+local_start_offset] *= 2.0;      \r\n"
    "        }                                          \r\n"
    "    }                                              \r\n";

//+-----+
//| Test_CPU                                     |

//--- free OpenCL context
CLContextFree(cl_ctx);

```

```
//---  
    return(0);  
}
```

CLProgramFree

Removes an OpenCL program.

```
void CLProgramFree(  
    int program    // Handle to an OpenCL object  
);
```

Parameters

program

[in] Handle of the OpenCL object.

Return Value

None. In the case of an internal error the value of [_LastError](#) changes. For information about the error, use the [GetLastError\(\)](#) function.

CLKernelCreate

Creates the OpenCL program kernel and returns its handle.

```
int CLKernelCreate(  
    int          program,          // Handle to an OpenCL object  
    const string kernel_name      // Kernel name  
);
```

Parameters

program

[in] Handle to an object of the OpenCL program.

kernel_name

[in] The name of the kernel function in the appropriate OpenCL program, in which execution begins.

Return Value

A handle to an OpenCL object if successful. In case of error -1 is returned. For information about the error, use the [GetLastError\(\)](#) function.

Note

At the moment, the following error codes are used:

- ERR_OPENCL_INVALID_HANDLE - invalid handle to OpenCL program.
- ERR_INVALID_PARAMETER - invalid string parameter.
- ERR_OPENCL_TOO_LONG_KERNEL_NAME - kernel name contains more than 127 characters.
- ERR_OPENCL_KERNEL_CREATE - internal error occurred while creating an OpenCL object.

CLKernelFree

Removes an OpenCL start function.

```
void CLKernelFree(  
    int kernel    // Handle to the kernel of an OpenCL program  
);
```

Parameters

kernel_name

[in] Handle of the kernel object.

Return Value

None. In the case of an internal error the value of [_LastError](#) changes. For information about the error, use the [GetLastError\(\)](#) function.

CLSetKernelArg

Sets a parameter for the OpenCL function.

```
bool CLSetKernelArg(  
    int    kernel,          // Handle to the kernel of an OpenCL program  
    uint   arg_index,       // The number of the argument of the OpenCL function  
    void   arg_value        // Source code  
);
```

Parameters

kernel

[in] Handle to a kernel of the OpenCL program.

arg_index

[in] The number of the function argument, numbering starts with zero.

arg_value

[in] The value of the function argument.

Return Value

Returns true if successful, otherwise returns false. For information about the error, use the [GetLastError\(\)](#) function.

Note

At the moment, the following error codes are used:

- ERR_INVALID_PARAMETER,
- ERR_OPENCL_INVALID_HANDLE - invalid handle to the OpenCL kernel.
- ERR_OPENCL_SET_KERNEL_PARAMETER - internal error of OpenCL.

CLSetKernelArgMem

Sets an OpenCL buffer as a parameter of the OpenCL function.

```
bool CLSetKernelArgMem(  
    int    kernel,           // Handle to the kernel of an OpenCL program  
    uint   arg_index,       // The number of the argument of the OpenCL function  
    int    cl_mem_handle     // Handle to OpenCL buffer  
);
```

Parameters

kernel

[in] Handle to a kernel of the OpenCL program.

arg_index

[in] The number of the function argument, numbering starts with zero.

cl_mem_handle

[in] A handle to an OpenCL buffer.

Return Value

Returns true if successful, otherwise returns false. For information about the error, use the [GetLastError\(\)](#) function.

CLSetKernelArgMemLocal

Sets the local buffer as an argument of the kernel function.

```
bool CLSetKernelArgMemLocal(  
    int    kernel,           // handle to a kernel of an OpenCL program  
    uint   arg_index,       // number of the OpenCL function argument  
    ulong  local_mem_size   // buffer size  
);
```

Parameters

kernel

[in] Handle to a kernel of the OpenCL program.

arg_index

[in] The number of the function argument, numbering starts with zero.

local_mem_size

[in] Buffer size in bytes.

Return Value

Returns true if successful, otherwise returns false. For information about the error, use the [GetLastError\(\)](#) function.

CLBufferCreate

Creates an OpenCL buffer and returns its handle.

```
int CLBufferCreate(  
    int    context,    // Handle to an OpenCL context  
    uint   size,       // Buffer size  
    uint   flags       // Flags combination which specify properties of OpenCL buffer  
);
```

Parameters

context

[in] A handle to context OpenCL.

size

[in] Buffer size in bytes.

flags

[in] Buffer properties that are set using a combination of flags: CL_MEM_READ_WRITE, CL_MEM_WRITE_ONLY, CL_MEM_READ_ONLY, CL_MEM_ALLOC_HOST_PTR.

Return Value

A handle to an OpenCL buffer if successful. In case of error -1 is returned. For information about the error, use the [GetLastError\(\)](#) function.

Note

At the moment, the following error codes are used:

- ERR_OPENCL_INVALID_HANDLE - invalid handle to OpenCL context.
- ERR_NOT_ENOUGH_MEMORY - insufficient memory.
- ERR_OPENCL_BUFFER_CREATE - internal error creating buffers.

CLBufferFree

Deletes an OpenCL buffer.

```
void CLBufferFree(  
    int    buffer    // Handle to an OpenCL buffer  
);
```

Parameters

buffer

[in] A handle to an OpenCL buffer.

Return Value

None. In the case of an internal error the value of [_LastError](#) changes. For information about the error, use the [GetLastError\(\)](#) function.

CLBufferWrite

Writes into the OpenCL buffer and returns the number of written elements.

```
uint CLBufferWrite(
    int          buffer,           // A handle to the OpenCL buffer
    const void&  data[],          // An array of values
    uint         buffer_offset=0,  // An offset in the OpenCL buffer in bytes,
    uint         data_offset=0,    // An offset in the array in elements, 0 by
    uint         data_count=WHOLE_ARRAY // The number of values from the array for
);
```

There are also versions for handling [matrices and vectors](#).

Writes the values from the matrix to the buffer and returns true if successful.

```
uint CLBufferWrite(
    int          buffer,           // a handle to the OpenCL buffer
    uint         buffer_offset,    // an offset in the OpenCL buffer in bytes
    matrix<T>    &mat             // the values matrix for writing to the bu
);
```

Writes the values from the vector to the buffer and returns true if successful.

```
uint CLBufferWrite(
    int          buffer,           // a handle to the OpenCL buffer
    uint         buffer_offset,    // an offset in the OpenCL buffer in bytes
    vector<T>    &vec             // the values vector for writing to the bu
);
```

Parameters

buffer

[in] A handle of the OpenCL buffer.

data[]

[in] An array of values that should be written in the OpenCL buffer. Passed by reference.

buffer_offset

[in] An offset in the OpenCL buffer in bytes, from which writing begins. By default, writing start with the very beginning of the buffer.

data_offset

[in] The index of the first array element, starting from which values from the array are written in the OpenCL buffer. By default, values from the very beginning of the array are taken.

data_count

[in] The number of values that should be written. All the values of the array, by default.

mat

[out] The matrix for reading data from the buffer can be any of the three types — matrix, matrixf or matrixc.

vec

[out] The vector for reading data from the buffer can be of any of the three types – vector, vectorf or vectorc.

Return Value

The number of written elements. 0 is returned in case of an error. For information about the error, use the [GetLastError\(\)](#) function.

true if a matrix or a vector is handled successfully, otherwise **false**.

Note

For one-dimensional arrays, the number of the element, with which reading of data for writing into an OpenCL buffer begins, is calculated taking into account the [AS_SERIES](#) flags.

An array of two or more dimensions is presented as one-dimensional. In this case, *data_offset* is the number of elements that should be skipped in the presentation, not the number of elements in the first dimension.

Example of matrix multiplication using the [MatMul](#) method and parallel computing in OpenCL

```
#define M      3000      // the number of rows in the first matrix
#define K      2000      // the number of columns in the first matrix is equal to the
#define N      3000      // the number of columns in the second matrix

//+-----+
const string clSrc=
    "#define N      "+IntegerToString(N)+"          \r\n"
    "#define K      "+IntegerToString(K)+"          \r\n"
    "          \r\n"
    "__kernel void matricesMul( __global float *in1,    \r\n"
    "                          __global float *in2,    \r\n"
    "                          __global float *out  )    \r\n"
    "{          \r\n"
    "  int m = get_global_id( 0 );          \r\n"
    "  int n = get_global_id( 1 );          \r\n"

```

CLBufferRead

Reads an OpenCL buffer into an array and returns the number of read elements.

```
uint CLBufferRead(
    int          buffer,           // A handle to the OpenCL buffer
    const void&   data[],          // An array of values
    uint         buffer_offset=0,  // An offset in the OpenCL buffer in bytes,
    uint         data_offset=0,    // An offset in the array in elements, 0 by
    uint         data_count=WHOLE_ARRAY // The number of values from the buffer for
);
```

There are also versions for handling [matrices and vectors](#).

Reads the OpenCL buffer to the matrix and returns true if successful.

```
uint CLBufferRead(
    int          buffer,           // a handle to the OpenCL buffer
    uint         buffer_offset,    // an offset in the OpenCL buffer in bytes
    const matrix& mat,            // the matrix for receiving the values from
    ulong        rows=-1,         // the number of rows in the matrix
    ulong        cols=-1          // the number of columns in the matrix
);
```

Reads the OpenCL buffer to the vector and returns true if successful.

```
uint CLBufferRead(
    int          buffer,           // a handle to the OpenCL buffer
    uint         buffer_offset,    // an offset in the OpenCL buffer in bytes
    const vector& vec,            // the vector for receiving the values from
    ulong        size-1,          // vector length
);
```

Parameters

buffer

[in] A handle of the OpenCL buffer.

data[]

[in] An array for receiving values from the OpenCL buffer. Passed by reference.

buffer_offset

[in] An offset in the OpenCL buffer in bytes, from which reading begins. By default, reading starts with the very beginning of the buffer.

data_offset

[in] The index of the first array element for writing the values of the OpenCL buffer. By default, writing of the read values into an array starts from the zero index.

data_count

[in] The number of values that should be read. The whole OpenCL buffer is read by default.

mat

[out] The matrix for reading data from the buffer can be any of the three types – matrix, matrixf or matrixc.

vec

[out] The vector for reading data from the buffer can be of any of the three types – vector, vectorf or vectorc.

rows=-1

[in] If the parameter is specified, the *cols* parameter should be specified as well. If the new matrix dimensions are not specified, the current ones are used. If the value is -1, then the number of rows does not change.

cols=-1

[in] If the parameter is not specified, the *rows* parameter should be skipped as well. The matrix adheres to the rule: either both parameters are specified, or none, otherwise an error will occur. If both parameters (*rows* and *cols*) are specified, the matrix size is changed. In case of -1, the number of columns does not change.

size=-1

[in] If the parameter is not specified or its value is -1, the vector length does not change.

Return Value

The number of read elements. 0 is returned in case of an error. For information about the error, use the [GetLastError\(\)](#) function.

true if a matrix or a vector is handled successfully, otherwise **false**.

Note

For one-dimensional arrays, the number of the element, into which writing of data into an OpenCL buffer begins, is calculated taking into account the [AS_SERIES](#) flags.

An array of two or more dimensions is presented as one-dimensional. In this case, *data_offset* is the number of elements that should be skipped in the presentation, not the number of elements in the first dimension.

Example of calculating Pi using the equation:

$$\pi = \lim_{N \rightarrow \infty} \frac{1}{N} \sum_{k=0}^{N-1} \frac{4}{1 + \left(\frac{2k+1}{2N}\right)^2} = 16 \lim_{N \rightarrow \infty} \frac{1}{N} \sum_{k=0}^{N-1} \frac{1}{4N^2 + (2k+1)^2}$$

```
#define _num_steps      1000000000
#define _divisor        40000
#define _step           1.0 / _num_steps
#define _intrnCntr      _num_steps / _divisor
```

```

CLExecute

The function runs an OpenCL program. There are 3 versions of the function:

1. Launching kernel functions using one kernel

```
bool CLExecute(
    int          kernel           // Handle to the kernel of an OpenCL program
);
```

2. Launching several kernel copies (OpenCL function) with task space description

```
bool CLExecute(
    int          kernel,           // Handle to the kernel of an OpenCL program
    uint         work_dim,         // Dimension of the tasks space
    const uint&  global_work_offset[], // Initial offset in the tasks space
    const uint&  global_work_size[]  // Total number of tasks
);
```

3. Launching several kernel copies (OpenCL function) with task space description and specification of the size of the group's local task subset

```
bool CLExecute(
    int          kernel,           // Handle to the kernel of an OpenCL program
    uint         work_dim,         // Dimension of the tasks space
    const uint&  global_work_offset[], // Initial offset in the tasks space
    const uint&  global_work_size[],  // Total number of tasks
    const uint&  local_work_size[]   // Number of tasks in the local group
);
```

Parameters

kernel

[in] Handle to the OpenCL kernel.

work_dim

[in] Dimension of the tasks space.

global_work_offset[]

[in] Initial offset in the tasks space.

global_work_size[]

[in] The size of a subset of tasks.

local_work_size[]

[in] The size of the group's local task subset.

Return Value

Returns true if successful, otherwise returns false. For information about the error, use the [GetLastError\(\)](#) function.

Note

Consider the use of the parameters in the following example:

- *work_dim* specifies the size of *work_items[]* array that describes the tasks. If *work_dim*=3, three-dimensional array *work_items[N1, N2, N3]* is used.
- *global_work_size[]* contains the values that set the *work_items[]* array size. If *work_dim*=3, *global_work_size[3]* array can be {40, 100, 320}. Then we have *work_items[40, 100, 320]*. So, the total number of tasks is $40 \times 100 \times 320 = 1\,280\,000$.
- *local_work_size[]* sets the subset of the tasks that will be executed by the specified kernel of OpenCL program. Its size is equal to *work_items[]* size and allows to split the common task subset into smaller subsets without loss of remainder in division. In fact, the size of *local_work_size[]* array should be selected so that the *work_items[]* global task set will be split into smaller subsets. In this example *local_work_size[3]={10, 10, 10}* will be OK, as *work_items[40, 100, 320]* can be gathered from *local_items[10, 10, 10]* array without division remainder.

CLExecutionStatus

Returns the OpenCL program execution status.

```
int CLExecutionStatus(  
    int kernel // handle to a kernel of an OpenCL program  
);
```

Parameters

kernel

[in] Handle to a kernel of the OpenCL program.

Return Value

Returns the OpenCL program status. The value can be one of the following:

- CL_COMPLETE=0 - program complete,
- CL_RUNNING=1 - running,
- CL_SUBMITTED=2 - submitted for execution,
- CL_QUEUED=3 - queued,
- -1 (minus one) - error occurred when executing CLExecutionStatus().

Working with databases

The functions for working with databases apply the popular and easy-to-use [SQLite](#) engine. The convenient feature of this engine is that the entire database is located in a single file on a user PC's hard disk.

The functions allow for convenient creation of tables, adding data to them, performing modifications and sampling using simple SQL requests:

- receiving trading history and quotes from any formats,
- saving optimization and test results,
- preparing and exchanging data with other analysis packages,
- storing MQL5 application settings and status.

Queries allow using [statistical](#) and [mathematical](#) functions.

The functions for working with databases allow you to replace the most repetitive large data array handling operations with SQL requests, so that it is often possible to use the [DatabaseExecute](#)/[DatabasePrepare](#) calls instead of programming complex loops and comparisons. Use the [DatabaseReadBind](#) function to conveniently obtain query results in a ready-made structure. The function allows reading all record fields at once within a single call.

To accelerate reading, writing and modification, a database can be opened/created in RAM with the DATABASE_OPEN_MEMORY flag, although such a database is available only to a specific application and is not shared. When working with databases located on the hard disk, bulk data inserts/changes should be wrapped in transactions using [DatabaseTransactionBegin](#)/[DatabaseTransactionCommit](#)/[DatabaseTransactionRollback](#). This accelerates the process hundreds of times.

To start working with the functions, read the article [SQLite: Native handling of SQL databases in MQL5](#).

Function	Action
DatabaseOpen	Opens or creates a database in a specified file
DatabaseClose	Closes a database
DatabaseImport	Imports data from a file into a table
DatabaseExport	Exports a table or an SQL request execution result to a CSV file
DatabasePrint	Prints a table or an SQL request execution result in the Experts journal
DatabaseTableExists	Checks the presence of the table in a database
DatabaseExecute	Executes a request to a specified database
DatabasePrepare	Creates a handle of a request, which can then be executed using DatabaseRead()
DatabaseReset	Resets a request, like after calling DatabasePrepare()
DatabaseBind	Sets a parameter value in a request

Function	Action
DatabaseBindArray	Sets an array as a parameter value
DatabaseRead	Moves to the next entry as a result of a request
DatabaseReadBind	Moves to the next record and reads data into the structure from it
DatabaseFinalize	Removes a request created in DatabasePrepare()
DatabaseTransactionBegin	Starts transaction execution
DatabaseTransactionCommit	Completes transaction execution
DatabaseTransactionRollback	Rolls back transactions
DatabaseColumnsCount	Gets the number of fields in a request
DatabaseColumnName	Gets a field name by index
DatabaseColumnType	Gets a field type by index
DatabaseColumnSize	Gets a field size in bytes
DatabaseColumnText	Gets a field value as a string from the current record
DatabaseColumnInteger	Gets the int type value from the current record
DatabaseColumnLong	Gets the long type value from the current record
DatabaseColumnDouble	Gets the double type value from the current record
DatabaseColumnBlob	Gets a field value as an array from the current record

Statistical functions:

- mode - [mode](#)
- median - [median](#) (50th percentile)
- percentile_25 - 25th [percentile](#)
- percentile_75
- percentile_90
- percentile_95
- percentile_99
- stddev or stddev_samp – sample standard deviation
- stddev_pop – population standard deviation
- variance or var_samp – sample variance
- var_pop – population variance

Mathematical functions

- [acos\(X\)](#) - arccosine in radians
- [acosh\(X\)](#) - hyperbolic arccosine
- [asin\(X\)](#) - arcsine in radians

- [asinh\(X\)](#) - hyperbolic arcsine
- [atan\(X\)](#) - arctangent in radians
- [atan2\(X,Y\)](#) - arctangent in radians of the X/Y ratio
- [atanh\(X\)](#) - hyperbolic arctangent
- [ceil\(X\)](#) - rounding up to an integer
- [ceiling\(X\)](#) - rounding up to an integer
- [cos\(X\)](#) - angle cosine in radians
- [cosh\(X\)](#) - hyperbolic cosine
- [degrees\(X\)](#) - convert radians into the angle
- [exp\(X\)](#) - exponent
- [floor\(X\)](#) - rounding down to an integer
- [ln\(X\)](#) - natural logarithm
- [log\(B,X\)](#) - logarithm to the indicated base
- [log\(X\)](#) - decimal logarithm
- [log10\(X\)](#) - decimal logarithm
- [log2\(X\)](#) - logarithm to base 2
- [mod\(X,Y\)](#) - remainder of division
- [pi\(\)](#) - approximate Pi
- [pow\(X,Y\)](#) - power by the indicated base
- [power\(X,Y\)](#) - power by the indicated base
- [radians\(X\)](#) - convert the angle into radians
- [sin\(X\)](#) - angle sine in radians
- [sinh\(X\)](#) - hyperbolic sine
- [sqrt\(X\)](#) - square root
- [tan\(X\)](#) - angle tangent in radians
- [tanh\(X\)](#) - hyperbolic tangent
- [trunc\(X\)](#) - truncate to an integer closest to 0

Example:

```
select
  count(*) as book_count,
  cast(avg(parent) as integer) as mean,
  cast(median(parent) as integer) as median,
  mode(parent) as mode,
  percentile_90(parent) as p90,
  percentile_95(parent) as p95,
  percentile_99(parent) as p99
from moz_bookmarks;
```

DatabaseOpen

Opens or creates a database in a specified file.

```
int DatabaseOpen(  
    string filename,      // file name  
    uint flags            // combination of flags  
);
```

Parameters

filename

[in] File name relative to the "MQL5\Files" folder.

flags

[in] Combination of flags from the [ENUM_DATABASE_OPEN_FLAGS](#) enumeration.

Return Value

If executed successfully, the function returns the database handle, which is then used to access the database. Otherwise, it returns [INVALID_HANDLE](#). To get the error code, use GetLastError(), the possible responses are:

- ERR_INTERNAL_ERROR (4001) - critical runtime error;
- ERR_WRONG_INTERNAL_PARAMETER (4002) - internal error, while accessing the "MQL5\Files" folder;
- ERR_INVALID_PARAMETER (4003) - path to the database file contains an empty string, or an incompatible combination of flags is set;
- ERR_NOT_ENOUGH_MEMORY (4004) - insufficient memory;
- ERR_WRONG_FILENAME (5002) - wrong database file name;
- ERR_TOO_LONG_FILENAME (5003) - absolute path to the database file exceeds the maximum length;
- ERR_DATABASE_TOO_MANY_OBJECTS (5122) - exceeded the maximum acceptable number of Database objects;
- ERR_DATABASE_CONNECT (5123) - database connection error;
- ERR_DATABASE_MISUSE (5621) - incorrect use of the SQLite library.

Note

If the *filename* parameter features NULL or the empty string "", a temporary file is created on the disk. It is automatically deleted after closing the database connection.

If the *filename* parameter features ":memory:", the database is created in the memory and is automatically deleted after the connection to it is closed.

If the *flags* parameter features none of the DATABASE_OPEN_READONLY or DATABASE_OPEN_READWRITE flags, the DATABASE_OPEN_READWRITE flag is used.

If the file extension is not specified, ".sqlite" is used.

ENUM_DATABASE_OPEN_FLAGS

ID	Description
DATABASE_OPEN_READONLY	Read only
DATABASE_OPEN_READWRITE	Open for reading and writing
DATABASE_OPEN_CREATE	Create the file on a disk if necessary
DATABASE_OPEN_MEMORY	Create a database in RAM
DATABASE_OPEN_COMMON	The file is in the common folder of all terminals

See also[DatabaseClose](#)

DatabaseClose

Closes a database.

```
void DatabaseClose(  
    int database    // database handle received in DatabaseOpen  
);
```

Parameters

database

[in] Database handle received in [DatabaseOpen\(\)](#).

Return Value

None.

Note

After calling DatabaseClose, all [handles of requests](#) to the database are automatically removed and become invalid.

If the handle is invalid, the function sets the ERR_DATABASE_INVALID_HANDLE error. You can check the error using GetLastError().

[DatabaseOpen](#), [DatabasePrepare](#)

DatabaseImport

Imports data from a file into a table.

```
long DatabaseImport(  
    int          database,          // database handle received in DatabaseOpen  
    const string table,             // name of a table to insert data  
    const string filename,         // name of a file to import data  
    uint         flags,             // combination of flags  
    const string separator,         // data separator  
    ulong        skip_rows,         // how many initial strings to skip  
    const string skip_comments     // string of characters defining comments  
);
```

Parameters

database

[in] Database handle received in [DatabaseOpen\(\)](#).

table

[in] Name of a table the data from a file is to be added to.

filename

[in] CSV file or ZIP archive for reading data. The name may contain subdirectories and is set relative to the MQL5\Files folder.

flags

[in] Combination of flags from the [ENUM_DATABASE_IMPORT_FLAGS](#) enumeration.

separator

[in] Data separator in CSV file.

skip_rows

[in] Number of initial strings to be skipped when reading data from the file.

skip_comments

[in] String of characters for designating strings as comments. If any character from *skip_comments* is detected at the beginning of a string, such a string is considered a comment and is not imported.

Return Value

Return the number of imported strings or -1 in case of an error. To get the error code, use [GetLastError\(\)](#), the possible responses are:

- ERR_INVALID_PARAMETER (4003) - no table name specified (empty string or NULL);
- ERR_DATABASE_INTERNAL (5120) - internal database error;
- ERR_DATABASE_INVALID_HANDLE (5121) - invalid database handle.

Note

If there is no table named *table*, it is generated automatically. Names and field types in the created table are defined automatically based on the file data.

If there is no table named *table*, it is generated automatically. Names and field types in the created table are defined automatically based on the file data.

ENUM_DATABASE_IMPORT_FLAGS

ID	Description
DATABASE_IMPORT_HEADER	The first line contains the names of the table fields
DATABASE_IMPORT_CRLF	CRLF (the default is LF) is considered a string break
DATABASE_IMPORT_APPEND	Add data to the end of an existing table
DATABASE_IMPORT_QUOTED_STRINGS	String values enclosed in double quotes
DATABASE_IMPORT_COMMON_FOLDER	The file is stored in the common folder of all client terminals \Terminal\Common\File.

Example of reading the table from the file created by the code from the [DatabaseExport](#) example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    string csv_filename;
    //-- get the names of text files for downloading from the common folder of the client
    string filenames[];
    if(FileSelectDialog("Select a CSV file to download a table", NULL,
        "Text files (*.csv)|*.csv",
        FSD_WRITE_FILE|FSD_COMMON_FOLDER, filenames, "data.csv")>0)
    {
        //-- display the name of each selected file
        if(ArraySize(filenames)==1)
            csv_filename=filenames[0];
        else
        {
            Print("Unknown error while selecting file. Error code ", GetLastError());
            return;
        }
    }
    else
    {
        Print("CSV file not selected");
        return;
    }
    //-- create or open a database
    string db_filename="test.sqlite";
    int db=DatabaseOpen(db_filename, DATABASE_OPEN_READWRITE|DATABASE_OPEN_CREATE);
    //-- check if the TEST table exists
```

```
if(DatabaseTableExists(db, "TEST"))
{
    //--- remove the TEST table
    if(!DatabaseExecute(db, "DROP TABLE IF EXISTS TEST"))
    {
        Print("Failed to drop the TEST table with code ", GetLastError());
        DatabaseClose(db);
        return;
    }
}

//--- import entries from the file to the TEST table
long imported=DatabaseImport(db, "TEST", csv_filename, DATABASE_IMPORT_HEADER|DATABASE_IMPORT_DATA);
if(imported>0)
{
    Print(imported," lines imported in table TEST");
    DatabasePrint(db,"SELECT * FROM TEST",DATABASE_PRINT_NO_INDEX);
}
else
{
    Print("DatabaseImport() failed. Error ",GetLastError());
}

//--- close the database file and inform of that
DatabaseClose(db);
PrintFormat("Database: %s closed", db_filename);
}
```

See also

[DatabaseOpen](#), [DatabasePrint](#)

DatabaseExport

Exports a table or an SQL request execution result to a CSV file. The file is created in the UTF-8 encoding.

```
long DatabaseExport(
    int          database,           // database handle received in DatabaseOpen
    const string table_or_sql,       // a table name or an SQL request
    const string filename,          // a name of a CSV file for data export
    uint         flags,              // combination of flags
    const string separator           // data separator in the CSV file
);
```

Parameters

database

[in] Database handle received in [DatabaseOpen\(\)](#).

table_or_sql

[in] A name of a table or a text of an SQL request whose results are to be exported to a specified file.

filename

[in] A file name for data export. The path is set relative to the MQL5\Files folder.

flags

[in] Combination of flags from the [ENUM_DATABASE_EXPORT_FLAGS](#) enumeration.

separator

[in] Data separator. If NULL is specified, the '\t' tabulation character is used as a separator. An empty string "" is considered a valid separator but the obtained CSV file cannot be read as a table - it is considered as a set of strings.

Return Value

Return the number of exported entries or a negative value in case of an error. To get the error code, use [GetLastError\(\)](#), the possible responses are:

- ERR_INTERNAL_ERROR (4001) - critical runtime error;
- ERR_INVALID_PARAMETER (4003) - path to the database file contains an empty string, or an incompatible combination of flags is set;
- ERR_NOT_ENOUGH_MEMORY (4004) - insufficient memory;
- ERR_FUNCTION_NOT_ALLOWED(4014) - specified pipe is not allowed;
- ERR_PROGRAM_STOPPED(4022) - operation canceled (MQL program stopped);
- ERR_WRONG_FILENAME (5002) - invalid file name;
- ERR_TOO_LONG_FILENAME (5003) - absolute path to the file exceeds the maximum length;
- ERR_CANNOT_OPEN_FILE(5004) - unable to open the file for writing;
- ERR_FILE_WRITEERROR(5026) - unable to write to the file;
- ERR_DATABASE_INTERNAL (5120) - internal database error;
- ERR_DATABASE_INVALID_HANDLE (5121) - invalid database handle;

- ERR_DATABASE_QUERY_PREPARE(5125) - request generation error;
- ERR_DATABASE_QUERY_NOT_READONLY - read-only request is allowed.

Note

If request results are exported, the SQL request should begin with "SELECT" or "select". In other words, the SQL request cannot alter the database status, otherwise DatabaseExport() fails with an error.

Database string values may contain the conversion character ('\r' or '\r\n'), as well as the value separator character set in the *separator* parameter. In this case, be sure to use the DATABASE_EXPORT_QUOTED_STRINGS flag in the 'flags' parameter. If this flag is present, all displayed strings are enclosed in double quotes. If a string contains a double quote, it is replaced by two double quotes.

ENUM_DATABASE_EXPORT_FLAGS

ID	Description
DATABASE_EXPORT_HEADER	Display field names in the first string
DATABASE_EXPORT_INDEX	Display string indices
DATABASE_EXPORT_NO_BOM	Do not insert BOM mark at the beginning of the file (BOM is inserted by default)
DATABASE_EXPORT_CRLF	Use CRLF for string break (the default is LF)
DATABASE_EXPORT_APPEND	Add data to the end of an existing file (by default, the file is overwritten). If the file does not exist, it will be created.
DATABASE_EXPORT_QUOTED_STRINGS	Display string values in double quotes.
DATABASE_EXPORT_COMMON_FOLDER	A CSV file is created in the common folder of all client terminals \Terminal\Common\File.

Example:

```
input int InpRates=100;
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    MqlRates rates[];
    //--- remember the start time before receiving bars
    ulong start=GetMicrosecondCount();
    //--- request the last 100 bars on H1
    if(CopyRates(Symbol(), PERIOD_H1, 1, InpRates, rates)<InpRates)
    {
        Print("CopyRates() failed,, Error ", GetLastError());
    }
}
```

```

    return;
}
else
{
    //--- how many bars were received and how much time it took to receive them
    PrintFormat("%s: CopyRates received %d bars in %d ms ",
        _Symbol, ArraySize(rates), (GetMicrosecondCount()-start)/1000);
}

//--- set the file name for storing the database
string filename=_Symbol+"_"+EnumToString(PERIOD_H1)+"_"+TimeToString(TimeCurrent())-
StringReplace(filename, ":", "-"); // ":" character is not allowed in file names
//--- open/create the database in the common terminal folder
int db=DatabaseOpen(filename, DATABASE_OPEN_READWRITE|DATABASE_OPEN_CREATE|DATABASE_
if(db==INVALID_HANDLE)
{
    Print("Database: ", filename, " open failed with code ", GetLastError());
    return;
}
else
    Print("Database: ", filename, " opened successfully");

//--- check if the RATES table exists
if(DatabaseTableExists(db, "RATES"))
{
    //--- remove the RATES table
    if(!DatabaseExecute(db, "DROP TABLE IF EXISTS RATES"))
    {
        Print("Failed to drop the RATES table with code ", GetLastError());
        DatabaseClose(db);
        return;
    }
}

//--- create the RATES table
if(!DatabaseExecute(db, "CREATE TABLE RATES("
        "SYMBOL          CHAR(10), "
        "TIME            INT NOT NULL, "
        "OPEN            REAL, "
        "HIGH            REAL, "
        "LOW             REAL, "
        "CLOSE           REAL, "

```

See also

[DatabasePrint](#), [DatabaseImport](#)

DatabasePrint

Prints a table or an SQL request execution result in the Experts journal.

```
long DatabasePrint(
    int          database,          // database handle received in DatabaseOpen
    const string table_or_sql,      // a table or an SQL request
    uint         flags              // combination of flags
);
```

Parameters

database

[in] Database handle received in [DatabaseOpen\(\)](#).

table_or_sql

[in] A name of a table or a text of an SQL request whose results are displayed in the Experts journal.

flags

[in] Combination of flags defining the output formatting. The flags are defined as follows:

DATABASE_PRINT_NO_HEADER	- do not display table column names (field names)
DATABASE_PRINT_NO_INDEX	- do not display string indices
DATABASE_PRINT_NO_FRAME	- do not display a frame separating a header and data
DATABASE_PRINT_STRINGS_RIGHT	- align strings to the right.

If flags=0, the columns and the strings are displayed, the header and the data are separated by the frame, while the strings are aligned to the left.

Return Value

Return the number of exported strings or -1 in case of an error. To get the error code, use [GetLastError\(\)](#), the possible responses are:

- ERR_INTERNAL_ERROR (4001) - critical runtime error;
- ERR_NOT_ENOUGH_MEMORY (4004) - insufficient memory;
- ERR_DATABASE_INTERNAL (5120) - internal database error;
- ERR_DATABASE_INVALID_HANDLE (5121) - invalid database handle;

Note

If the journal displays request results, the SQL request should begin with "SELECT" or "select". In other words, the SQL request cannot alter the database status, otherwise DatabasePrint() fails with an error.

Example:

```
//+-----+
//| Script program start function |
//+-----+
void OnStart()
{
    string filename="departments.sqlite";
```

```

//--- create or open the database in the common terminal folder
int db=DatabaseOpen(filename, DATABASE_OPEN_READWRITE | DATABASE_OPEN_CREATE | DATABASE_OPEN_READWRITE);
if(db==INVALID_HANDLE)
{
    Print("DB: ", filename, " open failed with code ", GetLastError());
    return;
}

//--- create the COMPANY table
if(!CreatTableCompany(db))
{
    DatabaseClose(db);
    return;
}

//--- create the DEPARTMENT table
if(!CreatTableDepartment(db))
{
    DatabaseClose(db);
    return;
}

//--- display the list of all fields in the COMPANY and DEPARTMENT tables
PrintFormat("Try to print request \"PRAGMA TABLE_INFO(COMPANY);PRAGMA TABLE_INFO(DEPARTMENT)\"");
if(DatabasePrint(db, "PRAGMA TABLE_INFO(COMPANY);PRAGMA TABLE_INFO(DEPARTMENT)", 0))
{
    PrintFormat("DatabasePrint(\"PRAGMA TABLE_INFO()\") failed, error code=%d", GetLastError());
    DatabaseClose(db);
    return;
}

//--- display the COMPANY table in the log
PrintFormat("Try to print request \"SELECT * from COMPANY\"");
if(DatabasePrint(db, "SELECT * from COMPANY", 0)<0)
{
    Print("DatabasePrint failed with code ", GetLastError());
    DatabaseClose(db);
    return;
}

//--- request text for combining the COMPANY and DEPARTMENT tables
string request="SELECT EMP_ID, NAME, DEPT FROM COMPANY LEFT OUTER JOIN DEPARTMENT '
                'ON COMPANY.ID = DEPARTMENT.EMP_ID";

//--- display the table combining result
PrintFormat("Try to print request \"SELECT EMP_ID, NAME, DEPT FROM COMPANY LEFT OUTER JOIN DEPARTMENT '
                'ON COMPANY.ID = DEPARTMENT.EMP_ID\"");
if(DatabasePrint(db, request, 0)<0)
{
    Print("DatabasePrint failed with code ", GetLastError());
    DatabaseClose(db);
    return;
}

//--- close the database

```

```

DatabaseClose(db);
}

DatabaseTableExists

Checks the presence of the table in a database.

```
bool DatabaseTableExists(  
    int     database,    // database handle received in DatabaseOpen  
    string  table        // table name  
);
```

Parameters

database

[in] Database handle received in [DatabaseOpen\(\)](#).

table

[in] Table name.

Return Value

Return true if successful, otherwise false. To get the error code, use `GetLastError()`, the possible responses are:

- `ERR_INVALID_PARAMETER (4003)` - no table name specified (empty string or NULL);
- `ERR_WRONG_STRING_PARAMETER (5040)` - error converting a request into a UTF-8 string;
- `ERR_DATABASE_INTERNAL (5120)` - internal database error;
- `ERR_DATABASE_INVALID_HANDLE (5121)` - invalid database handle;
- `ERR_DATABASE_EXECUTE (5124)` - request execution error;
- `ERR_DATABASE_NO_MORE_DATA (5126)` - no table exists (not an error, normal completion).

DatabaseExecute

Executes a request to a specified database.

```
bool DatabaseExecute(
    int     database,      // database handle received in DatabaseOpen
    string  sql            // SQL request
);
```

Parameters

database

[in] Database handle received in [DatabaseOpen\(\)](#).

sql

[in] SQL request.

Return Value

Return true if successful, otherwise false. To get the error code, use [GetLastError\(\)](#), the possible responses are:

- `ERR_INTERNAL_ERROR` (4001) - critical runtime error;
- `ERR_INVALID_PARAMETER` (4003) - sql parameter contains an empty string;
- `ERR_NOT_ENOUGH_MEMORY` (4004) - insufficient memory;
- `ERR_WRONG_STRING_PARAMETER` (5040) - error converting a request into a UTF-8 string;
- `ERR_DATABASE_INTERNAL` (5120) - internal database error;
- `ERR_DATABASE_INVALID_HANDLE` (5121) - invalid database handle;
- `ERR_DATABASE_EXECUTE` (5124) - request execution error.
